In many tropical frogs the reproductive habits are much modified. One species (*Phyllobates trinitatis*) of Venezuela and Trinidad carries its

DEVELOPMENT OF HYLODES

Life history of *Hylodes martinicensis*. 1 An egg with embryo about seven days old. 2 Embryo twelve days old. 3 Young frog just hatched. 4 Adult male, natural size.

tadpoles on its back, to which the young attach themselves by means of their suckers. A frog of the Seychelles Islands lives in the tree ferns far from water and carries its young about on its back, to which they are attached by their bellies. In the Kameruns lives a frog that lays

its eggs in a foamy mass on the leaves of a tree. When the larvæ are developed, the mass becomes slimy, and the tadpoles swim about it, and when a heavy rain falls, they are washed into pools of water lying at the bases of the trees. The foam is probably produced, as it is in culinary operations, by air being entangled in it by a beating that the frog gives the jelly with its feet. The inclosed air may well serve in respiration. Cf TOAD.

Utilities. Among both civilized and savage men frogs are a culinary dainty. The edible European frog is so much prized in France that it is bred for the market in large preserves. In the United States both the bullfrog and spring frog are sold in the markets. In France and the United States the hind legs alone are eaten, they are known as "saddles" to American marketmen and are usually served at table fried. In Germany all the muscular parts are served stewed, often with sauce. Frogs have enabled man to contribute much to his knowledge of physiology. The tail of the tadpole, so frequently fed on by dragonfly larvæ and other aquatic enemies, has great capacity of regeneration. The study of its reformation has added to our knowledge of the regeneration of animal tissue. The enucleation of the blood, so readily seen by the aid of the microscope in the web of the frog's foot, is a classic and painless classroom demonstration. Observations on the response of frog muscle to stimuli led the great Italian physiologist Galvani to the discovery of dynamical or current electricity, known to us as galvanic or voltaic electricity. See TREE FROG, *Factors of Organic Evolution*, in article EVOLUTION.

Fossil Forms. Fossil frogs and toads have been found in the Eocene phosphate deposits of southwestern France, and they seem to be identical with or very closely allied to the modern genera *Rana* and *Bufo*. The Miocene deposits of Germany, France, and Bohemia have also furnished fossil frogs and toads. The genus *Palæobatrachus* of the Oligocene lignites has been obtained in large numbers in both the larval tadpole stage and the adult tailless condition. Tailed batrachians, *Stegocephalia* (qv), were common members of the late Paleozoic and Mesozoic faunas. The stories of living frogs and toads being found in the middle of freshly broken blocks of stone, so commonly told in various parts of the country, are scarcely worthy of credence. They have originated either in deliberate falsehoods or in misapprehension on the part of the original observer.

Bibliography. Boulenger, *Catalogue of British Gradientia* (London, 1882), and many papers in the *Proceedings of the Zoological Society of London*, Cope, *Standard Natural History*, vol. III (Boston, 1885); id., *Batrachia of North America* (Smithsonian Institution, Washington, 1889); Dickerson, *The Frog Book* (New York, 1906); Gadow, *Amphibia and Reptiles* (London, 1901). The last (vol. VIII of the *Cambridge Natural History*) is a comprehensive work on the subject, both systematically and descriptively. For structure and dissection, consult Mivart, *The Common Frog* (London, 1874); Marshall, *The Frog: An Introduction to Anatomy, Histology, and Embryology* (11th ed., New York, 1912). For fossil forms, consult Wolterstorff, "Ueber fossile Frosche insbesondere *Palæobatrachus*," in *Jahresberichte des Naturwissenschaftlichen Vereins von Magdeburg* (1885-86).

FROG See RAILWAYS, *Frogs and Switches*

FROG See HORSE, HORSESHOEING

FROG, FLYING See FLYING FROG

FROG, NICHOLAS, or NIC A national nickname for the Dutch. It first occurs in Arbuthnot's *Law is a Bottomless Pit*

FROG-BIT A popular name of certain water plants of the family Hydrocharidaceæ See ANACHARIS, VALLISNERIA

FROG-FISH. One of a family of fishes (Annenariidæ), allied to the angels. They are remarkable for excessive ugliness. The head is larger than the body, flattened, and spiny, the mouth is very large, with many teeth, the lips are often furnished with filaments, the pectoral fins are supported by a short stalk or wrist. The skin is naked in some species, scaly in others. The species are numerous and widely distributed, and many inhabit the deep sea. They hide themselves in the sand to surprise their prey. Cf. ANGLER, and see Plate of ANGLERS AND BATFISH

FROG FLY, OR FROGHOPPER. See FROTH FLY

FROG-MORE A royal palace and mausoleum in the Home Park, 1 mile southeast of Windsor Castle, Berkshire, England. The palace, purchased in 1800 by Queen Charlotte, was the residence of Queen Victoria's mother and of Edward VII when Prince of Wales. The handsome mausoleum of Romanesque architecture, erected in memory of Prince Albert, contains the remains of the Prince Consort and Queen Victoria

FROG-MOUTH One of a group of large birds of the East Indian and Australian region, constituting a subfamily, the Podarginæ, of the nightjar family, Caprimulgidæ. They are noted for the very wide mouth, especially in the birds of the genus *Batrachostomus*, which is capable of completely engulfing small birds. They have a soft plumage and are largely nocturnal, like the owls. They have no oil gland, but possess a pair of large powder-down patches, one on each side of the rump. One of the best-known species is the Australian "more-pork" (qv). See Plate of NIGHTJARS, GUACHARO, ETC

FROGS, THE One of the most brilliant of the comedies of Aristophanes (qv)

FROG SHELL A small gastropod mollusk of the genus *Ranella*, closely related to the tritons (family Tritonidæ), so called because of a fancied resemblance of its rough, flattened form and mottled colors to a frog. There are many species in tropical waters, all of which feed upon decaying matter and are useful scavengers. See Colored Plate of MARINE GASTROPODS

FROGS' LEGS See FISH AS FOOD

FROG SNAKE See MATTUPI

FROG SPAWN. The popular name of certain fresh-water algæ which make green and slimy masses on the surface of ponds and sluggish streams. The name is applied properly to the gelatinous mass inclosing the ova of frogs. See ALGÆ, FROG

FROG SPITTLE (so called because formerly believed to be the spittle of frogs) A frothy substance appearing on weeds, grasses, etc., and produced in self-protection by the nymphs of certain plant bugs, called froth flies. (See FROTH FLY) In England the substance is called cuckoo spit

FROHLICH, frø'lik, ABRAHAM EMANUEL.

(1796-1865) A Swiss poet, born at Brugg. From 1835 until his death he was pastor at Aarau. His poems and fables are very popular, and the fables rank high among literature of that variety. His works include *Fabeln* (1825), *Das Evangelium Sankt Johannis in Ieneden* (1830), *Elegien an Wieg' und Sarg* (1835), the epics *Ulrich Zwingli* (1840), *Ulrich von Hutten* (1845), and *Johann Calvin* (1864). His collected works were published in 1853

FROHMAN, CHARLES (1860-1915) An American theatrical manager, one of the leaders of what is commonly called the Theatrical Trust, of which he became the producing partner. He was born in Sandusky, Ohio. While a youth he was advance agent for a traveling minstrel show, later, after a period as independent manager of various companies "on the road," he established himself in 1893 at the Empire Theatre, New York, and in the season of 1895-96 formed with several managerial firms the so-called "syndicate." He brought out as stars Maude Adams, Julia Marlowe, John Drew, and other well-known actors. In 1905-06 he managed E. H. Sothern and Julia Marlowe in their notable series of Shakespearean productions. He also became interested in several theatres in London, and was largely instrumental in effecting the system of exchange of successful plays which now exists between England and the United States. He died on the *Lusitania*

FROHMAN, DANIEL (1853-) An American theatrical manager, born in Sandusky, Ohio. In his youth he was employed in newspaper work in New York, but he early embarked in theatrical management with traveling companies. Previous to 1885 he managed the Fifth Avenue and Madison Square theatres, and more recently the Lyceum and Daly's Theatre, besides the Daniel Frohman Stock Company and various special attractions. He related himself closely to the so-called Theatrical Trust, formed by his brother Charles Frohman

FROHSCHAMMER, frø'sham-ër, JAKOB (1821-93). A German theologian and philosopher, born at Illkofen, near Ratisbon, and educated at Munich. For more than 40 years he was associated with the University of Munich, where he occupied the chair of philosophy from 1855 until his death. He had been ordained a priest in 1847, but because of his radical utterances on theology, especially for his *Beitrag zur Kirchengeschichte* (1850), which was put on the Index Expurgatorius, he was compelled to resign his position as preacher at the university in 1855, in 1862 an apostolic brief denounced him, and in 1871 he was excommunicated. He refused to join the Old Catholics and in 1862 founded the *Athenæum* as a Liberal Catholic organ. A large number of his writings were directed against the authority of the Church in matters of science, the freedom of which he defended in the work entitled *Ueber die Freiheit der Wissenschaft* (1861). He attacked the dogma of infallibility with equal vigor in a number of publications, which involved him in a long and bitter controversy with Catholic theologians. In his philosophical writings he defends the idealistic conception of the universe—a conception possible through a central principle which he defines as "fantasy." This idea is carried out in his books, *Monaden und Weltphantasie* (1879), *Die Philosophie als Idealwissenschaft und System* (1884), and *Ueber das Mysterium Magnum des Daseins* (1891). Con-

sult his autobiography in Hinrichsen's *Deutsche Denker* (1888), and critical studies by Friedrich (1899), Attensperger (1899), and Munz (1894).

FROHSDORF, frôsh'dôrf or **FROSCHDORF**, frôsh'dôrf (originally Kriottendorf) A village of Lower Austria, 30 miles south of Vienna, on the right bank of the Leitha. It has acquired some political significance, owing to the fact that its castle was the residence of the Duchess of Angoulême after 1844 and later of the Count of Chambord (qv), and became the rendezvous of the elder Bourbon party. Pop., 1900, 706.

FROISSART, frwâ'sar', JEAN (c 1338-1410) A French poet and historian, born at Valenciennes. He was destined for the Church and consequently received a liberal education, but he soon displayed a passion for poetry, for the tales of chivalry, and for travel. He visited England and Avignon, and in 1361 he went to London to present to Queen Philippa a poem concerning the recent war between England and France. It secured for him a position as secretary to the Queen, who encouraged him to continue his work. In 1365 he made a journey to the Scottish court at the expense and under the protection of Queen Philippa. In 1366 he left England in the train of the Black Prince and in 1368 visited Italy under the protection of the Duke of Clarence. Upon the death of his patroness the Queen, in 1369, he returned to Valenciennes. Soon, however, he found new patrons who admired his writings. In 1370 he entered the service of Duke Wenceslas of Luxembourg. He was also befriended by Robert of Namur, to whom he dedicated the first book of his *Chronicles*, and by Guy of Chatillon, who in 1373 appointed him curé of Lestines-au-Mont. For 10 years he led an uneventful life, working upon his *Chronicles* or composing poems with Duke Wenceslas. In 1383 or 1384 he became the chaplain of Guy of Chatillon, who had just inherited the County of Blois. Then for 15 years Froissart traveled much, seeking men who could tell of the great wars in which they had taken part. Thus in 1388 he visited the court of Gaston Phœbus at Béarn. To this journey we owe the striking description of this remarkable tyrant, whom Froissart admired. In 1394 he visited England a second time. Little is known of his life after he returned from England, and the date of his death is uncertain.

The work for which Froissart is famous is his four books of *Chronicles*, in which he recorded the events and wars of the last three-quarters of the fourteenth century. He was engaged on this work for over 40 years. He had little critical ability and recorded supernatural tales with as much credence as he gave to knightly feats of arms. Nevertheless he gives a masterly account of the character and manners of his age. He was able to describe most of the localities from his own knowledge, and he was fortunate in being able to consult important actors in every war which he described. Thus, he learned of the Scottish wars from King David, of Crécy from King Edward, of Poitiers from the Black Prince, of the famous Great Companies from their commanders, of the death of Wat Tyler from Robert of Namur, who had been present.

In the first redaction of his first book he borrowed freely from Jehan le Bel's *Chronicle*. Later he made two revisions, and in each he deleted many of the portions borrowed from Jehan le Bel. One defect in his work, considered as an historical source, must be noted

Froissart was far from being impartial. In the first redaction of his first book he was an English partisan. In the second redaction he suppressed much that was favorable to England. In the third redaction, which he made after 1400, when he was filled with grief for the murder of Richard II, the grandson of his former patroness, he made some very severe reflections on the English nation. The best editions of his *Chronicles* are those of Kervyn de Lettenhove (25 vols., Brussels, 1863-77) and Luce (Paris 1890-88, incomplete), in the publications of the Société de l'histoire de France. There are many other editions and translations, for which see Molnier, *Les sources de l'histoire de France*, vol. iv (Paris, 1904). Special mention should be made of the fine old English rendering by Lord Berners. Froissart is also noteworthy as a poet. He wrote many verses, which were greatly appreciated by his patrons. His first production was entitled *L'Épuiette amoureuse* (The Little Thorn of Love) and is an account of his boyhood and first love affair. The *Dir du florin*, which is partly autobiographical, is the most pleasing of his poetical works. The most lengthy was his *Melador*, which he read to Gaston Phœbus. It is a poem twice as long as the *Divine Comedy* of Dante and is an echo of the tales of the "Round Table", but although it contains beautiful and interesting passages, as a whole it is exceedingly prolix and tiresome. It has been published by Longnon for the Société des Anciens Textes (3 vols., Paris, 1895-99). The other poems have been published by Scheler (3 vols., Brussels). For Froissart's life, consult the introductions to the two editions of his *Chronicles*, which have been cited, the secondary works given in Molnier, and especially Mary Darmesteter, *Froissart* (Paris, 1894).

FROLIC, THE A British sloop of war captured in 1812 by the American sloop of war *Wasp*, under Capt. Jacob Jones, who received a medal from Congress for the exploit.

FROLICH, frē'lik, LORENTZ (1820-1908). A Danish painter, illustrator, and etcher. He was born at Copenhagen, studied there under Eckersberg, in Dresden under Bendemann, and in Paris under Couture. Afterward he lived much in Rome and in Paris, where he constantly exhibited at the salons. In 1877 he was appointed professor at the Copenhagen Academy. His illustrations, especially of children's books and old Danish ballads, are known everywhere and are more important than his paintings. He also furnished original etchings for Fabricius, *History of Denmark*, for Apuleius, *Cupid and Psyche*, The Lord's Prayer, *Die Götter des Nordens*, and many other works. Among his paintings are "King Harold Blaatand" (1840), "Cupid and the Water-Sprite" (1845, Leipzig Museum), "Family of a Wood-God", and decoration in the Court of Appeals at Flensburg, Prussia, and in some public buildings of his native land.

FROLLO. A Roman knight, serving as Governor of France and killed by King Arthur, in an Arthurian legend of the fifteenth century entitled *Arthur*, and other chronicles.

FROME, formerly FROME SELWOOD. An agricultural and manufacturing town in Somerset, England, on the Frome, a branch of the Avon, 12 miles south-southeast of Bath (Map England, D 5). Frome has a museum and a school of art. Its staple products are broadcloths, woolen goods, dyestuffs, silks, hats, ale, cards

for dressing woolen cloths, cutlery, and iron-ware. The town owns its water works. The celebrated Selwood Forest, part of which still exists, was in the vicinity. Pop, 1901, 11,057, 1911, 10,901.

FROMENTIN, frō'man'tān', EUGÈNE (1820-76). A French painter and author. He was born near La Rochelle, France, Oct. 24, 1820. His father was a physician of note, who had an inclination towards art, which he had cultivated while a student in Paris. In November, 1839, at the age of 19, Eugène was sent to Paris to study law. He became also much interested in literature and was associated intimately with eminent authors, as Benjamin Fillon, Michelet, Quinet, and Sainte-Beuve. He wrote much himself and at this time formed the vivid and charming style so well known in his later works. Not until 1840, at the age of 20, did Fromentin show any disposition towards painting. In 1843 he received his license in law and began to study for the doctor's degree. At this time he decided to abandon law and first entered the atelier of a mediocre painter, named Rémond, but a year later changed to that of Cabat. Fromentin occupied several studios in Paris, but finally settled in a little hotel in the Place Pigalle, which he occupied during the rest of his life. In 1846 occurred his first visit to Algeria, which decided the main direction of his interest in life and art, for he is essentially the painter of northern Africa, the Sahara, and its oases. From 1847, when he first exhibited his Sahara pictures in the Salon, he was chiefly in the Sahara or in Paris.

Interest in Fromentin culminated in the Salon of 1859, when he received a first medal and the cross of the Legion of Honor. The attention of Paris and the world had been especially awakened by his two newly published works, "Un été dans le Sahara," which first appeared in the *Revue de Paris* (1856) and "Une année dans le Sahel," in the *Revue des Deux Mondes* (1858)—published together in 1878 by Plon, in a memorial edition, superbly illustrated with Fromentin's pictures of the Sahara. Fromentin also wrote a novel, *Dominique* (1862), characterized by delicacy of observation and sincerity of feeling. His most important literary effort is his critical work, *Maîtres d'autrefois* (1876), an appreciation of Dutch and Flemish painting. His paintings are characterized by brightness and harmony of color, excellent draftsmanship, and spirited execution. Among the most important are "A Farm Near La Rochelle" (1847), his earliest work, "Gazelle Hunt in the Hodna" (1857), "A Street in El-Aghouat" (1859), "An Arab Bivouac at Sunrise," in the collection of Edouard Delessert, Paris, "The Falcon Hunt" (1863), and "An Arab Camp," his last picture, in the Louvre, which possesses six other pictures by him. Several good examples of his works are in America, notably in the Walters collection, Baltimore, and in the Vanderbilt collection and the Metropolitan Museum, New York. Fromentin died suddenly at Saint-Maurice, near La Rochelle, Aug. 27, 1876. Fromentin's letters were published, with biography and notes, by Blanchon (1909). Consult *Vingt-cinq dessins de Eugène Fromentin par Montefiore, texte biographique par Burty* (Paris, 1877), Gonse, *Eugène Fromentin, peintre et écrivain* (ib, 1881), Joun, "Fromentin," in *Maîtres contemporains* (ib, 1887), Claretie, "Eugène Fromentin," in *Peintres et sculpteurs*

contemporains (ib, 1882), Huther, *History of Modern Painting* (New York, 1907).

FROMMANN, frō'man, GEORG KARL (1814-87). A German philologist, born in Coburg. He was librarian of the Germanic Museum and edited the periodical *Die deutsche Mundarten*. In 1865, with 10 other Protestant theologians, he undertook the revision of Luther's translation of the New Testament. This revision was subsequently extended, at the request of the Protestant Conference, to the Old Testament, and the revised edition of the complete Bible appeared in 1892. Consult the memoir by Vogt (Nuremberg, 1888).

FROMMEL, frō'mäl, EMIL (1828-96). A German theologian and author. He was born at Karlsruhe and studied at Halle, Erlangen, and Heidelberg. After holding several pastorates, he served as army chaplain in the Franco-German War of 1870-71 and in 1872 was appointed court preacher at Berlin and pastor of the garrison in that city. His principal theological works include *Die zehn Gebote Gottes in Predigten* (6th ed, 1898), *In drei Stufen*, an anthology (8th ed, 1890), *Festflammen* (6th ed, 1896), *Das Gebet des Herrn in Predigten* (4th ed, 1893). He also wrote tales and miscellaneous essays, collected and published under the title of *Gesammelte Schriften, Erzählungen für das Volk, Aufsätze und Vorträge* (1873-97).

FROMMEL, GASTON (1862-1906). A Swiss theologian, born in Alsace. From 1894 until his death he was professor of theology at the University of Geneva. Like Vinet, he followed the method of psychological analysis of conscience and also emphasized personality as the summation of reality. He made liberty, however, of secondary importance, as being conditional upon the Divine Will. Consult G. Godet, *Gaston Frommel* (Neuchâtel, 1906).

FROMMEL, KARL LUDWIG (1789-1863). A German landscape painter and engraver, born at Birkenfeld, Oldenburg. He studied at Karlsruhe, under F. J. Becker and Haldenwang, visited Paris, and earned a considerable reputation in Italy (1812-17). On his return he was appointed professor at Karlsruhe, where he founded the Society of Art and Industry for the Grand Duchy of Baden. After a visit to London, in 1824, to acquaint himself with the technique of steel engraving, he opened at Karlsruhe, in conjunction with the Englishman Winkles, a studio for that branch of art. From 1830 to 1858 he was director of the picture gallery, which owes to his clever administration its present flourishing condition. In it are preserved several of his attractive landscapes. Among his best plates are six original etchings and the engravings "Arricia Near Rome," "View of Tivoli," "Mount Vesuvius," and "Mount Aetna." They are characteristic in conception and delicate in execution.

FROMMEL-LINDEMANN, lin'de-man, KARL AUGUST. See LINDEMANN-FROMMEL.

FROMONT JEUNE ET RISLER AÎNÉ, frō'mōn' zhēn ā rē'slā' ā'nā' (Fr., Fromont Jr and Risler Sr). A novel by Alphonse Daudet (1874).

FROND (Lat *frons*, OLat pl *frundes*, foliage). In botany, a term applied to a shoot in which stem and leaves are not differentiated. Among the lower plants this would apply to the bodies of many liverworts, to the sexual body (gametophyte) of ferns, etc., but in these cases the term "thallus" is more generally used. Perhaps the most general application of the term

"frond" has been to the leaves of ferns, which arose from a misconception as to the real character of a fern leaf. Since in common ferns the leaves seem to arise directly from the ground, the older botanists concluded that they represent a combination of stem and leaf and therefore called them fronds. This application of the term has been abandoned by botanists, but it is still in general use. The only application of the term now in scientific use is in connection with certain flowering plants, such as the duckweed (*Lemna*), in which there is no differentiation of stem and leaves. The application of the term to the leaves of palms has been merely a popular recognition that they resemble the leaves of ferns.

FRONDE, frônd (Fr, sling) The name given to the period of domestic intrigues and political troubles in France during the minority of Louis XIV, from 1648 to 1653. The grasping and despotic policy of Mazarin had given offense to all classes. The princes and nobles saw themselves excluded from all high offices in the state, and their places filled by foreigners, the Parliament of Paris saw itself threatened in its political rights, and the people complained of the burden of taxes and administrative abuses. The Parlement, therefore, commenced a course of determined opposition, refusing to register the royal edicts, more especially the financial measures initiated by Mazarin. At first the opposition was along constitutional lines, but finally it was turned by the nobles into a struggle to get back the civil and political rights which they had lost under Richelieu. Among the leaders in opposition, in addition to the first President, Mathieu Molé, were the councilors Blanchemesnil and Broussel. After Condé's victory over the Spaniards at Lens (Aug 20, 1648) had strengthened the hands of the court party, violent measures were determined on, and on Aug 26, 1648, Blanchemesnil and Broussel were arrested by order of Mazarin. The people took up arms, dispersed the Swiss Guard, and on the 27th of August erected barricades in the street around the Palais Royal. The court, without an army at the time in Paris, now removed to Rueil, and after some negotiations yielded in so far that an ordinance was issued regulating the financial and judicial administration of the realm. This victory gave courage to the supporters of the Parlement who continued to keep a sharp lookout on the court and were styled by the adherents of Mazarin *frondeurs*, i.e., censors (literally, slingers). The court, when the army returned after the Treaty of Westphalia, resolved to suppress the movement, and on Jan 6, 1649, removed secretly to Saint-Germain, leaving Paris to be blockaded by the Prince of Condé with 7000 men. The Parlement, instigated by the astute Cardinal de Retz and publicly supported by various nobles, including the Prince of Conti, the dukes of Longueville, Beaufort, Bouillon, and Elbeuf, and the Maréchal de la Mothe, called upon the people to resist. A sanguinary encounter at Charenton resulted in the defeat of the Frondeurs, and they were forced to enter into negotiations for peace. Accordingly, a treaty was made at Rueil, March 11, 1649, granting a general amnesty and regulating the matter of financial control. After the return of the court to Paris in August, a new turn was given to the contest, the princes of the blood disputing the power with Mazarin. This, on Jan 18, 1650, led to the sudden arrest of Condé,

Longueville, and Conti, which was the beginning of the new Fronde. The young sons of Louis XIII were roused against Mazarin, and Marshal Turenne assumed the title of lieutenant general of the royal army for the liberation of the princes. After some initial successes Turenne, who was fighting in conjunction with the Spaniards, was finally completely defeated by Mazarin's troops under Du Plessis-Praslin, near Rethel, on Dec 13, 1650. Mazarin returned to Paris, but found all parties against him, and his removal was insisted upon so urgently that he was obliged to release the princes and flee to the Netherlands. A system of intrigue was now substituted for force of arms, and the contest, which had begun for the interests of the people, was converted into a court cabal. Turenne was gained over by the Queen Regent, Anne of Austria, De Retz by Cardinal Mazarin, and Condé, who had made himself generally odious by his haughty conduct, was obliged to flee for safety into Guenne. Louis XIV, who had now attained his fourteenth year, endeavored to induce Condé to return, but the latter, mistaking the King's overtures, repaid to Boileaux in 1651, where he had many adherents. There he commenced a regular war against the court which might have had dangerous consequences had not Turenne opposed the Prince. A large force of Spanish regulars were continually under his command, and people gradually came to look upon him as a foreign invader. On July 2, 1652, an engagement took place between the two parties in the outskirts of Paris. Condé was in danger of defeat, when, through the efforts of his friends, he was allowed to enter Paris. Paris itself, weary of these fruitless dissensions, now entered into negotiations with the court, demanding, however, the final removal of Mazarin, who had meanwhile returned. This demand was complied with by Louis XIV, and the royal entry took place Oct 21, 1652. Various nobles were exiled as a result of the contest. Condé, who refused to enter into the compact, and had quitted Paris on October 15, repaired to Champagne, and finally, finding no one disposed to take up arms in his cause, entered the Spanish service and was declared a traitor. Mazarin returned to Paris and was once more intrusted with the reins of government. Thus ended the period of the Fronde in Paris, but the last signs of revolt in the provinces were suppressed only in 1653. The defeat of the Frondeurs contributed to make Louis XIV an absolute monarch. Consult Barante, *Le parlement de Paris et vie de M Molé* (Paris, 1859), Perkins, *France under Richelieu and Mazarin* (New York, 1888), Pardoe, *Louis XIV and the Court of France*, etc (London 1888), *Memoirs of Cardinal de Retz* (ib, 1896), Gordon, *The Fronde* (Oxford, 1905), *Lettres du Cardinal Mazarin* (Paris, 1878-1906). See CONDE, LOUIS XIV, RETZ, CARDINAL DE, TURENNE.

FRONSPERG See FRUNDSBERG, GEORG VON **FRONSPERGER**, frôns'pérk-ër, LEONHARD (c1520-75). A German writer on the art of war. He was born at Ulm and began the study of military science in early boyhood. In his celebrated *Kriegsbuch kaiserlicher Kriegsgerichte und Ordnungen vom Geschütz* (1573, 4th ed, 1596, rendered into Modern High German by F W A Böhm, vol 1, 1819), he displays a remarkable knowledge of army organization, equipment, fortification, military law, articles of war, and artillery practice. He was the

most competent German military writer of the sixteenth century

FRONT DE BŒUF, frôn de bēf In Scott's *Ivanhoe*, a ferocious baron, who threatens Isaac the Jew in order to extort money

FRONTENAC A city in Crawford Co., Kans., 100 miles south of Kansas City, on the Atchison, Topeka, and Santa Fe, the Joplin and Pittsburgh, and the Kansas City Southern railroads (Map Kansas, H 8) It is important as the distributing centre for the productive coal region in which it lies The water works are owned by the city Pop., 1900, 1805, 1910, 3396

FRONTENAC, frôn'tnak', LOUIS DE BUADE, COMTE DE (1620-98) The greatest of the governors of New France He was born in France in 1620 At an early age he entered the military service and rapidly attained promotion He became colonel at 23 and brigadier general at 26 and saw active service in Italy, Flanders, and Germany In 1672 he was appointed to succeed De Coucelles as Governor of New France Frontenac was choleic and arbitrary by nature, but extremely energetic, and sincerely ambitious to inaugurate an era of prosperity for Canada His first act was to convene the three estates—clergy, nobles, and commons—and to establish municipal government in Quebec The royal policy, however, was adverse to the granting of extensive political rights to the Canadians, and the Governor's reforms in this direction were disapproved and his power was decreased as well, by increasing the power of the council and reestablishing the office of intendant He next became involved in controversies with the Jesuits, with the Intendant Talon, and with Perrot, the Governor at Montreal The first were determined to make the state subordinate to the church These quarrels divided the colony into factions, and led at length to the recall of Frontenac in 1682 In 1689 he regained the King's favor and was restored to his former position, which he held until his death, in November, 1698 Frontenac's first administration was especially marked by energy and tact in his dealings with the Indians, and by his encouragement of French exploitations in the West He aided Joliet, Marquette, and La Salle, and established posts at Mackinac, Niagara, and in the Illinois country After his reappointment he waged a vigorous war against the Iroquois, who had reduced Canada to desolation, and against their allies and instigators, the English The frontier towns of New England and New York were repeatedly ravaged by his punitive expeditions His most signal achievement in these campaigns was the show of force by which he foiled Sir William Phipps's fleet before Quebec in 1690 At different times he might have made peace with the Iroquois if he had been willing to abandon to their vengeance his Algonquin allies, but this he steadfastly refused to do, and it was not until his last campaign in the Mohawk country in 1696 that the Iroquois were brought to sue for peace Frontenac, for his bravery and success, was decorated with the cross of St. Louis Consult. Winsor, *Cartier to Frontenac* (Boston, 1894), Parkman, *Frontenac and New France under Louis XIV* (ib., 1877), Le Sueur, *Count Frontenac* (Toronto, 1906)

FRONTERA, frôn-tā'ra A seaport on the Gulf of Campeachy, in the State of Tabasco, Mexico, 230 miles east by south of Vera Cruz

(Map Mexico, N 8) It is the port of San Juan Bautista, the capital of the state, and has a good harbor, which is being improved by extensive works Its exports, valued in 1912 at \$2,083,327, comprise coffee, cocoa, hides, rubber, and dyewoods Its imports, valued at half the above amount, consist of machinery, iron, steel, and cotton goods Frontera is the residence of the United States Consul Pop., 1910, 5760

FRONTIER, MILITARY The furthestmost limits of military lines of national defense, observation, and concentration By the mutual consent of countries contiguous to each other the military frontier is usually placed some little distance back of the actual geographical dividing line The sentries of England and Spain at Gibraltar are separated by a strip of land agreed upon as neutral territory With the principal military countries of Europe the various mobilization schemes are designed to secure the greatest possible concentration on the frontier, where they are knitted together by a more or less complete system of forts or intrenched camps Both France and Germany keep their frontier corps at a much higher peace strength than the remainder of their armies The most important British Indian camps of exercise, as well as their strongest points of concentration, are along the military frontier of northwestern British India The *Militargrenze*, or military frontier, was the former name of a narrow strip of land along the Turkish frontier in Hungary and Croatia-Slavonia, which had a special military constitution See FORTIFICATION, MOBILIZATION

FRONTINO, frôn-tē'nô The horse of Rogero, in Ariosto's and Boiardo's *Orlando*

FRONTINUS, SEXTUS JULIUS A Roman author, who flourished in the second half of the first century A.D. In 74 A.D. he was sent to Britain as governor of that island and obtained a great reputation by his conquest of the Silures and his vigorous maintenance of the Imperial authority He appears to have been twice consul and to have held several other important offices, notably that of *curator aquarum*, or water commissioner He died about 105 Several works are attributed to Frontinus, only two of which are certainly genuine—the *Strategemata*, a treatise on the art of war, in three books, and the *De Aquis Urbis Romæ*, in two books The latter is a highly important technical account of the Roman aqueducts and the marvelous water supply of the ancient city There is an edition of the *Strategemata* by Gundermann (Leipzig, 1888), and of the *De Aquis* by Herschel, in *Two Books on the Water Supply of the City of Rome* (Boston, 1899, 2d ed., London, 1913), including the text, translation, explanatory chapters in the Introduction, and commentary, numerous illustrations, and maps of the routes of the ancient aqueducts

FRONTISPIECE (from OF *frontispice*, ML *frontispicium*, front view, from Lat *frons*, front + *specere*, to look) The name generally given to an engraved and decorated titlepage of a volume, or an engraving or other illustration placed opposite the titlepage The term was formerly used in architecture to denote the front or principal face of a building, particularly when it is a screen without organic connection with the building.

FRONTO, MARCUS CORNELIUS A teacher and author He was born at Ciria, in Numidia, and came to Rome in the reign of the Emperor

Hadrian, where he soon obtained a high reputation as a teacher of eloquence and as an orator. Antoninus Pius intrusted to him the education of Marcus Aurelius and Lucius Verus, both of whom always retained the warmest admiration of their preceptor. Fronto gradually rose to the highest offices of the Empire, became very wealthy, and died, it is thought, about 175 A.D. Until 1814 nothing was known of Fronto as an author, except from a few fragments of a grammatical treatise (*De Differentiis Vocabulorum*), but in that year Angelo Mai discovered in the Ambrosian Library at Milan a palimpsest which, being deciphered, was found to contain a considerable number of Fronto's letters, with some short essays. These were published by Mai in 1815, in 1816 an edition was published at Berlin by Niebuhr, who wrote a critical preface, and also printed the commentaries of Buttmann and Heindorf. A few years afterward Mai found in the library of the Vatican at Rome another palimpsest containing more than 100 of Fronto's letters, including his correspondence with the Emperor and with his royal pupils. The result was a new edition by Mai (Rome, 1823), embodying the new discoveries. The contents of these letters are on the whole unimportant, although they help to confirm the good opinion which history has formed of the Emperor Marcus Aurelius. The best edition of Fronto is by Naber (Leipzig, 1867). Fronto belonged to the archaizing school of Latin writers, who found their models in the authors before Cicero. Consult Knapp, "Archaism in Aulus Gellius," in *Classical Studies in Honor of Henry Drisler* (New York, 1894), Ellis, *The Correspondence of Fronto and M. Aurelius* (Oxford, 1904), Brock, *Studies in Fronto and his Age*, a strong plea for Fronto against adverse modern judgments (Cambridge, 1911), Teuffel, *Geschichte der römischen Literatur* (6th ed., Leipzig, 1913).

FRORIEP, frô'iep, ROBERT (1804-61). A German physician, born at Jena and educated at Bonn. In 1833 he received a call to the Pathological Museum of the Charité at Berlin, of which he was director for nearly 13 years. His medical and surgical atlases are widely known. They include *Chirurgische Kupfertafeln* (96 parts, 1820-47), *Klinische Kupfertafeln* (12 parts, 1828-37), *Atlas der Hautkrankheiten* (1837), *Pferderassen* (6th ed., 1874), *Atlas Anatomicus* (6th ed., 1877). His treatise *On the Therapeutic Application of Electro-Magnetism in the Treatment of Rheumatic and Paralytic Affections* (Eng. trans. by R. M. Lawrence, 1850) was a very important contribution to electrotherapy in its day.

FROSDORF, frôsh'dôrf. See FROSDORF.

FROSINONE, frôzê-nô'nâ. A city in the Province of Rome, south Italy, 955 feet above the sea, 53 miles southeast of the city of Rome, on the river Cosa near its junction with the Sacco (Map Italy, D 4). Here are ruins of the ancient Volscian town, Frusino. Frusino is mentioned by Juvenal, iii, 224, as a place where one might buy property for less than the cost of one year's rental of a dark hole at Rome. It produces and markets wine. Pop. (commune), 1901, 11,191, 1911, 11,646.

FROSSARD, frô'sar', CHARLES AUGUSTE (1807-75). A French general. He was born at Versailles, studied at the military school at Metz, and served with distinction in the engineers. He participated in the siege of Rome

in 1849, commanded the Second Engineer Corps in the Crimean War, and in 1855 became brigadier general. He was chief of the engineering department during the Italian campaign of 1859 and in 1867 was appointed governor of the Prince Imperial. In the war with Germany he commanded the Second Corps of the Army of the Rhine, with a greatly superior force drove the Prussians out of Saarbrücken (Aug. 2, 1870), but was defeated four days later at Spicheren (or Forbach), where he had dug intrenchments. At Metz (August 16), when his troops were retreating, he gave the costly order that the Imperial Guard cavalry should charge, and he was taken prisoner when Bazaine surrendered and was detained until the close of the war. He published a *Rapport sur les opérations du deuxième corps de l'armée du Rhin dans la campagne de 1870* (1872).

FROST (ME *frost*, *forst*, AS *forst*, from *ficosan*, Eng. *freezec*). A formation of ice on the ground or on plants, also the temperature 32° F. or 0° C. that corresponds to the formation of ice and snow. When air whose dew point is below 32° F. comes in contact with a substance whose surface is colder than this, a portion of the aqueous vapor in the air is condensed upon that surface in the form of ice or frost, although this deposition is truly ice, yet the particles of ice are usually small, separate from each other, and reflect the rays of light in such a way as to make the deposit appear white, like crushed ice, instead of being transparent, as is the case with solid ice. In fact, the particles of ice usually have a crystalline structure, more or less perfect, as may easily be seen when moisture is deposited on the inside of a windowpane when the temperature outdoors is below freezing. In the latter case, when the air within the room has a dew point far above the freezing temperature, the moisture first condenses in drops of dew upon the pane of glass, but is afterward frozen into ice if the exterior cold is sufficiently intense.

When the air of the room has a dew point below the freezing temperature, then the moisture is deposited upon the windowpane directly in the form of spiculae or slender prisms of ice, and it is under these circumstances that the most delicate frost figures are formed. The latter is also the ordinary case in the formation of frost on vegetation and on the ground in the open air, in such a case every object is studded more or less thickly with small crystals of ice, the whole deposit is as white as snow and is usually called "hoar frost." It frequently happens that rain (or sleet, which is frozen rain) falls on objects that are already colder than 32° F. In such cases the rain or sleet remains congealed as a layer of almost transparent ice on the upper surfaces of the limbs, the leaves, the fences, and other objects. This usually happens when rain falls at the close of a period of very cold weather. On the summits of high mountains, notably Mount Washington and the mountain stations of southern Europe, it frequently happens that, although the air is apparently clear, yet it is filled with the most minute drops of water, which are cooled far below the freezing point, but retain their liquid condition. When these strike any object, they lose their spherical shape and are converted immediately into ice at the temperature of 32°. They therefore build up an accumulation of ice on the windward side of every object, giving

rise to remarkable displays of so-called "frost-work"

Aeronauts have occasionally ascended into and through thin layers of air bearing similar aqueous globules that are cooled below freezing, but still liquid water. These layers appear from a distance like thin stratus clouds, but are scarcely perceptible when viewed directly from below on account of their transparency. The globules instantly change to snowflakes or frost-work when they strike any object.

Tender vegetables in northern gardens and tropical plants in the southern portion of the United States and in California are severely injured or killed by freezing temperatures. The mere deposition of frost on the outside of such plants does not necessarily argue that the plant is frozen through and through, it may therefore produce only slight damage, on the other hand, when the air is too dry to deposit much moisture, and when it deposits frost only when cooled greatly below 32° F, it often happens that the plants are frozen under a clear sky or during a cold, dry wind without the deposition of much, if any, frost upon their exterior surfaces, in such cases the sap within the cells and especially within the medullary rays is frozen, the structure of the plant is destroyed, and when the sun's warmth has melted the frozen sap, the leaves and stalks sink to the ground, wilt away, and turn black, being in fact dead. This phenomenon is known as "black frost." It is, however, more properly a freeze than a frost.

The interval between the last frost of spring and the first frost of autumn is the so-called growing season of the agriculturists. Between these dates tender plants of all kinds must perfect their crops, while those that can withstand frosts continue their growth uninterruptedly. Especially must the great staple crops of the country—the Indian corn or maize, the cotton, tobacco, and a large range of tender fruits, as well as spring wheat, rye, and buckwheat—all complete their growth between these dates. The accompanying maps show by curved lines the regions in the United States over which the first and last frosts occurred on given dates on the average of the past 30 years. A comparison of these maps will therefore show the length of time that is available as a normal growing season in any part of the country. Although agriculturists always select seed that is likely to produce a quick-growing crop that may be harvested before the early frost of autumn, yet, owing to the irregularities of climate, the late spring frosts, and the early autumn frosts frequently bring their crops into jeopardy. This has stimulated the invention of many methods of frost protection, which are fully described in the *Monthly Weather Review* for the years 1894-97 and 1910-11, and especially in *Bulletins on Frost Protection*, issued by the United States Weather Bureau.

The methods of frost protection are divided into several categories, as follows: 1. A light screen of any material, even a few slats or a gauzy veil, stretched above a plant prevents the radiation of the plant's heat into space and by reflecting back the heat from the soil may keep the temperature of the plant so high as to prevent frosty temperatures. 2. Fires with clouds of smoke warm the air of a field, while the smoke cloud prevents radiation, in perfectly still air such a cloud of smoke will spread evenly

in all directions and continue effective through the night. 3. Without reliance upon a cloud of smoke, one may warm the ground and the air either by fires or by streams of water or by flooding the field. All these methods and various combinations of them are in regular use for the protection of tropical fruits in California and Florida and for the protection of tobacco, cranberries, and early vegetables in Northern States. Many patented devices for making smudges are on the market, but in general the smudge disguises the fruit, and other protective devices are preferred.

Although the tender portions of plants are destroyed by frost, yet the ripened mature seed is much less susceptible. The kernels of both corn and wheat may be subjected to very low temperatures without being injured. Unfortunately many of the bacterial germs and fungoid spores also are not injured by cold. It was formerly supposed that freezing weather destroyed the germs of malarial and yellow fever, but it is now probable that such germs are not affected by cold, but that, on the other hand, the cold checks the mosquitoes and other insects by which these germs are introduced into the human body.

The prediction of frost is a matter of great importance to a farmer and can usually be made with great exactness by the help of the daily weather map, wherefore special attention is paid to this subject by the officials of the Weather Bureau. All persons whose interests depend largely upon the knowledge of frost keep in close touch with the Weather Bureau and receive special telegrams when freezing temperatures are approaching. In general, when the dew point is below 32° F and the night is still and clear, the temperature will fall rapidly, and it may reach the freezing point before sunrise.

Air Drainage. This name is extensively applied to a type of convective local circulation of the air occurring chiefly during the nighttime and often playing an important part in the distribution of frosts, especially in regions where hill and valley conditions form a conspicuous feature of the topography. As the words suggest and as is generally supposed, the air on the higher slopes, becoming heavier as it cools, flows or drains down into and fills the valley locations, there forming a lake as it were of cold air, the warmer air being found higher up the slopes. Thus the valley regions experience heavy frosts, while the higher slopes escape. The conditions are generally pretty well recognized and understood by gardeners and horticulturists, who avoid the low valleys and prefer the upper slopes for their gardens and orchards. The idea, however, that the flow of cold air downhill into the valley resembles the flow of water under the action of gravity, is quite erroneous and not in accord with the fundamental principles of thermodynamics.

The type of air drainage in hill and valley locations now under consideration occurs chiefly when little or no wind prevails and during a night of comparatively cloudless skies following a still, warm, sunny afternoon. During the course of the day the soil and surface vegetation becomes strongly heated by solar radiation, the air in contact therewith is also heated and ascends more or less vertically, cooling by expansion as it rises. As a result of the active vertical convection thus established during the daytime, the air for several hundred feet above

the surface is in a state of adiabatic equilibrium in which the temperature diminishes at a rate of slightly more than 0.5° F per 100 feet. When nightfall sets in, cooling takes place rapidly by radiation from the soil and vegetal cover. The free masses of air cool only very slowly, but those next to the soil and among the foliage of trees, plants, etc., cool rapidly by contact. The surface air in the bottom of the valley remains practically where it is, the cooling by radiation goes on continually, and, since the air in the valley is constrained to remain there, it grows colder and colder in proportion to the loss of heat made possible by the clear skies and the active radiation. The surface air on the slopes is also cooled by contact with the cooled soil and vegetation and flows downhill to a slight extent. In this descent, however, the air is heated by compression at the adiabatic rate of 0.5° F per 100 feet. Moreover, the surface air below it is already dynamically as cold or colder and denser than the air up the slopes. What happens then, briefly, in hill and valley locations on still, clear nights is that the surface air in the valley cools chiefly by contact with the cooling soil and vegetation, and with very little motion remains where it is, becoming colder and colder. The surface air on the slopes also cools in a similar manner, descends slightly, and not remaining close to the surface flows out to overspread laterally the lakelike mass of cold air that has formed in the valley. Thus this lakelike mass continually grows in depth and extent throughout the night, with the temperature warm at its top and colder at its bottom. The "drainage" is not along the surface of the ground from the upper edges of the "lake" to the bottom, but from the hill slopes slightly down and then out over the surface of the lake. Similar lines of relatively horizontal flow beginning tangential to the slopes also occur in the intermediate layers of the atmospheric lake.

Frosts will occur over regions occupied by lakes of cold air, as described above, whenever the conditions of humidity are favorable and the temperature falls to or below 32° F. It is also apparent why the upper levels of the hill slopes may be warmer than the lower valleys.

A somewhat similar explanation of "air drainage" has been published in the *Bulletin, Mount Weather Observatory*, vol. vi, pp 118-124 (Washington, 1914).

Inasmuch as severe frosts have sometimes been very destructive to the staple crops, they have occasionally been the direct cause of severe famines, lists of memorable frosts for the last 400 years will be found in Andrews, *Famous Frosts and Frost-Fairs in Great Britain* (London, 1887), also Walford, paper on "Famines" in *Journal of the Statistical Society* (ib, 1878). The record for the United States will be found most conveniently in Pierce on *The Weather* (Philadelphia, 1860) and in the successive numbers of the *Monthly Weather Review* (Washington).

A special and elegant form of frostwork occurs as "ice needles" or "ice columns," that rise up in masses from gravelly ground, raising up the top layer of gravel and small stones on their summits to a height of two, four, or six inches. These ice columns are hollow, and are apparently formed by the freezing of the films of moisture that rise up from the lower warm wet soil and freeze on the under side of

the top layer of stones when the latter are chilled by radiation during clear nights. These columns do not form when the air is cold enough to freeze the soil below the top layers. A similar formation exudes from a thin crack in the bark of a tree when the body of the tree affords moisture enough. The mechanics of this process is treated by Prof. Cleveland Abbe in the *American Meteorological Journal* for April, 1893 (Detroit), and by W. W. Coblentz in the *Monthly Weather Review*, August, 1914 (Washington).

Garriott, *Cold Waves and Frost in the United States*, *Weather Bureau Bulletin* P (ib, 1906); *Canada's Perilous Northland* (Department of Interior, Ottawa, 1907); Stupart, "Climate of Yukon Territory," *Transactions of Canadian Institute* (Toronto, 1906); Hann, "Zum Klima Manitoba," *Meteorologische Zeitschrift* (Vienna, 1894); Hann, "Zum Klima von Winnipeg, Manitoba, 30-jährige Temperaturmittel," etc., *Meteorologische Zeitschrift* (Vienna, 1905).

FROST, ARTHUR BURDETT (1851-) An American caricaturist and illustrator. He was born at Philadelphia and at 15 worked as an engraver and afterward as a lithographer, but was in the main self-taught. Subsequently he was employed by the *New York Graphic*, and in 1876 he changed to Harper and Brothers, where he was associated with Abbey, Reinhart, and Alexander. Frost's works show thorough draftsmanship. Honesty, healthy and delightful humor, and convincing naturalness are the principal characteristics of the artist. He draws all the elements that compose the picture with equal interest and sympathy. His first illustrations for a volume, entitled *Out of the Hurly-Burly* (1872), attracted much notice. Other important illustrations are found in Stockton, *Rudder Grange* (1879), Octave Thanet, *Stories of a Western Town* (1893), Bunner, *Stories of a New York House* (1887). Publications of his own are: *Stuff and Nonsense* (1888), *Bull Calf, and Other Tales* (1892), *The Golfer's Alphabet* (1898), *Sports and Games in the Open* (1899), *Book of Drawings* (1905).

FROST, EDWIN BRANT (1866-) An American astronomer. He was born at Brattleboro, Vt., and graduated in 1886 from Dartmouth College, and also studied at Princeton, Strassburg, and the Royal Astrophysical Observatory at Potsdam, Germany. At Dartmouth he was instructor (1887-90), assistant professor of astronomy and director of the observatory (1892-95), and professor (1895-98). He became professor of astrophysics (1898) and director of the Yerkes Observatory (1905) at the University of Chicago. After serving six years as an assistant editor he became editor of the *Astrophysical Journal* in 1902. In 1896 he was secretary of the American Association for the Advancement of Science. His researches include particularly stellar velocities in the line of

sight, stellar spectroscopy, sun spots, and thermal radiation of the sun. In 1911 Dartmouth conferred on him the degree of D Sc. He translated, revised, and enlarged J. Scheiner's *A Treatise on Astronomical Spectroscopy* (1894).

FROST, GEORGE HENRY (1838-) An American publisher. He was born in Ontario, Canada, and graduated as civil engineer from McGill University in 1860. He was a railroad engineer and land surveyor at Chicago until 1878, when he moved to New York City. He founded the *Engineering News* in 1874 and published it until 1911. He became president of the Courier-News Publishing Company and a member of various engineering societies of the United States and Canada.

FROST, JACK. See JACK FROST.

FROST, JOHN (1800-59). An American compiler. He was born in Kennebunk, Me., studied at Bowdoin and graduated at Harvard (1822), and taught in Boston and in Philadelphia, where he had a girls' school in 1828-38, and afterward until 1845 taught in the Central High School. He published many school books, juveniles, and historical and biographical compilations, among which may be mentioned *Pictorial History of the United States* (2 vols., 1844), which was exceedingly popular, *Pictorial History of the World, Lives of American Generals, American Naval Biography*.

FROST, PERCIVAL (1817-98). An English mathematician, born at Hull. He attended school at Beverley and Oakham and in 1835 entered St John's College, Cambridge. Although as a boy he showed great aptitude for classics, at Cambridge he devoted his attention chiefly to mathematics. He was made a fellow of St John's in 1839, and on his marriage in 1841 he became tutor in mathematics, among his pupils being, somewhat later, W. K. Clifford. He held a mathematical lectureship at Jesus College for 12 years, and afterward at King's College for 30 years, becoming fellow of King's and taking his degree of D Sc. (Cambridge) in 1882. His chief works were *A Treatise on the Principia* (1854), *A Treatise on Solid Geometry* (with Wolstenholme, 1863), *A Treatise on Curve-Tracing* (1872). Consult Taylor's biographical note in the *Proceedings of the London Mathematical Society*, vol. XXIX (London, 1898).

FROST, WILLIAM EDWARD (1810-77). An English historical and portrait painter. He was born at Wandsworth in September, 1810, and studied chiefly in the schools of the Royal Academy. At first he painted portraits, but, under the influence of Etty, devoted himself to mythological subjects, many of which were inspired by Spenser and Milton. In 1839 he exhibited "Prometheus Bound," for which he received the Academy's gold medal. In 1847 he won a competition prize at Westminster Hall by his cartoon, "Una Alarmed by the Fauns." Among his principal paintings are "Una and the Wood Nymphs" (1847), painted for Queen Victoria; the "Disarming of Cupid" (1850), painted for the Prince Consort, "The Sirens" (1849), which is particularly good in color, "Narcissus" (1857), "Hylas and the Nymphs" (1867), "Masadora" (1871). The Dublin Museum possesses "Dancing Nymphs," the Victoria and Albert Museum, London, "Contemplation" and two studies. His pictures, which were frequently engraved, are highly finished but deficient in color and design. Some of his

smaller canvases, however, have considerable grace and charm. He was elected to the Royal Academy in 1870.

FROST, WILLIAM GOODSELL (1854-) An American college president, born at Le Roy, N. Y. In 1876 he graduated at Oberlin College (A. M., B. D., 1879), and later he studied at Wooster (Ph. D., 1891), Harvard, and Göttingen universities. At Oberlin he was instructor in Greek in 1877-79 and professor of the Greek language and literature from 1879 to 1892. As president of Berea College after 1892 he did much to promote higher education among the "mountain whites." He is author of *Alpha and Greek Primer Introductory to Xenophon* (1889), *Inductive Studies in Oratory* (1890), *University Extension in the Southern Mountains* (1898).

FROST BIRD, or **FROST SNIPE**. An American gunner's name for the stilt sandpiper (*Micropalama himantopus*). See STILT, and Plate of BEACH BIRDS.

FROSTBITE. A term usually applied to local effects of cold, although it may be properly used to designate all results of low degrees of temperature, from chapped hands to freezing to death (*asphyxia congelatorum*). The frostbitten part is at first pale, cold, tingling, and numb, then stiff, with loss of sensation and motion, later, shrunken, hard, even brittle, livid and mottled from coagulation of blood in the veins. Molecular death occurs, the blood corpuscles disintegrate, sloughing and mortification result, and a line of demarcation is established (See GANGRENE). Although a sudden violent application of cold may cause death of the tissues by reducing the temperature to a degree incompatible with animal life, the most common cause of the destructive effects of moderate frostbite is perhaps the excessive reaction which occurs on sudden removal of the cold, or the application of heat, this is especially the case with moist cold.

Most cases of frostbite are very trifling, the most common being chilblains (See CHAPPED HANDS, CHILBLAINS). The treatment of frostbite is best effected by friction, at first with snow, then with ice water, and then with water at ordinary temperature, no warmth being applied for some time. If the frozen part is brittle, spraying with ice water must be substituted for rubbing with snow. As the coldness subsides, the painful tingling and then redness and heat return, in a short time the heat is above the normal, and a febrile reaction sets in. Partial recovery may always be expected unless the freezing has been continued too long. When sloughing begins, it is necessary to employ supportive and stimulative treatment, with hot fomentations or moist antiseptic dressings. After the line of demarcation is established amputation should be performed. Eczema and pruritus may follow moderate frostbite. Partial paralysis of the parts supplied by the facial and radial nerves, or even hemiplegia, may follow. The use of alcoholic drinks when one is exposed to cold is a fatal mistake. The drug brings heat to the surface of the body, where it is rapidly lost, and the vitality of the individual is lowered. Alcoholism predisposes to a fatal result in comparatively mild frostbite, from which temperate persons would quickly recover.

FROSTBURG. A town in Allegany Co., Md., 80 miles (direct) southeast of Pittsburgh, Pa., on the Western Maryland and the Cumber-

and and Pennsylvania railroads (Map Maryland, B 1). It is picturesquely situated at an elevation of about 2200 feet and is a summer resort. It is the seat of a State normal school and contains a miners' hospital. Frostburg has large fire-brick and tile works, planing mills, foundries, hosiery mills, etc., but is engaged chiefly in coal mining. The government is administered under a charter of 1870, which provides for a mayor, chosen annually, and a city council elected at large. The water works are owned by the municipality. Pop., 1900, 5274, 1910, 6028.

FROSTFISH 1 A slender, scaleless, pelagic fish (*Lepidotus caudatus*), elsewhere known as scabbard fish, but called frostfish in New Zealand, where it visits the coast to spawn at irregular intervals and is much sought after as a delicacy by a strange method of capture. It has the extraordinary habit, in winter, of coming ashore alive on certain sandy beaches, where it wriggles on to the finer sands above the surf line, there to die or be quietly devoured by some animal. No satisfactory reason has yet been assigned for this suicidal proceeding, but it is taken advantage of by the "fisherman." When the night is clear and calm, with comparatively low surf, as well as frosty, the fish may be expected, and then parties of men go to the beach shortly before daybreak (or perhaps camp there overnight and rise early) and walk back and forth, seizing the fish as they come floundering out of the surf and killing them.

2 In New England, a tomcod (q.v.)

FROTH FLY, FROTH-HOPPER, FROG FLY, or FROGHOPPER. Insects of which the young—larvæ and pupæ—are found in a frothy exudation on plants. They form the family Cercopidæ of homopterous bugs and are allied to aphids and still more nearly to cicadas and lantern flies. The larvæ and pupæ differ little in appearance from the perfect insect, except that the latter possesses four large wings. The froth, commonly called frog spittle, is believed to be composed of sap which the insect sucks up through its proboscis. The sap passes through the intestine and is emitted as a clear mass, into which the insect draws bubbles of air by means of its tail claspers, and thus makes foam. When the insect is about to transform, the foam dries in such a way as to produce a shelter for the ensuing quiescent stage. The most common insect in the eastern United States is *Aphrophora quadrangularis*. Some of the tropical forms assume very bizarre shapes, caused by outgrowths from the thorax. The fluid is emitted by some species in drops which may be thrown a considerable distance, causing the phenomenon known as weeping trees. A few dozen larvæ of a Madagascar form may exude a quart of fluid in an hour and a half. Frog spittle is supposed to be produced as a protective covering for the young insect, but in spite of it certain Hymenoptera pick the larvæ out and carry them off to be stored as food for their larvæ. The winged stage is a much flattened one and capable of long leaps, whence the name "froghopper," first given to them because they came from the frog spittle, is doubly appropriate.

FROTHINGHAM, frôth'ing-am, ARTHUR LINCOLN (1859-1923). An American archaeologist and educator, born in Boston, Mass. He studied at the Catholic Seminary of San Apollinare, Rome, Italy, the Royal University of

Rome, and the University of Leipzig (Ph.D., 1883), was fellow in Semitic languages and lecturer in archaeology at the Johns Hopkins University in 1882-86, in 1887 was appointed to the Princeton chair of archaeology and the history of art, and in 1895-1906 was professor of archaeology and ancient history. In 1884 he was secretary of the Archaeological Institute of America, in 1885 founded the *American Journal of Archaeology*, of which he was owner and editor until 1896, and in 1895-96 was an associate director of the American School of Classical Studies at Rome. His publications include contributions to periodicals, monographs on sculpture and painting, *Stephen Bar Sadaihi, the Syrian Mystic and the Book of Hierotheos* (1886), with A. Maiquand, *A Text-Book of the History of Sculpture* (1896), *Monuments of Christian Rome* (1908), *Roman Cities in Italy and Dalmatia* (1910), *A History of Architecture* (1911). He prepared articles on architecture for the NEW INTERNATIONAL ENCYCLOPEDIA.

FROTHINGHAM, ELLEN (1835-1902). An American translator, the daughter of Nathaniel Frothingham. She was born in Boston. She made a special study of German literature and is well known for her translations into English of Lessing's *Nathan der Weise* (1868), Goethe's *Hermann und Dorothea* (1870), Auerbach's *Die Leierweiser* (1871) and Lessing's *Laokoön* (1874).

FROTHINGHAM, NATHANIEL LANGDON (1793-1870). An American clergyman and writer. He was born in Boston and in 1812 graduated at Harvard, where he became the first professor of rhetoric and oratory. In 1815 he was ordained pastor of the First Church (Unitarian) in Boston, which position he occupied until 1850, when he devoted himself to literature. He published *Sermons in the Order of a Twelve-month* (1852) and *Metrical Pieces, Translated and Original* (1855, 1870). He translated Aratus' *Phænomena*, contributed largely to periodical literature, and was a thorough student of German, when such scholarship was rare in America. His biography was written by his son, Octavius Brooks Frothingham, in the volume entitled *Boston Unitarianism, 1820-1850* (Boston, 1890).

FROTHINGHAM, OCTAVIUS BROOKS (1822-95). An American Unitarian clergyman. He was born in Boston, Nov. 26, 1822, a son of Rev. Nathaniel Langdon Frothingham. He was graduated at Harvard College in 1843, at the Cambridge Divinity School in 1846, and was settled as pastor of the North Church (Unitarian), Salem, Mass., in 1847. In 1855 he became minister of a church in Jersey City, N. J., where he remained four years. In 1859 he accepted a call to the pastorate of the newly formed Third Unitarian Congregational Church in New York and remained at that post for 20 years, when ill health compelled his resignation. From the beginning he belonged to the most radical wing of the Unitarians, and the name of his church was finally changed from the Third Unitarian to the First Independent Liberal Church of New York, the connection with the Unitarian denomination being thereby sundered. After 1881 he resided in Boston and devoted himself to literary work. He died Nov. 27, 1895. Frothingham was one of the founders of the Free Religious Association, and its president for the first 12 years of its existence. He ranked high as a scholar, and as a preacher was impressive and eloquent. He contributed largely to the peri-

odical press, on a great variety of subjects, and published more than 200 sermons. Other works worthy of mention are A translation of Renan's *Studies of Religious History and Criticism* (1864), *Child's Book of Religion* (1866), *History of Transcendentalism in New England* (1876), *Boston Unitarianism, 1820-1850*, including a memoir of his father (1890), and lives of Theodore Parker (1874), Gerrit Smith (1878), George Ripley (1882), William Henry Channing (1886), and David Atwood Wasson (1889).

FROTHINGHAM, RICHARD (1812-80). An American journalist and historical writer, born in Charlestown, Mass. He was a member of the State Legislature in 1839, 1840, 1842, 1849, and 1850, was mayor of Charlestown in 1851-53, was a delegate to the National Democratic Conventions of 1851, 1852, and 1876, and from 1852 to 1865 was managing editor of the *Boston Post*, of which he was also for many years a proprietor. He devoted much of his time to historical study, was treasurer of the Massachusetts Historical Society, and published, in addition to pamphlets and magazine articles, a *History of Charlestown* (1845-49), *History of the Siege of Boston* (1849), *Life and Times of Joseph Warren* (1865), *The Rise of the Republic of the United States* (1871), his most important work.

FROTTOLA, frōt'to-la (It. ballad). A kind of Italian folk song, much cultivated in the sixteenth century. It was midway between the very simple villanella (qv) and the more elaborate madrigal (qv). Between 1504 and 1509 Petrucci published nine books of Frottole. The words were generally of an erotic character.

FROUDE, frōd, JAMES ANTHONY (1818-94). An English historian, litterateur, and educator. The youngest son of Robert Hurrell Froude (1771-1859), Archdeacon of Totnes, he was born at Dartington, Devonshire, April 23, 1818. He was educated at Westminster School, and at Oriel College, Oxford, where in 1840 he obtained a second-class in classics and in 1842 graduated B.A., won the Chancellor's prize for an English essay, and was elected a fellow of Exeter College. He graduated M.A. in 1843 and to retain his fellowship took deacon's orders in 1845, which the Clerical Disabilities Act enabled him to relinquish in 1872. For, influenced by the Tractarian movement, of which his brother Richard Hurrell Froude and Newman were leaders, his views changed, and his early works, *The Shadows of the Clouds* (1847), published under the pen name of "Zeta," and the *Nemesis of Faith* (1848), being condemned by the university authorities, he resigned his fellowship, also an appointment as head master of the Hobart High School, Tasmania, abandoned the clerical profession, and devoted himself to historical study and literature. He wrote for the *Westminster Review* and other periodicals, including *Fraser's Magazine*, of which he subsequently became editor, and in 1856 appeared the first two volumes of *The History of England from the Fall of Wolsey to the Defeat of the Spanish Armada* (12 vols., 1856-1870), on which his fame chiefly rests. In 1868 he was elected rector of St. Andrews University and received the degree of LL.D. The preparation and publication of his important historical and biographical works were relieved by intervals of travel and lecturing. In 1872 his lectures in the United States on the relations between England and Ireland, in which, arguing from historical parallels, he scoffed at

all attempts to conciliate the Irish, involved him in an animated controversy with the Dominican Father Thomas Burke. In 1849 Froude married Charles Kingsley's sister-in-law, Charlotte Maria, fifth daughter of Pascoe Grenfell. She died in 1860, and 17 months later he married Henrietta Elizabeth, daughter of John Ashley Warre. Upon her death, in 1874, he resigned the editorship of *Fraser's Magazine*, and in 1874 and again in 1875 was sent by the Earl of Carnarvon, Secretary of State for the Colonies, to the Cape of Good Hope to investigate the plan of South African federation. The result of these missions was singularly unfortunate and disastrous to Lord Carnarvon's policy, owing to Froude's tactless speeches and representations. In 1884-85 he visited Australia and in 1886-87 the West Indies, he wrote accounts of these two visits, which were violently assailed by colonial writers as biased and misleading. As Carlyle's personal friend and literary executor, he edited his *Reminiscences* (2 vols., 1881), *Mrs. Carlyle's Letters and Memorials* (1883), and *Thomas Carlyle A History* (4 vols., 1882-84), but their copious personal criticism excited much discussion as to Froude's editorial discretion. In 1892 he succeeded Edward A. Freeman (qv), one of his most caustic critics, as regius professor of modern history at Oxford. Froude died at Salcombe, Devon, Oct. 20, 1894. Besides the works already mentioned, his writings include *The English in Ireland in the Eighteenth Century* (3 vols., 1872-74), *Short Studies on Great Subjects* (2 vols., 1877-82), *Cæsar* (1879), *Two Lectures on South Africa* (1880), *Oceana* (1886), *The English in the West Indies* (1888), *The Two Chiefs of Dunboy* (1889), an historical romance, *Life of Lord Beaconsfield* (1890), *Erasmus* (1894), *Elizabethan Seamen* (1895). Froude was afflicted with constitutional sentimentality and an unfortunate, if unconscious, facility for inaccurately adapting facts to suit the views he sought to promulgate. His partisan glorification of Henry VIII as the disinterested and magnanimous executor of the public wish in regard to ecclesiastical reform is one of the most striking examples. Hence the frequent storms of protest and criticism that his writings evoked, and the blemishes of his otherwise splendid works. For although he at times subordinated accuracy to the exigencies of descriptive, vivid, and emphatic writing, and justified his action on the score of dramatic effect, the lucidity and beauty of his style make his works rank among the finest examples of English prose of the nineteenth century and have earned for his *magnum opus* an imperishable position in the chronicles of British history. "The description of the setting sail of the Armada is an echo perhaps of Thucydides' account of the great Athenian fleet leaving the Piræus for Syracuse, but an echo so beautiful as amply to justify itself." Froude's life has been written by Herbert Paul (London, 1905), whose treatment without being definitely eulogistic is certainly conceived in a spirit of admiring appreciation. Consult also Harrison, "Historical Method of Froude," in *Tennyson, Ruskin, Mill, and Other Literary Estimates* (New York, 1900), Bourne, *Essays in Historical Criticism* (ib., 1901), Cecil, *Six Oxford Thinkers* (London, 1909).

FROUFROU, frōō'frōō'. A five-act comedy, the most celebrated work of Melhac and Halévy, produced at the Gymnase in 1869.

FROZEN STRAIT. A passage leading north-

west from Fox Channel, the northern continuation of Hudson Bay, to Rowe's Welcome (Map Canada, O 3). It separates Southampton Island from Melville Peninsula. It is 15 miles wide and is nearly always icebound and inaccessible to navigation.

FROZEN WELLS Wells in which ice is found either with or without water. They occasionally occur in the United States and Europe. A famous one in Brandon, Vt., was sunk through a mass of frozen ground 15 feet thick and formerly showed ice at 14 feet below the surface in the summer time. In most frozen wells the ice lasts until late summer, and the temperature is seldom above the freezing point. The low temperature and ice were originally attributed to the fact that the well pierces a stratum of glacier drift in which ancient glacier ice still survives, but the researches of Kimball have shown that this extreme hypothesis is quite unnecessary. He has demonstrated that the low temperatures in frozen wells, ice caves, and similar situations are due to the percolation of cold air into the interior of the earth during cold winter weather and the coldest hours of the morning. He has shown that the deserted iron mines at Westport, N. Y., give a complete key to the method of formation of ice in caves and wells. Consult *United States Monthly Weather Review* (Washington, 1901). See ICE CAVES.

FRUCTIDOR, fruk'ti-dôr' (Fr., from Lat. *fructus*, fruit, Gk. *δῶρον*, *dōron*, gift). The twelfth month of the French Republican calendar. It ran from August 18 to September 16 in the years I-VII and from August 19 to September 17 in the years VIII-XIII, being followed by five supplementary days, known as sans-culottides, which filled out the year. The 18th Fructidor, Year V (Sept. 4, 1797), is celebrated as the day on which Barras, Rewbell, and La Révellère, members of the Directory, by a coup d'état, expelled their colleagues Carnot and Barthélemy and saved the Republic from the machinations of the party of reaction, who had obtained the upper hand in the Council of Five Hundred. See FRENCH REVOLUTION.

FRUCTOSE. See SUGARS.

FRUGONI, frū-gō-né, CARLO INNOCENZIO MARIA (1692-1768). An Italian poet, characteristic of the Arcadian school at the height of its development. Born at Genoa, after many wanderings he settled down in Parma, under ducal protection, as tutor, court poet, director of the court theatre, and secretary of the Academy of Fine Arts. The verses he produced with extraordinary ease are marked by graceful superficiality and sensuous idealism. Consult his *Opere poetiche* (10 vols., Parma, 1779), the *Poesie* (15 vols., Lucca, 1779-80), Carducci, *Poeti erotici del sec. XVIII* (Florence, 1878), *Lettere inedite*, ed. by Bertoldi (Forlì, 1891), and others ed. by Mazzatini (ib., 1892), the biography in Fabroni, *Vite*, vol. 1 (1778-1805), Torelli, *Paesaggi e profili* (Florence, 1861), E. Bertana, "Intorno al Frugoni," in *Giornale storico della letteratura italiana*, vol. xxiv (Torino, 1883-).

FRUIN, froin, ROBERT (1823-99). A Dutch historian, born in Rotterdam. He was educated at Leyden, where he was appointed professor of the history of the Netherlands in 1860. He was editor of the *Nijhoff's Bijdragen voor Vaderlandsche Geschiedenis* and was a frequent contributor to *De Gids* and other publications. He was regarded as the greatest living authority on

Dutch history, and his work entitled *Tien jaren uit den tachtigjarigen oorlog* (4th ed., 1889) is considered one of the best historical works of modern times. His *Reply to Sir Bartle Frere* and an *Appeal to the People of England* (1881), relative to the Transvaal question, created considerable comment. Another of his publications is *Geschiedenis der staatsinstellingen in Nederland tot den val der republiek* (1901). His *Verspreide Geschriften* were published by Blok, P. L. Muller, and S. Muller (8 vols., 1900-03).

FRUIT (OF, Fr. *fruit*, Lat. *fructus*, fruit, from *frui*, to enjoy). The structure that ripens in connection with the seeds in the spermatophytes (seed plants). In popular application the term is also used in connection with the sporogonium of mosses and the sori of ferns (see FERN), but it is misapplied in these senses. The structures of seed plants included in the fruit are exceedingly variable. In typical cases the fruit is the ripened ovary, as in ordinary pods, the transformed wall being called the pericarp, in apples it includes floral structures outside of the ovary, in strawberries it consists in the main of a very much enlarged receptacle, while in pineapples it is the whole inflorescence. So variable are fruits in structure that it is difficult to classify them satisfactorily, and it is not profitable to give a complete list of the numerous and often pedantic terms which have been applied to them. It will be sufficient to describe the principal forms. It seems to be most convenient to divide fruits into two great divisions, dry fruits and fleshy fruits.

Dry Fruits. Dry fruits either open (dehiscent) in various ways to discharge their seeds, or they contain but a single seed, which accompanies the fruit in the dispersal. The dry fruits therefore naturally fall into two groups: (1) those which are dehiscent, and (2) those which are indehiscent. Such fruits also consist of the ripened ovary and therefore have a strict morphological boundary. (1) *Dehiscent fruits* have received the general name of pods and are grouped on the basis of the number of carpels they contain and the method of dehiscence. The prominent forms are as follows: *Follicle*, a pod consisting of a single carpel and dehiscing by splitting down the inner side, as in the peony; *Legume*, a pod consisting of a single carpel and dehiscing by splitting down both sides into two pieces or valves, as in the common pea and bean. Very frequently legumes are simply spoken of as pods, and they are so characteristic of the great pea family that it has been called the Leguminosæ. *Capsule*, a pod consisting of more than one carpel and dehiscing variously. The dehiscence is said to be septical when the carpels separate from one another, and in such case each carpel may split down the inner face as if it were a follicle, as in the genus *Hypocistis*. In other cases the carpels do not separate, but each one splits down the back, such dehiscence being called loculicidal, as in iris, evening primrose (*Oenothera*), etc. In still other cases there are no slits of dehiscence, but the seeds are discharged through porelike openings near the summit of the capsule, as in the common poppy *Silique*, the peculiar pod of the mustard family (Cruciferae), which consists of two carpels and is divided into two chambers by a false partition, to which the seeds are attached. In dehiscence the two carpels split away as two valves from the membranous partition, which is thus exposed with its attached seeds. *Silicle*,

a short silique, which is little if at all longer than broad, as in the common shepherd's-purse (*Capsella*). *Pyxis*, a pod which opens by means of a caplike lid, as in twinleaf (*Jeffersonia*)

(2) *Indehiscent fruits* mature but a single seed, although they are often derived from an ovary composed of more than one carpel, and the pericarp so closely invests the seed that such fruits are popularly spoken of as seeds. Common illustrations are as follows *Achene*, or *Akene*, the most common seedlike fruit, characteristic of the great family *Compositae*, to which belong the sunflowers, thistles, dandelions, etc. In this family the achene commonly bears at its summit the modified calyx (pappus), which in the form of a tuft of hairs or plumes, bristles, hooks, etc., aids in dispersal by wind or animals. *Caryopsis*, or *Gram*, the peculiar seedlike fruit of the grasses, as maize, wheat, barley, rice, etc. *Nut*, a dry indehiscent fruit, in which the pericarp becomes very hard and bony, as in the acorn, chestnut, beechnut, etc. Very commonly there is associated with the nut a peculiar involucre, as that which forms the cup of the acorn and the characteristic investment of chestnuts and beechnuts

Fleshy Fruits Fleshy fruits are indehiscent, since the flesh is intimately associated with the seeds in their dispersal. It is these fruits which are so variable on account of the different structures which ripen. The most common forms are as follows *Berry*, a fleshy fruit, which is pulpy throughout, and which has a thin skin, or rind. In this case the fruit is a ripened ovary, and common examples are the grape, currant, gooseberry, tomato, etc. *Hesperidium*, a berry with a leathery rind, as the orange and lemon. *Pepo*, a pulpy fruit with a hard rind, as the pumpkin, squash, melon, and the whole race of gourds. *Drupe*, or *Stone fruit*, in which the pericarp ripens in two layers—an outer pulpy one and an inner stony one, as the peach, plum, cherry, etc. In these cases the pit, or stone, is often spoken of as the seed, but it invests the seed, which is the kernel. *Drupelet*, a small drupe, as the individual grains of raspberry, blackberry, mulberry, etc. *Drupelets* are usually aggregated to form a single fruit, as in the illustrations cited. In the raspberry the fruit is simply an aggregation of drupelets, while in the blackberry and mulberry there is associated with the aggregation of drupelets a fleshy axis. *Pome*, a fleshy fruit in which the pulp is the ripened urnlike outgrowth which surrounds the carpels and bears the sepals, petals, and stamens on its rim. Common illustrations are apple, pear, quince, hawthorn, etc. In these cases the modified ovary is the so-called core.

While this classification is fairly complete, it does not include some of the most familiar fruits. For example, the strawberry is a fruit which consists of a very much enlarged and fleshy receptacle, in which are embedded numerous minute achenes (pits). The banana is a fleshy fruit, but it dehiscs by the pericarp splitting into valves, and hence it is often called a fleshy capsule, which is really a contradiction of terms. Almonds are dry fruits, but they are constructed exactly like the peach, except that the pulpy layer of the pericarp in the peach is a fibrous layer in the almond. The almonds of the markets correspond to the stone of the peach, being the hard inner layer of the pericarp, investing the seed or edible kernel. The pineapple is a whole inflorescence, in which axis, bracts,

flowers, and all have become a mass of luscious pulp.

Fruits, Food Value of Fruits are eaten fresh, both raw and cooked, dried or evaporated, canned and preserved. They are frequently divided into a number of classes, the edible fruits being mostly pomes, e.g., apple, pear, etc., stone fruit, e.g., cherry, plum, etc., berries, e.g., blueberry, grape, currant, etc., aggregate fruits, e.g., strawberry, raspberry, pineapple, etc., hesperidium, e.g., orange, grapefruit, lemon, etc., syconium, e.g., fig. A large class of edible fruits, such as tomatoes and melons, are more commonly spoken of as vegetables (qv), and another as nuts (qv). The accompanying table gives the composition of the more common fresh fruits as well as of a number of dried or evaporated and canned or preserved fruits.

These figures represent average values, individual specimens will vary greatly from the average. Many fruits contain more or less inedible material or refuse, such as stems, seeds, pit, etc., while others are entirely edible. The inedible portion may be considerable, thus, in oranges the skin and seeds amount to about 27 per cent. In bananas the skin constitutes about 35 per cent of the fruit as purchased. On the other hand, the inedible portion may be very small. Thus, the pits of cherries or the hulls of strawberries constitute about 5 per cent of the weight of the fruit. It will be seen in general that fruits have a high water content. Carbohydrates, which include starches, sugars, and similar bodies, make up the principal nutritive material. Pectin is an important carbohydrate constituent of fruit. To it is due the jelly-making quality which so many fruits possess, particularly when green or underripe. Pectin, with acid, sugar, and a relatively large amount of water, has the property of setting, or jelling. In general, fruits contain very little protein or fat. An exception is the avocado or alligator pear, which contains about 10 per cent of fat. The ash content of fruits is small. However, mineral matter is important in the diet, and fruit is a valuable source of it. The ash is made up of salts of calcium, potassium, magnesium, sodium, etc. For instance, the ash of one sample of cherries (which constitutes about 0.6 per cent of the total fruit) contained 4.2 per cent of calcium oxide, 57.7 of potassium oxide, 5.5 of magnesium oxide, 15.1 of phosphoric acid, 6.8 of sodium oxide, and 5.8 of sulphuric acid. The ash of three samples of figs (also constituting some 0.6 per cent of the total fruit) contained an average of 2.4 per cent of calcium oxide, 55.8 of potassium oxide, 5.6 of magnesium oxide, 12.4 of phosphoric acid, and 3.9 of sulphuric acid. In the ash of five samples of grapes (which made up 0.5 per cent of the fruit) there was an average percentage of 5 calcium oxide, 50.9 potassium oxide, 3 magnesium oxide, 21.2 phosphoric acid, and 4.3 sulphuric acid.

Dried or evaporated fruits contain much more nutritive material in proportion to their bulk than do the fresh fruits, owing to the fact that, like other dried foods, they have been concentrated by evaporation. Canned or preserved fruits are, generally speaking, cooked fruits, with or without the addition of sugar. Fruits owe their flavors to the presence of esters, acids, volatile oils, salts, and other chemical bodies. The coloring is due to the presence of erythrophyll and other complicated chemical compounds.

In food analysis such materials are not estimated separately. The total amount is not large, and such bodies are generally included under the carbohydrates, or, as the most important part of the group is termed, the nitrogen-free extract. The flavor, appearance, and composition of fruits may be modified by cultivation.

A few experiments have been made regarding the digestibility of fruits, i.e., the amount of material which they give up in their passage through the digestive tract. The results indicate that they are quite thoroughly assimilated. Overindulgence in fruit and the consumption of

fruits have value in addition to their nutritive value. They contain salt, acids, and other bodies which are believed by physiologists to have a beneficial effect on the system, and doubtless very often they stimulate the appetite for other food. They are also useful in counteracting a tendency to constipation.

Another point—and one entirely apart from food value—should not be overlooked, i.e., fruits add very materially to the attractiveness of the diet. It is not easy to estimate their value from this standpoint, since often the appearance of food has a value which cannot be

COMPOSITION OF EDIBLE PORTION OF FRUITS, FRESH, DRIED, AND PRESERVED

unripe fruit or of that which is more or less decayed, frequently cause pain or other unpleasant symptoms, and there are persons who because of personal idiosyncrasy cannot eat certain fruits without distress. Judging by the results of a large number of dietary studies made in the United States, fruits furnish about 1 per cent of the total food, 5.6 per cent of the total carbohydrates, and 4.9 per cent of the total protein and fat taken together.

In many dietary studies which have been made the cost of foods has been recorded. It has been found that a large consumption of fruits or fresh vegetables, owing to their low food content, increases the cost of the diet out of proportion to the nutritive material furnished. It must not be forgotten, however, that

measured in dollars and cents. For bibliography, see separate articles on various kinds of fruits. See also FOOD PRESERVATION, and consult "Use of Fruit as Food," *United States Department of Agriculture, Farmers' Bulletin, No. 293* (1911), "Raisins, Figs, and Other Dried Fruits and their Use," *United States Department of Agriculture, Yearbook 1912*, Bailey, *Sketch of the Evolution of our Native Fruits* (New York, 1898).

FRUIT, CULTIVATED Cultivated fruits exhibit great diversity of form, color, texture, flavor, and keeping quality. All are intimately associated with the flower which precedes their formation, and all find their chief use as food for man. The plants that produce them are adapted to great diversity of climate and soil,

and may be divided into three main groups—tropical, subtropical, and temperate—depending upon the temperature they require for their perfect development. The leading fruits of the tropics are date, banana, coconut, and pineapple, of the subtropics, orange, lemon, fig, pomelo, of the temperate, apple, grape, plum, olive, peach, pear, cherry, strawberry. All of these contribute largely, not only to the diet of the resident populace, but through export, in either the fresh or the preserved state, to the prosperity of the region in which they grow.

The present commercial importance of cultivated fruits is largely due to the developments of the latter half of the nineteenth century. Prior to that period few fresh fruits other than apples, lemons, oranges, and coconuts, and such dried fruits as figs, raisins, and prunes, could be obtained for more than a few consecutive weeks in the general markets of the world, their perishable nature precluding long shipment and exposure previous to sale. During that period the great advances made in quick transportation by sea as well as by land, and the remarkable improvements wrought in methods of canning and evaporating and in holding fresh fruits in edible condition by means of cold storage, have had a wider influence in extending the area devoted to cultivated fruits than improvements in the fruits themselves or in the methods of cultivation. Improved methods of preservation and expeditious transportation have enabled fruit growers throughout the world to educate the taste and create a demand for fruits in remote regions, with the result that the number of cultivated and even of important wild edible fruits not found either fresh or preserved in the world's principal markets is small indeed and is becoming steadily smaller. America and Australia ship apples, pears, canned and dried fruits to Europe, which reciprocates by exporting figs, raisins, and the seedless grapes known in commerce as currants. California sends grapes and raisins, citrus fruits, fresh and canned peaches, pears, cherries, and apricots to the States east of the Rocky Mountains, the States bordering the Gulf of Mexico send citrus fruits to the North, as well as strawberries, peaches, and other perishable fruits before the Northern season opens, the tropics export bananas, coconuts, and pineapples to markets in the temperate zones. Apples, lemons, bananas, and oranges may now be obtained in a fresh state throughout the year, and many other fruits, such as pears, strawberries, grapes, and peaches, that could be obtained for only a few weeks, have had their seasons extended in some instances to as many months. Fruit, fresh or preserved, domestic or exotic, is so generally included in the daily diet of the people of all civilized countries, and the extension of plantations in every country visited by commerce is so active, that the world may be said to be in its fruit age. Fruits now form an important factor in international trade. The imports of fruits into the United States in the fiscal year 1914 were valued at \$33,600,000, and the exports at \$31,030,000.

If the standing of fruits be determined by the area devoted to each, the consumption of each, and the variety of fruit products of each, the order of sequence in a list of the world's cultivated fruits and their products would probably not vary greatly in a series of years from the following: apple (evaporated, butter, marm-

lade, jelly, cider, vinegar, wine, champagne, brandy), grape (wine, juice, vinegar, jelly, argols, or dried as raisins or currants), olive (pickled, oil), lemon (candied, extract, citric acid), orange (cider, marmalade, candied), coconut (dried, oil), banana (evaporated), peach (canned and dried), plum (canned or dried as prunes), pear (canned, Perry), date (dried), fig (dried), strawberry (canned jam), pineapple (canned), cherry (canned, dried, and candied). If commercial standards, quantity and variety of product, and quick precision in applying scientific discovery and business acumen to fruit growing and marketing, be employed to determine the standing of a country with respect to its cultivated fruits, the United States stands without a peer, and among the continents North America ranks first. Immigrants from Europe, who brought with them the fruits of the fatherland, found the land of their adoption to be rich in new kinds of fruits. The dual list begun by them has been swollen by importations from other regions—Asian, African, Australian, and South American—and now far exceeds in number of species that of any other country. All the fruits of the northern temperate zone, many of the southern and the subtropical, and a few peculiarly tropical may be found in some region of the United States. Europe contributed the apple, pear, and cherry, Asia, the peach, plum, orange, fig, and coconut, Africa, the date, South America, the navel orange, and so on. America has developed many varieties of the following indigenous fruits which she offers in exchange: viz, blackberry, raspberry, cranberry, dewberry, grapes, and some gooseberries, plums, and apples, besides innumerable improvements in species already highly developed abroad. Yet she has scarcely made more than a beginning, many fruits, such as the persimmon, papaw, buffalo berry, and prickly pear, have as yet attracted only temporary interest, but are acknowledged by horticulturists to be rich in promise of possible amelioration. But this remark is true also of fruits of other regions, especially of fruits indigenous to the tropics.

Apart from the business side of fruit growing already touched upon, the improvements made in the fruits themselves and in fruit culture during the last half of the nineteenth century have resulted mainly from the application of scientific discoveries in plant life. These discoveries and the improvements based upon them may be divided into three general groups: ecological (the influence of temperature, moisture, wind, air, drainage, soil); physiological (manuring, tilling, mulching, pollenizing, thinning, pruning, hybridizing, and selecting); parasitical and pathological (the control of animal and plant parasites). Concerning these, see MANURES and MANURING, ECOLOGY, DISTRIBUTION OF PLANTS, TILLAGE, PLANT BREEDING, PRUNING, MULCH, POLLINATION, CROSS-FERTILIZATION, FUNGI, ECONOMIC, FUNGICIDE, INSECTICIDE, HARVEST AND HARVESTING, IMPLEMENTS, AGRICULTURAL, WIND-BREAK, REFRIGERATION, and articles on the various fruits. Consult also Bailey, *Principles of Fruit-Growing* (New York, 1897), *Standard Cyclopedia of Horticulture* (ib, 1914-15), Goff, *Lessons in Commercial Fruit Growing* (Madison, 1902); Thomas, *American Fruit Culturist* (21st ed, New York, 1903), Maynard, *Successful Fruit Culture* (ib, 1905); Turner, *Fruits and Vegetables under Glass* (ib, 1912), Green,

Popular Fruit Growing (4th ed., St Paul, 1912)

FRUIT, FOSSIL See CARPOLITH

FRUIT BAT Any fruit-eating bat, especially of the Old World tropical family Pteropodidae, called fox bats, or flying foxes. These constitute a suborder, Megachiroptera, of the bats, based not only upon their large size, but upon distinctive structural features. The wings of fruit bats have three, instead of one or two, joints in the second, or index, finger, which is generally provided with a claw, while the thumb alone of other bats possesses one. The ears are small, lack any inner tragus, and the conch forms a ring at its base, the tail, when present, is short, and beneath and free from the membrane between the hind legs. The teeth are unlike those of ordinary bats, particularly in the molars having elongated flat crowns, adapted to crushing pulpy fruits, such as the fig and banana, which constitute nearly the entire diet of the group. These bats are regarded as a specialized offshoot from the ordinary type of insectivorous bats. Consult Thomas, *Proceedings of the Zoological Society of London* (London, 1888). See FOX BAT, HARRY BAT, TUBE NOSE

FRUIT CROW A name for several South American birds of the family Cotingidae and the genera *Gymnocephalus* and *Gymnodora*. They are closely related to the bell birds and umbrella birds (q.v.), are crowlike in appearance, and feed upon fruits to a great extent. They possess the baldness or tendency to wattles which characterizes the group, and one or more prominent species are known as baldheads.

FRUIT FLY Any small fly of the family Trypetidae. They are very numerous and include many species which injure fruit and others that make galls. Most of them are minute, and all are marked with varied colors and spots. Prominent examples are *Trypeta pomonella*, whose larva, the apple maggot, bores tunnels in apples. Another species, *Ceratitis capitata*, is highly injurious to peaches in the Old World, but is not met with in America. The Morelos orange worm (see ORANGE INSECTS) of Mexico is of this family, and others might be named. Consult Loew, *Monographs of the Diptera of North America*, parts I and III (Washington, 1862-73), and Coquillett, "Descriptions of Trypetidae," in *Journal of the New York Entomological Society* (New York, 1899). See GALL INSECTS

FRUIT PIGEON. A pigeon of the family Treronidae. They have the bill considerably depressed at the base, compressed and moderately arched at the tip, the membrane in which the nostrils are pierced little prominent or swollen, the forehead low, and the feathers advancing on the soft part of the bill, the wings moderately long, the feet, and particularly the hinder claw, large, and formed for grasping. During the breeding season a curious gristly knob grows on the base of the upper mandible of some of the species and soon after disappears. They are birds of splendid plumage, natives of the forests of India, the Indian Archipelago, the warmer parts of Australia, the islands of the Pacific Ocean, and one species is found in Africa. There are over 200 species in the family. Their food consists of fruits, which are swallowed whole.

FRUIT SUGAR. See SUGARS

FRUMENTIUS, frō-mēn'shī-ūs, SAINT (c.300-c.380). The apostle of the Abyssinians. About 316 he and his brother Edesius, both young

boys, accompanied their uncle Meropius, a Greek philosopher of Tyre, on a trading voyage, or, according to others, a scientific expedition. Landing on the coast of Abyssinia, all were slain by the natives except the two boys, who became slaves in the service of the King. They won the confidence of their master, were raised to important positions, and ultimately were set free. After the death of the monarch Frumentius became instructor to the young Prince Aizanes and obtained great influence in the administration of state affairs. He formed a church of native converts and Christian merchants who came to the country. After the Prince attained his majority Edesius returned to Tyre and became a presbyter. Frumentius went to Alexandria and informed Athanasius, who had lately been nominated Bishop, of the progress he had made in preparing the way for Christianity in Abyssinia and was consecrated Bishop of Axum (328). After his return he baptized the King and made many converts. He is supposed to have translated the Bible into Ethiopian. Frumentius' day is celebrated by the Latins on October 27, by the Greeks on November 30, and by the Abyssinians on December 18. The chief authority for his life is the Church historian Rufinus. See ABYSSINIAN CHURCH

FRUNDSBERG, frunts'bērk, or **FRONSBERG**, frōns'pērk, GEORG VON (1473-1528). A German soldier. He was born at the castle of Mindelheim, Swabia, and received his military training in the wars of the house of Hapsburg against Switzerland and in the Italian campaign between the League of Cambria and Venice. In 1519 he was appointed commander in chief of all the infantry troops of the Swabian League. He fought with distinction at the battle of Pavia (1525). He was called "the Father of the German Landsknechte" (or pikemen) because of the help he rendered Maximilian in organizing and developing this military body, which continued to take a prominent part in European campaigns until the termination of the Thirty Years' War. Consult the biography of him and his son Kaspar (1500-36) by Adam Reissner (in Latin, Frankfurt, 1568, German, 1572), and Barthold, *Georg von Frundsberg* (Hamburg, 1833).

FRUSINO See FROSINONE

FRUSTUM. See CONE

FRY, SIR EDWARD (1827-1918). An English jurist, born at Bristol and educated at the college there and at University College, London. He was called to the bar in 1854, was appointed judge of the High Court (Chancery Division) in 1877, was judge of the Court of Appeal from 1883 to 1892, and in 1897 was president of the Royal Commission on the Irish Land Acts. In 1906 he became president of the Royal Commission for Inquiring into the State of Higher Education in Ireland. He was arbitrator in many local and international cases, becoming a member of the Permanent Court of Arbitration at The Hague in 1901, and in 1907 was British Ambassador to The Hague Peace Conference. His writings, which were chiefly on law and botany, include *Essays on the Accordance of Christianity with the Nature of Man* (1857), *A Treatise on the Specific Performance of Contracts* (1858, 5th ed., 1911), *British Mosses* (1892), a life of James Hack Tuke (1899), *The Mycetozoa* (1899), *Studies by the Way* (1900); *The Lwerworts* (1911).

FRY, ELIZABETH (1780-1845). An English

philanthropist and prison reformer, born at Norwich, Norfolk, daughter of John Gurney, a banker and member of the Society of Friends. As a child of 15, she became deeply interested in the house of correction at Norwich. In 1813 she first became practically engaged in prison reform and turned her attention to the condition of women prisoners at Newgate. Under her leadership an association was formed in 1817 for the improvement of these unfortunates and did much to better their condition materially and morally. Mrs Fry also joined in the movement to induce the government to make proper regulations for the voyage of convicts, at that time transported to New South Wales, and to make provision for their employment at the end of their voyage. She extended her activities throughout England, traveled from place to place, and founded prison associations. Her work attracted attention in other countries also and contributed materially to prison reform on the Continent. She wrote several works of minor importance. For the story of her life, consult the *Memours*, ed by her two daughters (2 vols., London, 1847), *Memours*, by Thomas Timpson (ib., 1847); a *Life*, compiled from her journal by Susanna Corder (ib., 1853).

FRY, JAMES BARNET (1827-94). An American soldier. He was born in Carrollton, Ill., graduated at West Point in 1847, served for a time as assistant instructor of artillery there, was stationed successively in Oregon, Louisiana, and Texas, was instructor at West Point in 1853-54, and was adjutant of the Academy from 1854 to 1859. In 1861 he acted as chief of staff to General McDowell. In 1862 he held a similar position under General Buell. He was then provost marshal general of the United States from March, 1863, until August, 1866, when this office was abolished. He subsequently served as adjutant general and was successively brevetted colonel, brigadier general, and major general. He published: *A Sketch of the Adjutant-General's Department, United States Army, from 1775 to 1875* (1875), *History and Legal Effects of Brevets in the Armies of Great Britain and the United States, from their Origin in 1692 to the Present Time* (1877), *Army Sacrifices* (1879), *Operations of the Army under Buell* (1884), *McDowell and Tyler in the Campaign of Bull Run* (1884), *New York and Conseription* (1885), *Military Miscellanees and The Conkling and Blaine-Fry Controversy in 1866* (1893).

FRYE, ALEXIS EVERETT (1859-) An American geographer, born at North Haven, Me. He graduated from the Cook County Normal School, Chicago (1885), and from Harvard Law School (1890), taught in the Chicago Normal School (1883-86), lectured on educational topics (1886-90), was superintendent of schools at San Bernardino, Cal (1891-93), and traveled in Europe, Asia, and Africa in 1897. He served as captain of the Harvard Graduates' Company in the Spanish War in 1898 and as lieutenant of the First Massachusetts Artillery in 1898-99. While superintendent of schools of Cuba (1899-1901) he organized the public-school system of the island and conducted the Cuban teachers' expedition to the United States in 1900. In 1904-06 he was president of the National Teachers' Association of Cuba. His most important books are a large number of excellent and widely used school geographies.

FRYE, WILLIAM PIERCE (1831-1911). An

American legislator, born in Lewiston, Me. He graduated at Bowdoin College in 1850, and after studying law in the office of William Pitt Fessenden, practiced at Rockford and later at Lewiston. He was a member of the State Legislature in 1861-62, was a presidential elector on the Lincoln ticket in 1864, and was again a member of the Legislature in 1866-67, serving at the same time as mayor of Lewiston. He was Attorney-General of the State from 1867 to 1869. Elected in 1871 to the national House of Representatives, he was reelected five times, resigning his seat in 1881 to fill the vacancy in the United States Senate caused by J. G. Blaine's resignation. He was elected for the full term in 1883, and was reelected in 1889, 1895, 1901, and 1907. He was elected president pro tempore of the Senate in 1896 and was the permanent presiding officer of that body after the death of Vice President Hobart, in 1899, and again after the elevation of Vice President Roosevelt to the presidency in 1901. In 1898, after the close of the Spanish War, Senator Frye was a member of the Peace Commission at Paris. He had a great influence on national legislation, as chairman of the Committee on Commerce, he framed the legislation and proposed legislation in regard to American shipping.

FRYER, JOHN (1839-) A promoter of education in China. He was born at Hythe, Kent, England, and graduated at Highbury College, London, in 1860. He was principal of St Paul's College, Hongkong, China (1861-63), professor of English at Tung-Wen College, Peking (1863-65), and head master of the Anglo-Chinese School, Shanghai (1865-67). From 1867 to 1896 he had charge of the translation of foreign scientific books into Chinese at the Imperial Government Arsenal in Shanghai. He served as an examiner of the Imperial Naval College at Nanking in 1894-95, founded and from 1884 to 1911 was proprietor of the Chinese Scientific Book Depot, Shanghai, and also founded the Institution for Chinese Blind at Shanghai in 1911. He published more than 100 books in Chinese, and also *Educational Directory for China* (1895), *Translator's Vade-Mecum, or Vocabulary of Scientific Terms in Chinese and English*, *Admission of Chinese Students to American Colleges* (1909).

FRYING. See **COOKERY**.

FRYKEN, fruk'en. A series of small lakes in the southern part of Sweden, north of Lake Wenern, into which their waters flow. They are arranged in three main groups, are connected by narrow channels, the whole forming a river of irregular width, and are famed for their beautiful scenery.

FRYTH, JOHN. See **FRITH**.

FRYXELL, fruk-sel', ANDERS (1795-1881). A Swedish historian. He was born at Hessel-skog in Dalsland, and after studying at the University of Upsala and taking holy orders, became in 1819 instructor at the Djurgårdsskole in Stockholm, from which he went in 1822 to the Maria-Skole in the same city. From 1828 to 1836 he was rector of that institution. In 1824 he published his Swedish Grammar, the only one used for a long period of time. His interest lay chiefly in questions of public education. In 1835 he became pastor at Sunne, and in 1836 Bishop of Northern Wermland. From 1847 till his death, March 21, 1881, he devoted himself exclusively to historical research. His great work is the *Berättelser ur Svenska historien*,

'Contributions to Swedish History' (46 vols, 1823-79), dealing with the history of his county till 1771. These narratives are marked not only by their patriotic sentiment, but by their fresh and natural conception, their richness of biographic detail, and their naive and vivacious style. They possess, too, the faults of their kind, and have been criticized for their diffuseness and lack of critical insight. The *Berättelser* have nevertheless become a national classic. His *Characteristics of the Period from 1592 to 1600 in Sweden* (1830) received the grand prize of the Swedish Academy. Between 1845 and 1850 he published *Om aristokrat-fordomandet i Svenska historien*, 'The Rôle of the Aristocracy in Swedish History'. This was in the nature of a defense of the Swedish nobility, and brought upon him the hatred of the Liberal element in Sweden. Fryxell's minor works include *Handlingar rörande Sveriges historia*, 'Studies in Swedish History' (1836-43), and *Bidrag till Sveriges litteratur-historia*, 'Contributions to the History of Swedish Literature' (1860-62). His autobiography, *Min historiska historia*, appeared at Stockholm in 1884. It was written by his daughter, but from his own manuscripts.

F'S AUNT, Mr. A character in Dickens's *Little Dorrit*. She was left to Mrs. F by her husband as a not very acceptable legacy.

FTELEY, ALPHONSE (1837-1903). An American hydraulic engineer, engaged chiefly on the construction of municipal water works. He was born in Paris, France, in April, 1837. After serving in several European engineering offices, he came to the United States in 1865 and for a year was a mechanical draftsman on marine steam engines. From 1866 to 1870 he assisted William E. Worthen, an eminent civil engineer of New York City. He then opened an office as a civil engineer. In 1873 he became resident engineer in charge of investigation and construction of the Sudbury River water works of the city of Boston, under Joseph P. Davis, then city engineer of Boston, and from 1880 to 1884 he was chief assistant engineer of Boston. Then began his long and important connection with the Croton Aqueduct Commission on increasing the water supply of New York City by means of the new Croton Aqueduct and the new Croton Dam (see **AQUEDUCT**, **DAMS** and **RESERVOIRS**). In 1884 he became principal assistant engineer of the commission, from 1884 to 1886 he was consulting engineer, and he was chief engineer from 1886 until ill health led to his resignation in 1899. From time to time he was consulting engineer on water-supply additions to many cities, including Brooklyn, Cincinnati, Albany, and Rochester, on sewerage for Brooklyn, Newark, Hoboken, and the Passaic Valley Sewerage District (N. J.), on the lining of the Hoosac Tunnel, and on rapid transit in Boston and New York. He was elected a member of the American Society of Civil Engineers in 1876, was president in 1898, and contributed to the *Transactions* of the society.

FUAD PASHA, fū'ad pá-sha' (1814-69). A Turkish statesman and scholar, born in Constantinople. He was the son of the poet İzzet Mollah and nephew of Leila Khatun, one of the very few Turkish poetesses. He studied medicine at Galata-Serai from 1828 to 1832. In 1834 he was appointed Admiralty physician and accompanied the Grand Admiral in his expedition against Tripoli. On his return to Constantinople he forsook medicine and entered the

Bureau of Interpreters for the Porte. In 1840 he became First Secretary to the Turkish Embassy at London and served in various diplomatic positions until in 1848 he was appointed Grand Interpreter to the Porte. In 1850 he went on a mission to St. Petersburg and in 1853 on another to Egypt. On his return from the first of these he became Minister of Foreign Affairs under the grand-viziership of Ali Pasha. In 1854 Fuad went to Epirus along with Omer Pasha, where he suppressed the insurrection with great energy. In the following year he received the title of Pasha and was again appointed Minister of Foreign Affairs, and represented Turkey at Paris in the regulation of the affairs of the Danubian Principalities. In 1860 he was sent to Damascus in consequence of the disorders in the Lebanon (See **DRUSES**). In 1861 he held the office of Grand Vizier. In 1862 he became Minister of Finance and in 1867 again Minister of Foreign Affairs. He died in 1869. When the Turkish Academy of Science and Belles-Lettres was established, in 1851, Fuad became one of the first members, and in the following year he published a Turkish grammar, which is highly esteemed by native scholars. He also wrote a poem on the Alhambra. He received many honors and decorations from European sovereigns.

FUCA. See **JUAN DE FUCA**, **STRAIT OF**.

FUCA, fū'ka, **JUAN DE** (?-1602). A Greek navigator, whose real name was Apostolos Valerianos. He was born in Cephalonia and in 1596 told Michael Lok, an Englishman, that in 1592 he had found the Straits of Anian connecting the Pacific with the Atlantic. This story appeared in *Purchas, His Pilgrimes* (1625, vol. iii, pp. 849-852) and stimulated search for a passage between the two oceans. In 1788 Meares, discovering a great inlet on the north-west coast of North America, called it the Strait of Juan de Fuca, and the name is still used for the channel from the Gulf of Georgia. Most of the details of his story as reported by Lok seem false. For criticism of his claims, adverse, consult Bancroft, *History of the Northwest Coast*, vol. 1, chap. 3 (1884).

FUCHAU, fū'chou'. See **FOOCHOW**.

FUCHOW. See **FOOCHOW**.

FUCHS, fūks, **ERNST** (1851-). A German ophthalmologist. He was born and educated at Vienna, and after holding a professorship at the University of Liège (1881-86) was appointed to the chair of ophthalmology at the University of Vienna. His principal publications, most of which are translated into English and French, include *Das Sarcom des Uvealtractus* (1882), *Die Ursachen und die Verhütung der Blindheit* (1885), *Lehrbuch der Augenheilkunde* (1889; 11th ed., 1907, Eng. trans. by Alexander Duane under the title *Text-Book of Ophthalmology*, 4th ed., 1911).

FUCHS, IMMANUEL LAZARUS, also called **LUDWIG** (1833-1902). A German mathematician, born at Moschin, in Posen. After teaching mathematics in several institutions he became professor extraordinary at Berlin in 1866 and full professor of mathematics at Greifswald in 1869, at Göttingen in 1874, at Heidelberg in 1875, and at Berlin in 1884. His principal contributions bear upon the theory of functions and the theory of linear differential equations. After Kronecker's death, in 1891, he became editor of the *Journal für die reine und angewandte Mathematik*. His name has been connected by

Poincaré with a discontinuous group (Fuchsians) which is very important in the general theory of functions, and is frequently discussed by Poincaré in the volumes of *Acta Mathematica* (Stockholm)

FUCHS, JOHANN NEPOMUK VON (1774-1856) A German chemist and mineralogist. He was born at Mattenzell and was educated at Freiberg, Berlin, and Paris. In 1807 he became professor of chemistry and mineralogy at the University of Landshut, in 1823 curator of the mineralogical collection at Munich, and in 1826 professor of mineralogy at the University of Munich. He published a number of interesting papers on chemistry, mineralogy, and crystallography, and his *Gesammelte Schriften* were published at Munich in 1856. He is known for his process of making a soluble glass used in fixing fresco colors.

FUCHS, KONRAD HEINRICH (1803-55) A German physician, born at Bamberg and educated at Würzburg. He was professor of pathology and therapy at Göttingen from 1838 until his death, and wrote the important work entitled *Lehrbuch der speziellen Nosologie und Therapie* (1844-48). He also published *Die ältesten Schriftsteller über die Lusteuche in Deutschland* (1843). The pathologico-anatomical collection at the University of Göttingen was founded by him.

FUCHS, or FUCHSIUS, fuk'si-us, LEONHARD (1501-66) A German botanist, born at Wemdingen, in Bavaria, studied at Ingolstadt, under Reuchlin, and in 1535 became professor of medicine at Tübingen. He published a number of excellent works on botany, the most important of which is his beautifully illustrated *De Historia Stirpium Commentarii Insignes* (1542). Fuchs was one of the great herbalists, and in his *Historia Stirpium* made the first attempt at establishing a botanical terminology. Some of these terms are still in use, but most of them were founded upon such crude conceptions of morphology that they have been abandoned. Nevertheless it was a beginning of scientific terminology and marked a great advance in precision of observation and statement.

FUCHSIA, fuk'si-a, the plants and flowers are popularly called fū'sha (Neo-Lat., named in honor of Leonhard Fuchs). A genus of plants of the family *Genotheraceæ*, which contains about 70 species, mostly natives of tropical America. Some are climbers, some small trees, but the majority are shrubs or half-shrubby herbs. The leaves are opposite. The flowers, which are solitary and axillary, are sometimes arranged in terminal racemes, are generally pendulous, have a funnel-shaped, four-cleft, finely colored calyx, a four-petaled, usually red, corolla, and a four-celled berry, which in some species is edible. Several species are largely employed as greenhouse plants, and in climates not too rigorous they are grown out of doors with slight protection during the cold season. They are deservedly popular, because they yield a satisfactory display of bloom with less care in propagation and management than almost any other house plant, and in consequence of their beauty and gracefulness they have developed a great number of varieties, not only of the colors and forms they possess in nature, but others, such as white and double, which are not peculiar to the species from which they originate. *Fuchsia macrostemma*, a very

variable Chilean species, first attracted European attention about 1790, and for about 75 years usurped both name and fame of *Fuchsia coccinea*, which is considered a more attractive and free-blooming species. It has been largely employed, either singly or in crossing with *Fuchsia fulgens*, in the production of cultivated forms. Consult Bailey, *Standard Cyclopaedia of Horticulture* (6 vols., New York, 1914-15). See Plate of GREENHOUSE PLANTS.

FUCHSIN, fook'sin. See COAL-TAR COLORS.

FUCINO, fōō-chē'nō, LAKE. A former lake 2 miles east of Avezzano, in Abruzzi, Italy, the ancient Lacus Fucinus, now a vast fertile farm. For history of its drainage, see AVEZZANO.

FUCINUS LACUS. See AVEZZANO, FUCINO.

FUCUS. See HYDROPHYTES and Plate of HYDROPHYTES.

FUDGE FAMILY IN PARIS, THE. A skit by Thomas Moore (1818), satirizing the underbred English in foreign countries. The satire was followed by a sequel, *The Fudge Family in England*.

FUEGIAN, fū-ē'ji-an. See TIERRA DEL FUEGO, ONA, YAHGAN.

FUEL (OF FOUILLES, from ML. focale, fuel, from Lat. focus, hearth). Any material that is capable of being utilized for the heat it produces upon union with oxygen. (See COMBUSTION.) The fuel of greatest economical importance is coal. Many other substances are, however, rated very high commercially and industrially as fuels. Some of these substances, such as wood, peat, and crude petroleum, are of natural origin, others, such as coke, charcoal, and coal gas, are formed artificially. A useful classification of fuels is that which divides them according to their state of aggregation, and this classification will be followed in the present article. To enumerate. The principal solid fuels are coal, peat, coke, charcoal, and wood, the liquid fuels include petroleum, shale oils, and vegetable and animal oils, the gaseous fuels include coal gas, producer gas, water gas, mixed gas, and natural gas. The heat of combustion—i.e., the heat generated by the combustion of a certain quantity in oxygen—measures the calorific power or heat value of a fuel. However, the terms "calorific power" and "heat value" have, in common usage, a slightly wider significance than the term "heat of combustion." The latter term is applied only to the quantity of heat generated by the substance when completely burned, i.e., when the carbon and hydrogen are completely changed to carbonic acid and water. The terms "calorific power" and "heating value," on the contrary, apply to the measure of an industrial yield as well as to the heat given off by the fuel during its complete combustion. Scientifically the term "heat of combustion" is the most nearly correct. The units of measure of the quantity of the heat of combustion are the *calorie* and the *British thermal unit*. The calorie is the quantity of heat required to raise the temperature of one kilogram of water one degree Centigrade at the temperature of maximum density. The British thermal unit (usually abbreviated B. T. U.) is the quantity of heat required to raise the temperature of one pound of pure water one degree Fahrenheit at its temperature of maximum density, i.e., from 39° to 40° F.

There are two methods for finding the heat of combustion of substances. (1) calculation based on chemical composition, and (2) experimental

determination by means of a calorimeter. By the first method the units may be calculated directly from the composition of the substance, or indirectly from the quantity of oxygen consumed during combustion in a crucible. The direct calculation of the heat of combustion from the chemical composition of the fuel is usually performed by means of Dulong's formula. Other general formulas are in use, but they all resemble Dulong's and are usually only modifications of his. Dulong's formula, with recent average figures for the constants, as given by Prof. William Kent, for coal, is: Heating value per pound in

$$B.T.U. \text{ equals } \frac{1}{100} [14,650 C + 62,000 H \left(- \frac{O}{8} \right)$$

+ 4000 S] in which C, H, O, and S are respectively the percentages of carbon, hydrogen, oxygen, and sulphur in the coal. Prof. Kent points out, as the result of a comparison of numerous data, that the relation of the heat of combustion of coal to its ultimate analysis is expressed by Dulong's formula with remarkable accuracy, i.e., within a limit of error of usually less than 2 per cent. The method of calculating the heat of combustion indirectly, from the quantity of oxygen consumed, is also expressed by a gen-

eral formula, but this formula has been shown to be of very questionable value and is now used only where no other methods of determination are possible. The Mahler calorimeter (one of the most perfect of such devices) is shown in the accompanying engravings, of which Fig. 1 shows the apparatus complete with its accessories, and Fig. 2 shows the combustion chamber, or bomb, separated from the other apparatus. The combustion chamber (Fig. 2) consists first of a steel shell, *P*, and a stopper or cover, *E*. The shell has a capacity of 40 cubic inches,

FIG 2 SECTION OF COMBUSTION CHAMBER OF MAHLER CALORIMETER

FIG 1 MAHLER CALORIMETER FOR MEASURING THE HEATING VALUE OF FUEL

eral formula, but this formula has been shown to be of very questionable value and is now used only where no other methods of determination are possible.

It is generally conceded that the ultimate test of the heat of combustion of a fuel is its determination by actual combustion in a calorimeter. Calorimeters are made in various forms, but they all consist of a combustion chamber in which the sample of fuel is burned, surrounded by a chamber containing a known quantity of water whose rise of temperature is shown by a thermometer. The Mahler calorimeter (one of the most perfect of such devices) is shown in the accompanying engravings, of which Fig. 1 shows the apparatus complete with its accessories, and Fig. 2 shows the combustion chamber, or bomb, separated from the other apparatus. The combustion chamber (Fig. 2) consists first of a steel shell, *P*, and a stopper or cover, *E*. The shell has a capacity of 40 cubic inches,

tator *L* and the thermometer, pour in the previously weighed water and operate the agitator a few minutes to restore equilibrium of temperature, note the thermometer; connect the electrode with the battery and thus kindle the fuel, read the thermometer one-half minute after kindling, then at minute intervals until the readings begin to decrease regularly, next open the cock *R* and afterward the bomb, which should be washed inside with distilled water to collect the acids formed, and determine the acids volumetrically. The mode of procedure described furnishes all the data to be obtained by the test proper, the observer then proceeds to calculate the heat of combustion from these data. This calculation is a rather formidable one, and the interested reader should consult special treatises on calorimetry for its explanation. The result obtained is the heat of combustion expressed in terms of calories or of British thermal units. (See HEAT; THERMOCHEMISTRY.) When coal is the fuel tested, it is reduced to moderately coarse powder before being placed on the disk. Heavy oils, tars, etc.,

are weighed directly onto the disk. Volatile oils are inclosed in pointed glass bulbs, which are placed on the disk, and the ends of which are broken off just before closing the bomb. Gases are simply pumped into the bomb. A calorimetric test, in order to give reliable results, requires expert manipulation and extreme care.

Solid Fuels Of the solid fuels used at present, coal is by all odds the most important. Coal is a very varied product, and its value as a fuel is correspondingly variable. According to geologists, a bed of coal was many ages ago a mass of damp vegetable fibre, a portion of a peat bog. Through successive geologic ages the peat bog was submerged and overlaid with mud and glacial drift, tilted and compressed by upheavals of the earth's crust, and subjected to intense heat. During these processes it underwent a more or less complete destructive distillation. The conditions under which this distillation took place were not uniform, the variable factors were time, depth, and porosity of the overlying strata, pressure and temperature, disturbance of the beds, and the intrusion into them of mineral substances, such as clay, sand, iron, and sulphur. As a consequence the product of the distillation—viz, coal—varies all the way from the original peat, through brown coal

of 250° to 300° F, then the volatile matter is driven off at a red heat, then the carbon is burned out of the remaining coke at a white heat, until nothing is left but ash. The fixed carbon has a constant heating value of about 14,600 B T U per pound. The heat value of the volatile hydrocarbon depends on its composition, and that depends chiefly upon the district in which the coal is mined. It may be as high as 21,000 B T U per pound in the best bituminous coals containing very little oxygen, or as low as 10,000 B T U per pound in some of the poorest bituminous coals having a high percentage of oxygen. The ash has no heating value, and the water has in effect less than none, for its evaporation and the superheating of the steam made from it to the temperature of the chimney gases absorb some of the heat generated by the combustion of the fixed carbon and the volatile matter. The heating value per pound varies in different districts and bears a relation to the percentage of volatile matter. It is the highest in the semibituminous coals, being nearly constant at 15,750 B T U per pound, it is between 14,500 and 15,000 B T U in anthracite, and ranges from 15,000 B T U down to 13,000 B T U or less in the bituminous coals, decreasing usually as the source moves

TABLE I.—CLASSIFICATIONS OF COALS ACCORDING TO THE RELATIVE PERCENTAGE OF CARBON AND VOLATILE MATTER

KINDS OF COAL	Per cent fixed carbon	Per cent volatile matter	Heating value, B T U per lb	Relative combustible value
Anthracite	97 to 92½	3 to 7½	14,600 to 14,800	93
Semianthracite	92½ " 87½	7½ " 12½	14,700 " 15,000	94
Semibituminous	87½ " 75	12½ " 25	15,500 " 16,000	100
Bituminous, Eastern	75½ " 60	25 " 40	14,800 " 15,200	95
Bituminous, Western	65 " 50	35 " 50	13,500 " 14,800	90
Lignite	under 50	over 50	11,000 " 13,500	77

or lignite, bituminous, semibituminous, semianthracite, and anthracite, to graphitic coal. Graphitic coal has nearly all the volatile hydrocarbon gases and oxygen driven off from it, leaving practically only fixed carbon and ash, the carbon being in a form so hard to burn that the coal is not used as a commercial fuel. Lignite is at the extreme opposite end of the scale of coals, it being only one remove from the original peat, i.e., the proportion of fixed carbon is small and the proportion of volatile matter large. Between these two extremes come the other classes of coal. To summarize, there are thus different varieties of coal, due to differences in the extent to which the volatile gases have been driven off from the original peat or other woody coal-forming substance. There are also differences in quality in each variety, due to varying percentages of ash and water. The ash or earthy matter in coal ranges from 2 to over 30 per cent, the water ranges from less than 1 per cent in the anthracites up to 14 per cent or more in some of the bituminous coals, and to 25 per cent or more in some of the lignites. The importance of stating the preceding circumstances lies in the fact that they determine the relative heating value of the different coals for fuel. An illustration will explain this truth. Coal is composed of four different substances, which may be separated by proximate analysis, viz, fixed carbon, volatile hydrocarbon, ash, and water. When coal is burned the moisture is first driven off at a temperature

westward, and as the volatile matter contains an increasing percentage of oxygen, as shown by Table II. Tables I and II refer only to American coals, and they will be understood clearly if studied in connection with the preceding discussion, with the exception possibly of the last column of Table II. This column has been inserted to show the relative theoretical value of the different coals for evaporating water from 212° F to steam at 212° F. The following general figures of the heating value of foreign coals give a basis for a rough comparison between the American product and that of other nations.

COUNTRY	Heating value in B T U
Chile	11,758 to 14,954
France	15,030 " 16,560
Great Britain	4,000 " 15,955
Austria-Hungary	12,213 " 15,131
Germany	11,045 " 15,847
Spain	9,556 " 14,113
Russia	8,748 " 15,665
New Zealand	9,846 " 15,364

These values are the maximum and minimum in each case from a large number of tests. The purposes for which different kinds of coal are used do not admit of any very definite classification. The coal used in any particular country or locality is determined nearly always by questions of availability and cost. In America

the use of anthracite coal is nearly universal for domestic purposes in the East, and it is also used for industrial purposes in many Eastern cities where public sentiment demands the use of a smokeless fuel. The great industrial fuel, however, is coal of the semianthracite and bituminous classes, and the coal used in any particular locality is usually the coal which is most available and the cheapest.

In recent years a practice has arisen in large corporations of buying their coal on the basis of the unit of combustible in a given weight. This is called buying coal on the "heat-unit

tial combustion in furnaces called coke ovens, or by distillation in the retorts of gas works. It is considerably used as a domestic fuel, and somewhat used for steam making where some special condition prevails, such as the necessity for a smokeless fuel. For general steam making, however, its cost and the difficulty of its combustion in ordinary furnaces place coke rather low in the list of fuels available to the steam user. For metallurgical processes, an important example of which is iron smelting, coke is almost an invaluable fuel. Coke is composed mostly of fixed carbon and ash, the percentage

TABLE II — SHOWING PROXIMATE ANALYSES AND HEATING VALUE OF AMERICAN COALS

basis." A sample is taken from each car or boat load, and the percentage of incombustible matter, ashes, and moisture is determined by the analysis in the chemical laboratory. The percentage of carbon is made the basis of the price to be paid per ton of coal, i.e., the gross weight is corrected for the net weight of combustible and the price paid is agreed upon on the basis of the net heat value of the coal. Many corporations simply deduct the weight of moisture and then determine the B T U by means of an explosion calorimeter and pay on that basis.

The solid fuels other than coal are coke, charcoal, coal briquettes, coal dust, peat, wood, sawdust, tanbark, straw, and bagasse. *Coke* is the solid material left after evaporating the volatile ingredients of coal, either by means of par-

of volatile matter being seldom over 2 per cent, and often less than 1 per cent, of the total. Its heating value ranges generally between 14,400 and 14,600 B T U. See COKE.

Charcoal is the carbonaceous residue of wood which has been subjected to a process of smothered combustion. Its principal use as a fuel is in smelting certain kinds of iron. (See IRON AND STEEL.) A small amount is used for domestic heating and cooking, and for heating purposes in certain trades and arts. Pure charcoal is nearly pure carbon, but commercial charcoal contains considerable volatile matter which is a decided advantage to it as a fuel. In fact it has been shown that half-burned charcoal is superior as a fuel to that more completely burned. The heat value of ordinary commercial charcoal is between 7000 and 7200 calories.

Briquettes, or patent fuel as they are sometimes called, are composed of coal or coke dust mixed with a binder of pitch, tar, or other substance and pressed or molded into blocks, bricks, ovoids, or other forms. Briquettes are not yet made to any extent in the United States, but in Great Britain and continental Europe their manufacture constitutes an important industry. They are used like coal for steam making, and industrial and domestic purposes generally.

Coal dust, as the name implies, is coal ground to a fine dust or powder. Theoretically coal dust should be a most excellent fuel, but it has the practical objection of requiring a rather costly apparatus for grinding the coal and feeding it to the furnace and of requiring great care in its combustion. The manner in which coal dust is burned is to inject it into the furnace through nozzles or burners by means of air pressure. The furnace used differs from the ordinary coal-burning furnace in being closed and without grates, both the fuel and the air for its combustion enter the furnace through the nozzle or burner. Powdered coal was used as a

after from 8 to 12 months' drying in air is reduced to from 20 to 25 per cent. When used as a fuel, wood should be as dry as possible, as otherwise some of the heat generated by its combustion is wasted in vaporizing the contained moisture. Evaporative tests made by Brix in Europe gave the following results in pounds of water evaporated per pound of fuel: pine, 5.5 pounds, elm, 4.6, birch, 4.5, oak, 4.56, ash, 4.63, beech, 4.47.

It will be noted that the coniferous woods have the higher heating values, due to the contained hydrocarbons in the form of pitch and turpentine. Pine knot containing much pitch has given as high as 10,863 B. T. U. by test. Wood was formerly much used for steam raising, and is now used for this purpose in newly settled countries and where coal cannot be obtained cheaply. The countries using wood for making steam are, however, growing fewer each year, owing to the discovery of new coal deposits and the development of transportation systems by which coal can be cheaply imported.

The following table shows the composition and heating value of the more common woods.

KIND	Carbon	Hydrogen	Oxygen	Nitrogen	Ash	B. T. U.
Ash	49.18	6.27	43.91	.07	.57	8,480
Beech	49.06	6.11	44.17	.09	.57	8,591
Birch	48.88	6.06	44.67	.10	.29	8,586
Elm	48.89	6.20	44.25	.06	.50	8,510
Fir	50.36	5.92	43.39	.05	.28	9,063
Oak	50.16	6.02	43.36	.09	.37	8,316
Pine	50.31	6.20	43.08	.04	.37	9,153

fuel in England as early as 1873, but without much success, and the same lack of success has distinguished most of the subsequent attempts to employ it in steam making. Quite recently, however, coal dust has been used in firing cement kilns of the rotary type with so much success that it is now the standard fuel for the rotary-kiln process of cement manufacture. The heat of combustion of coal dust is of course the same as that of the coal from which it is ground, its economy as a fuel comes from the fact that in the finely powdered state of dust the coal burns rapidly and thoroughly without the waste of unburned particles and the formation of clinker, that the combustion is smokeless, and that the cost of firing, furnace repairs, and handling of waste is reduced.

Peat is the agglomeration of partly decomposed vegetable matter obtained from peat bogs, cut into blocks, and dried to serve as a fuel. Its composition varies but little from that of wood, the composition of Irish peat, e.g., being carbon 59 per cent, hydrogen 6 per cent, oxygen 30 per cent, nitrogen 1 per cent, and ash 4 per cent. Air-dried peat contains from 10 to 25 per cent of water. The heat of combustion of peat is lower than that of brown coal or lignite; for dry Irish peat it is about 10,250 B. T. U., and for moist Irish peat it is about 7,390 B. T. U. Generally speaking, a pound of peat will evaporate about five pounds of water from and at 212° F. Peat does not rank as a commercial fuel in the United States, but in Ireland and some of the western countries of continental Europe it is so extensively used that the peat industry is one of importance.

Wood is perhaps the most widely known and used of all fuels. Wood when newly felled contains from 30 to 50 per cent of water, which

Sawdust is often used as a fuel in steam saw mills. The conditions necessary for burning sawdust are that plenty of room be given it in the furnace and sufficient air supplied on the surface of the mass. It is sometimes burned by blowing it into the furnace by air pressure, much as coal dust is burned. The heating power of dry sawdust is naturally the same per pound as that of the wood from which it is derived. Generally speaking, sawdust cannot be profitably burned except in furnaces especially designed for its combustion and where it costs nothing. Sawdust briquettes have been made and utilized as fuel, but only to a very limited extent. *Tanbark*, or more correctly the residue of tanbark which has been used in the process of tanning, is sometimes used as a fuel where it can be had at slight cost. The heating value of perfectly dry tan containing 15 per cent of ash is 6,100 B. T. U., according to Peclet. The same authority states that tan in the ordinary state of dryness, containing 30 per cent of water, has a heating value of only 4,284 B. T. U. The weight of water evaporated from and at 212° F. by one pound of tan, equivalent to these heating powers, is, for perfectly dry tan, 5.146 pounds, and for tan with 30 per cent moisture, 3.84 pounds. *Straw*, like sawdust and tanbark, is used as fuel under special conditions. Experiments have shown dry winter-wheat straw to have a heating value of 6,290 B. T. U., and the same straw with 10 per cent water a value of 5,448 B. T. U. *Bagasse* is the refuse of sugar cane after the juice has been extracted. It is much used as a fuel under the boilers of sugar mills. Its heating value is from 2,000 to 3,000 B. T. U., depending upon the quality.

Liquid Fuels. The liquid fuels of greatest practical importance are the mineral oils, petro-

leum and its distillates and residues. Of much less, but increasing, importance is alcohol. Crude petroleum is a hydrocarbon often containing a small percentage of sulphur and oxygen as impurities. It may be broken up by distillation into gasoline, benzine, kerosenes, and other less familiar distillates and residuum of various qualities, any one of which makes a very good fuel under certain conditions. Gasoline and its associated distillates are too valuable for other purposes ever to be used as liquids for fuel in metallurgy or for steam making or general heating. *Benzine* will also have a restricted use as fuel owing to the difficulty, danger, and expense of transporting it and to the care with which it must be handled. Were it not for these objections, benzine would be the best of all oil fuels. *Kerosene* is much more suitable for use as a fuel than benzine, because of its portability and the safety and ease with which it can be handled. Roughly speaking, American crude petroleum contains from 50 to 75 per cent of benzine, and kerosene and Russian crude petroleum contain from 15 to 50 per cent. Peruvian oil is about the same composition as Russian.

The use of kerosene as a liquid fuel is common, but this use is limited by the price of that oil, and its value as an illuminant, to small installations for special purposes. For general industrial purposes, therefore, resort must be had either to the crude petroleum or to the residuum remaining after the kerosene has been distilled off the crude petroleum. In the United States, where the percentage of residuum is so small that its distillation is demanded for lubricating oil, crude petroleum is the principal industrial fuel oil and is employed in locomotives, steamships, and industrial plants. In Russia, however, the percentage of residuum is so great that only a small portion is required for distillation into machine oil, and the remainder is available for fuel. The residuum is the fuel oil par excellence, and in Russia it is used in every possible place. Fuel oils used as liquids burn with great difficulty and with great smoke unless very finely divided or atomized so as to enter the furnace in the form of spray, the oil being injected into the furnace through nozzle-like burners by air or steam pressure which breaks it up into a fog or mist. It then acts as a gaseous fuel. Oil firing on locomotives or for general steam making has all the advantages of mechanical stoking—ease and controllability, smokelessness and absence of sparks and ashes.

The coal production of the world is in the neighborhood of 1,360,000,000 tons per year, while that of petroleum is in the neighborhood of 47,000,000 metric tons, of which much is used for illuminants and lubricating purposes. The amount of petroleum available for fuel purposes is probably less than 5 per cent of the coal used. Obviously it cannot be used very extensively as compared with coal. Again, while oil has greater heating value and evaporative efficiency than the best coal, there is always some point where this is counterbalanced by the lesser cost of coal. For example, comparative tests between Lima (Ohio) oil costing $2\frac{1}{2}$ cents per gallon and coal giving an evaporation of $7\frac{1}{2}$ pounds of water per pound of coal showed that the two fuels were equally economical when the price of coal was \$3.85 per ton. The heating value of fuel oils ranges between about 18,000 and 21,000 B T U.

Since 1907, when alcohol for use in the arts,

and rendered unfit for use in beverages, was freed from tax in the United States (see METHYLATED SPIRIT), it has been used as a fuel for various purposes, as it has been employed also in Europe. Though its calorific value, 10,600 B T U, is less than that of the mineral oils, it possesses certain advantages over them, especially for household uses. It burns freely, without smoke or disagreeable odor, in almost any kind of burner. There is little danger of explosion from it, and, moreover, burning alcohol can be extinguished with water, with which it mixes.

Gaseous Fuels. For many purposes the best fuel for heating is combustible gas. The ideal fuel is natural gas, but this is obtainable over only a limited area of the earth's surface. Next in value are gases secured by distilling highly gaseous coals or by enriching water gas. The following are some of the gases which may be used for fuel. *Blast-furnace gas* is the gas given off by blast furnaces for smelting iron ore, and its composition varies with the fuel consumption of the furnace and other conditions. Six analyses made from one blast furnace by Prof. D. S. Jacobus gave the following average figures: carbon dioxide, 7.08 per cent, carbon monoxide, 27.8 per cent, oxygen, 0.1 per cent, nitrogen, 65.02 per cent. The heating value calculated from this analysis was 1175 B T U per pound. Blast-furnace gas is used in large steel plants as fuel for internal-combustion engines which drive the blowers and electric generators, and for raising steam under boilers, as well as for heating the hot-blast stoves. Large installations of this kind are to be found at the plant of the Lackawanna Steel Company at Buffalo, N. Y., where gas engines of 1000 horse power each run on furnace gas, as well as at the Gary works of the United States Steel Corporation at Gary, Ind., and also in plants at or near Pittsburgh. *Coke-retort gas* is the gaseous by-product distilled from coal in making coke. It makes an excellent fuel, but until recently was for the most part wasted in coke making as practiced in the United States. To secure coke-oven gas for fuel or other purposes special forms of ovens known as retort or by-product ovens must be employed. The gas given off by retort coke ovens varies in heating value at different stages of the process of coking the coal. According to tests made on retort-oven gas from Cape Breton coal, the heating value increased during the first three hours from 690 to 770 B T U per cubic foot, then it decreased for 18 hours to 630 B T U, and then more steadily for 12 hours to 340 B T U. There is a wide field for the use of coke-retort gases for fuel, but it has been only slightly worked. *Water gas* is produced where steam is blown into a bed of white-hot coke; it consists of equal volumes of carbon monoxide and hydrogen or by weight of 28 parts of carbon monoxide and 2 parts of hydrogen. The heating value of pure water gas is by calculation 343 B T U per cubic foot. Thirty years or so ago there was much hope that water gas could be manufactured and sold extensively as a fuel, but none of the plants established then or since have been commercially successful. It has, however, a field of usefulness in small furnaces in manufacturing plants and in gas engines. Water gas enriched by hydrocarbon gases from petroleum or gas coal has had great success as an illuminant, and is also much used for domestic stoves and cooking ranges and in certain

of the arts where its convenience counterbalances its cost. See GAS, ILLUMINATING AND FUEL.

Producer gas, or air gas, is a mixed gas containing carbonic oxide and hydrogen compounds and is formed by the incomplete combustion of coal in special retorts or producers. There are a number of producer-gas processes, and the principal ones with the heating values of these products per cubic foot are as follows: Mond, 155 B T U, Siemens, 134½ B T U, Dawson, 160 B T U, Lencauchez, 207 B T U. *Retort gas*, or coal gas, is gas made by distilling coal in closed retorts heated by coke burning beneath them. Before the advent of water gas, illuminating gas was produced by this process. A typical analysis of coal gas given by Dr. Gideon E. Moore shows a heating value of 642 B T U per cubic foot. *Oil gas* is gas made by decomposing oil, usually petroleum or its derivatives, by means of heat or steam or by steam and air. Pintsch gas, which is so extensively used for car lighting, is, e.g., made by allowing the oil to fall drop by drop on a highly heated surface, and it has a heating value of about 1320 B T U per cubic foot. Oil gases resulting from a less perfect process range in heating value in the neighborhood of 870 B T U per cubic foot. *Natural gas* varies in composition and in heating value. The best kinds generally range between 900 and 1100 B T U in value and the poorest kinds fall as low as 400 B T U. Natural gas has been used extensively for domestic purposes, steam making, glass manufacture, iron making, brick making, and for numerous other purposes. Its cheapness has until very recently encouraged wasteful use, with the result that in many places the available supply remaining is very limited. For the uses of gas and gaseous fuels for power directly in a motor cylinder, see INTERNAL COMBUSTION ENGINES.

Economical Utilization of Fuel. The question of the economical use of fuel is one of ever-increasing importance and is receiving much study by engineers. A high authority, Prof. William Kent, has stated the conditions as follows: "A fair estimate of the average cost of coal to the consumer, including transportation charges, is \$2.50 per long ton, which would make the total fuel bill of the United States, in 1899, approximately \$562,757,560. A very large portion of this amount represents a kind of waste that may easily be prevented by means of well-known modern appliances, another portion is waste that is not preventable in the light of our present knowledge, a third is waste that might be saved by the use of appliances which are too expensive to be economically practicable, and a fourth portion is waste that may be saved under some circumstances and not under others. Examples of the first kind of waste—i.e., that which is easily preventable—are (1) the use of furnaces for burning soft coal under steam boilers, which are not well adapted to that kind of coal, (2) the discharge of exhaust steam into the atmosphere when all or a part of it might be utilized for heating purposes. An example of the second kind of waste—i.e., that which is not preventable with our present knowledge—is the heat losses in the condensing water of condensing engines and in the jacket water of gas engines. An example of the third kind of waste—i.e., that which may be saved by the use of expensive appliances—is that part of the heat lost in the chimney gases of steam boilers which might be saved by the use of an economizer.

An example of the fourth kind of waste, which is preventable under some conditions and not under others, is that of exhaust steam from engines in a factory or other building, which may be utilized for heating purposes in cold weather, but for which there is no use in warm weather."

To the general reader the phase of the subject which is of most direct practical interest is that referring to waste that may be easily prevented by the use of well-known modern appliances. First among these appliances comes the furnace, which if properly designed will insure practically perfect combustion, and if improperly designed will cause a very serious waste of heat-producing fuel. Smokeless combustion of fuel, an important matter in cities, is simply a question of perfect combustion. The second kind of preventable waste—viz., the discharge of exhaust steam without extracting its useful heat—is less easy to handle. Among the means for saving this exhaust heat is the use of economizers and feed-water heaters.

A calculation of the possible saving to be accomplished by the use of an economizer has been made by Prof. Kent as follows: "Assume a boiler evaporation of 8 pounds of water per pound of coal and a production of 20 pounds of chimney gas per pound of coal, or 25 pounds of gas per pound of water evaporated. If the temperature of the furnace is 2150° F (a theoretical figure, assuming that there is no direct radiation from the fire to the boiler) and the flue gases are 600° F, the heat wasted in the flue gases will be $600 - 2150 = 28$ per cent. If by an economizer the temperature of the gases can be reduced to 300° F, half of this waste, or 14 per cent of the total heating value of the fuel, will be saved. The efficiency of the boiler alone will be 72 per cent and of the combined boiler and economizer 86 per cent. The gain in economy is $14 - 72 = 19.3$ per cent. The gain of heat per pound of gas is $300 \times \text{specific heat } 0.24 = 72$ B T U, and per pound of water evaporated $72 \times 25 = 180$ B T U. Also, suppose the feed water is supplied to the economizer at 100° F and the steam pressure is 150-pound gauge, corresponding to a temperature of 358° F, and 1213 B T U per pound above 0° F. The heat furnished to the water by the boiler and economizer will be $1213 - 100 = 1113$ B T U, of which 180 B T U is supplied by the economizer and 933 by the boiler. The gain in economy is $180 - 933 = 19.4$ per cent—a percentage quite possible in practice, provided that there is sufficient heating surface in the economizer and that the feed-water temperature is 100° F, with the gas as hot as 600° F."

After economizers comes the use of steam superheaters. The economy gained by superheating is stated to be from 15 to 20 per cent with the most economical forms of engines, when the steam is superheated 100° to 150° F. For many purposes the best method of utilizing coal is to convert it into gas and burn the gas in the furnace, or to grind it to dust and burn this dust. When all is said, however, the great desiderata in the economical use of fuel are a well-designed and suitable furnace, a similarly perfect boiler, and a well-trained crew of stokers intelligently supervised.

The literature on fuel and its economic utilization is extensive and widely scattered, but the following books will be found to meet all the ordinary requirements for information. William Kent, *Steam Boiler Economy* (New York, 1901);

Heiman Poole, *The Calorific Power of Fuels* (ib, 1903), F J Brislee, *An Introduction to the Study of Fuel* (London, 1912), J S Brame, *Fuel, Solid, Liquid and Gaseous* (New York, 1914). The following articles in this ENCYCLOPEDIA may also be consulted with advantage: COMBUSTION, COAL, CHARCOAL, GAS, INTERNAL-COMBUSTION ENGINES, PETROLEUM, COKE, FURNACE, BOILER.

FUEL FOR SHIPS. While coal remains—and is likely always to remain—the principal fuel for steam vessels, oil has become a very important competitor, while it is also, in the internal-combustion engines of the Diesel type, displacing to some extent both coal and boilers.

Crude oil varies greatly in character. The heavy, black, viscous oils of the Mexican fields contain a considerable percentage of asphalt and sulphur, the Texas and Pacific coast oils are less viscous and contain a smaller percentage of these substances, the oils of Oklahoma, Kansas, Louisiana, Colorado, and Wyoming show practically no asphalt and very little sulphur, the Pennsylvania, West Virginia, Ohio, and Indiana oils are the most fluid of all and are free from asphalt and, except in certain districts, from sulphur.

Nearly all crude oil can be used for fuel. If it contains very little sulphur or asphalt, it is suitable for heavy oil engines of the Diesel type. Crude oil is not, however, much used for either of these purposes and the reasons are two. First, the presence of the more volatile oils renders storage dangerous, and second, these light oils have much greater value when separated.

The total production of crude oil in the United States in 1911 and 1912 was about 220,000,000 barrels per annum. Under former methods of refining and distillation this would have yielded about as follows: gasoline, 20,000,000 barrels, kerosene, 65,000,000, gas oil, 20,000,000, lubricating oil, 20,000,000, fuel oil, 80,000,000, paraffin, coke, and loss, 15,000,000. Improved methods of refining and the constantly increasing demand for gasoline will probably increase that product to 25,000,000 barrels or more. The amounts of kerosene, gas oil, and lubricating oil are likely to remain about as given. Fuel oil will be reduced, at one end by removal of remaining light oils and at the other by slightly increased amounts of paraffin and coke. The resulting product would be rather heavy, and in such cases some of the gas oil would be added to secure the necessary fluidity.

The Mexican oils have a very much smaller content of gasoline and kerosene and a very much larger one of fuel oil. So that it is to them we shall look to supply the greater part of the oil fuel and a large part at least of the oil for Diesel engines. Oil for both these purposes must be sufficiently fluid to flow readily. For fuel it must not clog the burners, and for the engines it must burn without undue deposit of carbon.

The advantages of oil over coal as a fuel are reduced weight of boiler, reduced size of fire rooms, greatly reduced force of firemen, increased facility of bringing fuel to the fires from considerable distances, ease of maintenance of speed and quickness of attaining it, increased amount of space available for fuel, greater radius of action of the ship, reduced time required to take on board fuel, facility of transshipping at sea through flexible piping or hose, ab-

sence of ashes, ash-hoisting or ash-ejecting machinery, and all expense and trouble connected with ashes. When oil is burned, the amount of smoke given out can be very exactly controlled, a most desirable feature for naval vessels in war time. A further advantage of oil is that it preserves the metal of the compartments in which it is carried, while coal bunkers require frequent scaling and painting. These advantages are not only such as have value in naval war, but they largely offset the greater prime cost of oil in determining the total cost of propulsion per horse power, so that under certain conditions oil fuel is economical for merchant ships.

The chief objections to the use of oil fuel are its cost, uncertainty of supply in great quantities, and lack of supply in many parts of the world. Consult F J Brislee, *An Introduction to the Study of Fuel* (London, 1912), and J S. Brame, *Fuel, Solid, Liquid, and Gaseous* (New York, 1914). See PETROLEUM, FUEL SHIP, NAVAL, COAL, COALING SHIP.

FUEL SHIP, NAVAL. In the United States navy the vessels of the fleet are, except when in certain home ports, supplied with coal and fuel oil by fuel ships. The later vessels of this type are of great capacity (10,500 tons of cargo coal, 1000 to 2000 tons of fuel oil, 2200 tons of bunker coal), and having a speed of 14.5 knots, they are able to accompany the fleet when proceeding at ordinary cruising speed. When it is not practicable for them to cruise with the fleet they are sent to meet it at predetermined points. The use of radio (wireless) telegraphy greatly facilitates such plans and enables change of the point of meeting to be effected, if that be necessary.

The new fuel ships resemble in some respects the cargo steamers of the Great Lakes, having their engines and boilers in the stern and their stores in the bow, the intervening holds being reserved for coal and oil. This facilitates discharge and loading. They are fitted with coaling gear capable of delivering 1200 tons per hour, all to a single vessel or to two vessels, one on each side. This gear is supported by a high steel framework extending the full length of the hold spaces. The coal is lifted out of the hold by means of clamshell dredge buckets. When the loaded bucket reaches a point about 20 feet above the deck, it is drawn out on a heavy wire rope on which it is supported by a trolley. The outer end of the wire rope is held in position over the deck of the man of war by means of an adjustable arm supported by the framework of the fuel ship. When over the proper point for discharging, the bucket is lowered and the coal dumped. Fuel oil is pumped on board the warship through suitable hose. All recently built destroyers and some new battleships are fitted to use only oil as fuel. Other new battleships use both coal and oil. Very few navies have specially built fuel ships. They rely upon coaling stations or vessels of their mercantile marines. See COALING SHIP, FUEL FOR SHIPS.

FUENTE OVEJUNA, fwān'tá-ō-vā-hoo'ná. A town in the Province of Cordova, Spain, 45 miles northwest of the city of Cordova (Map. Spain, C 3). It is situated in a well-watered agricultural region. In the surrounding country are deposits of argenteriferous lead, calcite, and building stone. The town manufactures leather, soap, flour, bricks, and tile. The curing of meat is

an important industry, owing to the number of cattle. There is abundant trade in wheat, wine, fruit, and honey. The parish church occupies the site of the palace of the Knights of Calatrava, to whom the village was granted by Henry III in 1430. Some authorities maintain that Fuentovejuna is the ancient Mellaria (named from the abundance of honey). Pop, 1900, 11,777, 1910, 13,470.

FUENTERRABIA, fwān'tēr-rā-bē'a, or **FONTARABIA**. A town in the Province of Guipúzcoa, on the French frontier of Spain, about 10 miles east-northeast of San Sebastián, on the river Bidassoa, near its mouth (Map Spain, E 1). It is built on a hill and retains much of the picturesque interest of a ruined mediæval town, though outside of the walls a modern quarter for summer colonists, who come here in increasing numbers, has grown since 1900. It has a castle dating from the tenth century, a pretentious town hall, and many curiously gabled houses. The municipal archives contain valuable records. Magdalena, situated in the vicinity, is a popular watering place. The fisheries constitute an important industry, there is some coastwise trade, and particularly in the new quarter manufactures of rope, nets, flour, lumber, railway supplies, and paper flourish. Pop, 1900, 4,422, 1910, 4,976. Owing to its position on the French frontier, Fuenterrabia has been the scene of many conflicts, not the least famous of which was when the Prince of Condé was repulsed in 1638. The town was fortified towards the close of the twelfth century, captured in 1794 by the French, and its works were destroyed. In 1813 the Duke of Wellington crossed the Bidassoa near Fuenterrabia in spite of the opposition of the French under Marshal Soult. The town played a part also in the Carlist wars of the nineteenth century. Latin inscriptions found in the vicinity gave basis to the theory that this locality was known to the Romans as Fons Rapidus.

FUENTES, fwān'tās, or **FORTE**, fōn'tā, **BARTOLOME**. A Spanish or Portuguese navigator, who is said to have discovered in 1640 a passage uniting the Atlantic and Pacific oceans north of the American continent. An account of this voyage first appeared in a letter published in the *Monthly Miscellany* (London, 1708), but doubt has been cast upon its authenticity, and by many Fuentes is believed to have been a fictitious personage. The mystery attaching to the affair has led to considerable discussion among scholars. Vancouver admitted the possibility of the discoveries of Fuentes. The real or fictitious discoveries assigned to this navigator have been treated in a number of works published in Paris and in London and notably in the book entitled *The Great Probability of a Northwest Passage, Deduced from Observations on the Letter of Admiral del Fonte* (1761).

FUENTES, DON PEDRO HENRIQUEZ D'AZEVEDO, CONDE DE (c 1535-1610). A Spanish soldier and statesman, born at Zamora. He served in the Netherlands and under Alba in Portugal, where he commanded the Spanish army in 1589 and defended Lisbon with complete success against the English. From 1591 to 1596 he was civil and military assistant to the royal governors in the Netherlands. About 1600 he was appointed captain general and Governor at Milan, where he was incessantly busied with crafty political manœuvres. He has often been confused with another of the name (known to

the French as *Fontaines*) who fell at his defeat by the Duc d'Enghien, near Rocroi (May 19, 1643). Consult the life by Duro (Madrid, 1884), and Julio Fuentes, *El Conde de Fuentes y su tiempo. Estudios de Historia Militar* (Siglos XVI á XVII) (ib., 1908).

FUENTES DE OÑORO, fwān'tās dā ō-nyō'rō. A village of Spain, on the Portuguese border, 14 miles west of Ciudad Rodrigo. It is celebrated as the scene of a battle between Wellington and the French under Masséna and Bessières, May 3, 1811. The French, by a furious charge, twice drove back the British lines, but each time the latter, at the point of the bayonet, regained the lost ground. When night came on, Masséna retreated, with the loss of about 1000 men. The battle, indecisive in itself, served to keep the French out of Portugal and encouraged the English at home. Pop. about 1200.

FUERO, fwā'rō (Sp., jurisdiction). A term variously applied in Spain to special jurisdictions of privileged classes, municipal charters, and provincial and general codes.

1 **Special Fueros**. In the development of legal procedure in Spain during the Middle Ages, certain classes came to be subjected to special jurisdictions, laws, and procedure, known as *fueros*. Thus, there were the ecclesiastical, military, naval, commercial, and other *fueros*, to which these privileged classes were severally subjected in civil and criminal matters. By a decree of Dec 6, 1868, and others of later dates, these special *fueros* were abolished, and the members of these classes were placed under the ordinary tribunals, with the exception that certain necessary disciplinary powers were left to the Church, the army, and the navy.

2 **Municipal Fueros**. The most common use of the term "*fuero*" is to designate the charters and privileges, dealing with civil and criminal as well as economic and administrative matters, which were granted to the municipalities by the kings and the nobles during the Middle Ages. The Moorish conquest destroyed the unity of the old Visigothic code, and as the reconquest went on there arose need for the concession of special privileges to those who undertook the protection of the newly acquired territory. The municipal *fueros* then grew up as the product of the ancient Gothic code and the new circumstances under which its laws were applied. The earliest grants date from the eighth century, they become common in the eleventh, and few are found after the fourteenth century. In many cases the *fuero* of one town was applied to another. In all, over 800 municipal *fueros* were granted, some of the more noted are the *fueros* of León granted by Alfonso V (1020), Nájera by Sancho the Great and confirmed by Alfonso VI (1076), Sepúlveda (1076), Logroño (1095), and Toledo (1118). The essential elements of every municipal *fuero* were exemptions from taxation and the grant of special privileges. However, the *fueros* offer a collection of administrative as well as civil and criminal dispositions designed to satisfy the necessities of the towns. For example, the *Fuero* of León consists of 48 or 49 sections, the first seven of which refer to ecclesiastical matters, sections 8 to 20 are the regulations regarding civil matters, while sections 21 and following provide for the special privileges, including a right of asylum and exemptions from taxation. These *fueros* were largely suppressed by the

legislation of Alfonso the Learned (1252-75), which was made effective in the following century

3 Provincial Fueros. A natural development in legislation was the extension of these local fueros over more extensive regions and their transformation, by virtue of the general law of custom, into constitutional rights of the kingdoms or provinces. In time, under the influence of the introduction of the representative element of the Cortes, these charters were collected in the various kingdoms of Spain into general codes, which were confirmed from time to time by the petty monarchs. This gradual development, involving a struggle between the princes and the people, forms an interesting chapter in the history of modern constitutionalism. In this manner were developed the fueros of Navarre, of the Basque provinces of Vizcaya, Alava, and Guipúzcoa, of Catalonia, Aragon, and Valencia. These provincial fueros were based upon the old Visigothic laws, as well as upon the local charters, and grew up in the period between the irruption of the Moors into the Spanish peninsula and the consolidation of the Spanish monarchy under the Hapsburg house. Thus, the fueros of Navarre, which had been multiplied during centuries, are considered to have been collected and recorded in 1237, under the title of *Cartulario del rey Tibaldo*, as a result of the contest between Theobald I and his Cortes. However, it is probable that the compilation was really of a later date, though it is usually held to be earlier than the reform of 1330. Ferdinand the Catholic, who united Navarre with the crown of Castile, maintained the fueros, adapting them to the new relations existing with Castile. According to the fueros of Navarre the Cortes, chosen for three years, and consisting of the three estates of clergy, nobles, and commons, met yearly, and without their consent no law could be passed or anything of importance undertaken. The government consisted of the Viceroy, who presided in the Cortes and Great Council, the Great Council of Navarre, a body similar to the old French parlements, and the *contaduría*, before which all accounts of revenue and expenditure were laid. There was no customhouse or toll but at the frontier, and, except the trifling grant of 176,000 reals, nothing flowed into the royal treasury. The King took an oath to respect and maintain these fueros.

In the Lordship (*señorío*) of Vizcaya there was the same development—first the grant of local fueros and then the formation of a general fuero through the struggle of the inhabitants with their counts. It was not till 1452 that the customs of Vizcaya were formed into a fuero general and confirmed by the King of Castile. After the final union of Vizcaya with Castile the code was recast, completed, and confirmed by King Charles I (Emperor Charles V) and published under the title *Fueros, privilegios, franquezas, y libertades del muy noble y muy leal señorío de Vizcaya*. According to this charter of rights every new "lord"—this being the title given by the Biscayans to the King of Spain as their Prince—on attaining the age of 14, must come into the country within a year and in certain places appointed for that purpose take the oath to uphold the fueros. The government consisted of a *corregidor*, appointed by the "lord," and two deputies, and these, aided by six *regidores* and forming the *regimiento*, con-

ducted the administration. The supreme power resided in the General Assembly (*junta general*) which met yearly under the tree at Guernica, regulated all the affairs of the lordship, and appointed the deputies and *regidores*. Justice was administered, in the first instance, by the lieutenants (*tenientes*) of the *Corregidor*, in the second by the *Corregidor* and his deputies, and in the third, by the royal court at Valladolid. Other privileges were, that every Biscayan of pure blood was counted noble, that except the post office there was to be no royal governing board in the province, that Biscayans were not bound to serve in the Spanish army. The fueros of Alava and Guipúzcoa were of analogous origin and character, but differed in details. It was on behalf of these fueros that the Basque Provinces fought in the Carlist wars. They were abolished in 1837, restored in 1839, and confirmed with modifications in 1841 and 1844. In 1876 a law abolishing the Basque fueros was adopted, and in 1878 a decree was passed assimilating the administration of the Basque Provinces to that of the rest of Spain.

A similar development took place in Catalonia, Aragon, and Valencia. The fueros of Catalonia were first collected and confirmed by Ramón Berenguer (1068), those of Aragon by Sancho Ramírez (1071), and those of Valencia, by Jaime I (1239). These, with later modifications and confirmations, were the law of these kingdoms till Philip V abolished them in 1707 and made the provinces subject to the laws of Castile. Later the fueros of Catalonia and Aragon were restored in part and so remained till the nineteenth century.

4 General Fueros. The first general fuero of Spain was the *Fuero Juzgo*, a codification of the existing chaotic laws, made during the reign of Chindaswinth (642-649). Its purpose was to unify legislation and by so doing to wipe out the distinctions between the conquerors and the conquered. Its provisions were taken from the older codes, especially the Roman, from the decisions of councils, and from the decrees and laws of the Visigothic kings. The *Fuero Juzgo* consists of 12 books, divided into titles and laws. The subject matter of the books is as follows: I. Legislation, its effects and circumstances, II. Purpose of the code and judicial procedure, III. Civil code, IV. Relationships, V. Ecclesiastical matters, VI. Accusations and criminals, VII. Robbery and deception, VIII. Coercion and injuries, IX. Fugitives and refugees, X. Land, XI. The sick, dead, and merchants in foreign trade, XII. Conduct of the judges, heretics, and Jews. It is a code "without parallel in the annals of jurisprudence." Consult Scott, *History of the Moorish Empire in Europe* (Philadelphia, 1904).

After the coming of the Moors, which largely destroyed the force of the *Fuero Juzgo*, no attempt at a general codification was made till the time of Alfonso the Learned, who issued among other codes the *Fuero Real* (1254). It is divided into four books, the first deals with the Catholic faith, contracts, and obligations, the second, with judicial procedure, the third presents a civil code, and the fourth treats of criminal legislation.

FUERO, JOAQUIN (1814-67) A Mexican soldier He was born at Guadalupe Hidalgo and was educated at the Military College of Segovia, at which he subsequently became professor and vice president After suppressing the insurrection of 1840 he was, in 1843, appointed chief of staff of the army division in Tamaulipas and also fought with distinction in the war with the United States, receiving a wound from which he ultimately died Besides a Spanish translation of General Makena's *Treatise on Military Tactics*, he published a *Manual del militar, ó tratado completo de instrucción en la ordenanza* (1842)

FUERTES, fwâr'tas, ESTEVAN ANTONIO (1838-1903) An American civil engineer and educator, born at San Juan, Porto Rico He took the degrees of A B and Ph D from the Conciliar College of San Ildefonso, at Salamanca, Spain, and of civil engineering at the Rensselaer Polytechnic Institute, Troy, N Y, the latter in 1861 From 1861 to 1863 he was first an assistant engineer in the Department of Public Works and later director of public works for the western district of the island of Porto Rico In 1863 and 1864 he was assistant engineer, and from 1864 to 1869 engineer, on the Croton Aqueduct Board In 1870-71 he was engineer in chief of the United States expedition to Tehuantepec and Nicaragua, to investigate the practicability of a trans-Isthmian ship canal He became dean of the department of civil engineering in Cornell University in 1873, and from 1890 to 1902 was director of the college of civil engineering and obtained for Cornell an excellent special equipment for this work On retiring from this position he was made professor of astronomy at Cornell and spent the last months of his life supervising the completion of the A C Barnes Observatory Among other undertakings as a consulting engineer, he was engaged on a drainage system for Santos, Brazil He was a member of the American Society of Civil Engineers, the Société d'Ingenieurs de France, and other learned organizations, and published numerous scientific articles and reports He was notably enthusiastic, energetic, and courteous

FUERTES, JAMES HILLHOUSE (1863-) An American hydraulic and sanitary engineer, born at Ponce Porto Rico, son of Prof E A Fuertes He planned and constructed various engineering works for the drainage, sewerage, water purification, and water supply of cities in Brazil, Canada, and the United States, and served as a consulting engineer of various corporations and municipalities He is author of *Water and Public Health* (1897), *Water Filtration Works* (1901), and articles in the *Engineering Record*

FUERTES, LOUIS AGASSIZ (1874-1927) An American painter of birds and an illustrator, son of Prof. E. A. Fuertes He was born at

Ithaca, N Y, and graduated from Cornell University in 1897 His habitat bird groups in the American Museum of Natural History are one of the most attractive features of the institution He made 25 decorative panels for F F Brewster, of New Haven, Conn., illustrated *Birding on a Broncho* (1896), *Citizen Bird* (1897), *Song Birds and Water Fowl* (1897), *Birdcraft* (1897), *The Woodpeckers* (1901), *Second Book of Birds* (1901), *Birds of the Rockies* (1902), *Handbook of Birds of Western United States* (1902), Coues's *Key to North American Birds* (1903), *Handbook of Birds of Eastern United States, Upland Game Birds* (1902), *Waterfowl* (1903), and *Birds of New York* (1910), and prepared plates for the *Report of the New York Game, Forest, and Fish Commission* in 1903

FUERTEVENTURA, fwâr'ta-vên-tōō'ra One of the Canary Islands (q v), situated north of Grand Canary and south of Lanzarote, across the Straits of Bacayna (Map Spain, G 4) Area, 665 square miles There are a number of extinct volcanoes, with a maximum elevation reaching 2700 feet The soil is only slightly productive, the larger portion being best adapted for grazing Only a few fruit and nut trees survive in this climate The annual rainfall is extraordinarily slight The chief products are figs, olives, almonds, chalk, and gypsum, there are thriving fisheries Pop, 1900, 11,662, 1910, 12,960 Cabras, on the east coast, has a good harbor Capital, Betancuria Pop, 1910, 673

FUESSLI, füs'le, or FUSSLI A Swiss family, originally from Zurich, several members of which were artists—MATTHIAS, called The Old (1598-1665), the first engraver painter of the family, studied in Italy and produced some excellent battle pictures and portraits—His son and pupil, JOHANN KASPAR (1707-82), also an artist, painted portraits, but is celebrated for his work on Swiss artists, *Geschichte und Abbildungen der besten Künstler in der Schweiz* (1769-79)—His son, JOHANN HEINRICH (1741-1825), born at Zurich, and called in England Henry Fuseli, after traveling in Germany came to England about 1763 and first tried a literary career, but was encouraged by Sir Joshua Reynolds to devote himself to painting He studied in London and Italy and finally made his home in London, where he first attracted attention in 1782 with his painting "The Nightmare" In 1786 he painted a series of pictures illustrating Shakespeare, of which the best is perhaps "Titania and Bottom," in the National Gallery, London, and these were followed in 1799 by 47 paintings illustrating Milton's poems His powerful imagination makes these curious works, often purely metaphysical, very interesting, for he possessed a strong sense of the grotesque and undoubted poetic power, but his action is exaggerated, he was not a colorist, and he never considered the factor of beauty He left about 800 drawings and sketches which are often more characteristic than his paintings As professor of painting in the Royal Academy, he delivered lectures on art, which were in many ways remarkable Twelve of his lectures were published in 1801-20 Consult his biography by Knowles, who also edited his works (London, 1831)

FUGA, fōō'ga, FERDINANDO (1699-1784) A prominent Italian architect of the baroque period, born in Florence in 1699 He worked principally at Rome, where his masterpieces are the Corsini Palace and the exterior of the basilica of Santa Maria Maggiore He then

went to southern Italy, and died while engaged in reconstructing the cathedral of Palermo

FUGATO, fū-ga'tō (It, p p of *fugare*, to put to flight) A passage consisting of fugal imitations Only the entrances of the several voices are given After the first development is completed the composition continues in the free style See **FUGUE**

FUGER, fu'g'er, HEINRICH (1751-1818). A German historical painter, born at Heilbronn, Württemberg He was a pupil of Gubal in Stuttgart and of Oeser in Leipzig Afterward he traveled, and spent some time in Rome and Naples, where he painted frescoes in the Palazzo Caserta On his return to Vienna he was appointed court painter, professor and vice director of the Academy, and in 1806 director of the Belvedere Gallery Among his historical paintings are "The Farewell of Coriolanus" (Czernin Gallery, Vienna), "Allegory on Peace" (1801), and four other canvases in the Vienna Gallery, "Bathsheba" (Budapest Gallery), and among his portraits those of the Emperor Joseph II, the Grand Duchess Elizabeth, Queen Caroline of Naples, and Lord Nelson (National Portrait Gallery, London) He painted in the classic style of David and Mengs and was inclined to be theatrical

FUGGER, fug'g'er A German family of Augsburg, important in continental financial history—The founder of the family was JOHANN FUGGER, master weaver in Graben, near Augsburg, about the middle of the fourteenth century, who married Marie Meissner of Kirchheim—His eldest son, JOHANN, acquired by marriage in 1370 the freedom of Augsburg and began to carry on a trade in linen together with weaving By a second marriage in 1382, with the daughter of a counselor, he had two sons and four daughters This Johann Fugger was one of the council of twelve (*Die Zwölfer*), in the weaving guild, and an assessor of the famous *Vehmgericht*, or secret tribunal of Westphalia He died in 1409 and left a considerable fortune—His eldest son, ANDREAS, made such good use of his share of the inheritance that he was known as "the rich Fugger" He founded a noble line, which died out in 1583—Johann's second son, JAKOB, who died in 1469, was the first of the Fuggers who had a house in Augsburg and carried on an extensive commerce—Of his seven sons, three, ULRICH, GEORG, and JAKOB II, by industry, ability, and integrity, as well as by their inheritance, laid the foundation of the princely prosperity of the family Its members married into the noblest houses and were raised by the Emperor Frederick III to the rank of nobles The Emperor Maximilian mortgaged to them, for 70,000 gulden, the County of Kirchberg and the Lordship of Weissenhorn and received from them afterward, through the mediation of Pope Julius II, 170,000 ducats to assist him in carrying on the war against Venice—ULRICH (1441-1510) devoted himself specially to commerce with Austria, and there was hardly an object that did not enter into his speculations—JAKOB (1459-1525) engaged in mining, he farmed the mines in Tirol and accumulated immense wealth, he lent to the Archduke of Austria 150,000 gulden and built the magnificent castle of Fuggerau in Carinthia Under Charles V the house attained its greatest splendor, because it was chiefly through the Fugger gulden that he was elected Emperor Jakob having died childless, and the family of Ulrich

being also extinct, the fortune of the house rested with the sons of Georg (died 1506), one of whom MARKUS, entered the Church—The two younger, RAIMUND and ANTONIUS, carried on the business and became the founders of the two chief and still flourishing lines of the house of Fugger The two brothers were zealous Catholics and with their wealth supported Eck in his opposition to Luther During the Diet held by Charles V at Augsburg, in 1530, the Emperor lived in Antonius Fugger's splendid house on the Weinmarkt On this occasion he raised both brothers to the rank of counts and invested them in full sovereignty with the still mortgaged properties of Kirchberg and Weissenhorn, and a letter under the Imperial seal conferred on them the rights of princes In 1535 they received the right of coining money Antonius, at his death (1560), left 6,000,000 gold crowns in ready money, besides jewels and possessions in all parts of Europe, Asia, and America Ferdinand II confirmed the Imperial letter of Charles V and conferred additional privileges on the family The Fuggers continued to carry on commerce, attained the highest posts in the Empire, and several princely houses prided themselves on their alliance with the house of Fugger They possessed the most extensive libraries and collections of art, maintained painters and musicians, and liberally encouraged art and science Ulrich, Georg, and Jakob, the sons of the first Jakob, bought houses in one of the suburbs of Augsburg, pulled them down, and built 108 smaller houses, which they let to poor citizens at a low rent This was the origin of the Fugerei, which still remains under the same name, with its own walls and gates Many other benevolent institutions were set on foot by Antonius and his sons The race is continued in the two principal lines of Raimund and Antonius, besides collateral branches, all of whom are hereditary members of the Upper House of Bavaria, where the chief domains are A collection of portraits of the most important members of this great house, executed by Dominicus Custos, of Antwerp, appeared at Augsburg (1593 et seq) This collection, increased to 127, with genealogies written in Latin, was republished by the brothers Kilian (Augsburg, 1618), and in 1754 a new edition of the work, still further improved, and containing 139 portraits, was published at Ulm, under the title *Pinacotheca Fuggerorum* Consult Stauber, *Das Haus Fugger von seinen Anfängen bis zur Gegenwart* (Augsburg, 1900), and Jansen, *Studien zur Fugger-geschichte* (Leipzig, 1907)

FUGHETTA, fū-gēt'ta A miniature fugue, following in all essentials the laws of a regular fugue The dimensions of all the development sections are reduced, and the more complicated portions, such as strettas and organ points, are omitted See **FUGUE**

FUGITIVE SLAVE LAW In the history of the United States, the name of two statutes enacted for the purpose of securing to the slave owners their rights in slaves who had escaped from the State in which they were held in servitude Such statutes were directed to the enforcement of Art IV, Sec 2 of the Constitution, which provides that "persons held to service or labor in one State, under the laws thereof," escaping into another, "shall be delivered up on claim of the party to whom such service or labor may be due" This is generally supposed to have been suggested by a fugitive-

slave clause in the Articles of the Confederation of the New England Confederation of 1643. The existence of slavery depended entirely upon the sanction of State laws and could in no way be affected by Federal laws. If, however, slavery was merely a status dependent upon positive enactment, such status ceased when the slave entered a State where slavery was prohibited. On the other hand, if the master's right in the slave was a property right, the situation was quite different. Property rights were defined by State laws, and the protection of such property rights in all other States was guaranteed by the Federal Constitution. Upon the 'property' theory of slavery, it was thus possible to pass such an enactment as that of Feb. 12, 1793. This gave the owner or supposed owner of a fugitive slave the right to seize the alleged fugitive, to take him before any Federal judge or certain local magistrates, and, upon satisfying the judge or magistrates of his ownership, to secure a warrant for removing the slave, or alleged slave, to the State of the owner's domicile. There was no provision for a jury in this preliminary trial, the warrant might be secured upon the testimony of the owner alone, and a heavy fine was imposed for obstructing the owner or rescuing or concealing the alleged fugitive. The rigor of the act gave opportunity for considerable laxity in its enforcement, and as soon as the controversy over slavery became acute, efforts were made to amend the act or to nullify its effect. A way towards the latter end seemed to be opened by the decision in 1842 of the Supreme Court in the case of *Prigg* against Pennsylvania, in which it was held that the duty of enforcing the statute rested solely upon the Federal authorities. Thereupon various States passed laws prohibiting State officials from assisting in the enforcement of this Federal statute and forbidding the use of State jails for such a purpose.

The continued and vigorous demands of the South for a more complete recognition of its rights led to the inclusion in the Compromise Measures of 1850 (qv) of a new Fugitive Slave Law, the Statute of Sept. 18, 1850. This included many features of the old act and in addition provided for certain commissioners, with jurisdiction concurrent with that of the courts, who received a larger fee in case they decided in favor of the claimant than if they decided in favor of the fugitive. Ex parte testimony was sufficient to determine even the identity of the fugitive, the testimony of the alleged slave was expressly barred, and he was denied a jury trial, even after being returned to the State whence he had fled. The enforcement of the law was placed wholly in the hands of Federal officials, and heavier penalties were imposed upon violators of the law. The extreme antislavery element in the Northern States soon forced the issue by refusing to recognize the "finality" of the Compromise of 1850 and by securing the passage of the so-called "personal liberty" laws. These prescribed heavy penalties for the seizure of free persons, forbade State officials to aid in enforcing the Federal act, and provided that the fugitive should be entitled to a writ of habeas corpus and to a trial by jury. Other requirements of the State laws served to minimize the effect of the Federal statute and in some cases almost to nullify it. Ten States passed such laws and thus afforded the South an available ground of complaint. The second Fugitive Slave

Law was finally repealed on June 28, 1864. Consult McDougall, *Fugitive Slaves* (Boston, 1891), and Rhodes, *History of the United States from the Compromise of 1850*, vols. 1, II (New York, 1893). See SLAVERY. UNDERGROUND RAILWAY.

FUGLEMAN, fū'g'l-măn (from Ger *Flugelmann*, file leader, from *Flugel*, wing, file + *Mann*, man). A term more common in Europe than in the United States and used to denote a soldier posted a little in advance of the body of troops of which he is a part, to give the time to his fellows, in the execution of an order entailing more than one distinct movement. Fixing and unfixing bayonets and drawing or returning swords are instances in point. He is usually a flank man, hence the name.

FUGUE, fūg (Fr., from It *fuga*, fugue, flight, from Lat *fuga*, flight, from *fugere*, Gk *φύγειν*, *phugein*, to flee, Skt *bhu*, AS *būgan*, to bend). In music, the name of a composition wherein the parts do not all begin at once, but follow or pursue one another at certain distances, hence the name *fuga*, a flight or chase, each part successively taking up the subject or melody. Any voice may begin the fugue, but the others follow according to fixed rules. The *subject* is generally a few bars of melody, which is given out in the principal key by the voice which begins. The subject of a fugue should always be short—three or four bars—so that it impresses itself upon the memory and can be followed and distinguished in the course of the composition. Also, it must *never* be constructed periodically. (See FORM.) After the subject (*dux*) has been announced, the second voice repeats it a fifth above or a fourth below. It is then called the *answer* (*comes*). The first voice meanwhile proceeds with a counterpoint, as does every successive voice upon the completion of the fugue theme. This counterpoint, called *countersubject*, is constructed so as to afford the composer opportunities for ingenious contrapuntal combinations in the further development of the fugue. The third voice follows with the subject again in the principal key, but an octave higher or lower than the first voice, and is answered by the fourth voice in the same manner as the second voice answers the first. When the subject and answer have been introduced in all the parts, the first section, or first *development*, of the fugue is said to be completed, an episode of a few bars then follows, sometimes in its form like part of the subject, and with a modulation into a nearly related key. The subject and answer are again brought forward, but following in a different order from the first section, while at the same time all the parts are continued, and in some of them the original counterpoint appears either simply or inverted, the subject and answer forming the predominating idea throughout the whole composition.

This is the second development and is again followed by an episode. The greater the number of voices that are employed in a fugue, the greater will be the number of development sections. A four-part fugue admits of no less than 24 possible development sections, while in a five-part fugue the composer may use any number of developments out of a possible 120. In extended fugues the composer must exercise all his ingenuity on the episodes, otherwise the frequent repetitions of the development section will tire the hearer. Beginning with the third or

fourth development, the answer is often given in another interval than the fifth, so as to avoid monotony. Even transposition into other keys is permissible. Masters of the fugue sometimes give the answer in *inversion*, *augmentation*, or *diminution* (See the separate articles). The last development is generally an exhibition of

all the composer's contrapuntal art. Bach generally closes with a *stretto* (qv), where the subject and answer are crowded together, so that the latter begins before the former is completed. Often the *stretto* is elaborated over an organ point (qv). When the subject does not ex-

middle of the composition and afterward worked up with the first subject, it is then called a *fugue on two subjects*.

A *double fugue* begins at once with two subjects in different parts, both of which are strictly treated throughout.

There are also fugues with three subjects (*triple fugue*), a famous example is that in the finale of Mozart's C Major (Jupiter) Symphony. A *free fugue* is that in which the subject and counterpoint are not strictly treated throughout, but mixed up with episodes and ideas not connected with the subject. The fugue is not, as has been erroneously believed, a production of German genius. This form was gradually developed from the canonic tricks of the Dutch masters by the great Italian masters of the sixteenth and seventeenth centuries—Merulo, Frescobaldi, Pasquini. It reaches its highest development in the eighteenth century, in the works of Bach (instrumental) and Handel (vocal). Bach's fugues have never been equaled and are, in fact, musical problems of great

tend in compass beyond the half of an octave, the answer is invariably made in the other half, and, to avoid modulation out of the key, the progression of a fifth is answered by a fourth. A fugue consisting of one subject with a counterpoint throughout is called a *strict fugue*.

When a second subject is introduced in the

depth. He devoted a special work to the subject, *Die Kunst der Fuge* (1749). His *Inventionen* and *Das wohltemperirte Klavier* (1722) are necessary to every pianist, and his *Musikalisches Opfer*, elaborated on a theme given to him by Frederick the Great in 1747, are among his best examples. Handel ranks next to Bach.

Celebrated treatises on fugues are by Mattheson, Maipurg, Fux, Albrechtsberger, André, Marx, Lobe, Jadassohn, Cherubini, and Fétis

FUHCHOW, fū'chou' See FOCHOW

FU-HI, fū'he', or **FO-HI**, fō'hē' A legendary or semimythical chieftain of China, the first of the Wu-ti or "Five Rulers," who emerge in succession from the haze of the purely mythical period of Chinese history, and who were succeeded about 2356 B.C. by Yao, with whose reign the Chinese historical classic known as the *Shu-king* opens. The first year of his reign is usually placed in 2852 B.C.

Fu-hi is the reputed founder of the Chinese nation, and is said to have laid the foundations of civilization among a people who were still little better than beasts, eating raw flesh, clothed with the skins of wild animals, pairing promiscuously, and destitute of even the rudest arts of life. He taught them the arts of fishing, hunting, and pasturage, and instituted marriage, dividing the people into 100 families or clans, to which he gave a name, and ordaining that persons of the same clan should not intermarry, a custom observed in China to the present day.

His own surname was *Feng*, 'wind,' and his birth was miraculous, having been carried in his mother's womb for 12 years. Among many other things, he is reputed to have discovered the elements of writing on the back of a tortoise or dragon, which rose from the waters of the Yellow River. From thence he evolved the *Pa-kua* (q v), or 'eight trigrams,' which by combination and multiplication form the 64 hexagrams, on which is based the text of the *I-king*, the oldest book in China, and one of the five *King*, or classics. He died in 2738 B.C. and was succeeded by *Shen-nung*, the 'Divine Husbandman,' who introduced agriculture and continued the task of civilizing and uplifting his people. Consult Mayers, *Chinese Reader's Manual* (Shanghai, 1875), La Couperie, *Western Origin of the Early Chinese Civilization* (London, 1894), Legge, "The Yih-King," in *Sacred Books of the East*, vol. xvi (Oxford, 1882), Hirth, *The Ancient History of China* (New York, 1908).

FUHRICH, fu'rīk, JOSEPH VON (1800-76)

An Austrian painter and engraver. He was born at Kratzau, Bohemia, Feb. 9, 1800, and studied under Bergler at the Prague Academy, where he was greatly influenced by the literary works of Schlegel and Tieck. He designed 15 plates for the latter's *Genoveva* (1824) and went to Rome in 1827. In that city he joined the German Nazarenes, and while there collaborated with Overbeck, Veit, and Koch in painting the frescoes in the Villa Massimo, of which he painted the three representing scenes from Tasso's *Jerusalem Delivered*. Born and bred a country boy, Fuhrich felt the beauty and influence of landscape as a background to biblical subjects, and the study of Dürer made him lean towards the portrayal of patriarchal and idyllic scenes, like "Ruth and Boaz," "Jacob and Rachel." All his works are conceived in the spirit of Christian mysticism and show purity of form, grace of movement, and skill in composition and in treatment of drapery, but they lack true sentiment and feeling for color. In 1829 he returned to Prague, and in 1834 removed to Vienna, where he was appointed professor at the Academy in 1841. There he con-

tinued many of his important works, including a series of frescoes in the church of St. John Nepomuk (1844-46). For his fresco painted in the church of Altlerchenfeld, a work which occupied the years between 1854 and 1861, he was knighted and received the decoration of the Order of the Iron Crown. Among his paintings are the "Mourning Jews" (Gallery of Count Nostitz, Prague), "Christ on His Way to the Mount of Olives," "Peter's Draught of Fish," and "Mary's Journey over the Mountain" (Gallery of Vienna), his best work. Among his designs for woodcuts and steel engravings, which by many are considered finer than his paintings, are series illustrating the Psalter, Thomas à Kempis, and the Prodigal Son. His etchings include the "Lord's Prayer" (1826) and a cycle entitled the "Triumph of Christ" (1839). At the age of 71 he illustrated the legend of St. Gwendolen. Fuhrich died at Vienna, March 12, 1876. Consult his autobiography (Vienna, 1875), the monographs by his son Lucas (ib., 1886) and Dreger (ib., 1912), also Wornle, *Joseph Fuhrichs Werke* (ib., 1914), and Muther, *History of Modern Painting* (London, 1907).

FUJI-SAN, fō'jē-san' See FUJIYAMA

FUJITA SADUSAKI (1734-1807) One of the leading Japanese mathematicians of the eighteenth century. His original name was Honda Teiken and he was born in the Province of Musashi. He wrote several works, among them the *Seyō Sampō* (1779), which was devoted chiefly to algebra. His son, FUJITA KAGEN (1765-1821), was also a mathematician of some importance.

FUJIWARA, fō'jē-wa'ra The name of one of the most renowned noble families in Japan, eminent in civil affairs, as the Taira and Minamoto were in military, and the Tachibana were in religious affairs. The founder was Kamatari, Regent of the Empire 645-649 A.D., reputed to be the twenty-first in descent from his heavenly ancestor who served the great-grandfather of the first Mikado. The family was most powerful at court from the eighth to the twelfth century and down to the present time has been notably productive of statesmen, artists, poets, authors, scholars, historians, etc. (Consult Mentchikoff, *Empire du Japon* vol. 1, Geneva, 1881, for a list of these.) The present Empress of Japan is of the Fujiwara family, of the fortieth generation in descent from Kamatari, the founder, the eighteenth from Tadamitsu, the founder of the Kujo family.

FUJIYAMA, fō'jē-ya'ma (more correctly FUJI-NO-YAMA, or FUJI-SAN, frequently but incorrectly called FUSIYAMA) The celebrated mountain of Japan, in the Province of Suruga, 60 miles west of Tokyo, and visible from 14 provinces far out at sea, height, 12,395 feet (Map Japan, F 6). It is a volcano, with a crater 500 feet deep and about 2½ miles in circuit. Tradition says that it rose from the plain in a single night (285 B.C.), while at the same moment Lake Biwa (q v), near Kyoto, was formed. The last recorded eruption began Nov. 24, 1707, and lasted until January 22 of the following year. A hump called Hō-vei-zan (9400 feet), noticeable on its south side, was then produced. As the sacred mountain of Japan, it is annually frequented by many thousands of pilgrims from all parts of the Empire. Its summit may be reached by five different paths. Shrines and temples are numerous. Fuji-San is the focus of Japanese legend, the

frequent theme of the poet, and a familiar object in Japanese art. Consult Chamberlain, *Things Japanese* (London, 1892), Griffis, *The Mikado's Empire* (11th ed., 2 vols., New York, 1906), Satow and Hawes, *Handbook for Travelers in Central and Northern Japan* (Yokohama, 1881), and the ordinary books of travel.

FUKIEN, fōō'ki-ēn', or FŌ'KIEN, in the local dialect HOKIANG. A maritime province of China, bounded on the north by Chekiang, on the northwest and west by Kiangsi, on the south by Kuangtung, and on the east by the Formosa Channel, area, 46,320 square miles, pop., about 22,000,000, capital, Foochow (qv) (Map China, L 6). In 1886 Formosa (now belonging to Japan) was detached from it and made a separate province. Low ranges cross it from southwest to northeast, rising in heavily wooded slopes on the west border to 9000 feet. The only level alluvial tracts are found near the mouths of the Min and the Lung and their numerous tributaries. The soil is fertile and in a high state of cultivation, producing tea, rice, wheat, barley, sweet potatoes, indigo, sugar, etc. Quantities of timber are obtained from the mountainous districts of the interior and floated down the Min to Foochow, where it is transhipped to Shanghai and other ports. The manufactures are few. Tea is extensively grown and exported, and in May every year British vessels begin to load for England with the new harvest of black tea, most of which comes from the renowned Bohea hills on northern tributaries of the Min, near Kienning and Shauwu.

The Province of Fukien has long been noted for its production of porcelain. That produced in the Sung dynasty (960-1280) was originally made at Kien-an hien, and is described by an author of the eleventh century as being "invested with a soft black glaze flecked with lighter spots, like the fur of a hare." Fukien porcelain of the present day is white instead of black and is produced at the potteries of Te-hua, established in the early part of the Ming dynasty (1368-1644). This is the kind known to collectors as "blanc de Chine."

Fukien was the great centre of the early trade with the Arabs and Sumatra and is noted historically for its close relations with the Japanese and its stubborn resistance to Manchu rule. In our day it is noted for its reformers and progressives.

Its two treaty ports are Foochow and Amoy (qv). In 1899 another port, San Tu Ao (Samsah Inlet), farther north, was voluntarily opened to foreign trade by the Chinese authorities.

FUKUDA, fōō'kōō'da, Tokuzo (1874-). A Japanese educator, born in Tokyo and educated at the Commercial High School there. In 1897 he was sent by the Japanese government to study in Europe and, after several years at Munich, returned in 1901, became a teacher in the Commercial High School, and (1906) professor in the University of Tokyo. He wrote *Die gesellschaftliche und wirtschaftliche Entwicklung in Japan* (1900).

FUKUI, fōō'kōō'ē. The name of seven or more places in Japan, but especially of the chief city of the Province of Echizen and the ken or prefecture of the same name (Map Japan, E 5). It has a population exceeding 50,000. Fukui is situated on both sides of the Ashiwa River, 5 miles from the sea. The chief manufacture is habutai, a thin white silk, the production of which in recent years has reached a value of

over \$10,000,000. The city is clean and cheerful and has had a famous history. In the modern renaissance of the nation Fukui was one of the first educational centres, and it is at once the stronghold of Buddhism and the seat of thriving Christian missions. Consult Griffis, *The Japanese Nation in Evolution* (New York, 1911).

FUKUOKA, fōō'kōō-ō'ka. A prefectural town of Japan, situated on the north coast of Kiushiu, about 50 miles from Kokura (Map Japan, B 7). It has a number of fine streets, an old castle now occupied by a garrison, and a public garden. Pop., 1903, 71,047, 1908, 82,106.

FUKUSHIMA, fōō'kōō-shē'ma. A prefectural town of Japan, situated in the Province of Iwashira, 49 miles by rail from Sendai, and 168 miles from Tokyo (Map Japan, G 5). It is an important centre for trade in raw silk and cocoons. Pop., 1903, 27,233, 1908, 33,493.

FUKUYAMA, fōō'kōō-ya'ma. A seaport of Japan, situated at the southern end of the island of Yezo, over 60 miles from Hakodate (Map Japan, C 6). It was formerly the seat of the lords of Matsumai and was the chief outlet for the trade of Yezo. Since the abolition of feudalism the town has lost its commercial importance and has been superseded by Hakodate. It contains a number of interesting temples and has an estimated population of 15,000.

FUKUZAWA, fōō'kōō-za'wa, YUKICHI (1834-1901). A Japanese author and journalist, born in the Province of Buzen. Going to Yedo (Tokyo) in 1858, he was so fortunate as to be invited to accompany Awa Katsu in the first Japanese steamer that crossed the Pacific, remaining several months in the United States. In 1862 he accompanied a Japanese embassy to Europe and improved his opportunity while in London to purchase a library of foreign books and to improve his knowledge of English. In 1866 he published a work, the first of its kind, in several volumes, called *Sei Yō Jiyō* (Western Manners and Customs), which became immensely popular and probably did more than any other publication or event to turn the minds of the Japanese towards Western civilization. He again visited the United States and on his return was appointed an instructor in the Government College in Yedo, where he continued until the civil war in 1868. He then entered upon that systematic course of literary labor by which, through his books and his newspaper, the *Jin Shimpō*, he has influenced the reconstruction of Japanese literary style. He wrote on an amazing variety of subjects, criticizing old Japanese traditions, opinions, and customs, opened lecture halls, and helped to form the scholarly Méi Roku Sha, or Society of the Sixth Year of Méiji (1874). In 1898 the Emperor bestowed on him a gift of 50,000 yen. He died Feb. 3, 1901. His second son, Sutejuro, entered Yale in 1883 to study engineering and on his return to Japan in 1890 became manager of the *Jin Shimpō*. Consult Chamberlain, *Things Japanese* (London, 1891), Griffis, *The Japanese Nation in Evolution* (New York, 1911), Gulick, *Evolution of the Japanese* (ib., 1903), Lloyd, *Every-Day Japan* (London, 1911), Okuma, *Fifty Years of New Japan* (New York, 1909).

FULAH, fōō'la (or *Pulo*, pl *Fulbe*). An important Hamite-Negro people on the upper Senegal River in "Futa Toro and Futa Jallon in compact masses; elsewhere in scattered groups

from Senegambia east to Darfur and south to Adamawa." They are of good stature and light brown or copper color, having long heads (index 74.3), Caucasoid features, black and frizzled, but not woolly, hair, and negroid speech. According to Passarge, they strongly resemble the darker Berber populations of north Africa. There are four great branches of the Fulah, the *Jel*, the *Baa*, the *So*, and the *Beri*, and many tribes in each. Their name undergoes many changes in the mouths of their neighbors, being variously known as Fula (Mandingan), Fulaji, Fellani (Hausa), Fulata, Fellata (Kanuri), Fullan (Arab), Ufuf, Ifulan (southern Tuaregs), Afellen, Ifellen (northern Tuaregs), Peul, Poul (French), Fulah (English). In the term "Fulah-Zandeh" are sometimes included all peoples resulting from the mixing of Ethiopians with Sudanese negroes, extending from east to west across the whole of Africa over a belt of five to six degrees in width. Consult Passarge, section "Kamerun," in Hans Meyer, *Das deutsche Kolonialreich*, vol. 1 (Leipzig, 1909).

FULBERT, ful'bâr' (c.960-1028). A French bishop and scholar. He was a charity student in the school at Rheims under Gerbert and afterward was connected with the church of Chartres. Here he taught, and under his direction the schools of the Academy of Chartres attained a European reputation. In 1006 he was elected Bishop of Chartres. He caused the burned cathedral to be rebuilt (1020), and part of the present edifice dates from his episcopate. He was an active participant in the political affairs of the time and was on intimate terms with King Robert. His correspondence, discourses, and hymns are in volume 141 of the *Patrologia* of Migne. The letters are valuable history of those days and show the Bishop to have been a man of character and piety. Consult Pfister, *De Fulberti Carnotensis Episcopi Vita et Operibus* (Nancy, 1886).

FULCO. See FOULQUES.

FULDA, ful'da. An episcopal city, the capital of a district in the Prussian Province of Hesse-Nassau, situated on the river Fulda, 69 miles northeast of Frankfurt (Map Prussia, C 3). The most prominent buildings are the noble cathedral erected at the beginning of the eighteenth century in imitation of St Peter's in Rome and containing the remains of St Boniface, the church of St Michael, consecrated in 822; the old palace of the prince bishops, the former Benedictine convent, and a new and modern barracks. The town has a teachers' seminary and a school of military music. The Catholic gymnasium of Fulda is believed to be the oldest establishment of its kind in Germany and has a library of 40,000 volumes. The manufactures include different kinds of textiles, plush, leather, metal goods, farm machinery, musical instruments, soap, chemicals, vinegar, and other products. Fulda is an important cattle market and has large railway shops. Pop., 1900, 16,900, 1910, 22,487. The town is identified with the life of St Boniface, who founded an abbey here in 744. In the eighteenth century it was the seat of a university. It has belonged to Prussia since 1866.

FULDA, MONASTERY OF. One of the most famous of the Benedictine abbeys in Germany. It was founded in 744 by Boniface, the apostle of Germany, who desired to establish safe headquarters for further missionary efforts. A grant of the spot, with 4 miles of surrounding terri-

tory, was obtained from Kailmann, son of Charles Martel. Boniface superintended the clearing of the ground and erection of the building, while his disciple Sturm, destined to be the first abbot, spent a year in Italy, visiting the monasteries and studying the mode of life pursued at the celebrated Benedictine convent of Monte Cassino. The abbey soon became a centre of education and civilization for the surrounding tribes and for centuries maintained its position as a place of learning, to which, e.g., Alcuin looked for help in his great educational schemes. Many privileges were given to it, in 968 the abbot was made primate of the abbeys of Germany, and he was later created a prince of the Empire. But with the advance in influence and wealth there was an increasing corruption in many of the monasteries, from which Fulda did not escape. At the beginning of the eleventh century a reform was attempted by substituting new monks from Scotland for the old and re-establishing in all its strictness the Benedictine rule. The Reformation of the sixteenth century brought discord into the community, but Balthasar von Dermbach (abbot, 1570-1606) effected the suppression of the new doctrines. Abbot Schenk von Schweinsberg (1623-32) completed the work of reformation, supported by Pope Urban VIII. In 1626 he brought 17 monks from St Gall to set a good example. With the election of Joachim von Gravenegg, in 1654, the abbey entered upon a new period of prosperity. Benedict XIV, in 1752, created the abbot Prince Bishop of Fulda. The diocese was secularized in 1802, to be restored, with somewhat different boundaries, in 1829. The buildings of the old monastery were occupied by a clerical seminary, which was one of the first points of attack in the *Kulturkampf* of 1874. The diocese is at present an important one, with about 200,000 Catholic population, the cathedral and episcopal seminary still being at Fulda. Consult Arnd, *Geschichte des Hochstifts Fulda* (Frankfurt, 1862), and Hartmann, *Zeitgeschichte von Fulda* (Fulda, 1895). A collection of original documents is in course of preparation.

FULDA, LUDWIG (1862-) A German poet and dramatist, born at Frankfurt-on-the-Main. He studied at Heidelberg, Berlin, and Leipzig, and in 1882 obtained a prize in competition by his one-act verse comedy, *Die Aufrichtigen* (1883). After the appearance of a series of comedies, including *Ein Meteor* (1887) and *Die wilde Jagd* (1888), he assumed the manner of the so-called Berlin School of Realism. In 1893 he was awarded the Schiller prize for the very successful fairy drama, *Der Talsman* (1893), but the Emperor refused his consent. Subsequent works are *Jugendfreunde* (1897), *Lost Paradise* (1898), *Die Zwillingsschwester* (1901), an English version of which was presented in America, *Kaltwasser* (1903), *Novella d'Andrea* (1903); a volume of dramatic studies, *Aus der Werkstatt* (1904), *Der heimliche König* (1906), *Amerikanische Eindrücke* (1906), *Der Dummkopf* (1907), *Herr und Diener* (1910), *Die Seerauber* (1911), *Herr Aladdin und die Wunderlampe* (1912), a tale Fulda's verses are distinguished by their epigrammatic wit, and his plays are skillfully contrived. His translations from the French of Beaumarchais, Molière, and Rostand are excellent. In 1906 and 1913-14 he lectured in the United States.

FULFORD, FRANCIS (1803-68). A Cana-

dian Anglican bishop, born at Sidmouth, England, and educated at Exeter College, Oxford. He was curate at Holne and Fawley, rector of Trowbridge, Wiltshire (1832-42), and of Croydon (1842-45), and minister of Curzon Chapel, London (1845-50), and in 1848 was appointed editor of the *Colonial Church Chronicle and Missionary Journal*. His knowledge of colonial church affairs led in part to his promotion in 1850 as the first Bishop of the newly created see of Montreal, and his success in that office was so marked that in 1860 he was created Metropolitan of Canada by royal letters patent, the see of Montreal at the same time being given metropolitan rank. As an organizer of church work and an administrator, he was eminently efficient, but his great popularity with all classes was due to his tolerant and sympathetic attitude. In 1852 he won instant regard from the adherents of non-Anglican churches by his public statement that the Church of England in Canada existed but as one of many religious bodies. He was a learned and scholarly prelate. In 1850 he received the honorary degree of D.D. from Oxford University. He published *Plain Sermons on the Church and her Services* (1837-38), *Progress of the Reformation in England* (1841), *Sermon at the Consecration of Horatio Potter, D.D., in Trinity Church, New York* (1854); *Sermons and Addresses* (1865), besides many pastoral letters, charges, and lectures.

FULGENTIUS. See GOTTSCHALK.

FULGENTIUS, fŭl-jěn'shĭ-ŭs, **FABIUS PLACI** (c.480-c.550). An African grammarian, of whose life and personality nothing is known save from internal evidence. His style is typically African. Besides a *Liber de Fictivis Poëtarum* and *Liber Physiologus*, both now lost, he wrote *Mythologicon Libri III*, with etymological explanations after the manner of Martianus Capella, *Expositio Vergilianæ Continentiæ*, which interprets the Æneid allegorically, a history, *Absque Literis, de Etatibus Mundi*, which does not employ the letter A at all in the first book, B in the second, etc., through 14 books, and the very untrustworthy *Expositio Sermonum Antiquorum*, which contains many fictitious quotations. In the Teubner texts Helm edited *Fulgentii Opera* (1898). His relative Fulgentius (468-533), Bishop of Ruspe, wrote several volumes on theology. Consult Zink, *Der Mytholog Fulgentius* (Wurzburg, 1867).

FULGENTIUS, SAINT, OF RUSPE (468-533). A Latin Christian Father. He was born at Telepte, northern Africa, of senatorial family. He received a good education and became first procurator of his province. Disturbed by the turbulence of the times, he retired to a monastery near Telepte. Persecution from the Arian kings drove the monks elsewhere, and Fulgentius went to Rome in 500. Returning to Africa, he founded a monastery. He was made Bishop of Ruspe in 508. About 510 he was banished and again in 515, and suffered other persecutions from the Vandal King Thrasimund (496-523). On the death of the King he was recalled and passed his later years in peace. He died at Ruspe, Jan. 1, 533, and is commemorated on that day by the Catholic church. Fulgentius was an ardent admirer of monasticism and a rigorous ascetic, he was recognized as one of the ablest defenders of Christianity against Arianism and Pelagianism. His works are in Migne, *Patrol Lat.*, lxxv. His life by his pupil, Fulgentius Ferrandus (c.540), is contained in

Migne, *Patrol Lat.*, lxxvii. His letters have been edited by Hurter (Innsbruck, 1884). Consult Mally, *Das Leben des heiligen Fulgentius* (Vienna, 1885), and Bardenhewer, *Patrology* (St. Louis, 1908).

FULGURATION. See SURGERY.

FULGURITE, fŭl'gŭ-rit (from Lat. *fulgur*, lightning, from *fulgere*, to flash, connected with *flagrare*, to blaze). A name given to tubes or pipes found in rocks and sands and formed by the actual fusion of these materials by lightning. Such tubes may have a diameter of from 1 to 2 inches at the surface, but as they descend in a vertical or oblique direction they branch and rapidly lessen in size. They are commonly found in such regions as are visited by frequent and violent storms, often on mountain peaks.

FULHAM, fŭl'həm. A metropolitan borough of London, England, formerly a suburban village, 6 miles southwest of St. Paul's Cathedral, on the left bank of the Thames, opposite Putney, with which it is connected by two bridges (Map London, E 6). It includes the residential districts of West Kensington and Walham Green. Its distinction dates from the reign of Henry VII, when it was chosen as the summer residence of the Bishop of London. The episcopal palace, an extensive brick building, parts of which date from the sixteenth century, stands in fine grounds girded by a moat, 1 mile in circuit. The parish church of All Saints, restored in 1881, with a picturesque perpendicular tower of the fourteenth century, contains the tombs of several bishops of London. The borough maintains electric lighting, public libraries, baths, hospitals, and charitable institutions. At the Queen's Club most of the athletic contests between Oxford and Cambridge and American universities are held. Pop. (borough), 1901, 137,289, 1911, 153,325.

FULK, or **FULC**, or **FOULQUES**, fŭl'k. The name of several counts of Anjou—FULK II (938-958), called "the Good," is remembered for his saying that "An illiterate king is a crowned ass"—FULK III, called "the Black" (972-1040), became Count in 987. He was a successful and indefatigable warrior, but was renowned chiefly for his repeated pilgrimages to the Holy Land, whither he went as a penance for his many crimes—FULK V, called "the Young" (1092-1143), became Count in 1109. In 1129 he went to Jerusalem, where he married Melisande, the daughter of King Baldwin II. In 1131 he succeeded his father-in-law as King (of Jerusalem), and reigned until 1143. He strengthened the kingdom to a large extent by making alliances and by driving back the Turks. He was succeeded by his two sons Baldwin III and Amalric I.

FULKE, fŭl'k, **WILLIAM** (1538-89). A Puritan controversialist. He was born in London, graduated from Cambridge, and began the study of law, but gave it up for theology. He became fellow of his college (St. John's) in 1564, rector of Warley and Dennington in 1569, and master of Pembroke Hall, Cambridge, 1578. He was a Puritan of the most extreme type and particularly delighted in controversy. His *Defense of the Sincere and True Translation of the Holy Scriptures into the English Tongue Against the Cavils of Gregory Martin* (1583), *Stapleton's Fortress Overthrown* (1580); *Rejoinder to Martell's Reply Against the Answer of Martin Calhull* (1580), and *Discovery of the Dangerous Rock of the Popish Church* have been reprinted

by the Parker Society, with a memoir (Cambridge, 1843-48)

FULLAM, WILLIAM FREELAND (1855-1926) An American naval officer, born in Monroe Co., N Y He graduated at the head of his class from the United States Naval Academy in 1877 and was promoted successively through the lower grades to the rank of commander in 1905 and captain in 1909 From 1883 to 1904 he served at the Naval Academy as instructor in various departments and later as head of the department of ordnance During the Spanish-American War he served on the *New Orleans* He commanded the *Chesapeake*, *Terror*, and *Marretta*, was commandant of the Naval Training Station at Newport, R I, in 1907-09, commanded the *Mississippi* in 1910, and directed naval training on the Great Lakes in 1912 In 1914 he became superintendent of the United States Naval Academy He is author of *Hand-Book of Infantry and Artillery, United States Navy* (1899), and *Text-Book of Ordnance and Gunnery* (1902, rev ed, 1903, new ed, 1905)

FULLER, ANDREW (1754-1815) An English Baptist minister, controversial writer, and promoter of foreign missions He was born at Wicken, Cambridgeshire, Feb 5, 1754 He received the rudiments of an education at the free school of Soham and in 1775 was chosen pastor of the Baptist congregation of that place In 1782 he removed to Kettering, Northamptonshire, to take the pastorate of a congregation there, and remained there till his death, May 7, 1815 His first interest in foreign missions was shown in 1784, and his sermon, *The Gospel of Christ Worthy of All Acceptation* (Northampton, 1785), greatly impressed Carey, the first Baptist missionary When the Baptist Missionary Society was formed at Kettering in 1792, he became its secretary and gave the remainder of his life to its affairs His writings were very popular, they include *The Calvinistic and Socinian Systems Examined and Compared as to their Moral Tendency* (1794), *The Gospel its Own Witness* (1799), *An Apology for the Late Christian Mission to India* (1808) There are several editions of his collected works For his biography, consult Rylands (London, 1816), T E Fuller (ib, 1863), and A G Fuller (ib, 1882)

FULLER, ARTHUR BUCKMINSTER (1822-62) An American Unitarian clergyman He was born at Cambridgeport, Mass, graduated at Harvard College in 1843, and studied theology in the Harvard Divinity School He was a teacher and missionary in Illinois, and pastor at Manchester, N H, Boston and Watertown, Mass He volunteered in the Federal army in the Civil War, was made chaplain in a Massachusetts regiment, and was killed at Fredericksburg, crossing the Rappahannock He was a brother of Margaret Fuller (Marchioness Ossoli) and edited several of her works (1855) Consult R F Fuller (his brother), *Chaplain Fuller* (Boston, 1863), and a sketch by Higginson in *Harvard Memorial Biographies*, vol. i (Cambridge, Mass, 1866)

FULLER, GEORGE (1822-84) An American figure, portrait, and landscape painter, born at Deerfield, Mass From 1836 to 1838 he was in Illinois with a party of civil engineers and was associated with Henry Kirke Brown the sculptor Returning to Deerfield, he completed his rather scanty education and tried his hand at landscape and portrait painting In 1842-43 he

studied with Brown in Albany He spent several years in Boston as a portrait painter, then removed to New York and continued his studies at the Academy He was elected associate of the National Academy in 1857, upon an exhibition of a portrait of his first master, Henry Kirke Brown He spent three years in the South, making many studies of negro life, and in 1860 he went to Europe On his return to Deerfield he combined his interests as an artist and farmer For 16 years he ceased to exhibit his pictures, and during this period he developed an individual style, very different from his precise, prosaic early work, which differed little from the average output of the day Finally, being in need of money, in 1876 he exhibited 14 pictures in Boston, which were received with enthusiasm This was followed by frequent exhibitions at the National Academy in 1879 he showed the "Romany Girl" and "She Was a Witch" (Metropolitan Museum, New York), in 1880 the "Quadrone," an admirable production (Metropolitan Museum), and in 1881, the finest of all his works, "Winifred Dvart," and "Nydia" (Metropolitan Museum) were painted, and in 1883 "Arethusa" and "Turkey Pasture in Kentucky" The subjects of Fuller's pictures are extremely simple, conceived in a pictorial spirit His landscapes are not so much definite pictures of localities as idealized studies of color, light, and foliage, with a poetic expression of sun and shadow He preserved all the large lines of form, sacrificing the minor details to the beauty of the whole The essence of his art was selection Fuller was the forerunner of a new tendency in art, that of the Idealistic school He was one of the founders of the Society of American Artists Consult his biography by Millet (Boston, 1886), Van Rensselaer, *Six Portraits* (New York, 1889), Isham, *History of American Painting* (ib, 1905)

FULLER, HENRY BLAKE (1857-) An American novelist and story-writer, born in Chicago His first story, *The Chevalier of Penservivam*, was published anonymously, won favor in the eyes of Professors Norton and Lowell, and, on its republication (1892), became popular In 1892 also appeared *The Chatelaine of La Trinité* Both were romantic *The Cliff Dwellers* (1893) was an essay in relentless realism This picture of Chicago life was followed by the realistic *With the Procession* (1895), kinder in touch, with humor playing over its seriousness His work also includes *Under the Skylights* (1901), *Waldo Trench and Others* (1908), and 12 one-act plays collected in *The Puppet Booth*

FULLER, LOIE An American actress and dancer, noted for her invention of the "Serpentine Dance" She was born near Chicago, and as a child appeared at the Academy of Music there Subsequently she appeared in a variety of characters (including Ustane in *She*) before devoting herself to her specialty In later years she resided chiefly in Paris, where she appeared at the Folies-Bergère and in 1900 in a theatre of her own In 1913 she published a volume of reminiscences called *Fifteen Years of a Dancer's Life*

FULLER, LUCIA FAIRCHILD (1872-) An American miniature painter, born in Boston She studied at the Cowles Art School under Dennis M Bunker, and at the Art Students' League under William M Chase and H Siddons Mowbray In 1893 she was married

to Henry Brown Fuller After 1889 she came to be known as a painter of miniatures She won a bronze medal at the Paris Exposition in 1900, a silver medal at the Buffalo Exposition in 1901, and a gold medal at the St Louis Exposition in 1904 She became president of the American Society of Miniature Painters, and in 1906 was elected an Associate National Academician

FULLER, MARGARET See **FULLER, (SARAH) MARGARET**

FULLER, MELVILLE WESTON (1833-1910) An American jurist Born in Augusta, Me, he belonged to a family of lawyers, his maternal grandfather, Nathan Weston, having been a justice of the Maine Supreme Court He graduated at Bowdoin College in 1853, studied at the Harvard Law School, began legal practice at Augusta in 1855, and was also there for a time an associate editor of the *Age*, a Democratic newspaper In 1856 he was president of the Augusta Common Council and city attorney, but resigned his offices and established himself at Chicago, Ill He was a member of the Illinois State Constitutional Convention of 1862, and in 1863-65 was a member of the Lower House of the Illinois Legislature In 1864, 1872, 1876 (when he placed T A Hendricks in nomination), and 1880 (when he withdrew from active politics) he was a delegate to the Democratic National Convention As a lawyer, he attained prominent rank locally, but he was not widely known when in 1888 he was appointed by President Cleveland Chief Justice of the United States Supreme Court, to succeed M R Waite (q v), deceased In 31 cases during his term he dissented from the majority of the court In December, 1889, he delivered before the two Houses of Congress an address commemorating the inauguration of President Washington In 1899 he was a member of the Arbitration Commission convened at Paris for the adjustment of the Anglo-Venezuelan boundary question, and in 1904-05 he was chosen by Great Britain as arbitrator at The Hague in the case of the French flag at Muscat He received the degree of LL D from Harvard in 1891. Consult an article by Reeder in *University of Pennsylvania Law Review* (October, 1910), for a summary of his work in the Supreme Court

FULLER, RICHARD (1804-76) An American Baptist clergyman He was born in Beaufort, S C, studied at Harvard, was admitted to the bar, and after successful practice entered the Baptist ministry—in 1831 he had become a Baptist after being brought up as an Episcopalian From 1846 until his death he was pastor of the Seventh Baptist Church in Baltimore He was a leader of the proslavery party in the church, as Francis Wayland was of the antislavery party, and their controversies led to the split into the Northern and Southern churches He published *Letters* [to Bishop England] on the Roman Chancery, *Correspondence on Domestic Slavery, Baptism and Close Communion* (1849), *The Psalmist*, a hymn book used in America and England, *Scriptural Baptism* (1863) Consult Cuthbert, *Memoir of Richard Fuller* (New York, 1879)

FULLER, (SARAH) MARGARET, (MARCHIONESS OSSOLI) (1810-50) An American critic and essayist, born at Cambridgeport, Mass, May 23, 1810. The eldest of the eight children of Timothy Fuller, a Massachusetts lawyer and poli-

tician, she was strenuously educated by her father, by Dr Park of Boston, and in the Misses Prescott's School of Groton, beginning Latin at six and Greek at 13, and permanently injuring her health by overapplication On the death of her father (1835) she supported her brothers and sisters by public and private teaching in Boston and Providence She was a frequent guest at Brook Farm, though never sharing its enthusiasms, held intellectual conversations in Boston, conducted the Transcendental organ, the *Dial*, for the first half (1840-42) of its brief existence, made translations from the German, and published in 1844 her first volume, *Summer on the Lakes*, the record of a season of travel in 1843 In December (1844) she went to New York as literary critic of the *Tribune*, taking active part in the philanthropic, literary, and artistic life of the city In 1846 she went to Europe, residing for some time at Rome, where she married (December, 1847) Giovanni Angelo, Marquis Ossoli, by whom she had one child She took an active part in the Italian struggle for independence and served heroically in the hospitals during the French siege of Rome On its capture (July, 1849) she took refuge with her husband first in the mountains of Abruzzi, then at Florence, and on May 17, 1850, sailed for America, but with her husband and son was drowned off Fire Island Beach just as they were approaching New York on July 16

Her life falls naturally into three periods Till 1844 she lived an intense life, seeking self-culture in the exciting stimulation of the Transcendental circle The two years from 1844 till her visit to Italy are those of original literary production *Women in the Nineteenth Century* (1844) and *Papers on Literature and Art* (1846) are its monuments Her activities in Rome found a literary expression in a book on the Roman Republic, the manuscript of which was lost with her With all her tact and brilliancy, she was not an original genius, she needed the inspiration of an audience, talking better than she wrote Her *Letters* are therefore the most readable of her works, and the position that she held in Boston and in New York is hardly to be understood from her writings Some of these have been edited by Julia Ward Howe It was a natural instinct that led her to select for translation Eckermann's *Conversations with Goethe* (1839) and *The Correspondence of Fraulein Gunderode and Bettina von Arnim* (1840-42). There are biographies by Emerson, Clarke, and Channing (Boston, 1852), Julia Ward Howe (ib, 1883), and Thomas Wentworth Higginson (ib, 1884) •There is also a *Memoir* by her brother, Arthur B Fuller (Boston, 1855) Her *Love Letters 1845-6* were published in 1903. Consult also reprint of the *Dial* by the Rowfant Club (Chicago, 1902), H C Goddard, *Studies in New England Transcendentalism* (New York, 1908), *Margaret and her Friends*, 10 conversations ed by Mrs. C H Dall (Boston, 1895), A Macphail, *Essays in Puritanism* (ib, 1905), F A Braun, *Margaret Fuller and Goethe* (New York, 1910).

FULLER, THOMAS (1608-61) An English author and divine He was born at Aldwinckle, Northamptonshire, of which parish his father was rector, and was educated at Queen's College, Cambridge, graduating B A in 1625 and M A in 1628 Two years later he was appointed to the curacy of St. Benet's The next year he became a prebendary in Salisbury Ca-

thedral, and in 1634 he was appointed to the rectory of Broadwindsor, Dorsetshire. Abandoning both his living and his prebend in 1641, he settled in London, where he soon became curate of the Savoy, a church in the Strand. In the meantime he had published the *Holy State and the Profane State* (1642), and an account of the Crusades, entitled *History of the Holy Warre* (1643), the most characteristic of his works. During the Civil War he adhered firmly to the royal cause and shared in its reverses. He was a chaplain in the royal army, when he wrote for the encouragement of his men a manual of prayers and meditations entitled *Good Thoughts in Bad Times* (1645), and a sequel, *Better Thoughts in Worse Times* (1647). About 1648 he was presented to the living of Waltham in Essex. In 1650 he published a geographical account of the Holy Land, entitled *A Pisgah Sight of Palestine and the Confines Thereof*, with maps and views. In 1655 appeared *The Church History of Brittain, from the Birth of Christ Until the Year 1648* (for a modern edition, see that of J. S. Brewer, 6 vols, Oxford, 1845). In 1658 he received the living of Cranford, Middlesex, and at the Restoration he was reinstated in his prebend of Salisbury, of which he had been deprived by the Parliamentarians. He was also appointed chaplain extraordinary to the King. He died in London. The next year (1662) appeared *The Worthies of England*, valuable for the information it contains on provincial history, and abounding in biographical anecdote, witty remark, and acute observation on men and manners. Quaint humor is one of Fuller's peculiar characteristics, but his writings are no less remarkable for wisdom, imagination, and, when occasion demands, even for pathos. Consult Bailey, *Life of Thomas Fuller, with Notices of his Books, etc.* (London, 1874).

FULLER, THOMAS (1823-99). A Canadian architect. He was born in Bath, England, and studied with architects there and in London. His first work was the designing and erection of a cathedral in Antigua, West Indies, after

partment of Public Works, an office which he held until his retirement in 1897.

FULLER-MAITLAND, JOHN ALEXANDER (1856-) An English writer on music, born in London. He graduated at Trinity College, Cambridge, in 1879, and, after having contributed for a number of years to the London papers, became in 1889 music critic of the *Times*. He wrote many articles for the *Dictionary of National Biography*, for *Grove's Dictionary of Music and Musicians* (the appendix of which he edited), and for some of the leading periodicals. He also wrote a standard life of Schumann in the *Great Musicians Series* (1884), *Masters of German Music* (1894), *The Musician's Pilgrimage: A Study in Artistic Development* (1899), *English Music in the Seventeenth Century* (1902), *The Age of Bach and Handel* (being vol. iv of the *Oxford History of Music*, 1904), *Brahms* (1911), and was joint translator with Clara Bell of *Spitta's Life of J. S. Bach* (1884). He is the editor in chief of the revised edition of *Grove's Dictionary*.

FULLER'S EARTH (AS *fullere*, from Lat. *fullo*, fuller). A material resembling clay in appearance. It is fine-grained, of variable color, and has a specific gravity of from 1.8 to 2.2. It derives its name from the fact that its principal use once was for fulling cloth and wool, i.e., cleansing these materials of grease. At the present day a much more important application is for clarifying cottonseed and lubricating oil, by filtering them through the earth, which absorbs the impurities. Fuller's earth was originally mined only in England, where it occurs in Cretaceous beds which formerly served as the only source of supply for the United States. A variety of fuller's earth, known as cimolite, occurs in the island of Argentina, Greece, and has been mined since ancient times. More recently fuller's earth deposits have been discovered near Quincy, Fla., and at other localities in the United States, chiefly in Cretaceous and Tertiary formations. The following analyses of fuller's earth show the composition of the material:

	SiO ₂	Al ₂ O ₃	Fe ₂ O ₃	CaO	MgO	Na ₂ O	K ₂ O	H ₂ O	Moisture
1	52.81	6.92	3.78	7.40	2.27		74	14.27	
2	62.83	10.35	2.45	2.43	3.12	20	74	7.72	6.41

which he returned to England. Going to Toronto, Upper Canada, in 1857, he began practice in that city, and in 1859, in conjunction with his partner, Chilton Jones, won first premium for the design, ultimately adopted, of the Parliament building at Ottawa. At the same time his firm won second premium for the design for the departmental buildings and Governor-General's residence. Fuller then removed to Ottawa, where he remained until 1867. In that year the competition for the new capitol at Albany was opened, and Fuller's design was one of three for which equal premiums were awarded. In the second competition he, in conjunction with Augustus Laver, one of the three competitors, made a design from which the capitol was built. Soon afterward the joint design of the two architects for the city hall and the courts at San Francisco, Cal., was accepted. Fuller, who had removed to Albany, remained there until 1881, when he returned to Ottawa and in the same year was appointed chief architect of the De-

partment of Public Works, an office which he held until his retirement in 1897. 1 is from Reigate, England, and 2 from Quincy, Fla. It should be added, however, that the power of fuller's earth is a purely physical property and stands in no relation to its chemical composition. The output of fuller's earth in the United States in 1912 was 32,715 short tons, valued at \$305,522. Consult Ries, *Clays, Occurrence, Properties, and Uses* (New York, 1910), and Parsons, *Bureau of Mines, Bulletin 71* (1913).

FULLER'S THISTLE See TEASEL.

FULLERTON, GEORGE STUART (1859-1925). An American philosopher and psychologist. He was born at Fatehgarh, India, graduated in 1879 from the University of Pennsylvania and in 1883 from Yale Divinity School, and returned to Pennsylvania to be instructor, adjunct professor, and professor, dean of the department of philosophy, dean of the college, and vice provost of the university. In 1904 he was appointed professor of philosophy at Columbia University. In 1913-14 he was exchange professor at the University of Vienna. He was

president of the American Psychological Association in 1896. His philosophy is realistic. His writings include *The Conception of the Infinite* (1887), *A Plain Argument for God* (1889), *On Sameness and Identity* (1890), *On the Perception of Small Differences*, with Cattell (1892), *The Philosophy of Spinoza* (1894), *On Spinozistic Immortality* (1899), *A System of Metaphysics* (1904), *An Introduction to Philosophy* (1906), *The World We Live in, or Philosophy and Life in the Light of Modern Thought* (1912).

FUL/LERTON, LADY GEORGIANA (1812-85). An English novelist and philanthropist, daughter of the first Earl Granville. She was born at Tixall Hall, Staffordshire, and in 1833 married Alexander Fullerton. In 1844 she published her first novel, *Ellen Middleton*. Her second work, *Giantley Manor*, was written in the interest of the High Church party. In 1846 she entered the Roman Catholic church and afterward published a number of controversial novels, chief among which are *Lady Bird* (1852), *Too Strange Not to be True* (1864), and *Constance Sherwood* (1865). After 1854 she devoted much time to charity. Consult Coleridge, *The Life of Lady Georgiana Fullerton*, trans from the French of Madame P. de la F. E. Craven (London, 1888).

FULMAR, fulmar (special use of *fulmar*, *fulmart*, *foulmart*, *polecat*, from AS *fūl*, Eng *foul* + OF *marte*, Fr *martre*, from OHG *mar-dar*, Ger *Marder*, AS *mearps*, Eng *marten*). Any of several species of strictly oceanic petrels (See PETREL). The common northern fulmar (*Fulmarus glacialis*), the "mallemuck" of sailors, is a bird about the size of a duck, gray above, white beneath, head, neck, and tail pure white, bill yellow, the young are brownish gray. It inhabits the most northern seas, in which its numbers are prodigious, breeds on the rocky shores of the Faroe Islands, Iceland, Greenland, Spitzbergen, etc., on the grassy shelves of the precipices, making a slight nest or a mere excavation, in which it lays one egg. It is rarely to be seen on the United States coast south of Massachusetts or on the southern coasts of Great Britain, but breeds in great numbers in St Kilda and adjacent islets. It is extraordinarily abundant about these isles and is of importance to the inhabitants of St. Kilda, who esteem its eggs and flesh above those of any other bird and gather them in the most perilous manner, descending by ropes from the summit of the precipices. The fulmars are also valued for their feathers, down, and oil, the last is one of the principal products of St Kilda and is obtained from their stomachs. The old are said to feed the young with it, and when they are caught or assailed these birds lighten themselves by disgorging it. It is amber-colored and has a peculiar and nauseous odor. Fulmars feed on all animal substances which come in their way, giving an evident preference to fat and delighting in the blubber of whales. Another important species is the giant fulmar (*Ossifraga gigantea*, or *Macronectes giganteus*), notable for its size, which equals that of a small albatross. It is found in the Pacific Ocean and is known to sailors as "bone breaker," because of the observed crushing power of its great hooked beak. The slender-billed fulmar (*Fulmarus*, or *Procella, glaciaroides*) is a very widely ranging form which occurs on the Alaskan coast of Bering Sea. It is of the same size as the common fulmar, but the bill is much longer and more slender.

Several of the fulmars are remarkable for their dichromatism. See Plate of FISHING BIRDS.

FULMINATE (fūl'mi-nāt) OF MERCURY (from Lat *fulminare*, to lighten, from *fulmen*, lightning, from *fulgere*, to flash), or FULMINATING MERCURY ($C = NO$), $Hg \frac{1}{2}H_2O$, or, in its anhydrous state, $(C = NO)_2Hg$. A highly explosive crystalline organic salt of mercury, sparingly soluble in cold water, freely soluble in hot water. It is obtained by dissolving mercury in an excess of nitric acid and gradually adding the solution to alcohol. The operation is attended with considerable danger and should not be conducted in the neighborhood of flames, as the vapors evolved during the reaction are very inflammable. On cooling, fulminating mercury separates out in crystalline form. When moist, it may be handled without much danger, but when dry, it explodes with violence if struck by a hard body or if heated. Mixtures of fulminating mercury with nitre or with chlorate of potash are employed as the primary of percussion caps.

FULMINATE OF SILVER, or FULMINATING SILVER, $C = NO-Ag$. An organic salt of silver, prepared by heating an aqueous solution of silver nitrate with nitric acid and alcohol. It is even more powerfully explosive than the fulminate of mercury, for, even if it is moist or under water, pressure with a hard body will cause its explosion, and when it is quite dry the slightest friction between two hard bodies produces a similar result.

FULMINATES. A term applied to a class of salts having the same percentage composition as the cyanates, but, unlike them, exploding violently when heated or struck. There are many fulminates, corresponding to the different metals. The preparation of the fulminates is attended with very considerable danger and should not be attempted by inexperienced persons. The structural formula at present assigned to the acid, fulminic acid, combined in the fulminates is $C = N - O - H$, a formula first demonstrated by Nef and remarkable because the carbon atom contained in it is shown, not as quadrivalent (as the carbon atom is generally found to be), but as bi-valent. The fulminate of sodium has been definitely shown to have the corresponding formula $C = N - O - Na$. The acid itself has not been isolated, but has been obtained as an unstable oily liquid in ethereal solution. See EXPLOSIVES.

FULMINIC ACID. See FULMINATES.

FUL/TON. A city in Whiteside Co., Ill., 41 miles by rail northeast of Rock Island, on the Mississippi River, and on the Chicago, Burlington, and Quincy, the Chicago, Milwaukee, and St. Paul, and the Chicago and Northwestern railroads (Map Illinois, D 2). It contains a Carnegie library. There are limekilns, novelty works, and manufactures of clay pipes, stoves, etc., and an extensive trade is carried on in grain, lumber, and produce. The water works are owned by the city. Pop., 1900, 2685, 1910, 2174.

FULTON. A city in Fulton Co., Ky., 50 miles south of Paducah, on the Illinois Central Railroad (Map Kentucky, A 6). It contains the Carr Institute, Terry-Norman High School, and Tennessee College. The industrial establishments include flour mills, foundry and machine shops, a stirrup and whipstock factory, tobacco prizing houses, a harness and saddle factory, and lumber mills. The water works are owned by the city. Pop., 1900, 2860, 1910, 2575.

FULTON. A city and the county seat of

Callaway Co., Mo., 135 miles by rail west of St. Louis, on the Chicago and Alton Railroad (Map Missouri, E 3) It is the seat of the State School for the Deaf, State Hospital No. 1, an insane asylum, Westminster College (Presbyterian), founded in 1853, Synodical College, Conservatory of Music for Young Ladies, founded in 1874, under the care of the Synod of Missouri, and William Woods College of the Christian church of Missouri, founded in 1890, and it contains a Carnegie library The city is in a rich agricultural and stock-raising region, has an extensive supply of coal and fire clay of excellent quality, and manufactures flour, fire brick, and overalls Settled in 1825, Fulton was incorporated in 1859, and in 1903 became a city of the third class Its government is administered by a mayor and a council elected every two years The city owns and operates its water works and electric-light plant Pop, 1900, 4883, 1910, 5228

FULTON A city in Oswego Co., N. Y., 25 miles northwest of Syracuse, on the Oswego River, the Oswego Canal, and the New York Central, the Lackawanna, and the New York, Ontario, and Western railroads (Map New York, D 4) It has a public library The city carries on a considerable trade in milk and tobacco, and there are manufactures of chocolate, flour, woolen goods, paper pulp, firearms, tools, pocket cutlery, butchers' supplies, excelsior, water motors, ensilage and straw cutters, paper-mill machinery, canned goods, motor boats, canoes, and yachts Pop, 1900, 5281, 1910, 10,480, 1914 (U. S. est.), 13,303, 1920, 13,043 Fulton was settled about 1791 and was first incorporated in 1835 In April, 1902, the villages of Fulton and Oswego Falls, with an aggregate population of 8206 (census of 1900), were consolidated and chartered as a city, the government of which is administered by a mayor and common council The water works are owned and operated by the municipality

FULTON The first steam war vessel, designed by Robert Fulton and built in New York in 1815 The *Fulton* was a vessel of 38 tons, provided with central paddle wheels. She was accidentally blown up in 1829

FULTON, FREDERICK JOHN (1862—) A Canadian statesman He was born at Bedlington, England, and was educated at Magdalene College, Cambridge Removing to Canada, he practiced law at Victoria, British Columbia, in 1900 was elected a Conservative member of the British Columbia Legislature, and in 1903 was appointed President of the Council in the cabinet of Sir Richard McBride (qv) He afterward filled the offices of Provincial Secretary, Minister of Education, Attorney-General, and Commissioner of Lands In 1906 he was appointed a member of the Royal Institution for the Advancement of Learning, British Columbia, in 1907 a member of the Irrigation Convention, and in 1909 chairman of the Timber and Forestry Commission When Commissioner of Lands, Fulton procured the enactment of a water and irrigation law of much importance In 1909 he retired from public life

FULTON, JUSTIN DEWEY (1828–1901) An American Baptist clergyman He was born in Earlville, N. Y., graduated at Rochester University in 1851, studied in the Rochester Theological Seminary, and was ordained in 1854 in St. Louis, where he was editor of the *Gospel Banner* and whence his antislavery views soon drove

him He had pastoral charges in Sandusky, Ohio, Albany, Boston, Brooklyn, N. Y., and Montreal, Canada, but was best known for his attacks on the Roman Catholic church Among his works are *Roman Catholic Elements in American History* (1859), *Woman as God Made Her* (1867), *Rome in America* (1884) Consult the sketch of the author in the last-named volume, by R. S. MacArthur

FULTON, ROBERT (1765–1815) A celebrated American engineer, born at Little Britain, Pa., of Irish parents, who were in such poor circumstances that all the education young Fulton acquired was the ability to read and write He made good use, however, of his opportunities and passed in study the time allowed him for recreation At an early age he was apprenticed to a jeweler in Philadelphia, and in addition to devoting himself to this trade, he applied himself to painting The sale of his portraits and landscapes enabled him, in the space of four years, to buy a small farm, on which he placed his widowed mother At the age of 22 he proceeded to London, where he studied painting under Benjamin West, but after several years thus spent he abandoned painting to devote himself wholly to mechanics Some works that he executed in Devonshire obtained for him the patronage of the Duke of Bridgewater and of the Earl of Stanhope In 1794 he obtained from the British government a patent for an inclined plane, the object of which was to displace canal locks, and in the same year he invented a mill for sawing and polishing marble His next invention was a machine for spinning flax, followed by one for making ropes He was received as a civil engineer in 1795 and wrote a work on canals, in which he developed his system and ideas Accepting an invitation from the United States Minister at Paris, he proceeded to that city in 1796 and remained there for seven years, devoting himself to new projects and inventions Among the inventions developed here was the *Nautilus*, or submarine boat, carrying torpedoes, invented to be used in naval warfare, but he was unable to secure its adoption by either the French, British, or United States government He next turned his attention to a subject that had frequently occupied his mind before and about which he had written a treatise in 1793, viz., the application of steam to navigation.

In 1803 he constructed a small steamboat, and his experiments with it on the Seine were attended with great success The French government, however, did not give him any encouragement, but he had the cooperation of Robert Livingston, the Minister of the United States to France, who assisted Fulton in his experiments. Returning in 1806 to New York, Fulton superintended the construction of a larger steamship provided with an English engine In 1807 he launched the *Clermont* upon the Hudson, which started off on her trip to Albany in the presence of thousands of astonished spectators At the beginning the average speed was only about 5 miles an hour, which was considered a great achievement From this period steamers, for the use of which on the waters of New York State Fulton and Livingston were granted a monopoly by the Legislature, came into general use upon the rivers of the United States Although Fulton was not the first to apply steam to navigation, as a steam vessel had been tried upon the Forth and Clyde Canal as early as

1789, and by Rumsey and Fitch in America in 1786-87, yet he was the first to do so with any degree of success. His reputation as an engineer and inventor was now firmly established, and he was employed by the United States government in the execution of various projects with reference to canals and other engineering works. In 1814 he obtained the assent of Congress to construct a steam frigate, which was launched in the following year. Though the labors of Fulton were attended with such great success, various lawsuits in which he was engaged in reference to the use of some of his patents prevented him from ever becoming wealthy, and anxiety, as well as excessive application, tended to shorten his days. His death in New York, Feb. 24, 1815, produced extraordinary demonstrations of mourning throughout the United States. He married, in 1806, a niece of Robert Livingston, United States Minister to France. The centennial anniversary of the construction of the *Clermont* was celebrated in 1909 and a replica of the vessel able to proceed under its own steam was constructed. Fulton's published works included *A Treatise on the Improvement of Canal Navigation* (1796), *Letters on Submarine Navigation* (1806), *Torpedo War* (1810), *Letter to the Secretary of the Navy on the Practical Use of the Torpedo* (1811), *Report on the Practicability of Navigating with Steamboats on the Southern Waters of the United States* (1813), *Memorial of Robert Fulton and Edward P. Livingston in regard to Steamboats* (1814), *Advantages of the Proposed Canal from Lake Erie to the Hudson River* (1814). Consult Thurston, *History of the Growth of the Steam Engine* (New York, 1878), id., *Robert Fulton His Life and its Results* (ib., 1891), Colden, *Life of Robert Fulton* (ib., 1817), Reigart, *Life of Fulton* (Philadelphia, 1856), Knox, *Fulton and Steam Navigation* (New York, 1886), Sutchiff, *Robert Fulton and the Clermont* (ib., 1909), Dickinson, *Robert Fulton, Engineer and Artist, His Life and Works* (ib., 1913).

FULVIA Daughter of M. Fulvius Babbulo of Tusculum. She married first P. Clodius, their daughter afterward became the wife of Octavianus (Augustus). In 44 B.C. she married Marcus Antonius, with whom she was deeply in love, and into all whose ambitious plans she entered with enthusiasm. Cicero was murdered in 43, and, when his head was brought to Antonius, Fulvia is said to have pierced with her needle, in vindictive spite, the tongue that had uttered so many reproaches against her husband. But Antonius in the East fell into the snares of Cleopatra, and Fulvia attempted to stir up a riot in order to secure his recall to Rome, but failed and was banished from Italy. At Athens, Fulvia and Antonius met, and he reproached her so bitterly for her part in political affairs that she retired to Sicily in despair, and died there shortly after (40 B.C.). Consult Abbott, *Society and Politics in Ancient Rome* (New York, 1909), Sihler, *Cicero of Arpinum* (New Haven, 1914).

FUMAGE (OF *fumage*, ML *fumagium*, fuel, from Lat *fumus*, smoke). In the law of England, a chimney tax, commonly called smoke-farthing. This tax is mentioned in Domesday as paid by custom to the King for every chimney in the house. Edward, the Black Prince, is said to have imposed a tax of a florin for every hearth in his French dominions. The first stat-

utory enactment on the subject in England is 13 and 14 Car. II, c. 10, whereby a tax of two shillings on every hearth in all houses paying to Church and poor was granted to the King forever. This tax was abolished in 1689.

FUMARIACEÆ, fû-mâ'ri-â'se-ê (Neo-Lat nom pl., from *Fumaria*, from Lat *fumus*, smoke). A family of herbaceous plants with watery juice, alternate, much-divided leaves, calyx of two deciduous sepals, corolla of four very irregular, white, yellow, pale-red, crimson, or purplish petals, stamens sometimes four and distinct, more generally six, and in two bundles, ovary free, one-celled, one-seeded, or many-seeded, and seeds with abundant endosperm. The Fumariaceæ are related to the Papaveraceæ (poppy, etc.), but their general aspect is very different, and they do not possess the same powerful properties. About 170 species in five genera are recognized, mostly natives of temperate climates in the Northern Hemisphere, some of great beauty in both flower and foliage. Bleeding heart (*Dicentra spectabilis*), a native of China, is a well-known favorite in gardens and greenhouses. Several species of *Dicentra* and *Corydalis* are natives of America. The common fumitory (*Fumaria officinalis*), a rather delicate and beautiful weed of frequent occurrence in gardens and fields, is an annual of easy extirpation. Its leaves, which have an intensely bitter, saline taste, were formerly much employed in medicine as a tonic and diaphoretic, and although disused in America, are still esteemed in France as a remedy for scorbutic affections, chronic eruptions, etc. Some other species are credited with anthelmintic, antiperiodic, emmenagogue, and similar properties, but except in household or in foreign medicine they are now little used.

FUMARIC AND MALEIC ACIDS (from Neo-Lat *Fumaria*, the type of the herbaceous order Fumariaceæ). Two organic substances having not only the same composition and molecular weight ($C_4H_4O_4$), but the same chemical constitution ($COOH \cdot CH \cdot CH \cdot COOH$), yet differing considerably in both their chemical and physical properties. Fumaric acid crystallizes in fine needles and sublimes without melting and without decomposition at $200^\circ C$, at higher temperatures it is converted into the anhydride of maleic acid, and it is sparingly soluble in water. Maleic acid crystallizes in rhombic prisms that melt at $130^\circ C$, and if heated to 160° , loses the elements of water and is converted into maleic anhydride, it is readily soluble in water. Both fumaric and maleic acids may be obtained by heating malic (oxysuccinic) acid. Maleic acid is, however, more conveniently prepared by distilling the acetyl derivative of malic acid. Both fumaric and maleic acids readily form addition products with the halogens and are therefore classed with the unsaturated compounds. The relation between the two acids is explained by the modern stereochemical theory, according to which the atomic groups composing their molecules, though the same in kind and number, are in two cases differently arranged in space. The formulæ of the two acids are, accordingly, written as follows

See STEREOCHEMISTRY

FU'MAROLE Volcanoes after eruption often continue to send forth water vapor and heated gases in great volume, both from the main vent and from parasitic cones. A vent emitting such gaseous discharges is a fumarole or a solfatara. Examples of fumaroles are found also in regions where hot springs and geysers occur, as in the Yellowstone Park, but which have had no recent volcanic outbursts. The gases evolved differ among individual conduits, the commoner gases are water vapor, hydrochloric acid, carbon dioxide, carbon monoxide, methane, hydrogen, nitrogen, oxygen, sulphur dioxide, and hydrogen sulphide. The nature of the gases seems to depend to some extent upon the temperature, which ranges from under 100° C in the cool fumaroles to 400° or 500° in the hot types, such as develop soon after a volcanic eruption. See VOLCANO.

FUMBINA, foom-bé'na. See ADAMAWA.

FUMIGA'TION (from *fumigate*, from Lat. *fumigare*, to fumigate, from *fumus*, smoke). The cleansing or medicating of the air of an apartment by means of vapors, employed chiefly for the purpose of destroying odors or disinfecting the room, as well as clothing, furniture, etc. (See CONTAGION, INFECTION). Most of the methods of fumigation formerly employed have little real value and are to be looked on chiefly as grateful to the senses; as, eg, the burning of frankincense, camphor, etc. The really active processes are noticed under DISINFECTANTS. The application of fumes of medicines to the respiratory tract is also called fumigation. For this purpose fumes of tobacco, stramonium, nitrate of potash, muriate of ammonium, and various gums are employed.

FUNCHAL, foon-shal' (Portug. place of fennel). The capital of the Madeira Islands, Portugal, situated on the southern side of the island of Madeira (Map Spain, E 5). It is a picturesque and well-built town, and contains a cathedral, an opera house, a casino, and a museum. Its streets are mostly narrow and, owing to their steepness, sleds, drawn by oxen, and sometimes luxuriously fitted up, take the place of wheeled vehicles. The houses are mostly whitewashed and the principal streets lighted by electricity. The well-fortified harbor, though not very safe, is the only port in Madeira for ocean-going steamers. Funchal is the seat of a bishop. The town lies in a fertile district surrounded by sugar plantations, and vineyards on the slopes of the picturesque mountains which hem it in. Owing to its mild climate, the town has come into prominence as a health resort. Pop., 1900, 20,844.

FUNK-BRENTANO, funk'-brän'ta'nô', THÉOPHILE (1830-1906). A French philosopher, born at Luxemburg. He studied law and medicine in France and abroad. In 1873 he became professor at the School of Political Sciences in Paris. His works include *Les sciences humaines* (1869), *La civilisation et ses lois* (1876), *La politique* (1892), *L'Homme et sa destinée* (1895), *La science sociale, morale, politique* (1897), *Les sophistes français* (1905). His son FRANZ, born at Munsbach, Luxemburg, in 1862, became librarian at the Bibliothèque de l'Arsenal. In 1900 he held the chair of comparative legislation at the Collège de France, and in 1904 he lectured before the Alliance Française in the United States and Canada. He published interesting studies, dealing mainly with the dramatic and episodic in French history.

These include *Légendes et archives de la Bastille* (1898, 5th ed., 1902), *La diame des poisons* (1899, 6th ed., 1903), *L'Affaire du Collier* (1901, 5th ed., 1903), *Les lettres de cachets à Paris* (1904), *Les novellistes* (1905), *Louis Mandrin, capitaine général des contrebandiers* (1907), *La régence* (1909).

FUNCKE, fun'ke, OTTO (1836-1910). A German Protestant theologian. He was born at Wulfrath, near Elberfeld, and was educated at Halle, Tübingen, and Bonn. In 1868-1904 he preached at the Friedenskirche in Bremen, where he also published a great number of devotional works which have made him widely known. Among these are *Christliche Fragezeichen* (15th ed., 1907, Eng. trans. by E. Steiling under the title *Self Will and God's Will*, 1887), *Reisebilder und Heimatklänge* (1869, 1871, 1872), *St. Paulus zu Wasser und zu Land* (8th ed., 1891), *Die Welt des Glaubens und die Alltagswelt* (9th ed., 1895), *Gottes Weisheit in der Kinderstube* (5th ed., 1890), *Ungeschminkte Wahrheiten* (1902), *Reisegedanken und Gedankenreisen eines Emeritus* (1905), *Christi Bild in Christi Nachfolgern* (4th ed., 1906), *Vademecum für junge und alte Eheleute* (1908).

FUNCTION (from Lat. *functio*, use, from *fungi*, to employ, Skt. *bhuy*, to enjoy, to be useful). The specific physiological processes of a part or organ. In the amoeba all the functions of the organism are performed by the same protoplasmic mass. In higher forms, both plant and animal, where division of labor is established, certain parts take in water, digest food, or excrete waste for the benefit of the whole body. This assumption of particular function by certain parts must necessarily involve great changes in form and structure of the organism. Any subsequent change in function that an organ may undergo brings about far-reaching changes in structure. Certain organs, like the liver and the brain, have many functions. Some of these functions we speak of as primary, others as secondary. Thus the primary function of an insect's wing is locomotor, while secondarily the wing may serve in respiration. What are secondary functions may at times or in certain animals become primary, thus the allantois is an unimportant bladder in frogs, in birds and reptiles it is the chief fetal respiratory organ, while in many mammals it forms part of the placenta. With the change in function, and consequently in form and structure, are correlated changes in various other organs, hence any change in one organ is of far-reaching importance to the whole organism. See BIOLOGY, PHYSIOLOGY, FUNCTION CHANGE.

FUNCTION A mathematical term due to Leibnitz (1692), but first defined in its present sense by Johann Bernoulli (1718). In this sense a function is a quantity whose value depends upon that of another quantity. Eg, in the formula for the circumference of a circle, $c = 2\pi r$, c depends upon r for its value, c is therefore said to be a function of r . Likewise, in the equation $y = x^2 + 2x + 3$, the value of y depends upon the value of x , so that if $x = . . . -2, -1, 0, 1, 2$, etc., $y = . . . 3, 2, 3, 6, 11$, etc., y is therefore a function of x , and this is expressed by the symbol $y = f(x)$, which was first employed almost simultaneously by Euler (1734) and Clairaut. Instead of $f(x)$ other symbols are often used, as $F(x)$, $\phi(x)$, $\psi(x)$, etc. In $y = f(x)$, the value of y depending upon that of x , x is called the independent and y the dependent variable. In

a function like $y = ax + b$, y is called an *explicit* function of x , in the expression $x^2 + 2xy + b = 0$, y is an *implicit* function, and this is indicated by the symbols $f(x, y) = 0$. In the same way we may have $f(x, y, z) = 0$, $f(x_1, x_2, x_n) = 0$, or we may have $z = f(x, y)$, $y = f(x_1, x_2, x_n)$. If a function has only one value for each given value of the variable, it is called a *uniform* (monodromic, monotropic, *eindeutig*) function, as in the case of $y = x^2 + 2x + 3$. But if a function has more than one value for any given value of the variable, or if its value can be changed by modifying the path in which the variable reaches that given value, the function is said to be *multiform* (polytropic, *mehrdeutig*), as in the case of $y = \sqrt{x}$. If the equation $y = f(x)$ is solved for x , then x will equal some function of y , i. e. $x = \phi(y)$, and the latter function is called the inverse of the former. Eg., in the case of a sphere $v = f(r) = \frac{4}{3}\pi r^3$ and $r = \sqrt[3]{\frac{3v}{4\pi}} = \phi(v)$,

$v = f(r)$ and $r = \phi(v)$ being inverse functions. Functions were classified by Leibnitz as algebraic and transcendental. The former are such as include only the four fundamental operations, together with the use of constant exponents, their simplest forms being $a + x$, ax , $\frac{a}{x}$, x^a , and their most general form being

$$\frac{(a + bx + cx^2 + \dots)^m}{(a' + b'x + c'x^2 + \dots)^{m_1}}.$$

In the broadest sense we say that y is an *algebraic* function of x when $A_0y^n + A_1y^{n-1} + A_2y^{n-2} + \dots + A_{n-1}y + A_n = 0$, where A_i is a polynomial in x of the form $A_i = a_0x^m + a_1x^{m-1} + \dots + a_{m-1}x + a_m$. The *transcendental* functions include all other functions, to which, from the domain of the common operations, powers with variable exponents, the so-called *exponential* functions and their inverse, *logarithms*, chiefly belong.

An important class of transcendental functions are known as circular functions. These include the goniometric functions, $y = \sin x$, $\cos x$, $\tan x$, $\cot x$, etc. (see TRIGONOMETRY), and their inverses, the *cyclometric* functions, $x = \sin^{-1} y$ or $\arcsin y$, etc. It is shown in trigonometry that $y = \sin x = \sin(x \pm 2k\pi)$, where k is any integer, so that x may be increased or decreased by 2π , 4π , 6π , . . . without altering the value of y , the function is then called *simply periodic*. In the inverse function, $x = \sin^{-1} y$, x evidently may have, for any value of y , an infinite number of values, this function is therefore called *infinitely multiform*. The inverse exponential function (i. e., the logarithm) and the circular function are integrals of algebraic functions. Thus,

$$\int \frac{dx}{x} = \log x, \quad \int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x,$$

$$\int \frac{dx}{1+x^2} = \tan^{-1} x, \quad \int \frac{dx}{x\sqrt{x^2-1}} = \sec^{-1} x,$$

etc., all with the proper constants.

If a function $y = f(x)$, or $\phi(x, y) = 0$, is plotted, the figure is a curve with infinitely many points in immediate succession. The continuity of the curve and, corresponding to it, the continuity of the function, consist in this that any two successive points lie infinitely near each other, so that an infinitely small variation of the abscissas is attended by an infinitely small vari-

ation of the ordinates. This suffices to explain what is meant by a *continuous* function, the meaning of the term "*discontinuous* function" being easily inferred. Eg., the functions $a + x$, ax , a^x , $\sin x$, $\cos x$ are continuous in the domain $(-\infty, +\infty)$ of the variable x , as is also x^n when n is a positive integer. The functions \sqrt{x} , $\log x$ are continuous in the domain $(0, +\infty)$.

The function $\frac{a}{x^n}$, where n is a positive integer, is continuous in the domains $(-\infty, 0 - \epsilon)$, $(0 + \epsilon, +\infty)$, however small ϵ may be, but for $x = 0$ it breaks its continuity and $y = \pm \infty$.

The term "theory of functions" was first used by Lagrange (*Théorie des fonctions analytiques*, Paris, 1797). The branch thus denoted deals with functions of more general form than those described above. Eg., in the equation $w = f(z)$, z must, in general, be taken to be a complex number (qv), $x + yi$, where i stands for $\sqrt{-1}$. The theory, therefore, has for its object the study of functions of one or more variables, in which either the variables or the coefficients, or both, are complex numbers. This general theory may be said to have been founded by Lagrange (1772, 1797, 1806), although Newton, Leibnitz, Johann Bernoulli, Clairaut (1734), D'Alembert (1747), and Euler (1753) had already worked towards it. Gauss contributed to the theory, especially in its application to the fundamental theorem of algebra. Cauchy, starting from Lagrange's work, greatly developed it, and numerous propositions due to him are found in the various textbooks on the subject. His memoirs extend over a period of nearly 40 years (1814-51), covering a large part of the general theory as known to-day and placing the subject upon a firm foundation. The historical development after Cauchy's time becomes interwoven with that of special functions, notably the elliptic and Abelian.

Elliptic functions arose from the consideration of the integral $\int \frac{Rdx}{\sqrt{X}}$, where R is a rational $f(x)$ and X is the general rational and integral quartic $a_0x^4 + a_1x^3 + a_2x^2 + a_3x + a_4$. The theory of these functions had been suggested by Jakob Bernoulli (1691) and by Maclaurin (1742), and D'Alembert (1746) had approached it. Euler had gone further (from 1761) and had prophesied (1766) that there would come "a new sort of calculus of which I have here attempted the exposition of the first elements." To Landen (1775), however, the honor is usually given of founding the theory. But it is to Legendre that its real development is due. He worked 40 years in perfecting it, his labor culminating in his *Traité des fonctions elliptiques et des intégrales Euleriennes* (1825-28). At the same time that Legendre published this work, Abel and Jacobi began their great contributions. Abel, whose fundamental theorem was not published until after his death, discovered the double periodicity of elliptic functions. Jacobi created a new notation and gave name to the "modular equations" of which he made use. Cayley contributed to the subject in England, his only book being devoted to it.

The general theory of functions has received its present form largely from the works of Cauchy, Riemann, and Weierstrass. Endeavoring to subject all natural laws to mathematical interpretation, Riemann attacked the subject from

the standpoint of the concrete, while Weierstrass proceeded from a purely analytic point of view. Riemann's theories have been elaborated by Clebsch, and also by Klein, who has materially extended the theory of Riemann's surfaces and who has generalized Clebsch's application of modern geometry to the study of elliptic functions in his *Theorie der elliptischen Modulfunctionen*. This last-named theory had its origin in a memoir of Eisenstein (1847) and in the lectures of Weierstrass on elliptic functions.

In the theory of functions the number of special functions is very great. For the list at the present time, consult Muller, "Mathematische Terminologie," in *Bibliotheca Mathematica* (Leipzig, 1901), where some 200 are mentioned. The most notable work on the historic development of functions is that of Brill and Noether, "Die Entwicklung der Theorie der algebraischen Functionen in alterer und neuerer Zeit," in *Jahresbericht der deutschen Mathematiker Vereinigung*, vol. 11 (Berlin, 1894). For theory, bibliography, and historical notes, consult Harkness and Morley, *Theory of Functions* (New York, 1893), and Forsyth, *Theory of Functions* (Cambridge, 1893). For further bibliography of historical development and for articles on the theory of functions, consult Merriman and Woodward, *Higher Mathematics* (New York, 1896), Osgood, *Lehrbuch der Functionen-theorie* (2d ed., 1b, 1912), Burkhardt, *Theory of Functions of a Complex Variable* (1b, 1913), Kennelly, *Complex Hyperbolic and Circular Functions* (2 vols., Cambridge, Mass., 1914).

FUNCTION CHANGE The disuse of an organ for one function and its modification for the performance of another, thus an organ may be transformed into another homologous with it, but performing a different function, serving a quite different use. It originates in a series of functions performed by one and the same organ. Of these several functions one is the chief or primary, while the rest are secondary. If the primary function is for any reason suppressed, some one of the secondary functions becomes the chief one, and the final result of these processes is the transformation of the organ.

As an example may be mentioned the change of function in the anterior limbs of certain crustaceans from swimming and breathing uses to organs of mastication (mandibles, maxillae, and maxillipeds), the outer division, or "exopodite," undergoing reduction from disuse. Thus the original or chief function is suppressed, and what was an accessory or minor function becomes the chief one. More apparent examples are the change from the five-toed legs of the reptilian ancestor of birds into the wings, and of the forelegs of the ancestors of whales into the paddles of existing cetaceans. All such changes of function are the result of change of environment, of habits, and of instincts.

Still another good example of the principle of change of function is afforded by the swimming bladder of fishes. This in most fishes is a closed sac lying directly beneath the backbone. In the gar pike it has acquired a connection by a duct with the throat. It then becomes an accessory breathing organ in such fishes as the *Protopterus* of Africa, which is able temporarily to live out of water. Finally, by further change in habit and structure, this bladder with its pneumatic duct has become transformed into the lung of the amphibians, reptiles, and higher vertebrates. The transformation is due to

change of surroundings and of habit, resulting in the changes of function.

This principle is pure Lamarckian doctrine, i.e., that changes of surroundings and of habits bring about changes of function or use, and finally of structure. Yet there are very numerous examples of this principle, and it has been most active in the origination of the classes and orders of animals. Consult many of the books under EVOLUTION.

FUNCTUS OFFICIO (Lat., discharged from duty or authority). A phrase applied to something which, having formerly had legal vitality and force, is without any further validity or authority. When an agent or officer has fulfilled the duty assigned him, his office is *functus officio* and his powers are at an end. The same is true of legal instruments which have been duly executed and have been used for the purpose for which they were created, or on which a judgment has been entered. Thus a warrant of attorney on which a judgment has been entered is *functus officio*, and a second judgment cannot be based upon it. So, also, a bill of exchange paid by the drawee, or passed by him to the credit of the drawer, is *functus officio*, and cannot be further negotiated.

FUNDAMENTALS OF CHRISTIAN DOCTRINE A term much used in Protestant theological discussion, but very difficult to define. The church down to recent times has usually defined the fundamental Christian doctrines as those which it is necessary to believe in order to attain salvation. But this logically involves conclusions concerning the condemnation of large classes of individuals which men, particularly in the later time, shrink from accepting. A distinction has been drawn between truths necessary to salvation and the degree of knowledge necessary in an individual in order that he may be saved. That is, a truth may be necessary to salvation, yet an individual who does not know it may not be condemned, it being assumed that he would believe it if he knew it. It is not involuntary ignorance of the truth, but rejection or denial of it, that results in condemnation. Hence the fundamentals vary for individuals, and it is impossible to draw up a certain definite list which shall hold good in all cases. A more scientific definition is that the fundamental Christian doctrines are those which are the essential characteristics of Christianity, differentiating it from other religions. All Christians consider certain truths essential to the Christian system, and others as comparatively unessential. But each Christian body has doctrines essential to its own system which are not held by the entire Christian Church. And a distinction must be made between doctrines fundamental to Christianity and those fundamental to a particular system. Adherents to the various bodies do not always find it easy to draw this distinction, and the best attempts to state the former in terms of doctrine almost inevitably prove unsatisfactory because of the natural tendency to include the latter. In general, however, there is a practical tendency towards agreement between the different Protestant churches, whatever differences there may be upon specific points in their statements of fundamentals of doctrine, and such agreement is increasingly recognized. Modern Protestantism denies that saving faith is an exercise of the intellect, it is an action of the will in respect to what is known. The characteris-

ties of Christianity are to be found in the sphere of conduct rather than in belief. Roman Catholic theologians claim that they do not use the expression.

The discussion of fundamentals in doctrine has had importance chiefly in attempts to unite the various Christian bodies, particularly the Lutheran and Reformed churches. It was actively carried on in Germany in the early post-Reformation period. In England a committee of clergymen was appointed in 1653 to draw up a list of "fundamentals" and report to Parliament. Richard Baxter, who was one of the committee, proposed that it should consist of the Apostles' Creed, the Lord's Prayer, and the Ten Commandments. A catalogue of 16 articles was adopted, however, including doctrines concerning God, Christ, divine worship, faith, sin, the resurrection, the judgment, everlasting life, and everlasting condemnation. The aim seems to have been to exclude rather than to furnish common ground for agreement. The Federal Council of the Churches of Christ in America (1908), while not professing to form a creed, so defines itself as to make belief in "Jesus Christ as Divine Lord and Saviour" the fundamental. Many would regard the fundamental to be a belief in Jesus Christ as the highest revelation of God.

FUNDI. See FONDI.

FUNDI, fūn'di, or **FUNDUNGI** (West African word). A kind of grain, *Paspalum exile*, much cultivated in the west of Africa. It is allied to the millets and still more nearly to some of the kinds of grain cultivated in India. It is wholesome and nutritious, and has been recommended as a light and delicate food for invalids. The natives of western Africa throw it into boiling water, pour off the water, and add palm oil, butter, or milk. In Sierra Leone it is much used with stewed meat and sometimes made into porridge with milk. See **PASPALUM**.

FUNDY, BAY OF (from Fr *fond de la base*, head of the bay). An arm of the Atlantic, separating Nova Scotia from New Brunswick and the State of Maine (Map Nova Scotia, D 4). With an average breadth of 35 miles, it extends 180 miles in length from northeast to southwest. It forks, at its head, into two inlets, the northern, called Chignecto Bay, and the southern, Minas Channel, which are divided by narrow necks of land from Cumberland Strait. Along its northwest side it receives the St. John, the principal river of New Brunswick, and the St. Croix, which, through its entire course, forms the international boundary. The navigation is rendered perilous by frequent summer fogs and by the peculiarity of the tides, which have a rise and fall of 53 feet at certain seasons, producing dangerous bores in the upper reaches. The shores present a very bare appearance at low tide, with long expanses of mud flats and estuaries completely drained. Consult W. B. Dawson, *The Currents at the Entrance of the Bay of Fundy* (Ottawa, 1905).

FUNEN, fu'nēn (Dan *Fyen*). The largest of the Danish islands after Zealand, situated between Zealand on one side and Jutland and Schleswig on the other (Map Denmark, D 3). It is about 50 miles long and over 40 miles in its greatest width, with an area of 1133 square miles. Its surface is slightly elevated in the south and west, where it rises to an altitude of over 400 feet. The larger part, especially in the north and east, however, is flat. The soil

is extraordinarily fertile and well watered. Grain is produced and considerable amounts are exported. Stock farming is also extensively carried on. Administratively the island forms, together with the adjacent islands of Langeland and Æro and a number of smaller islands, the Province of Funen, which is divided into the two districts of Odense and Svendborg. The principal towns are Odense (qv), the capital, Svendborg, and Nyborg (qv). Pop (district), 1901, 279,785, 1911, 203,179. Pop (island), 1901, 240,359, 1911, 252,288.

FUNERAL, THE, or **GRIEF À-LA-MODE**. A comedy by Steele, acted in 1701.

FUNERAL RITES. See **MORTUARY CUSTOMS**.

FUNES, fū'nās, GREGORIO (1749-1830). An Argentine historian. He was rector of the University of Córdoba, and as such introduced numerous reforms. He was highly distinguished as a lecturer, and counted among his pupils many men afterward famous. He was also celebrated as an historian and pulpit orator, and in the latter capacity was probably unexcelled in his day in South America. His qualifications ultimately secured for him an appointment to the deanship of the cathedral of Córdoba. His chief publication is entitled *Ensayo de la historia civil del Paraguay, Buenos Ayres y Tucumán* (Buenos Aires, 1816, 2d ed., 1856). His other works are *Plan de estudios para la universidad de Córdoba* (Córdoba, 1832) and *Examen crítico de los discursos sobre una constitución religiosa, considerada como parte de la civil* (Buenos Aires, 1825). Consult M. de Vedia y Mitre, *El Dean Funes en la historia argentina* (2d ed., Barcelona, 1910).

FUNKIRCHEN, funf'kérk-en, or **PÉCS**, pách. The capital of the County of Baranya, Hungary, and an important garrison town, 248 miles southeast of Vienna by rail (Map Hungary, F 3). It is picturesquely situated on the southern vine-clad slopes of the Mecsek Mountains. It has been the see of a Roman Catholic bishop since 1009 and has a handsome eleventh-century Romanesque cathedral with four towers, which has been restored since 1887. Two of the five Turkish mosques from which the town derives its German and Hungarian names are in ruins, but two have been converted into the Stadtkirche and the third Franciscan church. Other important buildings are the episcopal palace, the town hall, and a fine synagogue. Its many institutions of learning include a Catholic seminary, a priests' college, a gymnasium, a teachers' institute, a trade school, a military school, a museum, and a library. It has a large majolica factory. There is a considerable trade in the coal, marble, wine, fruit, tobacco, and hogs of the adjacent territory, and it has important manufactures of leather, cloth, pottery, champagne, and church organs. Funfkirchen is thought to be the Roman Colonia Serbinum. It was occupied by the Turks from 1543 to 1686. Pop, 1900, 42,252, 1910, 49,822.

FUNG. See **FUNJ**.

FUNG-HUANG, or **FENG-HWANG**, fūng'-hwang'. A fabulous Chinese bird which figures largely in Chinese poetry, art, and folklore. *Fung* is the male and *huang* the female, and as the two are inseparable they are considered models of conjugal love. The fung-huang is the second of the four supernatural creatures of Chinese mythology and has many symbolical analogies to the Greek phoenix. It is im-

mortal, lives in the highest air, and its appearance on earth presages the advent of a virtuous monarch or is emblematic of a prosperous reign. It appeared several times in antiquity. In China it used to be the special emblem of the Empress, in Japan (where it is called Hō-wō), of the Mikado. In art it is usually depicted with the head of a pheasant, the beak of a swallow, a long flexible neck, plumage of many gorgeous colors, a flowing tail, and long claws pointed backward as it flies. Each of the five colors of its plumage typifies one of the five cardinal virtues. The flowers usually associated with it are sprays of the tree peony. Consult Mayers, *Chinese Reader's Manual* (Shanghai, 1875), Griffiths, *The Mikado's Empire* (New York, 1900), Macgowan, *Chinese Folk Lore Tales* (London, 1910), Griffiths, *China's Story in Myth, Legend, Art, and Annals* (New York, 1911).

FUNGI, fūn'jī (Lat, mushrooms, connected with Gk σφόνγος, *sphongos*, σπόγγος, *spongos*, sponge). There are in use two applications of the term "fungi." In general, fungi are regarded as including all thallophytes (qv) without chlorophyll, i.e., unable to manufacture food. In scientific usage fungi apply only to that assemblage of dependent thallophytes which has the characteristic vegetative body called a mycelium. A mycelium consists of colorless filaments, usually more or less interwoven. It may be very open and delicate, like a spider web, or it may be felt-like, or even form a compact body (as in lichens). Since fungi are unable to manufacture carbohydrate food, they are either parasites, dependent upon living plants or animals as hosts, or they are saprophytes, dependent upon organic debris or products from plants or animals. These are not terms of classification, for some fungi are able to live either as parasites or saprophytes, and such are called facultative forms, while those restricted to either the parasitic or saprophytic habit are obligate forms.

Three groups of fungi are recognized: Phycomycetes (alga-like fungi), Ascomycetes (sac fungi), and Basidiomycetes (basidium fungi). In all of these groups the mycelium establishes absorbing connections with its food supply (substratum), and when these connections are definite and more or less specialized, they are called haustoria (suckers). In the case of the parasite the substratum is either the surface or the internal tissues of the host, and in such cases the haustoria are very definite structures. Under certain conditions the mycelium also produces vertical branches (sporophores) which in a variety of ways give rise to spores. In the case of internal parasites the sporophore reaches the surface of the host in a position favorable for spore dispersal. Fungi are notable for the vast number of spores produced, and in most cases their dispersal is aerial, so that mycelia are multiplied with great rapidity and over wide areas.

Phycomycetes—This comparatively small group of fungi resembles the green algae in many features, a fact which has suggested the name. The mycelium is peculiar among fungi in being coenocytic, i.e., in having no cross walls, the whole body of the mycelium having one continuous cavity. The striking resemblance to algae, however, consists in the presence of conspicuous sex organs. The two groups of Phycomycetes are distinguished by their sexual char-

acters: the Oömycetes, which are heterogamous, i.e., with distinct eggs and sperms, and the Zygomycetes, which are isogamous, i.e., with gametes similar.

The Oömycetes are regarded as more primitive than the Zygomycetes, because they are more closely related to the algae. They are mostly aquatic and produce zoospores, differing in this feature from the Zygomycetes, in which aerial, wind-dispersed spores are produced. The water molds (*Saprolegniales*) are the best representatives of the group. The genus *Saprolegnia* contains saprophytic species found on dead bodies of crustaceans, water insects, etc., and also parasitic species attacking fishes, frogs, etc. One species that attacks the eggs and young of fishes is very destructive in fish hatcheries. *Saprolegnia* is noted for the frequent and perhaps usual occurrence of parthenogenesis, which means that its eggs germinate without fertilization. The downy mildews (*Peronosporales*) constitute another group of Oömycetes, which merges into the Zygomycetes. They are the one assemblage of Oömycetes with distinctly aerial habit. The downy mildews are internal parasites, many of them destroying valuable crop plants. Among the conspicuous genera are *Albugo*, which is very common as white rust upon members of the mustard family, *Phytophthora*, which is the parasite producing potato rot, *Plasmopara*, one of whose species is the grape mildew, a disease of American origin, *Peronospora*, whose species are very common parasites on ordinary vegetables, as peas, beans, spinach, etc.

The Zygomycetes, distinguished by apparent isogamy and by the elimination of swimming spores, are best represented by the black molds (*Mucorales*), whose characteristic cobwebby, fleecy-white mycelia are very common on decaying material, stale bread, fruit juices, etc. Another very common order of Zygomycetes is the Entomophthorales, a group of parasites fatal to insects, the common house fly often being destroyed by them.

Ascomycetes—The sac fungi include the majority of fungi, and in contrast with the Phycomycetes the filaments of the mycelium have cross walls and the sex organs are much reduced and often suppressed. The common character of this great assemblage is the appearance of an ascus (sac) in the life history, in which the ascospores are formed. In the majority of forms a spore case is developed in connection with the asci, more or less investing them with a protective jacket, and called the ascocarp. The group is so extensive and varied that only a few illustrations from the eight usually recognized orders can be given. The order of the illustrations used will indicate the present opinion as to the relative rank of the forms.

The yeasts (*Saccharomycetes*) are very familiar forms, which represent the order Protoascascales, the name referring to the fact that yeasts are regarded as the simplest or most primitive of the Ascomycetes. Then follow orders containing parasites inducing such diseases as peach curl, plum pocket, and witch brooms, and such saprophytes as the well-known edible morel (*Morchella*), whose fleshy ascocarp is usually spoken of as a mushroom. One of the largest orders, Pezizales (cup fungi), is characterized by the open ascocarp, which takes the form of a flat disk, bowl, cup, or funnel. The cups are sometimes brightly lined as in the case of the

TYPES OF FUNGI

1. SPORE CASES OF A SLIME MOLD.

2. SPORANGIA OF BLACK MOLD.

3. DEVELOPMENT OF ZYGOSPORE OF BLACK MOLD.

4. WATER MOLD, (a), growing on a fly; (b), Sporangia with Zoöspores; and (c), Oögonia and eggs.

5. SPORE CASE OF CORDYCEPS (an insect parasite).

6. MILDEW ON LILAC.

7. LILAC MILDEW, showing (a), Ascocarp, and (b), Asci with spores.

8. GREEN MOLD WITH SPOROPHORES.

TYPES OF FUNGI

4. EARTH STAR.
5. WHEAT SMUT.
6. CEDAR APPLE.

common scarlet cup of the woods. To this same order also belong the fungi that produce lichens, upon which the characteristic disklike or cuplike ascomycetes are seen more commonly. Other orders contain the truffles, which are entirely subterranean fungi whose ascomycetes are tuberlike, becoming fleshy and edible, and also the common blue and green molds, such as appear on bread, preserves, etc. The largest order is Pyrenomycetales, or fire fungi, the common name referring to the fact that these fungi often form black spots, knots, etc., resembling charred places upon twigs and decaying wood. The order consists of two well-defined groups, the mildews and the black fungi. The mildews are superficial parasites on the higher plants, the cobweblike mycelium especially running over leaves, as in the case of the common lilac mildew. The black fungi constitute the fire fungi proper, and the name suggests their appearance. They include both parasites and saprophytes. Two of the best-known parasites among the black fungi are the black knot (*Ploerighia*), a destructive disease that attacks the plum and cherry, and the ergot fungus (*Claviceps*), a common parasite on the young ovaries of grasses, especially rye. At a certain stage of its life history the ergot fungus forms a compact mass of tissue from which the astringent drug ergot is extracted.

Basidiomycetes—This great group of fungi is characterized by the occurrence of a basidium in the life history, which is a cell that gives rise to slender branches, usually four in number, at the tip of each one of which a spore is cut off (basidiospore). There are two great divisions of Basidiomycetes, the first one being represented chiefly by the smuts and rusts, and the other being characterized chiefly by the mushrooms and puffballs. The smuts (see USTILAGINALES) are more commonly called brand fungi in Europe, and are destructive parasites that attack various cereals, conspicuous among which is the corn. The rusts (see UREDINALES) are all destructive parasites, ranging widely among seed plants, the best-known forms being the wheat rusts. The rusts are especially remarkable for their polymorphism, in extreme cases a single life history including two parasites living upon entirely unrelated host plants and producing at least five different kinds of spores. Associated with smuts and rusts in the first group of Basidiomycetes are two other orders, the best-known representative being the ear fungi, which appear as gelatinous earlike growths on bark, etc., a very common form occurring on stems of elder.

The second group of Basidiomycetes includes 10 orders, which are divided between two groups. Hymenomycetes, in which the basidia are freely exposed, and Gasteromycetes, in which they are inclosed by a characteristic sporophore. The most representative order of Hymenomycetes is the Agaricales, which is by far the largest group of fleshy fungi, containing most of the so-called mushrooms and toadstools. There are three conspicuous families of mushrooms, based upon the character of the special surface upon which the spore-forming basidia are exposed. While the sporophore usually has the ordinary mushroom (umbrella) form, with its stipe and pileus, it develops also in various bracket forms, and even as incrustations upon the surface of logs, etc. The tooth fungi (*Hydnaceae*) are those in which the basidium layer covers toothlike or spinelike processes. The pore

fungi (*Polyporaceae*) are those in which the basidium layer lines tubes that terminate on the surface in porelike openings. The gill fungi (*Agaricaceae*) are the common mushrooms and toadstools, whose basidium layers are exposed upon the characteristic bladelike plates which are the gills.

The Gasteromycetes are the most highly organized of the fungi, whose sporophore is differentiated into an outer zone (peridium) and an inner mass of tissue (gleba), in which there are numerous chambers lined by the basidium layer. In addition to the true puffballs, which are the most representative of the group, there are the curious nest fungi and the stinkhorns.

In addition to the true fungi considered above, there are other groups of thallophytes without chlorophyll which are commonly associated with fungi in an elementary presentation of thallophytes. The two most conspicuous groups of this kind are as follows:

Myxomycetes—These are the slime molds or slime fungi, which combine characters of plants and animals in such a way that opinions differ as to which they should be assigned. Those that incline to the view that they are animals use the term Mycetozoa (fungus animals) for the group. In general they are common in forests on rich soil, decaying wood, fallen leaves, etc., and one of the largest occurs on spent bark (flowers of tan). The characteristic plant body is called a plasmodium, which is a naked mass of protoplasm with a creeping motion, putting out and withdrawing regions of its body (pseudopodia) like a gigantic amoeba. The most unplant-like behavior of the plasmodium is its habit of engulfing solid food instead of admitting it in solution. Under certain conditions the plasmodium passes into a spore-forming stage, usually numerous stalked sporangia being produced from a single plasmodium. These sporangia produce countless spores with cellulose walls, which are very characteristic reproductive cells of plants.

Schizomycetes—These are the well-known bacteria (q v). The group has many characters in common with the blue-green algae and is now generally associated with them in the group Schizophytes. The chief characters in common with the blue-green algae are the one-celled body, which often forms filaments, a protoplast of simple structure, the power of locomotion, and reproduction only by vegetative multiplication, the cell divisions being in remarkably rapid succession. The immense economic importance of bacteria has stimulated their investigation to such an extent that bacteriology has become a distinct field of research. They are of great interest to the botanist as representing a group of plants in which there is extremely varied physiological differentiation and very little morphological differentiation. This means that in most cases a species is distinguished, not by its appearance, but by its activities. On the basis of activities, four conspicuous groups of bacteria are usually considered. The saprophytic bacteria are forms that attack the dead bodies or the organic products of plants and animals and bring about putrefaction and fermentation. The pathogenic bacteria are the disease-producing forms, their activities being connected with living organisms. The nitrogen bacteria are bacteria of the soil that are able to utilize the free nitrogen of the air and are the medium through which a steady supply of

nitrogen salts enters the soil. The nitrifying bacteria are also soil forms that lay hold of the simpler nitrogen compounds (as ammonia) and oxidize them into the nitrites and nitrates which are the nitrogen compounds available for green plants.

Buller, *Researches on Fungi* (London, 1909), George Massee, *British Fungi* (ib., 1911), McIlvaine and Macadam, *One Thousand and American Fungi* (rev. ed., Indianapolis, 1912), J. Eriksson, *Fungoid Diseases of Agricultural Plants* (London, 1912), F. L. Stevens, *Fungi Which Cause Plant Disease* (ib., 1913), W. B. Grove, *British Rust Fungi* (New York, 1913).

FUNGI, ECONOMIC Species of fungi that may directly or indirectly affect man's welfare. Of those that affect man directly, the edible and poisonous species and some parasites, such as ringworm, barber's itch, etc., may be mentioned as examples (see FUNGI, EDIBLE AND POISONOUS, MUSHROOM, TRUFFLE), of those that affect him indirectly are plant diseases, molds, some animal diseases, etc., whose functional activity may result in monetary or some other kind of loss. A large majority of fungi (saprophytes) are capable of living only on decaying organic matter, and since they do not ordinarily attack living plants, they do not produce plant diseases. They are therefore of little economic importance except as they occur on fruits and other food stuffs, timber, clothing, etc., when they may be considered harmful. On the other hand, many of these organisms are more or less beneficial, since they act as scavengers in the destruction of organic matter which would long cumber the earth if dependent upon the slow process of chemical oxidation. Under abnormal conditions of moisture, temperature, etc., some saprophytic fungi (usually called facultative parasites) are able to attack and injure living plants. The parasitic species (another large group) occur normally upon living plants and animals, from which they derive their sustenance. The plant or animal upon which they live is called the host. The relationship between host and parasite is more or less intimate, and as the economic plants are affected, the importance of the parasite is the greater. In some cases the fungi are of positive benefit to man because they (entomogenous fungi) destroy noxious insects, as locusts, grasshoppers, flies, scale insects, etc., others live at the expense of fungi that are themselves injurious to plants of value to man, as in the case of *Danilca filum*, a parasite of the injurious asparagus rust. The number of fungi that attack living animals is large, and in some cases the attack is very destructive. Young fish in hatcheries are subject to diseases due to fungi, and higher animals often suffer similar attacks. A lung disease of horses is caused by the presence of the fungus *Botriomyces*, and the various forms of ringworms, favus, barber's itch, etc., are all due to fungi.

When mention is made of fungus diseases the term commonly refers to diseases of plants caused by attacks of parasitic fungi. The number of species of such parasitic fungi is very large, and nearly every garden, orchard, and greenhouse crop may be attacked by one or many. The various parts of the maize plant are subject to the attack of at least 70 species

of fungi, the common tulip tree, or yellow poplar, is reported as the host of nearly 100 species, the oat plant has a dozen such enemies, and so on. The annual loss attributed to the attacks of fungi, to which the reduced yield and inferior quality of the product are largely due, amounts to hundreds of millions of dollars. It has been estimated that the average loss due to oat smut in the United States alone amounts to more than \$18,000,000 annually. If to this sum be added the similar losses of other great economic crops, the total would be enormous. Cereal rusts in the United States are believed to cause more loss than any other source of injury, and often the loss amounts to more than the damage done by all other enemies, fungus and insect, added together. In certain localities the grape crops have been almost wholly destroyed by parasitic fungi, and certain truck crops have suffered similarly. The great famine in Ireland during 1846-47 has been largely attributed to the almost total destruction of the potato crop, through the attack of the potato rot (*Phytophthora infestans*).

For the general classification of the fungi, see article FUNGI. Fortunately many of the diseases caused by these parasites may be prevented by the adoption of certain precautionary measures, by the application of a fungicide (qv), and by the exercise of proper methods of cultivation by which the general vigor of the plant is improved. See DISEASES OF PLANTS; also diseases of specific crops, eg, APPLE, GRAPE; POTATO, WHEAT, MAIZE, etc.

FUNGI, EDIBLE AND POISONOUS A general name given to mushrooms, toadstools, puffballs, etc., that may or may not be eaten with safety by man.

Edible Fungi. More than 700 species have been found to be safe and many are considered very nutritious. (See MUSHROOM.) Perhaps the principal reason that fungi are not more generally eaten is not so much that their value is unknown, as that people are afraid even to touch the plants because certain species are known to produce illness and even death. In the interests of safety, therefore, every writer upon the subject of edible and poisonous fungi iterates the warning to avoid eating any fungus the edible qualities of which are not positively known to the would-be consumer beyond the slightest shadow of doubt. Since certain toadstools (especially *Amanita phalloides* and *Amanita muscaria*, described below) are mistaken by the uninitiated for the common mushroom, all fungi found in the woods or in shady places (until they are proved to be wholesome) and all that have white or yellow gills should be avoided. The common mushroom grows in the open fields and has pink gills which gradually turn to purplish brown or black. A safe plan for the novice to adopt, even on becoming familiar with the 12 edible species described and illustrated, after being satisfied with their identification, is to eat only a small portion of a fungus new to him, to note the results carefully, and to allow several hours to elapse before indulging more freely. In no case should he be guided by pleasant taste alone, because some of the species considered unwholesome do not manifest any disagreeable quality.

1. Chanterelle (*Cantharellus cibarius*), common in light woods and on high ground, grows from 2 to 4 inches tall, expands from 2 to 3 inches, and has an irregular lobed orange or

yellow cap, which when young is domelike, but with age becomes expanded and depressed at the centre. The gills are thick, short, branching, and wide apart. The stem, at first white and solid, later becomes hollow. Since this species is rather tough and dry, only crisp heavy specimens should be selected for the table. A closely related poisonous species, *Cantharellus aestivalis*, found in rank or decaying grass, closely resembles the above in color, but has thin, crowded gills of deeper tint than the cap. 2 The common field mushroom (*Agaricus campestris*), which grows from 2 to 4 inches tall, is probably the commonest, best known, and most easily distinguished of all. It is the only one that is cultivated to any extent. (See Mushroom.) The cap is fleshy, from 1¼ to 4 inches broad, usually white, but sometimes tawny or brownish above, and, when in prime condition, pink below. With age it changes to dark brown. Upon the stem is a collar, the remains of a veil, which in the young mushroom joins the margin of the cap to the stem. This mushroom has never been found growing in woods or shady places, but always in open pastures, fields, and lawns. 3 The edible pore mushroom (*Boletus edulis*), found most abundantly during the autumn in pine, oak, and chestnut woods, has a brown white-fleshed cap from 4 to 6 inches across, with convex tubes at first white, but changing to yellow and then greenish. When in the pale-yellow stage the plants are most tender and edible. The 2 to 6 inch stem becomes light brown, with a network of pinkish veins near the top. 4 The variable mushroom (*Russula variata*), a common species found in woods from July to November, is usually some shade of dingy green, never reddish or purple. The stem is white, solid, and firm, the gills white, narrow, crowded, forked. The fleshy cap when peeled is white, of firm texture, and mild, sweet, nutty flavor while young and fresh, wilted and old specimens are not desirable even when free from grubs, which are especially fond of the plant. 5 Oyster mushroom (*Pleurotus ostreatus*), common on moist, decaying tree trunks throughout the United States. The cap is shell-shaped, 3 to 5 inches broad, dark when young, soon bleaching to brownish, and later yellow, stem white, short, or wanting, thickened upward, gills broad, rather distant, white or sometimes yellowish. Flesh tender, except in old specimens, of pleasant, but not pronounced, flavor. Especially good when dipped in egg and fried slowly like an oyster. 6 The fairy ring (*Marasmius oreades*) grows in short grass of lawns, pastures, etc., but never in woods. Its common name is derived from its habit of growing in ringlike patches, which increase in diameter as the plants reach outward to new feeding ground. The mushrooms are small (1 to 2 inches broad and 2 to 3 inches tall), reddish at first, pale afterward, solid, very tough, with broad, distant, free gills, alternately long and short. They have a weak but agreeable odor and mild, sweet, and nutty taste, which is retained well when the mushrooms are dried by exposure to air or sun—the simplest way to preserve them. It is one of the best and the most easily digested. The hairy-foot (*Marasmius personatus*) which grows in woods on dead leaves, etc., must not be mistaken for the fairy ring, since it is generally considered unwholesome. This species has darker and narrower gills, and a hairy down at the base of the stem. 7.

Morel (*Morchella esculenta*), common in spring in old apple orchards and in woods, especially under butternut trees and on burned-over surfaces or places where wood ashes have been scattered. The pale yellow, buff, or tawny cap is attached to the stout whitish hollow or stuffed stem by its base, is ribbed and pitted like honeycomb. The morel is one of the most easily recognized and the choicest species of edible fungi. Its near relatives (genus *Morchella*), which more or less closely resemble it, are all edible. 8 *Clavaria cinerea*, a fungus without a cap, which may be found in the woods from June until frost, grows from 1 to 3 inches high, in tufts or colonies, and has thin or thick stems lighter than the numerous irregular, wrinkled gray branches. It is considered the best of the Clavarias, but is said to be injurious in large quantities and to be digested with difficulty by weak stomachs. 9 Horse mushroom (*Agaricus arvensis*) is considered by some writers to be a variety of the common mushroom, which grows in similar places, but is slightly larger (2 to 5 inches tall, 3 to 5 inches or more broad), has gills which turn from whitish to pink and then dark brown, and a stem which is either hollow or stuffed with floccose pith. By some it is considered inferior and by others superior to the common mushroom. 10 *Cortinarius caerulescens*, an almost odorless species found among moss in woods, has a convex or plane yellowish cap 2 to 3 inches across, slightly rounded, thin, closely crowded, blue or purplish gills, which change to a dull cinnamon with age, and firm violet, pale, or whitish stems about 2 inches long, which rise from bulbs more than an inch thick. 11 Horeetail fungus (*Coprinus comatus*) may be found after hard rains from August until frost, sometimes in spring, singly or in clusters, in a great variety of places, from rich soil to dumping grounds. The cap is fleshy, at first oblong and white, but later a ragged bell shape and purplish black, the gills are crowded, broad, free from the stem, at first white, then pink, after which the plant becomes unfit for food, since it turns from purple to black and dissolves into inklike drops. The stem is hollow, often 10 inches long, but mostly hidden under the cap. It is not of high flavor, but is of great delicacy when young. 12 Liver fungus (*Fistulina hepatica*) is a juicy, red, fibrous-fleshed, nonrooting fungus, which may be found upon decaying trees and stumps, especially on oak, beech, and chestnut, after rains in summer and autumn. Under the name of beefsteak fungus it is highly esteemed everywhere for its rich, nutritious flesh of acid flavor and agreeable odor.

Poisonous Fungi. The number of fungi formerly considered poisonous was very large; investigation, however, has proved that many so regarded are not merely innocuous, but are good for food. The results are that not a few old beliefs have been upset and others are made to totter. Poisonous fungi may be divided into two groups: those that contain local irritant poisons, which quickly act on the alimentary tract, and those that contain poisons which, after the lapse of several hours, act on the nerve centres. Members of the first group, though exceedingly disagreeable in their effects, produce no serious disturbance, and unless eaten in very large quantities or by persons in ill health, need not be considered dangerous. The administration of an emetic, followed after ac-

tion by doses of sweet oil and whisky, or sweet oil and vinegar, is recommended. Unfortunately members of the second group give no warning of their harmfulness either by an unpleasant taste or by local action on the digestive tract, and toxic quantities of the poison are usually absorbed before symptoms appear. Should a poisonous *Amanita* be eaten by mistake or through carelessness, "take an emetic at once and send for a physician, with instructions to bring hypodermic syringe and atropine sulphate. The dose is $\frac{1}{100}$ of a grain, and doses should be continued heroically until the $\frac{1}{20}$ of a grain is administered, or until, in the physician's opinion, a proper quantity has been injected. Where the patient is critically ill, $\frac{1}{20}$ of a grain may be administered." The treatment is effective only when the first symptoms manifest themselves, and not when late effects of the dangerous toadstool poisons are evident.

The species illustrated and described herewith have, until recently, been considered poisonous, but some of them are either merely innocuous, injurious to only certain individuals in the same way that strawberries are, or are even more generally wholesome. Every one, even the fungus expert, should consider himself a novice until he has personally determined these two points.

1 Fly amanita or fly mushroom (*Amanita muscaria*), common in woods, especially of pine and birch, has a cap 4 or more inches broad, which, in its varieties, exhibits many colors—blood red, bay brown, orange, lemon, white, and the tint of cooked liver. Usually the skin, which is at first thick (sticky in damp weather), checks more or less and peels in angular fragments. The flesh is yellow just beneath the skin, otherwise white and rather loose. The stem, which is white, scaly, long, stout, but soon hollow, is bulbous at the base and bears a very soft torn frill or ring close to or even at its summit. The gills are white, sometimes yellow. This species is everywhere reported as poisonous, but is said to be eaten by the Siberians to produce a sort of intoxication. Its name, *muscaria*, is derived from its property of killing flies. 2 Satan's mushroom (*Boletus satanus*) is a somewhat rare species which grows in woods. Its cap, 3 to 8 inches across, is usually brownish, yellow, or whitish, and rather sticky. Tubes yellow, with bright-red mouths, which later become orange, stem 2 or 3 inches long, thick and reticulated above. Its flesh, which is whitish, turning to reddish or bluish where injured, is mild, reputed poisonous, but eaten without discomfort by many. Since its evil effects seem to vary with the individual who partakes, it should either be avoided or tested with extreme care. 3. The emetic mushroom (*Russula emetica*) has a cap 3 to 4 inches broad, rosy, changing to blood red, then tawny, sometimes yellow at first and later white. Its shape changes from bell form to flat, or with a depressed centre, and a furrowed tubular margin. The gills are white, rather free, broad, and distant. Reputed to be emetic and poisonous, but eaten with impunity by many. 4 The woolly lactarius (*Lactarius torminosus*) is a rare species which grows in damp woods and swamps. Its cap is 2 to 4 inches broad, at first convex, later concave, usually shining yellowish red, gills narrow, sometimes forked, whitish, tinged with yellow or red, stem, 1 to 2 inches long, lighter than the cap, flesh pinkish, extremely acrid, reputed very poisonous. 5 Titled clathrus (*Clathrus*

cancellatus), a reputed poisonous fungus of beautiful red, white, or yellowish lattice-like form and of very offensive odor. The latticed part rises from a white or fawn-colored cup. 6 Fiery boletus (*Boletus piperatus*), a common but variable species in woods and open places, is 1 to 3 inches in diameter, yellowish, light brown, or reddish, convex or almost flat, on a stem $1\frac{1}{2}$ to 3 inches tall, reddish or bright yellow at its base. The flesh, white or yellowish, loses its acrid, peppery flavor when cooked. Though reputed poisonous, this species has been eaten with enjoyment by many. 7 Deadly agaric, deadly amanita, death cup (*Amanita phalloides*), a common and very variable species found in woods from June until frost, is one of the most poisonous of mushrooms. The cap is 3 to 4 inches across, shining white, lemon, grayish brown, blackish brown, or grayish brown with a black disk sometimes dotted, viscid in damp weather, stem 3 to 5 inches long, sometimes much longer, white and rather smooth, hollow above, larger, solid, and bulblike below, rising from a sort of cup—hence the name "death cup", and bearing near its summit a reflexed, swollen, white, usually entire ring, gills white, free. This species is perhaps most dangerous, because most often mistaken for the common mushroom (*Agaricus campestris*). Since it grows in the woods, has white gills, white spores, and a cuplike base, the collector is to blame if he makes any mistake. The common mushroom does not grow in the woods, has pink gills, dark spores, and no cup at its base. 8 Spring mushroom (*Amanita vernus*), considered to be a variety of the preceding, which grows in similar places, but during spring and summer. 9 The verdigris mushroom (*Stropharia ceruginosa*), common from July to November in woods and meadows, has a cap about 3 inches in diameter, covered with a green or blue slime, a long, scaly, hollow, bluish stem, and brown or purplish gills. It is reputed poisonous, probably because of its disagreeable odor, color, and taste. 10 The stinkhorn or fetid wood witch (*Phallus impudicus*) grows during summer and autumn in woods, fence corners, kitchen yards, and under wooden steps. Its cap expands but little, is about 2 inches from edge to summit, and is borne in a thick ($1\frac{1}{4}$ -inch) stem, 6 to 8 inches tall, which rises from a white or pinkish cup 2 inches in diameter. This toadstool cannot be mistaken when full grown, because of its exceedingly offensive odor, which attracts blowflies and carrion beetles. The young plants are said to be very good when fried, but when mature the odor is against the species, and it is then considered unwholesome. 11 Red-juice mushroom (*Hygrophorus conicus*), found in woods and open places from August to October, has a thin, fragile, acutely or obtusely conical yellow, bright-red, or scarlet cap $\frac{1}{2}$ to 1 inch across, with a lobed margin, rather close, broad, yellow, free gills, and a hollow yellow stem, 3 to 6 inches long. Formerly this species was considered poisonous, probably on account of its color, it is now proved not to be merely harmless, but good for food.

FUNGI, FISSIO See SCHIZOMYCETES

FUNGIBLES, fūn'jī-b'iz In the civil law, articles of personal property, such as food, fuel, etc., loaned to another for the purpose of being consumed, i. e., such objects as cannot be used without being given away or consumed, which were the subjects of the civil-law contract of *mutuum*. Objects of this nature, from the fact that they were got rid of one for another (*fungantur*), were called fungibles. See **MUTUUM**

FUNGICIDE, fūn'jī-sid (from Lat. *fungus*, mushroom + *cadere*, to kill). Any material that will destroy fungi or prevent the germination of their spores. Fortunately for agriculture and horticulture there are a number of substances which may be employed for this purpose. On account of their destructive influence, copper salts, which form the basis of many fungicides, are used in several of the most important. A few of the commonest and best fungicides are given herewith. When used upon foliage, the liquids must all be applied as a mistlike spray, especially to the undersides of the leaves, where many of the fungi gain entrance through the stomata, and only in sufficient quantity to moisten the surfaces, without standing on them or running off in drops. Neither should they trickle off dormant wood.

Bordeaux mixture, accidentally discovered in France about 1882, is the best general fungicide known. It consists of a solution of copper sulphate and lime. The corrosive action of the former upon many kinds of foliage is neutralized by the lime, which also makes the mixture more adhesive. The following is considered the best method of preparation. In a wooden vessel dissolve copper sulphate at the rate of one pound to a gallon of water by suspending the salt in a coarse bag just below the surface of the water. It will dissolve more quickly if suspended than if placed at the bottom. In another vessel slake fresh lime with just enough water to cover it. This lime should contain little or no magnesium. When slaked, add water until the proportion is one pound of lime to one gallon of water. When needed for use, these two stock solutions, as they are called, are diluted with water and then mixed with as much agitation or stirring as possible. The proportions in the final mixture should be five pounds of copper sulphate, five pounds of lime, 50 gallons of water, making what is known as the 5-5-50 mixture for applying to dormant wood and strong foliage, such as apples and currants, for young and for tender foliage, such as peach and plum, an extra pound of lime and 25 gallons more of water should be added. It has been found that a still more dilute mixture can be successfully used without the injurious effects to foliage and fruit that follows the use of too strong mixtures. To test the neutrality of the mixture, a drop of ferrocyanide of potassium is added to a little of the compound, and if a brown color is observed, more lime must be added, if none, then the

fungicide may be applied with safety. The stock solution of copper sulphate may be kept indefinitely, the lime for only a few days. Since the mixture deteriorates rapidly by the flocculation of lime particles, it should be mixed fresh for each application. In order to make the fungicide more adhesive various substances may be added to it. Among those most commonly used are iron sulphate, molasses, resin, casein, gelatin, etc.

Ammoniacal copper-carbonate solution is almost as good as Bordeaux mixture, and since it is clear, and therefore produces no stain, it is better than Bordeaux mixture for spraying on ornamentals and ripening fruits. It is made by dissolving one ounce of copper carbonate in one pint of ammonia and adding 10 gallons of water.

Burgundy mixture, or soda Bordeaux mixture, is made by dissolving two pounds of copper sulphate in 50 gallons of water, three pounds of sodium carbonate (sal soda) in 50 gallons of water, and mixing the two solutions. This mixture is without a sediment and may be used when spotting of fruit is to be avoided.

Eau celeste is an important fungicide, but in inexperienced hands it may burn the foliage of many plants. It is made by dissolving one pound of copper sulphate in two gallons of water, adding one and a half pints of ammonia when cooled and diluting with water to 25 gallons.

Copper sulphate dissolved in water at the rate of one pound to 10 gallons of water is of great value as a spray for fungi, lichens, algae, etc., upon dormant trees and vines. It should not be used on foliage because of its corrosive action. The seed of oats, wheat, barley, etc., may be soaked in this solution to destroy the spores of smut (q. v.).

Lime-sulphur solution, which was first used as an insecticide, especially for the control of San José scale, has been found to be a valuable fungicide, and is less corrosive to foliage than some of the other fungicides. It may be secured in stock mixtures, or may be made by boiling fresh lime and sulphur together, or by slaking the fresh lime in contact with sulphur, the heat evolved being sufficient to dissolve the sulphur. This is the so-called self-boiled lime sulphur. With a few exceptions lime sulphur is as efficient as Bordeaux mixture and at the same time is a valuable insecticide.

Sulphur has an important rank among fungicides, especially as a remedy for powdery mildews. In outdoor use it is dusted upon the foliage, but in greenhouses it is generally evaporated. Either the steam pipes are coated with it or it is more rapidly volatilized by heating it in a sand bath over an oil stove. Extreme care must be exercised to prevent ignition, since the fumes of burning sulphur are fatal to plants, as may be seen from their use in ridding greenhouses of plant growths and spores upon the soil, benches, walks, etc. Of course, when so used, the houses are emptied of useful plants.

Hot water may be applied when nearly boiling to kill certain fungi and insects without injuring the plants. Its more valuable use, however, is for the destruction of smuts of cereals. For this purpose, also, solutions of formalin and of corrosive sublimate may be successfully employed. The methods of using these fungicides will be described more fully in the article on **SMUTS**.

Methods of Application The apparatus

needed to obtain the mistlike spray referred to above are nozzles, hose, and a force pump. The nozzles are the most important part of the machine. Those of the Vermorel type are considered the most satisfactory for short range, and the McGowan or a nozzle devised at the Massachusetts Experiment Station for long. Most progressive orchardists use the former upon the ends of long bamboo tubes, the operators often being raised upon platforms. A common form of apparatus is the so-called "knapsack" pump, a tank which is strapped over the shoulders like a knapsack. It contains a very compact and powerful pump, and is convenient for small plots and for crops that have grown too large to permit the entrance of a wagon sprayer. A sprayer that uses compressed air for driving out the liquid is growing in favor for spraying on a small scale. Success in combating plant diseases depends upon the thoroughness with which the fungicides are applied. No fixed rules can be given as to times for spraying, but in general three or four applications should be given at intervals of 10 days or two weeks. If much rainy weather intervenes, one or two additional sprayings may be profitably given. In spraying fruit trees and vines of all kinds, the first application should be given just as the buds begin to swell, but before they show characteristic color. No spraying should be given when the plants are in blossom, but one should follow the fall of the petals. Plant diseases are worse during some seasons than during others, hot, moist weather favors the rapid growth of many fungi. Perennial plants should be sprayed every season to keep them in good condition, the increased yields of better crops will more than pay for the trouble and expense of spraying. Spraying is preventive, not remedial.

See also FUNGI; BACTERIA; BASIDIOMYCETES, ASCOMYCETES, ETC.

FUNGOID PARASITE. A name occasionally used for fungi which are parasitic upon plants or animals. See FUNGI, ECONOMIC.

FUNGUS. A term in pathology, with several different meanings. Almost any growth from the skin or mucous membranes which has a cauliflower-like or excrescent character may be referred to as a fungoid growth. The term "fungus" is also used in connection with certain vegetable parasites which incite disease. These are treated in the article FUNGI. Bacteria and their relation to disease will be found fully described under BACTERIA and DISEASE, GERM THEORY OF, also found under their respective titles. Yeasts occur in the stomach in some forms of indigestion and have been found in the bladder in diabetes. A few cases of skin diseases have been reported in which the yeast fungus was apparently the exciting agent. The most common molds which are met with in pathology

are (1) the *Trichophyton tonsurans*, which is the active agent in the disease known as *tinea sycosis*, or ringworm (qv), (2) the *Achorion Schoenleini*, which is the parasite of favus (qv), and (3) the *Microsporon furfur*, which is the cause of pityriasis versicolor, a skin disease.

FUNGUS BEETLE, or FIDDLE. An extraordinary carabid beetle (*Mormolyce phyllodes*) of Java and the neighboring mainland, very variable in size, but sometimes 3 inches long, yet so flat as to be able to creep into surprisingly thin crevices. It is brown, with black legs and antennae, and the elytra are thin, soft, translucent, and greatly expanded, giving it a very strange form. These beetles remain in dark places, under bark, etc., during the day, and are particularly fond of hiding behind the fungi growing on trees. Within these their eggs are laid and the larvæ make their home, feeding, it is believed, on the larvæ of other insects. This insect is known to the English residents about Penang as the fiddle beetle, in allusion to the outline of its body.

FUNGUS BEETLE

FUNGUS GNAT. One of the little flies of the family Mycetophilidæ, so called from the fact that many of them breed in fungi, including edible mushrooms. They are, as a rule, delicate and rather slender, with clear wings, but sometimes the wings are smoky or have large dark spots. The larvæ are slender, cylindrical maggots, more or less wormlike in appearance. The damage which they do in mushroom beds is sometimes very great, and it becomes necessary at certain seasons of the year to cover the growing mushrooms with gauze.

FUNJ, fūnj, or FUNG. A mixed Hamite-Negro people on the upper Nile. They have not the woolly hair nor the flat nose of the negro, and the color varies much as that of the mulattoes in the United States. Their language also betrays their Abyssinian origin. The Shilluks and Dinkas are of the same stock. The Kingdom of Sennar was founded by them in the seventeenth century and lasted until overthrown by Mehemet Ali in 1821. Consult Bruce, *Travels* (Edinburgh, 1805).

FUNK, funk, FRANZ XAVER VON (1840-1907) A Catholic theologian. He was born at Abtsgmund, Württemberg, and was educated at Tübingen, at the Seminary of Rottenburg, and in Paris, where he studied economics. In 1870 he was appointed professor of theology at Tübingen and in 1876 became an editor of the *Tübingen Theologische Quartalschrift*. His principal publications are: *Opera Patrum Apostolicorum* (1878, 2d ed., 1901), *Lehrbuch der Kirchengeschichte* (1886, 4th ed., 1902), *Die apostolischen Konstitutionen* (1891)—Funk thought the apostolic constitutions were written as late as the beginning of the fifth century, *Kirchengeschichtliche Abhandlungen und Untersuchungen* (1897-99).

FUNK, funk, ISAAC KAUFFMAN (1839-1912) An American clergyman, editor, and publisher. He was born at Clifton, Ohio, and was educated at Wittenberg College in his native State. After

being pastor of St Matthew's English Lutheran Church, in Brooklyn, N Y, for seven years, he made an extensive tour through Europe, northern Africa, and Asia Minor (1872). In 1878 he entered into partnership with A W Wagnalls as book publishers. They published many reprints of valuable English and continental books. Among the religious publications founded by him after 1876 are the following. *Metropolitan Pulpit* (now the *Homiletic Review*) and the *Missionary Review*. In 1889 the *Literary Digest* was established. In 1895 the *Standard Dictionary* was published, and in 1913 the *New Standard Dictionary*. A monumental undertaking was the *Jewish Encyclopedia* (12 vols, 1901-06). Dr Funk was a Prohibitionist and founded the *Voice* (1880), an organ of that party. He interested himself in psychical research and published *The Next Step in Evolution* (1902), *The Widow's Mite and Other Psychic Phenomena* (1904), and *The Psychic Riddle* (1907).

FUNK, PETER A name used of persons employed at auctions to offer bogus bids in order to raise the price.

FUNNY BONE. A term used to designate really not a bone, but the ulnar nerve, which is so slightly protected in the groove where it passes behind the internal condyle of the humerus (q v) that it is often affected by blows on that part. (See **ARM**) A peculiar electric thrill passes along the arm to the fingers whenever the nerve is struck or pressed.

FUNSTON, FREDERICK (1865-1917). An American soldier, born at New Carlisle, Clark Co, Ohio, the son of an artillery officer in the Civil War. He studied for two years at the Kansas State University (Lawrence, Kans), was a member of the reportorial staff of the *Kansas City Journal*, became connected with the United States Department of Agriculture in 1891, accompanied the Death Valley expedition to southern California as assistant botanist, and in 1893-94 was in Alaska, where he made for the department a collection of the local flora and obtained material for the field report included in F V Coville's *Botany of Yakutat Bay* (Washington, 1895). In 1896 he was appointed deputy comptroller of the Atchison, Topeka, and Santa Fe Railway. In the same year he offered his services to the Cuban Junta and later was commissioned captain of artillery and distinguished himself as such at La Machuca. He was promoted successively to be major and lieutenant colonel (for bravery at Las Tunas), endeavored, because of wounds and illness, to escape to the United States, was captured by the Spanish and condemned to death, but was finally set free. At the outbreak of the Spanish-American War he became colonel of the Twentieth Kansas Volunteers. From November, 1898, he served in the Philippine Islands, where, for bravery at Calumpit, he was appointed brigadier general of volunteers in 1899, and on March 23, 1901, captured Emilio Aguinaldo, the insurgent leader. On March 30 he was commissioned brigadier general, U S A. In 1905 he was placed in command of the Department of California, with headquarters at San Francisco, where he aided in the preservation of order and rendered valuable services to the civil authorities after the San Francisco earthquake of 1906, and in December, 1907-March, 1908, commanded troops at Goldfield during the strike riots. After the occupation of Vera Cruz (q v) by

American sailors and marines, Funston was sent to take over the administration of the city (Mar, 1914). The following November he was promoted major general. Consult General Funston's *Memoirs of Two Wars* (New York, 1911).

FUR AND THE FUR TRADE (OF *forre*, *fuene*. It *fodero*, case, sheath, from Goth *fōdi*, AS *fōdder*, OHG *fuotar*, Ger *Futter*, sheath). Many species of animals, especially those living in cold climates, have a soft, silky covering called fur, which in some animals is mixed with a covering entirely different in texture, long and straight, called the overhair. It is often this overhair which gives the distinctive peculiarity and beauty to the fur. The use of the skins of beasts with the fur still on them, as clothing, is of very ancient origin. The Chinese and Japanese used furs as articles of luxury at least 2500 years ago. Herodotus mentions their use by other ancient peoples. By the Romans furs were much prized, especially during the later days of the Empire. The Saracens also made great use of them, and from them the Crusaders brought furs into general favor in Europe, where so much extravagance was exhibited in their use that in both France and England sumptuary edicts were issued against this fashion. But such laws, like most regulations of the sort, had little effect, and the demand for furs continued among all classes of people. It was to meet this demand that those pioneer explorers, the trappers and traders, penetrated the northern forests of America and established little trading stations which proved the vanguards of civilization. Albany and St Louis, and many other flourishing American cities, are the outgrowth of these stations. In the early days the most valuable furs could be obtained from the Indians in exchange for glass beads or other trifles. At one time this trade was carried on, especially in Canada, by *coureurs des bois*, but the scandalous practices of these reckless rangers brought the trade into such disrepute that a licensing system was established.

Beaver skins were used in New Amsterdam and elsewhere in place of gold and silver for currency, and the figure of a beaver is a conspicuous device on the escutcheon of the city of New York. The search for furs was one of the objects of the daring expeditions of the voyagers of French Canada, as the search for gold was the motive of the Spanish invasion of Mexico and South America. The famous Hudson's Bay Company originated in 1670 and claimed the entire country from the bay to the Pacific, and from the Great Lakes to the Arctic Ocean, except such portions as were then occupied by Frenchmen and Russians. Towards the close of the eighteenth century certain Canadian merchants formed the Northwest Fur Company, having their headquarters at Montreal, their operations being carried on in the districts watered by rivers that flow to the Pacific. This organization soon became a formidable competitor to the Hudson's Bay Company. In 1821 the two companies united. In 1763 some merchants of New Orleans established a fur-trading post where St Louis now stands, under the management of the brothers Chouteau. For the first half of the nineteenth century the St Louis trade was from \$200,000 to \$300,000 a year. One of the most famous of early American fur traders was John Jacob Astor, of New York, who began by trading in a small way after his arrival in the country in 1784. By 1810-12 his

trade, conducted under the name of the American Fur Company, was enormous. An entirely new field for American enterprise was opened by the purchase of Alaska in 1867, which secured complete control of an important seal fishery. In 1914 the furs shipped from Alaska amounted in value to \$701,511, this figure including other furs than seal. The sealskin industry had early become an important one and national and international action was necessary to prevent extinction of the herds. See under SEAL; SEALING.

Seekers for furs must now go beyond the extreme limits of civilization, especially in America, and the Arctic regions are hunted over to secure the pelts. In more civilized regions the hunter-trapper age is passing, and to meet the increased demand for valuable furs domestication and breeding must be developed. Already fur farming is being undertaken on a large scale in Canada, while the Karakule sheep, from which are obtained Persian lamb and broad tails, have been domesticated in Russia, and attempts have been made in Germany and America to produce by cross-breeding a sheep that will yield similar fur. Skunk farms are also in successful operation, and scientific biologists are being consulted in order to provide for new and valuable furs. Each animal presents special problems in regard to both domestication and breeding.

Collectors and dealers in Canada and the United States usually forward their furs to the seaboard, chiefly to New York, for sale there, or for consignment principally to London and Leipzig. In 1913 the United States government decided to send its sealskins and fox pelts from Alaska to be cured and sold at public auction at St. Louis, and it was thought that this might be the means of developing that city as one of the important fur centres of the world. Previously London had been recognized, even in America, as the great fur-dressing centre and market, and still remains the chief, and the great auctions are held there. To London are sent not only much of the produce of Asia and Europe, but also the fine peltries of Chile and Peru, the nutria from Buenos Aires, the fur seal of Cape Horn and South Shetland, the hair seal from Newfoundland, as well as the inferior peltries of Africa.

To prepare fur skins in a way to endure this long transportation is a simple and easy matter. When stripped from the animal, the flesh and fat are carefully removed, and the pelts hung in a cool place to dry and harden, nothing is added to protect them. Care is taken that they do not heat after packing and that they are occasionally beaten to destroy worms. A marked exception is the case of the fur seal, which is best preserved by liberal salting and packing in hogsheds. All other raw furs are marketed in bales.

Few kinds of animals furnish a pelt of suitable weight and pliability, and all of them differ widely in elegance of texture, delicacy of shade, and fineness of overhair, and these differences determine their place in the catalogue of merchandise. These few animals are not very prolific, and many of them attain their greatest beauty in wild and uncultivated regions, although there are some notable exceptions. Being thus few in kind and limited in quantity, the extinction of the several choice varieties has been threatened through the persistent energy of trappers.

The principal North American fur-bearing animals are beaver, muskrat, hare, and squirrel, the mink, sable, fisher, ermine, weasel, raccoon, badger, and skunk, the lynx, northern and southern, bears of several kinds, foxes of three or four varieties, two wolves, and, most valuable of all, musk ox, seal, and sea otter. Of foreign fur-bearing animals the most highly prized are the chinchilla, coypu (nutria), and various monkeys, marsupials (opossum, kangaroo, etc.), and cats. (See articles under their names, also, FUR-BEARING ANIMALS.) Many of the animals, however, enumerated in the American list are also natives of northern Europe, whence their pelts come to market under other names. In fact, there is a wide diversity of name between the trade designations of the various furs and the actual animals.

For manufacturing purposes furs are classified into *felted* and *dressed*. Felted furs, such as beaver, nutria, hare, and rabbit, are used for hats and other felted fabrics, in which the hairs or filaments are made so to interlace or entangle as to form a very strong and close plexus. The quality of the fur is better when the skin is taken from the animal in winter than in any other season, giving rise to the distinction between "seasoned" and "unseasoned" skins. The removal of the fur from the pelt is a necessary preliminary to the preparation of fur for felting purposes. The long hairs are cut off by a kind of shears, and the true fur is then removed by the action of a knife, requiring much care in its management. In some sorts of skin the long hairs are removed by pulling instead of shearing, in others the greasiness of the pelt renders necessary a cleansing process, with the aid of soap and boiling water, before the shearing can be conducted; and in others both pelt and fur are so full of grease as to require many repetitions of cleansing.

Furs have their felting property sometimes increased by the process of *carroting*, in which the action of heat is combined with that of sulphuric acid. The chief employment of felted furs is described under HAT, *Manufacture*. See also FELT.

Dressed furs are those to which the art of the *furrier* is applied for making muffs, boas, and fur trimmings for garments. The fur is not separated from the pelt for these purposes, the two are used together, and the pelt is converted into a kind of leather to fit it for being so employed.

The process of dressing furs, while in its general outlines the same, differs in its details with the character of the fur. The fur of the seal is prepared as follows. The salt used in packing is first thoroughly washed out, and every particle of flesh is carefully removed from the inside of the hide, after which the skins are stretched on frames and slowly dried. The process of thorough washing, this time in soapsuds, is repeated, and while the skin is still moist the long overhair is removed with a knife, leaving only the short soft fur. This process is a delicate and tedious one. The skin side of the pelts, after being subjected to moist heat, is shaved down until a smooth, even surface is obtained. When the skin is again dry, it is placed in a tub filled with fine hardwood sawdust, which absorbs any moisture remaining, and is softened and rendered flexible by treading with the bare feet. It is now ready to be dyed. The coloring matter is applied with a brush to the tips of

FUR-BEARING ANIMALS

1. EUROPEAN WEASEL (*Mustela erminea*), in white winter or Ermine dress.
2. WEASEL (*Mustela erminea*), in brown summer or Stoat dress.
3. SABLE (*Mustela zibellina*).

4. WOLVERINE OR GLUTTON (*Gulo luscus*).
5. EUROPEAN FERRET OR POLECAT (*Mustela putorius*).
6. SEA OTTER (*Latax lutris*).
7. AMERICAN PINEMARTEN (*Mustela americana*).

the fur and distributed by shaking the fur. It is then dried and brushed. The process of dyeing, drying, and brushing is often repeated as many as 12 times.

Statistics. The Thirteenth United States census in its report on manufactures, published in 1913, deals separately with fur goods and furs dressed. Under the former classification the manufacturers making various articles of apparel such as fur sets, overgarments, fur hats, caps, and gloves, were considered. These firms usually purchased their material in a dressed condition, but occasionally certain establishments dressed the furs themselves, so that the two divisions in the trade may overlap. The largest part of the manufacturing is done in New York City, it being the centre both of the industry and of the fashions. The production in 1909 amounted to about \$40,000,000 of furs, or 71 per cent of the total for the United States, and in 1912, of \$17,000,000 worth of fur skins imported into the United States, the metropolis used \$15,000,000. In 1909 there were 1241 establishments in the United States engaged in the manufacture of fur goods, with an average number of 11,927 wage earners, who received in wages \$7,787,845 and produced a product valued at \$55,937,549. This may be contrasted with the similar figure for 1889, when there were 484 establishments employing 6547 wage earners, who received in wages \$3,477,148 and produced a product valued at \$20,526,988. In addition, in 1909, products valued at \$532,781 were reported by establishments engaged primarily in the manufacture of gloves and men's clothing. Under the classification of "dressed" furs where the pelts are scraped, curried, tanned, and bleached, hatters' fur, dressed hair, and brush manufacturers' supplies are also included. It was reported that in 1909 there were 93 establishments engaged in this industry, with a total average number of 1241 wage earners and a product valued at \$2,390,959, which could be compared with the annual product of 1904, which was \$2,215,701, and 1899, when it was \$1,400,455.

The foreign trade in furs fluctuates greatly. The imports of furs and fur skins into the United States was in 1912 \$17,399,000 and in 1914 but \$8,840,000, and of furs dressed on the skins in 1912 \$5,346,000 and in 1914 \$3,204,000. The exports in 1913 were \$18,390,000 and in 1914 \$14,969,000. The value of raw seal skins exported in 1914 was but \$37,199. The imports are chiefly from Germany, England, and Canada, the exports chiefly to England and Germany. Consult Petersen, *The Fur Traders and Fur-Bearing Animals* (Buffalo, 1913), and Werner, *Die Kürschner Kunst* (Leipzig, 1914).

FURANI. See **FURS**.

FUR-BEARING ANIMALS. The group of animals whose pelts are utilized as fur garments or ornaments, forming the carnivorous family Mustelidæ. This family, which includes, besides its typical weasels (Mustelinæ), the skunks (Mephitinæ), the badgers (Melinæ), the otters (Lutrinæ), and the sea otters (Enhydriinæ), the honey badgers, ratels, etc., is world-wide in its spread outside of Australia. It is in the Northern Hemisphere, however, that the family is now most numerous and well represented, and it is in response to the demand of the cold winters of the subarctic regions, to which the most valuable of these animals are confined, that their coats have become the warm pelts which mankind finds so serviceable and attractive. All are small ani-

mals, the largest (the wolverine) being only about 3 feet long. Their bodies are in most cases slender, their legs rather short, their heads round, with very powerful jaws and teeth, and their tails (except in the skunks) are rather short. Great strength, nimbleness, and courage characterize them, and many exhibit a blood thirst beyond that of any other carnivore, nevertheless, they have been tamed. Weasels have always acted as mousers in the East and were so used in ancient Græco-Roman civilization. Ferrets still serve as vermin catchers, and otters have been taught to fish, while badgers were formerly used in cruel sport. Most of them are terrestrial and live in burrows of their own digging, but some are arborescent. They feed upon small mammals, birds, birds' eggs, fish, crustaceans, and insects, and all possess in a greater or less degree anal glands, from which they can discharge at will (sometimes shooting it a long distance) an acrid fluid, which is intensely offensive to the nostrils and mucous membrane of other animals. The chase of the leading members of this family has long been and still is an important industry on the frontiers of Europe and North America, and thousands of pelts have been gathered annually without exterminating any of the race, though the habitats of many species have been much reduced. Statistics of the trade in furs in London show that during the last century the receipts of pelts there of Mustelidæ alone, from North America exclusively, amounted to about 3,250,000 sables, 1,500,000 otters, 100,000 wolverines, 3,000,000 minks, 25,000 sea otters, 500,000 skunks, and 500,000 badgers, besides an unknown number of ermines, fishers, etc. "The scientific interest with which the zoologist, as simply such, may regard this family of animals, yields to those practical considerations of everyday life which render the history of the Mustelidæ so important." Consult authorities mentioned under **MAMMALIA**, especially Coues, *Fur-Bearing Animals* (Washington, 1877). See **BADGER**, **ER-MINE**, **FERRET**, **FISHER**, **FUR FARMING**, **MARTEN**, **OTTER**, **POLECAT**, **SABLE**, **SEA OTTER**, **SKUNK**, **WEASEL**, **WOLVERINE**, and similar titles.

FURBRINGER, fur'bring-ër, MAX KARL (1846-1920). A German anatomist and writer on comparative morphology, born at Wittenberg and educated at Jena and Berlin. In 1888 he became professor at Jena and in 1901 at Heidelberg. His publications include valuable works on the anatomical structure and development of the Vertebrata, such as *Die Knochen und Muskeln der Extremitäten bei den schlangen-ähnlichen Saurien* (1870), *Zur vergleichenden Anatomie der Schultermuskeln und des Brustschulterapparates* (5 parts, 1872-1902), *Zur Entwicklung der Amphibienniere* (1877), *Untersuchungen zur Morphologie und Systematik der Vogel* (1888), *Morphologische Streitfragen* (1902), *Abstammung der Säugetiere* (1904).

FUR/CA ET FLAGELLUM (Lat. gallows and whip). In feudal relations, the lowest of servile tenures, in which the bondman was entirely at the lord's mercy, both in life and limb.

FURETIÈRE, fur'tyâr', ANTOINE (1619-88). A noted French philologist, lexicographer, and novelistic satirist. He was born in Paris, was trained for the law and the Church, but afterward gave his life to letters. He published a volume of verse (1655) and two satires, the *Nouvelle allégorique, ou Histoire des derniers*

troubles arrivés au royaume d'éloquence (1658) and *Voyage de Mercure* (1659). These won him an academic seat (1662). Already he had begun the preparation of a dictionary which, as its copyright "privilege" states, was to contain all French words, old as well as modern. For 12 years he labored on it, when in 1674 a royal decree was issued forbidding any one to publish a dictionary till that of the Academy should appear. After a remarkable contest against his 39 fellow Immortals, Furetière was unjustly expelled from the Academy (1685), and his right to print in France revoked. He died two years before his dictionary appeared at Rotterdam (1690), under the title *Dictionnaire universel contenant généralement tous les mots français tant vieux que modernes et les termes des sciences et des arts*. Among his novels is *Le roman bourgeois* (1666), a realistic novel, portraying several interesting types of the middle class, as a reaction against the squeamish and sentimental characters of the aristocratic literature of the day. Furetière's dictionary was edited by Basnage in 1701 and again revised in 1725. It furnished the basis for the *Dictionnaire de Trévoux* that at length displaced it. Consult Gosse, "The Romance of a Dictionary," in the *Independent* (New York, 1901), and H. Chatelain, "Quelques remarques sur Furetière et ses prédécesseurs dans le roman réaliste du XVIIIe siècle," in *Revue Universitaire* (Paris, 1902).

FUR FARMING The commercial rearing of fur-bearing animals for their pelts. This industry was begun on account of the declining yield from the sources of supply in regions exploited by the historic fur-trading companies. The efforts of the hunter and the trapper no longer meet the increasing demand for furs, especially of the more costly varieties. Fur farming includes the rearing of fox, beaver, mink, muskrat, fisher, raccoon, sable, skunk, reindeer, and the sheep that produce the fur called Persian lamb. The rearing of foxes, reindeer, and of muskrat (in the New England States) has proved successful, while that of other fur-bearing animals is yet in the experimental stage and in some cases has government aid. For some years blue Arctic, and more recently silver black, foxes have been reared on islands off the Alaskan coast leased for that purpose. (See Fox, ALASKA.) In Prince Edward Island, Canada, fox farming attained phenomenal growth after 1900 and is regarded as firmly established notwithstanding the speculative features of the industry. According to the report for 1913 of the Commissioner of Agriculture for that island, there were in that year 277 ranches, with over 2500 foxes, young and old, of which more than half were silver black. The value of these ranches was estimated at \$15,000,000—more than twice the value of all the ordinary farm live stock in the island, according to the census of 1911. Although the pelts have sold well in the London market, yet during 1909–14 the sales were chiefly for breeding purposes, proved breeders of quality fetching from \$12,000 to \$15,000 a pair, and in rare cases up to \$40,000 a pair. The influence of the London and other fur markets promotes the stability of the industry by restricting the production of skins which can be imitated by dyeing. Sales of skins of the pure black variety fell off largely on this account during 1913, while skins of the silver black variety maintained their position because they cannot be successfully imitated,

the best silver black pelts fetching from \$1800 to \$2500 each. Such skins command these high prices on account of their sheen, the beauty and length of their overhairs, and the fineness of their underwool. These rare qualities distinguish the greater number of the Prince Edward Island foxes. The progeny of the silver black foxes caught there yield the best fur. Pure black foxes were also imported from Newfoundland, Labrador, and Ontario. The industry has spread to the other Canadian provinces, and in 1913 there were over 50 fox ranches in Nova Scotia, and in 1912 there were 8 in New Brunswick, 6 in Ontario, and 14 in other provinces. Part of the Nova Scotia foxes are the progeny of the blue Arctic variety, bred in the Alaskan Islands. In 1912 a number of these were imported into the Maritime Provinces and sold for about \$800 a pair. There are about 50 mink ranches in Canada, principally in the Province of Quebec, and there is an extensive ranch in Nova Scotia for the production of Persian lamb wool. The reindeer industry, which is cultivated not only for the fur, but for the milk and meat of that animal and also for transportation purposes, prospers in Lapland and Labrador. Two hundred and fifty head were sent to Labrador in 1907, and in 1911 they had increased to 1200 head. In 1914 the industry was further extended to Alberta, and preparations were made to establish it in the Yukon Territory. The Ontario government publishes an offer to supply to fur farmers in that province mink, marten, fisher, and beaver from Algonquin Park. Consult *Reports of the National Conservation Commission* (Washington), *Reports of the Commissioner of Conservation* (Ottawa), *Reports of the Commissioner of Agriculture* (Prince Edward Island, Canada).

FURFOOZ (fūr'fōz') **RACE** From brachycephalic skulls found at the Trou de Frontal, Furfooz, Belgium, this type of mankind is supposed to date from the end of the Quaternary period, just at the commencement of the Neolithic period (q.v.). Consult Mortillet, *Le Préhistorique* (Paris, 1900), and Sergi, *The Mediterranean Race* (London, 1901).

FURIANT, fūr'i-ant A very lively Bohemian dance, characterized by strongly marked accents and varying time. In the works of Dvořák it frequently takes the place of the usual scherzo (q.v.).

FURRIES See EUMENIDES

FURIOSO, fūr'ō-rē ō'sō, BOMBASTES See BOMBASTES FURIOSO

FURIOSO, ORLANDO See ORLANDO FURIOSO

FURIUS, MARCUS FURIUS BIBACULUS (c 103 B.C.–?) A Latin poet, born at Cremona. He wrote iambs, epigrams, and a poem on Cæsar's Gallic wars. "Jupiter hibernas cana nive conspuat Alpes," a line in the poem on Cæsar, is parodied by Horace (*Sat.*, II, 5, 41), who substitutes Furius for Jupiter, and conspuat for conspuat, and speaks of the poet as *pingui tentus omaso*, distended with fat tripe. It is probable that Furius also wrote the poem *Ethiopsis*, containing an account of the killing of Memnon by Achilles (q.v.), and that the *turgidus Alpinus* of Horace (*Sat.*, I, 10, 36) is really Bibaculus. He is compared by Diomedes with Horace and Catullus and is enumerated among the Roman iambic poets by Quintilian (x, 1, 96). Consult Bahrens, *Fragmenta Poetarum Romanorum* (Leipzig, 1886), Weichert, *Dissertatio de Turgido Alpino S. M. F. Bibaculo* (Meissen, 1882);

FURLO PASS See FOSSOMBRONE

FURLOUGH, fūr'lo (Dutch *verlof*, from Dan *forlov*, leave, from *for*, Eng *for* + *-lof*, Dan *lov*, Ger *Laube*, Eng *leave*, permission) A military term, applied to the leave of absence granted enlisted men. It does not apply to commissioned officers of the United States army, but does apply to English officers on foreign service. In the United States army furloughs in the prescribed form for periods of three months may be granted to enlisted men by commanding officers of posts, and for periods of one month by commanding officers of general hospitals, general depots of supply, mine planters, or by regimental commanders if the companies to which the men belong are under their control. Brigade and district commanders may grant furloughs for periods of three months to enlisted men under their immediate control. The number of men furloughed at any one time is not to exceed 5 per cent of the enlisted strength.

In England the furlough season is confined to the winter months, generally from the 15th of October to the 15th of March. All soldiers with over 12 months' service and qualified in conduct and musketry ability are entitled to six weeks' furlough. In France and continental Europe generally, soldiers in the active army who have qualified in their duties and can read and write may at the end of a prescribed period be sent on furlough for an indefinite period.

The army reserve was established in the United States army by Act of Congress dated Aug 24, 1912. Under this act a recruit enlists for a period of seven years in active service and in the army reserve. At the end of three years with the colors he is furloughed to the reserve for four years, without pay, but is subject to be recalled to the colors in case of war, in which case he receives a money bonus.

FURMAN, fūr'man, RICHARD (1755-1825) An American Baptist clergyman, born at Esopus, N Y. He was pastor of the First Baptist Church of Charleston, S C, from 1787 until 1822. During this period he was also active as a legislator and took part in the deliberations on the first constitution of South Carolina. As one of the foremost promoters of the Baptist movement, he was elected in 1814 first president of the Triennial Convention of Baptists. Furman University (Baptist) at Greenville, S C, was named in his honor, and his son, James Clement Furman (1809-91), was its president. Consult the memoir in Sommers's *Memoir of John Stanford* (New York, 1835).

FURNACE (from OF *fornais*, Fr *fournaise*, It *fornace*, from Lat *fornax*, furnace, from *for-nus*, oven, connected with Lat *formus*, Gk *θερμός*, *thermos*, Skt *gharma*, hot, Eng *warm*) A structure in which to make and maintain a fire, the heat of which is used for heating, generating steam, smelting ores, melting metals and glass, baking pottery, and for a great variety of other purposes in science and the arts. Furnaces may be divided into the following classes: 1. Furnaces in which the fire and the material to be heated are placed in contact. To this class belong the open blacksmith fire (see FORGE), blast furnace, cupola or foundry furnace, etc (See FOUNDRY and IRON AND STEEL for descriptions of blast furnaces and converters and foundry furnaces). 2. Furnaces in which the fuel is in one compartment and the material to be heated

in another, the material being heated by the flame and hot gases from the burning fuel. The most familiar form of this class of furnace is the reverberatory, employed in heating and melting iron and steel (See IRON AND STEEL). 3. Furnaces in which the material to be heated is within a closed chamber or retort which is heated externally by the fire or by flame and gases from the fire. Pot furnaces for making glass (see GLASS) and crucible furnaces for making crucible steel (see IRON AND STEEL) are examples. Furnaces may employ gas, powdered coal, and oil as fuel. The Siemens gas furnace is used in steel manufacture (See IRON AND STEEL). Furnaces for generating steam and those for heating form in a measure classes in themselves. See BOILER, FUEL, HEATING AND VENTILATION, KILN.

FURNEAUX, fūr-nō', TOBIAS (1735-81) An English navigator and discoverer, born at Swilly, near Plymouth. He entered the navy and served in the Seven Years' War. In 1766 he accompanied Wallis in the latter's voyage around the world. Three years after his return in 1768, he commanded the *Adventure* in Captain Cook's voyage, but twice became separated from him, and continued his exploration independently along the coast of Tasmania, naming the principal points on it. Cook named a group of the Low Archipelago in his honor.

FURNEAUX ISLANDS An Australasian group in lat 40° S and long 148° E, lying in Bass Strait between Australia and Tasmania. They were discovered in 1773 by Tobias Furneaux. Flinders Island is the largest.

FURNESS, CHRISTOPHER FURNESS, BARON OF GRANTLEY (1852-1912) An English shipbuilder. The son of a provision merchant, he entered that business in 1870 and made such an immediate success that he was able to establish the Furness line of steamships (1877), the shipbuilding concern of Furness, Withy & Co (1891), and the South Durham Steel and Iron Company (1898). In 1908 he set up a system of profit sharing with his workmen, who voted in 1910 to have it discontinued. He was knighted in 1895 and made a peer in 1910. He was a Liberal member of Parliament in 1891-95 and 1900-10 and was reelected in 1910, only to be unseated on petition.

FURNESS, HORACE HOWARD (1833-1912). An American Shakespeare scholar, born in Philadelphia. The son of William Henry Furness, a Unitarian clergyman and author, he graduated at Harvard in 1854. After a period in Europe, during which he received from Halle the degree of Ph.D, he returned home, studied law, and was admitted to the bar in 1859. He contributed to Troubat and Haly's *Præctice on Ejectment*, etc, and was a member of the Seybert commission to investigate modern spiritualism, but his *Variorum Shakespeare* is his especial work. *Romeo and Juliet* (1871) was the first volume to appear. Then followed *Macbeth* (1873); *Hamlet* (2 vols, 1877), *Lear* (1880), *Othello* (1886), *Merchant of Venice* (1888); *As You Like It* (1890), *Tempest* (1892), *Midsummer Night's Dream* (1895), *Winter's Tale* (1898), *Much Ado About Nothing* (1899), *Twelfth Night* (1901), *Love's Labor Lost* (1904), *Anthony and Cleopatra* (1907), and *Cymbeline* (1913). Associated with him in his work was his wife, herself author of a *Concordance to Shakespeare's poems*, and his son, Horace Howard Furness, Jr. Everywhere the *Variorum*

edition has been received as a monument of scholarship, and the adoption, since 1886, of the text of the First Folio as the basis of the work will by many be thought a distinct gain. Dr. Furness's services to learning were recognized by Columbia, Harvard, and Yale in the bestowment of honorary degrees, and he was made a member of the American Academy of Arts and Letters. In the year of Dr. Furness's death appeared (privately printed) *Appreciations of Horace Howard Furness* (Cleveland), which contained papers by Talcott Williams and Agnes Repplier.

FURNESS, HORACE HOWARD, JR. (1865-). An American Shakespearean scholar, son of Horace Howard Furness, and brother of William Henry Furness, 3d. He was born in Philadelphia and graduated from Harvard University in 1888. From 1891 to 1901 he was an instructor in physics at the Episcopal Academy of his native city, and after that period he became a coworker with his father, and his father's successor, on the *Vanorum Shakespeare*. He edited *Macbeth* (1903), *Richard III* (1908), *Julius Cæsar* (1913).

FURNESS, WILLIAM HENRY (1802-96). A Unitarian clergyman. He was born in Boston, graduated from Harvard in 1820, studied theology at Cambridge, and was minister of the First Unitarian Church of Philadelphia from 1825 to 1875. He was prominent in the anti-slavery movement. Harvard gave him the degree of D.D. in 1847. His writings include translations from German verse and prose and *Remarks on the Four Gospels* (1838), *History of Jesus* (1850), *The Unconscious Truth of the Four Gospels* (1868), *The Power of Spirit Manifested in Jesus of Nazareth* (1877), *The Story of the Resurrection Told Once More* (1885). Consult the sketch in *Proceedings of American Philosophical Society, Memorial Volume I* (Philadelphia, 1900).

FURNESS, WILLIAM HENRY, 3D (1866-). An American ethnologist, born at Wallingford, Delaware Co., Pa., a son of Horace Howard Furness. He was educated at St. Paul's School, Concord, N. H., at Harvard, where he graduated in 1888, and at the medical school of the University of Pennsylvania (1891). For scientific purposes he traveled much in South America and wrote interestingly of his researches there and elsewhere, in such books as *Folklore in Borneo* (1899), *Life in the Luchu Islands* (1899), *Home Life of the Borneo Head-Hunters, its Festivals, and Folk-Lore* (1902), and *Uap, the Island of Stone Money* (1910). In recognition of this and similar work he was made a fellow of the Royal Geographical Society and a member of other scientific associations. He was elected secretary and curator of the Free Museum of Science and Arts, University of Pennsylvania, in 1904.

FURNI ISLANDS, fūr'ne (Lat. *Corassæ* or *Corseæ*). A group of small islands in the Grecian Archipelago, in about lat. 37° 35' N. and long. 26° 30' E., between Nikaria and Samos, the largest of them is Furni. It is about 7½ miles long and has an average width of about 1 mile. It is the only inhabited island of the group. The islanders are settled in a small bay on the west coast. They have very little intercourse with the rest of the world.

FURNISS, HARRY (1854-1925). An English caricaturist, author, and lecturer. He was born at Wexford, Ireland, and was entirely self-

taught in art. At the age of 19 he went to London, contributed for many years to the *Illustrated London News* and other magazines, and in 1880 joined the staff of *Punch*. His *Diary of Toby, M.P.*, illustrating the parliamentary section, became especially popular. His *Royal Academy Guy'd* was another favorite contribution to *Punch*, and in 1890 he published a volume of stinging caricatures of leading artists entitled *Royal Academy Antics*. He withdrew from *Punch* in 1894 and started the *New Budget* and two other short-lived publications. He illustrated, among other works, Payn's *Talk of the Town*, Carroll's *Sylvie and Bruno*, Gilbert A'Beckett's *Comic Blackstone*, *Happy Thoughts*, Dickens's complete works (1910), and Thackeray's complete works (1911). His original publications include *America in a Hurry* (1900), *Confessions of a Caricaturist* (1901), *Harry Furniss at Home* (1904), *Poverty Bay* (1905), *How to Draw in Pen and Ink* (1905), *Harry Furniss's Christmas Annual* (first issue, 1905). He lectured in the United States, Canada, and Australia, and wrote, produced, and acted many photoplays. Furniss is a brilliant draftsman, possessing great vigor, versatility, and facility of execution. Consult Spielmann, *Magazine of Art*, vol. xxiii (London, 1899).

FURNITURE (Fr. *meubles*, Ger. *Möbel*, It. *mobiglio*). Decorative frames and boxes, such as chairs, beds, tables, and chests, to sit on or lie on, place things on or in, called movables (see above) by the French, Germans, and Italians, and usually made of wood ornamented with carving, paint, gilding, lacquer, inlay, veneer, or compo, often upholstered in leather, haircloth, cane, tapestry, brocade, damask, and other textiles. From stools and chairs were developed benches, settees, sofas, davenport, from chests and tables were developed cabinets, desks, bureaux, chiffoniers, sideboards, and other case goods (as they are called by the trade). Movable objects commonly classed with furniture are mirrors and pictures, clocks, pianos, lamps, and stoves. In a still broader sense furniture includes carpets and rugs, draperies, wall hangings, bedding and tableware, as well as lighting fixtures and interior woodwork.

Very definitely is furniture a measure of civilization. Primitive peoples sit and lie on the ground, sometimes carpeted with leaves, rushes, hides, blankets, or rugs. Nomadic tribes do not trouble to construct chairs and beds and tables that it would be difficult or impossible to transport from camp to camp. Only when men and women settle down in houses with floors do they acquire the habit of supporting their bodies on raised seats and couches. Chairs are fundamental. They mean that those using them live, not on the floor, but from 15 to 20 inches above it. They lead to the ultimate development of other raised furniture to match. For analysis and description of the historical styles as applied to furniture, see INTERIOR DECORATION.

Japanese. As long as the Japanese sat on the floor, their homes were bare of furniture. Bedsteads and raised couches they had none. Shelved closets took the place of bureaux, chiffoniers, commodes, and wardrobes. Their writing tables were only 5 or 6 inches high and 1 foot or 2 wide, convenient only for those seated on the floor. For the storage of gems and other small objects, they had small lacquered cabinets with numerous drawers and shelves.

Chinese The Chinese have for centuries used chairs and other raised furniture. Sir William Chambers, the English architect, who traveled extensively in China, wrote in 1757: "The movables of the Chinese saloon consist of chairs, stools, and tables, made sometimes of rosewood, ebony, or lacquered work, and sometimes of bamboo only, which is cheap, and nevertheless very neat. When the movables are of wood, the seats are often of marble or porcelain. The bedroom contains no other furniture than the bed, and some varnished chests in which they keep their apparel. The beds are sometimes very magnificent, the bedsteads made much like ours in Europe, of rosewood carved, or lacquered work. The movables of the study consist of elbowchairs, couches, and tables, there are several shelves filled with books, and on a table near the window are placed, in good order, pencils and other implements for writing." In the furniture illustrated by Sir William, straight lines and fretwork effects predominate, and the general appearance is like that of the rosewood and teakwood and bamboo tables and stands, stools and chairs and settees imported from China to-day.

Egyptian While it is possible to study ancient furniture from the illustrations that survive in the form of mural low reliefs and paintings, one actual example is worth 100 pictures. Fortunately the dry climate of Egypt has preserved for us in graves and tombs a few such examples, which, supplemented and interpreted by the ancient illustrations showing chairs and thrones, stools and couches, actually in use, are gradually beginning to give us an exact knowledge of the size, structure, and proportions. One such example is a child's chair in the New York Metropolitan Museum, pictured in the *Bulletin* of that museum for April, 1913, on page 75. Now, a chair of similar size and proportions was used by Demi-uzza, daughter of the Egyptian officer Nen-waf, who sat with both feet on the chair, her left leg doubled up under her, her right leg drawn up before her, as is illustrated in the limestone grave stela of the family in the Metropolitan Museum. The chair belonging to the museum is of wood, came from Thebes, and dates from about 1500 B.C. It is 23 inches high, with seat 17 inches wide, 18½ inches deep, and 7½ inches high. The back is filled with vertical wooden panels about ¼ of an inch apart. Long angle braces cut out of forked branches, thus utilizing the full natural strength of the wood, reinforce the union of legs with seat. Angle braces also hold the back firmly to the seat and introduce pleasing curves into the outline. The frame is held together entirely with wooden dowels and pegs. The seat was originally upholstered in plaited linen strings, fragments of which still remain in some of the 60 holes that are equally divided among the four rails. This interwoven filling was the nearest approach to springs with which the ancient world was acquainted. Much superior in construction and finer in finish are three armchairs in the Museum of Cairo, Nos. 51,111, 51,112, 51,113, all illustrated and described in vol. xliii of the *General Catalogue* of the museum (Cairo, 1908). No. 51,113, large enough for an adult, is of redwood, with the inside of the false back and the outside of the arms paneled in wood that is elaborately ornamented with gilded compo figures in low relief. The false back starts well forward on the seat and is sup-

ported at the top by the real back, which is an open frame of three vertical struts with rail above. In front of the arms and above the front legs rise women's heads in the round, with wings in plain wood, but faces, crowns, and necklaces gilded. A noticeable feature of these Egyptian chairs is that the feet do not reach the ground, but are supported on round spools, or bases. All of these chairs have front and back lion's legs, carved with considerable fidelity to nature. Nos. 51,108, 51,109, and 51,110 in the Cairo Museum are wooden bedsteads with footboard but no headboard, upholstered in plaited string, with side rails curved so that the head is higher than the foot and the middle lowest of all. The first of the three beds is of wood painted black, with decoration in white paint imitating ivory inlay, the other two have footboards paneled on both sides, with compo figures in low relief, and the plain surfaces of both are veneered in dark wood. All three beds have lion's legs supported on bases like the chairs. The oldest piece of furniture in the Metropolitan Museum is a very simple wooden couch, only 1 foot high, but 26 inches wide by 63 long. It dates from about 3400 B.C. and has bull's legs with bases beneath. Egyptian tables were comparatively small and simple, often mere stands. Of chests, coffers, caskets, and boxes, all sizes have been found—some pylon-shaped, with sides sloping inwards towards the top, which is crowned with a projecting cornice, others rectangular, with or without feet, which, if present, are usually a prolongation of the stiles. The lids, sometimes hinged, are flat, or unsymmetrically rounded, or rarely gable-shaped.

Babylonian and Assyrian Though the country watered by the great rivers, the Tigris and the Euphrates, has from remote antiquity been the home of nations that early reached a high degree of civilization, scarcely a trace remains of the actual furniture of the Babylonians and Assyrians. Almost all that we know has been worked out with difficulty from statues and bas-reliefs. The only Babylonian example is the stool (throne) that appears in the black-basalt statue of King Gudea, dating from about 3000 B.C. and now preserved in the Louvre. The next example is Assyrian and over 2000 years later—a throne illustrated in the sculptures from the palace of Nimrud, celebrating the victories of King Assurnasirpal about 880 B.C. It has no back, the side rails of the seat are prolonged into rams' heads, the legs are heavy, with tapering turned bases, and are connected by a low cross rail. The bronze throne of the same monarch—a portion of which is preserved in the British Museum, together with the fragment of a footstool—is similar, but with lion's feet facing away from each other. The furniture pictured on a slab in the British Museum dating from 668 B.C. is most interesting. King Assurbanipal reclines on a couch, the head of which is curved forward as an arm rest. The feet of the couch are the shape of large inverted cones, and the square legs and side rails are decorated with moldings and scrolls, and figures of lions and men. The Queen sits opposite the King, on a chair with high straight back and curved arms, resting her feet on a footstool. Between the royal pair is a high stand or table bearing the materials for a feast, and at one side is a lower table with the King's sword, bow, and quiver. The decoration of chair and tables is similar to that of the

couch Cedar was probably the wood most frequently used in the construction of furniture, but into Assyria, as into Egypt, other woods, such as ebony, teak, Indian walnut, and perhaps rosewood, were imported Ebony and ivory inlays were common

Hebrew The Hebrews undoubtedly borrowed freely both Egyptian and Assyrian forms Beds of wood inlaid with ivory and gold are mentioned as early as the thirteenth century B C, and in the ninth century the prophet Amos censures the rich for using them In the same century the bedroom furnished for an honored guest, the prophet Elsha, contained a chair, a table, a bed, and a lamp Solomon's bed (about 1000 B C) was made of cedar of Lebanon, with pillars of silver and base of gold Solomon's throne had arms decorated with lions, and six lions of gold or chryselephantine work stood on each side of the steps before his throne In early times the Jews seem to have sat at meals, but later reclined, owing to Roman influence

Greek Compared with modern French and Germans, English and Americans, the Greeks and Romans, as well as the Assyrians and Egyptians who preceded them, used little furniture But what furniture the Greeks and Romans did use was splendidly constructed and exquisitely fashioned and finished Unfortunately the climate of Greece and Italy was less kind than that of Egypt, and it is principally to the pictures painted on vases and walls and to marble and terra-cotta reliefs that we must turn for our information The most important piece of furniture in the Greek household of the fifth century B C was the couch or bed, that served not only to sleep on at night, but also to recline on by day while eating or reading or writing Proportions and ornaments were much more beautiful than those of Egyptian couches Turned legs replaced carved animal ones, the height was increased, often making necessary a foot bench or stool, raised ends, or headboards and footboards, and sometimes a back like that of a modern sofa, were added Mattresses and pillows increased the comfort Tables, being used chiefly at meals and not for reading or writing, were made low for the convenience of those reclining on couches Otherwise they resembled modern tables, being square or rectangular with four legs, or round with three connected legs The legs of the tripods (three-legged tables) were apt to be elaborately carved in the form of legs of animals, while the legs of the quadrangular tables were usually turned or plain round or square Among chairs the *thronos* was chief, which in Homeric times had been reserved for the King or the head of the family or to honor a special guest In the fifth century it was also occupied by judges, presiding officers, umpires at games, and other officials It was in form an armchair, with straight back and legs, and usually stood so high that a footstool was necessary In everyday life the *diphros* was more common It was a four-legged stool, without back or arms, and with legs sometimes crossed and sometimes upright Those with crossed legs and flexible seats folded like our modern camp stools The *klimos* was a chair without arms, but with front legs curved forward and rear legs backward, and a back curved to fit the human body The top rail of the back was usually wide and flat and curved, and was supported by two side posts, that were often extensions of the legs. The shape was copied

in the modern Empire period and after For storing clothes and household linen the Greeks used chests and boxes that were often beautifully decorated with floral ornament or figure scenes from history and mythology

Roman The Romans used tables with one, three, or four legs, and rectangular, round, or hexagonal tops These were made in many styles, and of many materials, such as wood, ivory, marble, gold, silver, and bronze They were often enriched with carving, inlay, engraving, damascening, and veneer The three-legged stands (tripods) were higher, usually bronze, and elaborately sculptured The legs included terminal and other figures, sphinxes, lions' legs crowned with lions' heads, architectural columns, etc A splendid example, illustrated on Plate 118 of Monaco's *National Museum of Naples* (Naples, 1880), has attenuated lions' legs standing on a triangular base and surmounted by squat sphinxes The deep rim of the top is ornamented with festoons and bucrania in relief Much less furniture has been found at Pompeii than is ordinarily supposed The wood of the beds, couches, chairs, and tables being charred, crumbled away, leaving slight traces, except the bronze and silver mountings and inlays In only one of the dining rooms were sufficient remains of a couch found to make possible its restoration This is No 121 in Monaco's book mentioned above It was 90 inches long, 48 inches wide, and 17½ inches high The legs were richly turned, and stood on molded cross pieces at each end There was no footboard. Inside the headboard fitted a double-curved bolster of wood, the end of which terminated in bronze plates with low-relief foliage ornament and sculptured figures. Of bronze lamps and candelabra Pompeii preserved many that are now in the Naples Museum Some, about 20 inches high, stood on tables, others, from 3 to 5 feet high, stood on the floor, and others hung from the ceiling or from wall brackets The feet of the standards were usually modeled to represent the claws or hoofs of animals The shaft was often a slender fluted or plain column Sometimes it carried one lamp, sometimes it divided into two or more branches, each of which carried a small hanging lamp Some of the standards were adjustable, the upper part sliding up and down in the hollow shaft of the lower part

A seat of honor peculiar to the Romans was the curule chair (*sella curulis*), several bronze pairs of legs of which have been unearthed at Pompeii The curule chair was a folding stool, with legs curved and crossed, dating from the time of the Roman kings, whose special attribute it was Afterward its use was permitted to the numerous officials who inherited one or more of the royal functions On the coins of famous Roman families the curule chair is often pictured in connection with the names of the individuals who held curule offices The example illustrated on Monaco's plate No 119 is 18 inches high, with a seat 23 inches square The wooden stools, side chairs, and armchairs of the Romans resembled those already described under the heading *Greek*, except that cushions were more luxurious and were used more freely, and sculpture was more elaborate Of marble armchairs, as well as of marble round and rectangular tables, numerous ancient examples survive, and have been widely copied by modern makers in both wood and stone Especially interesting is the temple throne in the Louvre, with

seat supported by two sphinxes whose wings form the arms. Among marble tables from the peristyles (inside gardens) of Pompeii is a round one, with three massive legs carved to represent lions' legs topped with lions' heads. Ancient pictures of Roman wooden armchairs in the Metropolitan Museum are the two that appear in color in the Boscoreale frescoes, both with occupants, and both with turned legs and flat backs—one very clearly showing yellow geometrical ornament painted on the reddish side posts, top rail, and two cross rails of the curved back. Also clearly shown is a very comfortable loose cushion. Also in the Metropolitan Museum is an ancient miniature bronze Roman chair with solid arms, the throne upon which the goddess sits in the processional lion-drawn wagon of Cybele, presented to the museum by the late Henry G. Marquand.

Byzantine At the beginning of the fourth century A.D., when Constantinople superseded Rome as the capital of the Roman Empire, it also superseded Rome as the centre of civilization and style. Even the barbarian tribes who overran western Europe in the fourth century, wrecking Roman buildings and destroying Roman furniture, looked longingly towards the comforts and luxuries of the ancient Byzantium. Even Charlemagne, when setting up his own Holy Roman Empire in the West, getting himself crowned Emperor by the Pope on Christmas Day of the year 800 A.D., used Byzantine furniture and furnishings imported direct from Constantinople or made by artisans from there. In moving from Rome to Constantinople furniture lost much of its classic grace, becoming heavier and more often architectural, and with flat surfaces of ivory and other rich inlay. The old custom of reclining at meals was discarded. Famous examples of ancient Byzantine furniture are the chair of St. Peter at Rome, and that of Maximian in the cathedral at Ravenna. Of illustrations there are many—the majority of ivory or metal carvings on caskets and other small objects, and especially on consular diptychs, of which there are a number in the British Museum.

Gothic. Decoratively, Gothic is the style of the pointed arch. Doors and windows and roofs are all topped by lines that meet at an angle. Copied from the architectural lines and from the framework and tracery of stained-glass windows are the lines of decorative carving on Gothic furniture. Where columns and pilasters and capitals are used, they are the slender Gothic columns, often grouped in piers, crowned, not by Doric or Ionic or Corinthian capitals, but by capitals sculptured with domestic foliage naturalistically carved. Structurally, most Gothic furniture is simple, made out of boards and planks fitted together at right angles, but ornamentally it is complex, with panels elaborately carved in low relief or carved and pierced. Indeed, the Gothic centuries were the paradise of the wood carver, whose figure work, both in low relief and in the round, was often employed to beautify movable as well as fixed furniture and woodwork. The Gothic centuries were also the paradise of the iron worker, whose large flat hinges and locks and pulls on chests and cupboards he hammered into exquisite shapes.

Most of the ancient Gothic furniture that has been preserved dates from the fifteenth century, and a large proportion of it is church furniture, particularly choir stalls, of which there are

notable examples in the Hoentschel collection at the Metropolitan Museum. Previous to the fifteenth century the mediæval residences even of kings and nobles were comparatively bare and empty, and what furniture there was had little rest, traveling with the family in wagons when they moved from castle to castle or from city to country. Consequently it was so made as to be transported easily and safely, and consisted principally of benches and chests and wardrobes, and tables on trestles, with perhaps a throne chair and a four-poster bed for the master. Even the wardrobes and cupboards were practically nothing but chests on benches, or chests on chests. A typical late-Gothic bed is the one in the Paris Musée des Arts Décoratifs from Château Villeneuve at Issoire. The most showy piece of furniture in the homes of fifteenth-century dignitaries was the sideboard (*dressoir*), and the degree of dignity of the family was supposed to be indicated by the number of shelves. "Madame de Charolais," wrote a writer of the period, "only had four shelves to her dresser, while her daughter the Duchess had five." "I have heard it said," he adds, "that no princess except the Queen of France should have five shelves." A typical Gothic chest in the Tours Museum has the principal panel divided into rectangular spaces ornamented with a lozenge molding, each lozenge containing rose tracery. Sometimes there is a series of arcades, each containing a kneeling figure. Often the side panels are carved in the linen-fold design, and often the front is a series of arcades subdivided by curves and half curves copied from architecture, the spaces between being filled with carved tracery, florals, or figures. Important pieces of fifteenth-century Gothic furniture on exhibition at the Metropolitan Museum are the walnut chest, 27 inches high, 29 inches deep, and 66 inches long, with front and ends divided by pilasters into panels that are filled with window tracery, the oak double chair or throne, 10 feet high by 5 feet 6 inches wide, with paneled back, elaborately carved and pierced canopy, paneled arms, and chest seat, the walnut chair, 82 inches high by 29 wide and 19 deep, with the back, and the front of the seat, each divided into two linen-fold panels.

Renaissance Of the domestic furniture of the Italian Renaissance, the most important piece was the *cassone*, or ornamented chest, rich not only with carving, but also with gesso and gold and inlay and painted scenes. As elsewhere in Europe, so in Italy at this period, brides received a chest filled with linen, often the principal part of their dowry. The only difference was that in Italy the chests were larger and more beautiful. Sometimes they were low, often they were raised high above the floor on a heavy and elaborately molded base, or on massive feet shaped like claws of lioncels or other animals. The painted panels pictured stories from the Bible and from classical mythology, or from the lives of the saints and from mediæval chivalry. The arms of the family were apt to be emblazoned on the front. The inlays were floral or geometrical, or in the grotesque style resurrected from the long-buried decorative paintings of ancient Rome. The relief ornamentation in the form of flowers and foliage was comparatively low, whether carved in the walnut or the chestnut, or modeled in gesso. But towards the end of the sixteenth century, and occasionally before, sculptural baroque influence began to

assert itself, and reliefs became high and bold, and architectural effects complex and bombastic. These *cassoni* were not only the most beautiful pieces of furniture in many residences, they were also the most useful. In them were stored the household linen and plate, draperies and tapestries, and clothing. At home they stood around the room close against the wall and served as settees or tables. Abroad they served as trunks. Developed from the *cassone* was the Florentine *cassapanca*, a bench with massive sides and back set upon a massive platform, all carved richly but appropriately. Occasionally, as on the throne of Giuliano dei Medici, the back was tripled in height and crowned with a heavy entablature that was supported at each end by classic columns, while pilasters marked the seat divisions. A special creation of the Italian Renaissance, paralleled only in Switzerland, was the *credenzzone*, a narrow cupboard with two front doors, often with small drawers above them, and with framing strongly architectural in character. Two-story cupboards, like those developed in the sixteenth century in France and Germany, were seldom used in Italy. Writing desks, however, with a folding lid instead of the upper set of doors, were much in vogue.

Italian Renaissance beds we know only from paintings and engravings. The headboards were high and elaborately ornamented, and the beds often had a canopy above. Of Italian Renaissance tables, many have survived—some long and narrow rectangles, others round or hexagonal or octagonal. Most of the former are supported at each end, like the marble garden tables of ancient Rome, by thick and elaborately carved flat standards. These standards a crosspiece connects, either horizontal and at the base, or decorated and vertical and halfway up. The round tables sometimes stand on a single turned or vase-shaped standard, sometimes on three or four wings richly carved, like the standards of the long tables. Of Italian Renaissance stools, with three or four legs and without back, few remain, though many of similar design and later date are still in use. They are usually of cheap construction and without ornamentation. Most of the stools supported on richly carved flat front and back standards have also a back in the same style. Of folding stools of X shape and of chairs derived from them, there were many. The upholstered armchair characteristic of the period has square legs, sometimes connected by plain stretchers close to the floor, sometimes with a high flat carved front stretcher, simpler back stretchers, and low side stretchers, sometimes with two flat shoes carved at the ends carrying the side legs, and no stretcher at all. The front legs run up to the flat arms, and above the seat are not infrequently turned. The back legs extend vertically into high posts, often with a slight backward slant, that terminate in carved finials. The seat is upholstered in leather or velvet or embroidery, often with a valance that boxes it in. Round-headed gilt nails and handsome fringes are freely employed. The backs are covered with a band of upholstery that sometimes leaves only 3 or 4 inches between it and the seat, but usually stops short near the arms.

From Italian Renaissance furniture, that of the French Renaissance was directly derived, as a result of the Italian campaigns of the French kings towards the end of the fifteenth century, the designs being either copied exactly or carried

out with less exuberance, greater delicacy, and rather more in the round, as would be natural in a country where Gothic wood and stone carving had flourished for centuries.

Elizabethan and Jacobean During the whole of the Elizabethan and Jacobean periods armchairs continued to be made with flat richly carved backs, although the Gothic box below was superseded by open-frame construction, square or turned. Architectural forms were especially emphasized in chests, a splendid example of which, 39 inches high by 28 deep and 78 long, is illustrated in MacQuoid's *English Furniture*, vol 1, p. 65 (London, 1904), and in massive four-poster bedsteads ornate with strap-work and other carving, and with the huge bulbous posts that continued in vogue through the Jacobean period. An important piece of furniture in the main hall was the two-story court cupboard in which were kept the wine, dry food, and candles used by the master, the servants' supplies being stored in livery cupboards. By this time the ancient Gothic movable or "trestle" dining tables had disappeared, their place being taken by tables with four massive legs connected by foot rails, and with top in three leaves, the lower two drawing out from beneath the upper, to be supported on long sliding brackets, thus doubling the size of the table. Jacobean furniture is distinctly severer and more restrained than Elizabethan, and the architectural ornament is much less fanciful and much more faithful to classic precedents. Furniture frames—particularly of chairs, which were lighter and flat, with squared members—began to be succeeded by turned and twisted ones, particularly in chairs. Of Jacobean upholstered furniture, the baronial mansion of Knole is a treasure house. One of the most interesting chairs, and one that is often copied more or less correctly, is illustrated on page 133 of MacQuoid. The curved legs cross X fashion, with loose cushion, upholstered seat, upholstered arms, and upholstered back. A portrait of James I seated in a chair like this hangs in one of the rooms at Knole. In the "King's bedroom" there can be seen the magnificent bed prepared at a cost of £8000 for the entertainment of James I by Richard, third Earl of Dorset. Especially noteworthy by contrast is the upholstery that takes the place of the luxurious Elizabethan carving. The posts are plain and slight and lost in voluminous folds of rich coral taffetas. The curtains are in coral taffetas richly embroidered, and the headboard covered with embroidery in high relief, with floral scrolls in gold and silver surmounted by a royal crown. Of the chests and cupboards and wainscot chairs with flat carving often attributed to the Elizabethan period in shops and sometimes in museums, a majority are Jacobean.

Louis XIV Between French furniture of the Renaissance and French furniture of the period of Louis XIV, the difference is great. The former shows clearly many marks of its Italian origin. The latter is absolutely and thoroughly French, and not only French, but baroque, with all the curves and wealth of sculptural ornamentation that characterized the seventeenth century. The flat and boxlike shapes of the sixteenth century have been largely replaced by framework in the round. Architectural features are minimized, chairs and tables and cabinets and beds are constructed from the use point of view, and as individual entities rather than as

an integral part of an architectural whole. Of Louis XIV makers of furniture, especially furniture in marquetry, André Charles Boulle stands first. From him the so-called buhlwork gets its name. A pair of wardrobes (*armoires*) made by him sold recently for over \$60,000, and the prices obtained for Boulle furniture at public sales are constantly rising. Boulle is noted for his inlays of tortoise shell in elaborate scrolls and arabesques, with ornaments of thin brass and white metal elaborately engraved. He also used bronze mounts freely.

The Hoentschel collection, presented by the late J. Pierpont Morgan to the Metropolitan Museum, contains many characteristic pieces. In the style of Boulle, and perhaps by the master himself, is a leather-covered flat desk, with drawers framed in bronze moldings, and with bronze pulls, the middle one showing a human mask. At each end of the desk are lions' masks, and on the cabriole legs acanthus mounts. A gilded table of the period, much more elaborately carved, of the type used to display vases, bronzes, and statuettes, has a top of richly veined white marble. A wardrobe exquisitely carved in low relief has pairs of doors above and below the horizontal molding, separated by an upright pilaster and flanked by pairs of pilasters. A faun mask crowns the round pediment at the top. Characteristic chairs in the collection have seats and backs upholstered—some in woven tapestry, some in needle tapestry, others in damask-figured velvet, cane, or leather.

Louis XV. In the reign of Louis XV the variety of pieces of furniture was greatly increased to meet real or fancied needs. Beds and canopies assumed the most varied shapes, and multiplicity of shapes was accompanied by variety of materials. The use of gilded wood continued, but the numerous varnishes (*vernis Martin*) developed in imitation of Chinese lacquer by Robert Martin were freely employed. On cabinets and commodes and bureaux and bookcases Martin painted Chinese landscapes with mountains suspended in the distance, brilliant and capricious flowers and trees, and rustic bridges. Design and execution are exquisite, but some critics object to the lack of relation between ornament and spaces covered—to scenes that are broken by the opening of a drawer, to keyholes that place themselves at random on the tree trunk or mountain.

Marquetry was also developed, by the sons of Boulle and by Cressent, Oeben, Caffieri, Roentgen, and Riesener, into one of the most complicated and exquisite of the arts. Rare woods in delicate tones were combined in patterns and pictures marvelously intricate. Among the Louis XV pieces in the Hoentschel collection the most characteristic is the gilded wooden candelabrum in the form of a three-arm wall bracket, of the type usually made in bronze or brass, because these metals lend themselves better to the asymmetrical convolutions of shape and the extreme contrasts of light and shade. The console in gilded wood with marble top, 25 inches high by 24 wide and 10 deep, is interesting to compare with similar models on Plate 93 of vol. 11 of Blondel's *Maisons de Plaisance* (Paris, 1738). Also typically rococo, like the designs of Meisssonier or Jacques Lajoue, are the tapestry coverings of two Louis XV armchairs with spirited fountains, vases, rocks, and fragments of architecture.

Louis XVI. Especially was the style of

Louis XVI influenced by the excavations at Pompeii and Herculaneum. The mural decorations and furniture unearthed there 1700 years after Vesuvius buried them, supplied models and designs that were copied with almost slavish fidelity. Many books were published illustrating and describing Pompeian forms and ornament, and the popular phrase in decorative circles was "in the antique style." Important for students of the style of Louis XVI are the Boscoreale frescoes in the Metropolitan Museum. These frescoes have brought to New York what Pompadour's decorators went to Italy in search of—the exact truth about ancient interiors and furniture. There are none of the bold reliefs so common in the days of Louis XIV. In both structure and ornament the straight line and the right angle rule. Parallelism of motifs is frequent, and rectangular panels are apt to be narrow. Characteristic of Louis XVI furniture panels is the bow of ribbon applied to the top, with ends floating down on each side. Fluting is most often longitudinal, sometimes spiral, and is common on chair legs that have the shape of reversed columns, smallest at the base. Famous makers of Louis XV furniture, who also became famous as makers of Louis XVI furniture, were Riesener and Roentgen. The former was officially appointed "furniture maker to the King," and the latter was generously patronized by Marie Antoinette. The Hoentschel collection contains a variety of Louis XVI chairs, and many pieces of furniture with applied metal ornaments by, or closely in the style of, Riesener, Thomire, and Gouthière. The last named was noted for the grace with which he chiseled cupids intermingled with garlands of flowers. Perhaps the finest example of his work is the clock in the Wallace collection signed by him as *Ciseleur et doreur du Roi*.

Empire. Empire furniture was solid and heavy, of mahogany, rosewood, or ebony, adorned with brass or bronze mounts. Flat surfaces were often veneered and often inlaid with ivory or ebony. Chairs were upholstered in damask, velvets, and prints, and the front legs were mostly straight, the rear legs curved in the classic style. The front legs were sometimes fluted, as in the style of Louis XVI, but were heavier. Other legs were in the form of bundles of arrows or fasces. Beds were low and massive, usually with head and foot boards of the same height. Many were like four-posters with the posts pollarded. In state beds the side rails frequently had the shape of an animal or a bird. Bolster rolls were common. The leading cabinetmaker of the period was Jacob. The most important examples of Empire furniture in the Metropolitan Museum are in the collection presented by the parents of the late playwright Clyde Fitch in memory of their son.

Charles II, William and Mary, Queen Anne. During the periods of the Commonwealth, Charles II, James II, William and Mary, and Queen Anne, the square and flat Elizabethan and Jacobean furniture shapes were supplanted in England by Dutch-Flemish twists and French cabrioles. During the reign of Charles II walnut furniture came into common use in England for the first time, walnut being more suitable for the reversed curves that in oak on the cross grain are likely to chip. The frames and linings of cabinetwork continued to be of oak, but outer surfaces were veneered with walnut and had applied moldings of walnut. Caned backs

and seats also came into fashion for chairs and settles. About 1675 clocks and small tables began to be ornamented with veneer marquetry. At first the designs were of Italian inspiration—acanthus-leaved florals, and birds inlaid in brown and buff woods, later, flowers and birds in the more realistic Dutch style, and later still, intricate series of fine scrolls. The standard type of small oak tables was the "gate-legged," few examples of which date earlier than Charles II. Even in the larger sizes for dining-room use it is comparatively light in appearance, lacking the massiveness of Elizabethan and Jacobean square and rectangular tables. The earlier chests of drawers were comparatively small, usually with raised panels or moldings and with bracketed corners or ball feet. Later the drawers were mounted on twisted or turned legs fixed to a shallow plinth or joined near the ground by shaped stretchers. The "high boys," or "tall boys," that began to appear during the reign of Queen Anne, were made in two sections, upper and lower, for ease of construction and convenience in moving.

Georgian. Just as in France during the period of Louis XV rooms became smaller and pieces of furniture more numerous, so it was in England during the Georgian period. Previously stools and benches and chests had sufficed as seats for the lesser members of the household. Now there began to be chairs for all, and interiors not only looked less like Roman temples, but felt less like them—which helps to explain why the Georgian period was so distinctly the age of chairs and afforded so brilliant an opportunity for Thomas Chippendale (qv).

One fact to be emphasized is that the furniture style of the Georgian period was a mahogany style. Shortly after the death of Queen Anne mahogany superseded walnut and oak in English furniture shops. This had a profound influence on design and construction, the toughness and strength and hardness of mahogany making lighter lines and more delicate carving desirable and possible. So that to mahogany, as well as to Chippendale, must be given much of the credit for the strong individuality that marks the furniture of the Georgian period. But Chippendale was by no means the only one who made good chairs in the style of Chippendale, nor are the mahogany chairs to be despised that were made before his influence began to be felt. Indeed, many of the so-called Hogarth chairs (so called because illustrated in the cartoons of the great caricaturist) are both comfortable and beautiful and are plainly ancestors of Chippendale chairs, though usually without the pierced work in the splat of the back, and apt to look more squat because of the rounder curves of legs and back. The early Georgian chairs and other furniture designed by the architect William Kent are heavily architectural and impressively classic in form and construction. The backs of Georgian chairs are distinctly lower than those of the Queen Anne period and before.

Adam. Even Chippendale, towards the end of his career, bowed before the new classic influence. It was his shop that executed the inlaid furniture designed by Robert Adam for Osterly and Harewood. MacQuoid publishes in facsimile part of the bill rendered to Lord Harewood's ancestor. The commode described in it, with its intricate inlays in delicate colors and its classic ornaments, is not only charac-

teristically Adam in all its style details, it also marks a new era in wood texture. The age of carved mahogany has passed, and the age of inlaid satinwood has begun. The surface of the commode is of yellow satinwood veneer, with inlaid swags and wreaths of garrya husks, once bright green but now faded to bright olive. The early inlays of the Adam period were on a large scale—classical heads, human figures, vases and broken columns, with marquetry frames of laurel wreaths or plain bands. Later the inlays became delicate, consisting principally of thin honeysuckle ornament, foliated scrolls, and, above all else, fan-leaved disks and ovals. Of the Adam chairs made by Chippendale for Osterly, six are illustrated by MacQuoid. All have the splat of the back running down into the frame of the seat, a relic of the older style. Without exception the splats of Chippendale chairs meet the seats, but in later Adam chairs, and in Hepplewhite and Sheraton (qv) chairs, the square, shield, and heart-shaped backs are several inches above the seat, being supported at the sides only. Haircloth was a favorite upholstery. Hepplewhite writes "Mahogany chairs should have the seats of horsehair, plain, striped, chequered, etc., at pleasure." And also "For chairs, a new and elegant fashion has arisen within these few years of finishing them with painted or japanned work, which gives rich and splendid appearance to the minute parts of the ornaments, which are generally thrown in by the painters."

Colonial. Colonial furniture is even more of a mixture than Georgian, including not only all the English and Dutch styles imported and copied by the American Colonies previous to the American Revolution, but also the French styles that were in vogue thereafter. There were, however, some interesting simplifications of Georgian and of Adam, notable in the South and in Massachusetts, and creditable furniture was produced in the styles of Chippendale, Hepplewhite, and Sheraton. Of late years the plain, dark-oak "Mission" furniture has been popular.

Bibliography. The general history of furniture is traceable in Racinet, *Le costume historique* (Paris, 1888), and in Viollet-le-Duc's *Histoire de l'habitation humaine* (ib, 1875). The illustrated history of furniture by Frederick Litchfield (London, 1892) attempts to cover the whole subject, but is, in the main, a compilation. It is valuable for reference. For antiquity, consult the plates of the works named in the bibliography under ASSYRIA, EGYPT, and other articles, also Perrot and Chippiez, *Histoire de l'art dans l'antiquité* (Paris, 1882 et seq.). For Japan, consult Morse, *Japanese Homes and their Surroundings* (Boston, 1886); for the New East, Lane, *An Account of the Manners and Customs of the Modern Egyptians* (London, 1871), also the numerous notes added to Sir Richard Burton's *Translation of the Thousand and One Nights* (ib, 1886-87), Chippendale, *Gentleman and Cabinetmaker's Director* (ib, 1754), Hepplewhite, *Cabinetmaker and Upholsterer's Guide* (ib, 1788), Sheraton, *Cabinetmaker's and Upholsterer's Drawing-Book* (ib, 1793), Lessing, *Italiensche Möbel des XVI Jahrhundert* (Berlin, 1893), Molnier, *Les meubles du moyen âge et de la renaissance* (Paris, 1897), id, *Le mobilier au XVII et au XVIII siècle* (ib, 1898), Lockwood, *The Pendleton Collection* (Providence, 1904), Ransom,

Couches and Beds of the Greeks, Etruscans, and Romans (Chicago, 1905), Robinson, *English Furniture* (London, 1905), Simon, *English Furniture Designers of the Eighteenth Century* (ib., 1905), Clouston, *English Furniture and Furniture Makers* (ib., 1906), Pollen, *Ancient and Modern Furniture* (revised by Lehfeldt, ib., 1908, South Kensington Museum Handbook), Bajot, *Encyclopédie du meubles* (Paris, 1909), Bann, *Style in Furniture* (London, 1910), Cescinsky, *English Furniture of the Eighteenth Century* (ib., 1910), Foley, *The Decorative Furniture* (ib., 1911), Schmidt, *Möbel* (Berlin, 1913), Lockwood, *Colonial Furniture in America* (New York, 1913). See also BOULLE, CHIPPENDALE, HEPPLEWHITE, SHERATON, ETC.

FURNIVALL, fūr'ni-val, FREDERICK JAMES (1825-1910). An English philologist. He was born at Egham, Surrey, England, Feb. 4, 1825, and was educated at University College, London, and at Trinity Hall, Cambridge, where he was graduated B.A. in 1846 and M.A. in 1848. He was called to the bar in 1849. For 10 years he was associated in philanthropic work with F. D. Maurice, teaching in the Workingmen's College. Devoting himself to philology, he was instrumental in founding, for the publication of texts, the Early English Text Society (1864), the Chaucer Society (1868), the Ballad Society (1868), the New Shakespeare Society (1874), the Browning Society (1881), the Wiclif Society (1882), and the Shelley Society (1885). He was honorary secretary of the Philological Society after 1854, and for some years edited their great English dictionary. He edited numerous works, chiefly through the medium of the above societies, one of the most notable being *A Six-Text Print of Chaucer's Canterbury Tales* (1868-75). This he followed with the publication of a seventh text and the manuscripts of Chaucer's minor poems. Under his supervision were published 43 facsimiles of the quartos of Shakespeare's plays. His introduction to the Leopold Shakespeare has been extensively circulated. In 1884 he was granted a Civil List pension of £150. On his sixtieth birthday the University of Berlin conferred on him the honorary degree of Ph.D., and on his seventy-fifth birthday he was elected member of the German Shakespeare Society. Consult Frederick J. Furnivall, *A Volume of Personal Record* (Oxford, 1911).

FURNIVAL'S INN. One of the ancient inns of chancery, affiliated to the more famous Lincoln's Inn. It derives its name from Sir William Furnival, whose family became extinct in the reign of Richard II. The inn stood in Holborn and came into the possession of the society in the first year of Edward VI (1547). It had a long and honorable existence, but with the other chancery inns fell into disuse and went out of existence about the middle of the eighteenth century. For a description of the various inns or guilds of lawyers and their functions, see INNS OF COURT. Consult R. R. Pearce, *Guide to the Inns of Court and Chancery, with Notices of their Ancient Discipline, Rules, and Customs* (London, 1855), and Cecil Headlam, *The Inns of Court* (New York, 1909).

FURRER, fūr'ēr, JONAS (1805-61). A Swiss statesman, born at Winterthur and educated at Zurich, Heidelberg, and Göttingen. In 1839, and again in 1844, he was President of the Grand Council, and in 1845 became President of the Cantonal Diet. One of the foremost advocates

of the new Federal Constitution, he was elected President of the Swiss Confederation upon its adoption, was three times reelected, and was a member of the Federal Council until his death. A monument to him was unveiled in Winterthur in 1895. He wrote *Das Erbrecht der Stadt Winterthur* (1832).

FURRUCKABAD, fūr'rūk-a-bād'. See FARKHABAD.

FURS. In heraldry (q.v.), one of the three classes of tinctures, the other two being metals and colors.

FURS, fūrz, **FORS**, fōrz, or **FURANI**, fōra'ne. The Moslem negroes dominant in Darfur (Fur Land), in eastern Sudan, between Kordofan and Wadai. They are tall (1730 millimeters, or 67 inches), very black and prognathic, and have woolly hair. Their language is related to Nuba and they, with the Nubas and Nubians, are placed with the Nigrilians, or negro race once dominant throughout Egyptian Sudan. The political history of the Furs, their dynastic wars of the sixteenth century, the prosperity of the monarchy under Solomon Solon at the beginning of the seventeenth, the ascendancy of Islam with the development of agriculture and other industries, the conquest of the country by the slave dealer Zebehr Pasha in 1874, and the Mahdist revolt, 1881-92, are the prominent events in their history during the last 400 years.

FUR SEAL. See SEAL.

FURST, furst, JULIUS (1805-73). A distinguished German Orientalist, born of Jewish parentage at Zerkow, Posen. He was educated for the rabbinical profession and displayed at a very early age a remarkable power of acquiring knowledge. He studied at a gymnasium in Berlin and entered the university there, but soon after returned to Posen, in 1825, to take a post as teacher. Gradually his convictions led him away from the faith of orthodox Judaism, and in 1829 he abandoned the idea of entering the ministry and proceeded to Breslau, where he continued his Oriental, theological, and antiquarian studies, which were completed at Halle, under Gesenius, Wegschneider, and Tholuck. In 1833 he went to Leipzig, where he was first tutor (1833), and from 1864 professor, in the university. His labors in the Oriental field now continued uninterruptedly until his death, in 1873. His chief works are the following: *Lehrgebäude der aramaischen Idome* (1835), *Concordantie Librorum Sacrorum Veteris Testamenti Hebraice et Chaldaice* (1837-40), a painstaking revision of Buxtorf's *Concordance of the Old Testament; Hebraisches und chaldaisches Handwörterbuch* (1857), and his *Geschichte der biblischen Literatur und des jüdisch-hellenistischen Schrifttums* (1867-70). He also wrote a *Geschichte des Karaertums* (1862-65), compiled a *Bibliotheca Judaica* (1849-63), and was editor (1840-51) of *Der Orient*.

FÜRSTENBERG, fūr'sten-bērk. A mediaeval principality in southern Swabia, now divided among Baden, Württemberg, and Hohenzollern. It gives its name to a noble family, branches of which exist in Baden and Austria. The Austrian family consists of the princes of Fürstenberg, whose estates are in Bohemia, and of the landgraves of Fürstenberg, who reside in Lower Austria. Other branches of the family are the counts of Fürstenberg, in Westphalia and Rhemish Prussia. Consult *Fürstbergisches*

Urkundenbuch, ed by S Riezler and F L Baumann (2 vols, Tübingen, 1877-91), continued by Baumann and Tumbult (2 vols, ib, 1899-1902), G Tumbult, *Das Fürstentum Fürstenberg* (Freiberg, 1908).

FÜRSTENBUND, fur'sten-bunt (Ger, league of princes), THE A league of German princes, formed about 1780, under Prussian leadership, to resist the encroachments of Austria. Its founding was almost the last important act of Frederick the Great, and was premonitory of the future strife between Austria and Prussia for preeminence in Germany, but the importance of the union was lost sight of, for the time, in the events of the French Revolution.

FÜRSTENWALDE, fur'sten-val'de A town in the Prussian Province of Brandenburg, situated on the right bank of the Spree, 30 miles east-southeast of Berlin (Map Prussia, F 2). It has a gymnasium, several fine churches, and monuments to Emperors William I, Frederick III, and Prince Bismarck. There are manufactures of woollens, electric lamps, wood alcohol, machinery, bricks, and glass. The Pintsch Gas Company alone employs more than 1600 hands. Owing to its ownership of an adjoining forest, 19 square miles in extent, Fürstenwalde is among the richest towns in Germany. Pop, 1900, 16,662; 1910, 22,626, chiefly Protestants. It is one of the oldest cities of Brandenburg, having obtained municipal rights in 1285.

FURTADO, fūr-ta'do, FRANCISCO JOSÉ (1818-70). A Brazilian statesman. He was born at Oeiras (Piahy) and was educated at the Academy of Law at Caxias, Province of Maranhão, but from political reasons took his degree at São Paulo. A Liberal in politics, he was elected to the Chamber of Representatives in 1847, and again in 1861. At various times he rendered excellent service as a local official and as judge in municipal and commercial courts. In 1856 he was made President of the new Province of Amazonas, which rapidly developed under his rule. In 1864 he was chosen senator and made Minister of State, in which office he performed efficient service in improving financial conditions.

FÜRTH, furt A town of Middle Franconia, Bavaria, 980 feet above sea level, situated at the confluence of the Rednitz with the Pegnitz, 5 miles northwest of Nuremberg (Map Germany, D 4). It has a modern Rathaus, built in Italian style, with a tower 180 feet high, and a seventeenth-century synagogue. In the church of St Michael there is an excellent late-Gothic ciborium. Fürth forms with Nuremberg practically one large manufacturing city. Its growth in the last quarter century has been very rapid. Among its chief manufactures are mirrors, toys, gold leaf, bronzes, spectacles and optical instruments, lead pencils, lamps, fine lithograph printing, machinery, leather goods, shoes, sheet metal, cabinetwork, furniture, and Venetian blinds. It has a gymnasium, a school for woodworkers, an agricultural school, and a library. The trade in hops is very active. Pop, 1890, 43,206, 1900, 54,822, 1910, 66,553. Although mentioned as early as the beginning of the tenth century, Fürth did not obtain a municipal charter until 1818. It was burned by the Croats in 1634 and passed from Prussia to Bavaria in 1806. At the Alte Veste, 3 miles southwest of the city, Gustavus Adolphus was defeated by

Wallenstein in 1632. The first steam railway in Germany was that between Nuremberg and Fürth, opened in 1835.

FURTHER INDIA. See FARTHER INDIA.

FURTWÄNGLER, furt'væng-lër, ADOLF (1853-1907). A German archaeologist. He was born at Freiburg and studied in his native city and at Leipzig and Munich. In 1878-79 he participated in the archaeological excavations at Olympia (qv). He became professor of archaeology at Berlin in 1884 and at Munich in 1894. In 1901 he conducted the excavations at Ægina (see ÆGINETAN SCULPTURES) and in 1903 at Orchomenos. He came to be recognized as an eminent authority on ancient vases and gems. He was a pupil of H Brunn and used even more effectually than Brunn had done the comparative method in the criticism of art. He was a dominant figure in archaeological circles. Besides several valuable treatises on the excavations at Olympia and Ægina, his publications include *Plinius und seine Quellen über die bildenden Künste* (1877), *Meisterwerke der griechischen Plastik* (1893, Eng trans, 1894), *Ueber Statuenkopien im Altertum* (1896), *Die antiken Gemmen* (1900), and with Reichhold, *Griechische Vasenmalerei* (1900-04). He also published important descriptive catalogues of vase collections in various cities. *Beschreibung der Glyptothek König Ludwig I zu München* (Munich, 1900), *Ein hundert Tafeln nach der Bildwerken der kgl Glyptothek zu München* (ib, 1903), and with Ulrichs, in 1908, a small edition of his *Meisterwerke*, which has been translated into English by Taylor (London, 1914).

FURUNCLE. See BOIL.

FURY AND HECLE STRAIT. A narrow channel in the Arctic regions which separates Melville Peninsula on the south from Cockburn Island on the north, and connects Fox Channel on the east with the Gulf of Boothia on the west (Map Canada, O 3). It received its name from the vessels used by Captain Parry, its discoverer, in 1822.

FURZE, fūrz (AS *fyrz*, of unknown origin), *Ulex*. A genus of plants of the family Leguminosæ. The common furze (*Ulex europæus*), also called whin and gorse, is a shrub about 2 or 3 feet high, extremely branched, the branches green, striated, and terminating in spines, the leaves few and lanceolate, the flowers numerous, solitary, and yellow. It is common in sandy soils in many of the southern parts of Europe, and in Great Britain, although there it often suffers from the frost of severe winters. Furze is sometimes planted for hedges, but is not well suited for the purpose, occupying a great breadth of ground and not readily acquiring sufficient strength, besides it does not, when cut, tend to acquire a denser habit. It is useful as affording winter food for sheep, and on this account is burned down to the ground by sheep herders when its stems become high and woody, so that a supply of green succulent shoots may be secured. A double-flowering variety is common in gardens. A very beautiful variety, called Irish furze, is remarkable for its dense, compact, and erect branches. A dwarf furze (*Ulex nanus*) occurs in some places, and is perhaps only a mere variety. Furze is sometimes planted as a sand binder, and *Ulex europæus* is extensively established along the eastern coast of the United States from Nantucket to Virginia.

FURZE CHAT. See WHINCHAT.

FUSAGASUGÁ, fōō'-sa-ga-sōō-ga' A town in Colombia, in the Department of Cundinamarca, 28 miles southwest of Bogotá. It is a summer resort of the latter city and has an important coffee industry. It is 5800 feet above sea level. Pop., 1912, 13,443.

FUSAN, fōō'-san', or **PUSAN**. The chief seaport of southeastern Chosen (Korea), 7 miles from the mouth of Nak-tong River, in lat 35° 6' N, long 129° 3' E, and the southern terminus of the railway from Seoul, which was opened to that capital (286 miles) early in 1905 (Map Korea, N 4). The port was opened by treaty to Japanese trade in 1876 and to general trade Nov 26, 1883. The native town (Old Fusan) has about 600 houses and 5000 inhabitants, while the Japanese have settled at New Fusan, opposite Deer Island. The city is now under control of a prefect appointed by the Governor-General of Chosen. Since the annexation the Japanese have far advanced the work of making roads, installing electric lights, and constructing large water works, and the place is very active and prosperous. A police system is maintained on the European pattern. In 1904 there were 9000 foreign residents, of whom a few were Chinese and Europeans and the rest Japanese, by October, 1906, the number of Japanese had risen to 18,297. There are now over 20,000 Japanese, with 100 Chinese and a handful of Europeans. A Chinese consulate is maintained. The harbor is formed by several islands, the largest of which is Deer Island, and the largest vessels can come close to the landing places. The climate is very healthful, summer bringing perfect sea bathing. The neighboring fisheries yield great supplies of herring and cod. Lines of small steamers connect Fusan with Nagasaki and other Japanese ports, Shanghai, Chefoo, Taku, Chemulpo, Port Arthur, and Vladivostok. The Japanese are now engaged in improving the harbor, for which 3,524,060 yen (about \$1,900,000) is the estimated cost. This is urgent because, by the completion of the Antung-Mukden Railway, Fusan has become the terminus of a world route. A submarine cable connects Fusan with Nagasaki. The chief imports are cotton goods, petroleum, and Japanese manufactures, the chief exports are hides, beans, dried fish, whale meat, and rice. In exports Fusan has exceeded those of Jinsen (Chemulpo) since 1908, but Jinsen still leads in imports. In 1911, exports amounted to 5,864,745 yen and imports to 12,457,801 yen, a total of 18,322,546 yen, or 26 1/2 per cent of the entire Korean trade.

FUSARO, fōō-sa'rō, LAKE. A lake, 3 1/2 miles long, in the Province of Naples, Italy, 1/2 mile west of Baja and 1 1/4 miles south of Cumæ, of which it was perhaps the harbor. It has always been famous for its oysters, and the restaurant and gardens of the Ostricoltura and the casino built on the lake by Ferdinand I have many visitors in spring and autumn. The ancients called it Acherusia Palus. Two canals connect it with the sea, from which it is separated by a line of sand dunes.

FUSBERTA, fōōz-bēr'ta. The name of Rinaldo's sword in Ariosto's *Orlando Furioso*.

FUSE, or **FUZE** (abbreviation of *fusee*, from Fr *fusil*, gun, steel for striking fire, It, *ML focile*, steel for striking fire). The name of a variety of devices employed for firing explosives in military shells and mines and in blasting operations, etc. The simplest form is the one

patented by William Bickford, of Cornwall, in 1831 and known as safety fuse. It consists of a powder thread around which is spun jute yarn, this is afterward waterproofed. Single fuses have but one layer, and double fuses two layers, of waterproofed yarn. Tape fuses are wound with overlapping waterproof tape. In wet holes either double fuse or tape fuse is used. Fuses are made to burn at a certain rate of speed, and the time of explosion can therefore be regulated definitely by varying the length. The rate of burning for good fuse is 1 foot in one-third to one-half a minute. In modern practice blasts are most generally fired by electric fuses. These are of two general classes. In both two naked copper wires pass through a cork or plug of some nonconducting material and project inside a metal cylinder in the open end of which the plug is inserted. In high-tension fuses the ends of the wires are not connected, and in low-tension fuses the ends of the large copper wires are connected by a very fine wire, commonly of platinum. The metal cylinder is filled with some explosive compound, commonly fulminate of mercury, which explodes with a detonation. The outer ends of the two copper wires are connected with two wires which lead to the poles of a battery or other electrical generator, often a magnetic machine.

In operation the metal cylinder with its exploding charge is inserted in the mine or blast to be fired, and the wires are connected with the electric generator. Upon completion of the circuit the current passes through the explosive compound in the detonator, forming a spark in the high-tension fuse and heating the fuse wire in the low-tension fuse, and in either case causing the compound to explode and thus explode the mine or blast. Electric fuses are used for firing submerged mines in warfare. In many of the large cities electric firing is now compulsory on account of the greater safety. It is also much more effective in open cutwork and where simultaneous explosion of a row of holes is desired. Consult H B Gillette, *Rock Excavation, Methods and Costs* (New York, 1904). See **BLASTING**.

Fuses for igniting the bursting charges of projectiles are classified as *time fuses*, *percussion fuses*, *combination fuses*. A *time fuse* begins to burn at the instant of discharge and continues to burn for a prearranged number of seconds and fifths of a second, at the end of which period the fuse ignites the bursting or detonating charge. *Percussion fuses* do not operate until the projectile strikes the ground or target. A *combination fuse* contains both a time train and a percussion element. It is used in all shrapnel (q v). To produce the maximum effect with the 252 or more bullets contained in a shrapnel case it is important to insure the burst at a certain height above and distance in front of the target. For example, at a range of 3000 yards the 3-inch shrapnel should burst at a height of 3 mils (9 yards) above the target and 66 yards in front of it. To accomplish this the time fuse must be set at about 7 1/2 seconds. The setting of the fuse is quickly and automatically done by an instrument called a *fuse setter*, attached to the caisson body. There are two general systems of *arming* a fuse—one by over-coming, by the shock of discharge, the resistance of a split ring on the *plunger*, the other by releasing the firing pin by means of the *centrifugal* force of *rotation* of the projectile. Fuses

depending on the latter principle are called *centrifugal fuses*

The time fuse alone, i.e., without percussion element, is no longer used. Percussion fuses generally have a plunger held by a safety ring or other device away from a cap of fulminate until, by the shock of discharge, they are *armed*, and the plunger left free to run forward, when the shell strikes its target, and strike the cap. Percussion fuses may be inserted either at the *point* or in the *base* of the projectile, and are called, according to location, *base* or *point percussion fuses*. Percussion fuses designed to detonate high-explosive shell are called *detonating fuses*. Time fuses are held safe, in old models, by a pin which is taken out when inserted in the gun, or in recent models by setting the time ring at "safety", the discharge then drives the plunger on to the cap at once, igniting a train of powder (time train) which burns during flight. Communication of flame to charge can be made only through the connecting vent, a small hole set at a point corresponding to the

action the case is not ruptured upon the explosion of the bursting charge, but the head is forced out, and the balls are shot out of the case with an increase of velocity of from 250 to 300 feet per second. In the meantime the head continues its flight, detonating on impact. If the fuse be set at "safety" or for a time of flight greater than the actual time of flight, this shrapnel may be used in lieu of high-explosive shell. Upon impact a high-explosive shrapnel is detonated by means of the percussion element of the combination fuse, the head being detonated first, which detonation causes the sympathetic detonation of the high-explosive matrix surrounding the balls.

In the time fuses above described the interval between discharge of shrapnel from the gun and the burst of the shrapnel near the target is regulated by the burning of a compressed powder train in the body of the fuse. A different principle is used in recent *mechanical fuses* which in 1914 were under consideration with a view to adoption. In these the time element

time desired before explosion. The percussion principle is combined with this to insure explosion on impact if the time train should fail to act, and the mechanism which is shown in the illustration is situated at the base of the fuse. The combination fuse is screwed into the *point* of the projectile.

The latest service high-explosive fuses in the United States army are the F A and the *Ehrhardt combination* (21 seconds), which, in addition to the features described above in the F A combination (1907 M), detonates the high-explosive shrapnel on impact, or, if burst in air, detonates the high-explosive head when the latter strikes the ground. The bursting charge of this shrapnel is composed of a charge of loose black powder (2½ ounces), covered by a steel diaphragm. The latter supports a steel central tube which extends forward to the high-explosive head. The shrapnel is filled with 285 balls secured in a matrix of high explosive. In time

was operated by a clockwork mechanism in lieu of a burning powder train. At the shock of discharge the mechanism was set in motion and, at a prearranged number of seconds, insured by the particular setting of the time-ring scale, released a pin which fired a primer which in turn ignited the bursting charge. This *mechanical fuse* was first practically developed by the Kluipps of Germany.

Safety Fuse A device used for conveying ignition from a safe distance to a charge of explosive and consisting of a flexible tube containing a core of fine-grained gunpowder. The tube is frequently made from two layers of spun yarn surrounded by tape which has been dipped in a waterproofing composition so that the device may be used in damp mines and other wet places. There are many grades, but the exterior diameters of all are such that they fit neatly into the cases of the commercial detonators. Safety fuse is sold in 50-foot lengths rolled into

coils, the fuse having previously been dusted with white clay or like body to prevent the sticky surfaces adhering when the fuse is coiled. The standard rate of burning stipulated by the United States government in its specifications is one yard in 90 seconds, and fuse should be so made that no portion of it varies more than 10 per cent from this rate. A uniform rate of burning is essential in blasting because the

cracked, is dangerous. Such gunpowder fuse as is described has been called *running fuse*. It is now called *burning fuse* to distinguish it from the recently invented *detonating fuse*, consisting of a lead tube, of the diameter of burning fuse, containing a core of compressed trinitrotoluene. It is fired by detonation and conveys detonation to charges of high explosives. It is styled *cordeau-detonant* and *cordeau-Bickford*. A piece of

blaster in setting a charge cuts a piece of fuse of such length as he believes is long enough to reach from the charge to the face of the coal or rock and sufficiently far beyond to give him ample time, after the outer end of the fuse has been set on fire, to reach a place of safety before the flame of the powder train reaches the detonator or charge. Fuse which has been imperfectly made, or which has been squeezed so as to displace the core, or become damp, or

cordeau-detonant extending through the longer axis of a cartridge of explosive when detonated greatly increases the power developed by the explosive. Brass tubes containing such a piece of the cordeau-detonant and a detonator are styled *renforts*, or *boosters*.

In spherical shell, now obsolete, a train of powder pressed into a wooden tube was cut to length proportionate to time of bursting. Ignited at the outer end by discharge, this tube

conveyed the combustion to the charge. For ricochet fire over water a water cap of brass with a zigzag channel prevented extinction by immersion. An improved fuse, chiefly used for spherical shell, was the Bormann. It was of pewter and was punched on a time scale. Greater accuracy was obtained by more uniform burning of the better time train. Consult Lissak, *Ordnance and Gunnery* (New York, 1907), and *Fuzes* (Government Printing Office, Washington, 1914). See AMMUNITION, PROJECTILES, SHRAPNEL.

FUSEE, fū-zē' (from OF *fusee*, thread, from ML *fusata*, spindleful, from Lat. *fusus*, spindle). A spirally grooved cone in a watch or chronometer, connected at its base with a chain which is wound up on the pyramidal cone. The opposite end of this chain is attached to the box containing the spring, which rotates by the force of the uncoiling spring. The object of the peculiar form of the fusee is, as the force of the spring is weakened by uncoiling, to give a longer leverage at the other end of the chain (on the fusee), and so to counteract the loss of power in the spring, thereby maintaining as nearly as possible a uniform rate of driving force. With the better skill and knowledge in the manufacture of steel and the material entering into watch springs, and the use of the stored energy of the spring between narrower limits of its complete resiliency, the need of the fusee has disappeared from modern watchmaking. See WATCH.

FUSEL (fū-zel) **OIL**, or **FOUSEL OIL** (Ger. *Fusel*, spirits of low grade, perhaps from Lat *fusilis*, fluid, from *fundere*, to pour). A frequent impurity in spirits distilled from fermented potatoes, barley, rye, etc., to which it communicates a peculiar and offensive odor and taste and an unwholesome property. (See ALCOHOL.) It is obtained from impure spirits in the form of an oily liquid having a penetrating odor, boiling at 131° to 132° C, and having a specific gravity of about 0.811 at 19° C. It has a much stronger intoxicating effect than ordinary alcohol and is highly injurious to health. The substances found in fusel oil belong to three classes of carbon compounds, viz, alcohols, acids, and esters. The alcohols of fusel oil include methyl alcohol (wood spirit, CH_3OH), ethyl alcohol (spirits of wine, $\text{C}_2\text{H}_5\text{OH}$), propyl alcohol ($\text{C}_3\text{H}_7\text{OH}$), isobutyl alcohol ($\text{C}_4\text{H}_9\text{OH}$), amyl alcohol ($\text{C}_5\text{H}_{11}\text{OH}$), and hexyl alcohol ($\text{C}_6\text{H}_{13}\text{OH}$). The acids found, either free or combined in fusel oil, include formic acid (HCO_2H), acetic acid ($\text{CH}_3\text{CO}_2\text{H}$), propionic acid ($\text{C}_2\text{H}_5\text{CO}_2\text{H}$), butyric acid ($\text{C}_3\text{H}_7\text{CO}_2\text{H}$), valeric acid ($\text{C}_4\text{H}_9\text{CO}_2\text{H}$), caproic acid ($\text{C}_5\text{H}_{11}\text{CO}_2\text{H}$), cenanthylic acid ($\text{C}_6\text{H}_{13}\text{CO}_2\text{H}$), caprylic acid ($\text{C}_7\text{H}_{15}\text{CO}_2\text{H}$), pelargonic acid ($\text{C}_8\text{H}_{17}\text{CO}_2\text{H}$), and capric acid ($\text{C}_9\text{H}_{19}\text{CO}_2\text{H}$). The principal constituents of fusel oil are the amyl alcohols. The composition of fusel oil contained in different spirits varies with the source from which the spirits are derived. Fusel oil is generally removed from ordinary alcohol by filtration through charcoal, or by distillation, which is more efficient, but best by a combination of the two processes. It must, however, be remembered that the increasing demand for fusel oil itself has made it about six times as valuable as ordinary alcohol. Fusel oil is used in making the widely used amyl acetate, in preparing artificial fruit essences, and in the manufacture of alkalis. See AMYL ALCOHOL, DISTILLED LIQUORS.

FUSELLI, fū'ze-lē, HENRY. See FUESSLI.

FUSHIKI, fū-shā'kē, or **FUSHIGI**. A seaport town of Japan, situated on the west coast of Nippon, 32 miles northeast of Kanazawa. It was made a free port in 1889 (Map Japan, E 5). Pop, about 19,000.

FUSHIMI, fū-shē'me. A town of Japan, situated on both banks of the river Uji-gawa, 3¼ miles from Kyoto (Map Japan, D 6). It is noted as the place where a battle occurred between the Imperialists and the adherents of the Shogun in January, 1868. Pop, about 20,000.

FUSIBLE METAL. A term applied to certain metallic alloys characterized by the relatively low temperatures at which they melt. Among the more important of these alloys are D'Arcet's metal, Rose's metal, Wood's metal, and Lipowitz' metal. *D'Arcet's metal* consists of 8 parts of bismuth, 8 parts of lead, and 3 parts of tin, it melts at 79° C (174.2° F). *Rose's metal* consists of 1 part of lead, 1 part of tin, and 2 parts of bismuth, it melts at 94° C (201.2° F). *Wood's metal* consists of 4 parts of tin, 3 parts of cadmium, and 15 parts of bismuth, it melts at 60° C (140° F). *Lipowitz' metal* consists of 8 parts of lead, 4 parts of tin, 3 parts of cadmium, and 15 parts of bismuth, it melts at 65° C (149° F). Of course, by varying the relative composition of these alloys, a variety of other fusible metals may be obtained, and the melting points of these may be made to answer the purposes for which they are intended. For example, the constituents of D'Arcet's metal may be mixed in the proportion of 5 parts of lead, 8 parts of bismuth, and 3 parts of tin, and then the melting point will be 94.5° C (202.1° F). Many fusible metals, especially D'Arcet's, have the property of expanding as they cool, while still soft, and are therefore used for taking proof impressions of dies, each line being exactly reproduced in the cast made of the alloy. Fusible metals have also been employed for making safety plugs for boilers. When the steam reaches a pressure corresponding to the melting point of the alloy, the plug gives way and the steam escapes. Of late years fusible metals have come into extended use for filling the nozzles, or in the form of links for the struts, of the automatic fire-sprinkler systems now installed in all large manufacturing and commercial buildings. The alloy usually employed consists of bismuth 4 parts, lead 2, tin 1, and cadmium 1, and melts at about 74° C (165° F). Such a material was said first to have been used in sprinkler heads by Major Harrison. Links of fusible metals, first designed by Edward Atkinson, are used in connection with self-operating doors, hatches, etc. See HEAT.

FUSILIERS, fū'zil-ēr-z' (Fr *fusilier*, from *fusil*, musket, It, ML *focile*, steel for striking fire, from Lat *focus*, hearth). Historic regiments of the British army, deriving their title from the fact that they originally carried a lighter fusil or musket than the remainder of the army. In point of age the fusilier regiments are next in seniority to the Coldstreams and other guard regiments, and consequently are more or less prominent in the military history of Great Britain. In time of peace their uniform differs from other infantry regiments only in the matter of headgear, which in their case is a busby (qv) similar, though smaller, in shape to the one worn by the Foot Guards.

The fusilier regiments are the Royal Inniskillings, the Royal Lancashire, the Royal Scots, the Royal Irish, the Royal Welsh

FUSING POINT See **MELTING POINT**

FUSION See **HEAT**

FUSION (Lat *fusio*, fusion, from *fundere*, to pour) A concept which has played a large part in recent psychological discussion, but the meaning of which cannot be said to be finally and precisely settled. It denotes a connection of sense elements of an extremely intimate kind—a connection so close that the resultant compound process seems rather to be a fusion or weld than a mere association of elements. The best instance of a fusion is the sound of a musical note or clang, in which a number of tonal elements are blended to give a single resultant perception which, in certain cases, may counterfeits the simplicity of sensation itself. See **CLANG TINT**

Fusion, as thus defined, might be nothing more than a limiting form of simultaneous association (qv). Wundt accordingly classifies simultaneous associations as (1) fusions (intensive, e.g., tones, and extensive, e.g., sights and touches), (2) assimilations, including discrimination and recognition, and (3) complications, connections of elements from different sense departments (e.g., of visual impressions and the organic sensations accompanying bodily movement). As thus understood, fusion does not necessarily imply any change in the connected sensations. We may suppose that they are intimately associated, owing to their habitual and constant concurrence some one of them dominates the group, forcing the others into obscurity, so that the whole is apprehended as a whole and not as a sum, but still analysis is possible, and when it takes place the obscure components may turn out to be the same in all respects as they would be if given in isolation. Fusion, in other words, might be merely a modern name for James Mill's indissoluble association. In point of fact, the question is more complicated.

1 We must, in the first place, take account of Wundt's law of psychical resultants. This law declares that "every mental complex shows attributes which may, indeed, be understood from the attributes of its elements, when these elements have been once presented, but which are by no means to be regarded as the mere sum of the attributes of these elements." Thus the musical note or chord has attributes, on its perceptual and affective sides, which do not attach to the component simple tones. So, too, spatial and temporal arrangement—extension, duration, order in space or time—is conditioned upon a certain collocation of sense elements, but neither space nor time is an intrinsic attribute of any sensation. It follows, then, that for Wundt both the intensive and the extensive fusions are, in reality, something more than indissoluble associations, the fusion is not only a whole, but a new whole, something that can be understood but not predicted from the nature of its elemental constituents. The law of psychical resultants has been much criticized, on the ground that it involves a belief in "mental chemistry" for which the facts give no warrant, on the ground, more particularly, that it is impossible to derive space from the nonspatial and time from the nontemporal. Nevertheless many psychologists of high standing accept the doctrine of secondary contents or secondary attri-

butes (see **FORM OF COMBINATION**)—the doctrine that associated complexes contain processes or show attributes which are set up by the association as such, and are not discoverable when the elements are separately examined, and this doctrine is but a variant of Wundt's law.

2 The laws of tonal fusion have been worked out in great detail by Stumpf. This author is very far from accepting a principle of mental chemistry, but, at the same time, he differentiates fusion from simple association. According to Stumpf there is in a collocation of tones, after all other hindrances to analysis have been removed, a tendency to fusion, or to a resultant oneness of impression, due to the character of the sense material itself. When full allowance is made for habitual association, for misdirection or distraction of attention, for lack of practice, and what not, this "sense phenomenon" of being fused still remains. It is not that a new process or attribute is set up, it is simply that, just as visual extents, owing to their intrinsic nature, associate, so do tonal qualities, owing to their nature as tones, fuse or blend. This position has recently been disputed, but the evidence for it is too strong to be lightly overthrown.

We turn to a consideration of the laws of tonal fusion. 1 If we grant Stumpf's postulate, it is clear that we may speak of *degrees* of fusion, according as the tendency to fusion, inherent in tonal material, is more or less completely realized. The musical interval of the octave may readily be confused, even by practiced observers, with a simple tone, the octave, then, represents the highest degree of fusion. On the other hand, the intervals of the major and minor second and major and minor seventh are rarely taken to be unitary, even by unpracticed and unmusical hearers. These intervals, then, represent the lowest degree of fusion. Between the two extremes stand, in order from better to worse fusion, the intervals of the fifth, of the fourth, of the major and minor thirds and sixths, and of the subminor or natural seventh and the tritone. We have, in other words, a scale of six fusion degrees within the octave of the musical scale. The facts are summed up in the primary fusion law that "the degree of fusion is a function of the vibration ratio of the component tones" (Stumpf). In general the consonances are the best fusions, the dissonances are the worst, and the imperfect consonances occupy an intermediate position.

Certain other laws of fusion may be formulated as follows. 2 The dependence of intraoctave fusion upon the vibration ratio of the component tones persists over all regions of the musical scale. Above and below the limits of this scale the discrimination of degrees of fusion becomes difficult or impossible. 3 The degree of fusion is independent of the intensity, absolute and relative, of the component tones. A weak chord fuses as does a loud chord, and a loud tone, accompanied by weak tones, gives the same fusion degree as would be produced if the same tones were all sounded at equal intensities. 4 Stumpf asserts that the fusion degrees of intervals wider than the octave are identical with those of the corresponding intraoctave intervals. Thus, the "ninths have the same fusion as the seconds, the tenths as the thirds, the double octave and triple octave as the octave." This law is not generally accepted. We must, of course, not be misled by the fact that dis-

crimination of the tones of the tenth, as compared with those of the third, is facilitated by the greater distance separating them upon the tonal scale. This has nothing to do with degree of fusion, our analysis may be made easier or more difficult by the concurrence of extrinsic conditions, while the degree of fusion remains absolutely the same. The question is: When analysis of the third and of the tenth has been performed, and the observer is able by effort of attention to single out the component tones in both complexes, do the third tones "go together" (blend) as well as or better than the tenth tones? Is the sense relationship, which we term fusion degree, the same or different in the two cases? The answer seems to be that the tenth, though a better fusion than, e.g., the tritone (a member of the intraoctave group lying next below the group of thirds and sixths), is still a worse fusion than the third, to which it corresponds. 5 Except in certain specific cases, falling under the laws already formulated, clang tint does not influence degree of fusion. 6 Spatial separation of the tones, though it facilitates analysis, does not affect degree of fusion. 7 If two tones are simultaneously ideated (reproduced, as sounding together, in memory or imagination), the resultant idea always evinces the degree of fusion that the same tones would show in perception. 8 The pitch of a fusion is never that of a tone lying midway between the pitches of the component tones, but rather the pitch of some one of these components. "In a continuously sounding compound clang," as heard by a musical observer, "the whole appears to possess the pitch of its deepest tone, even if this be not the loudest" (Stumpf). Unmusical observers are apt to estimate the pitch of a simple clang as somewhat lower than that of a compound clang based upon the same fundamental tone. These laws, it should be remarked, are regarded by certain other psychologists as deriving from an "ideal" conception of fusion, since, as they maintain, the impression of fusion is altered in actual experience by such factors as attention, expectation, practice, fatigue, etc. They argue further that, besides the acceptance of the single unitary impression as the principal criterion of fusion, we must also posit, as a secondary criterion, the relative difficulty with which the experience may be analyzed into its component parts. Those who adopt this position find, of course, that exceptions must be taken in practice to many of Stumpf's laws.

Other instances of fusion are to be found in the complexes of organic sensation that form the body of the feelings (see *FEELING*), in the qualitative taste-smell mixtures (the "taste" of coffee or lemonade), in the perceptions (weight, resistance) mediated both by external skin and by the sense organs of muscle, tendon, and joint, perhaps in all the impressions that we call colors (mixtures of color proper and of light); and, according to Kuelpe, in such affective formations as emotion, impulse, and feeling. It is, however, doubtful whether the connections of sensation and affection can be brought under the same conceptual heading as the fusion connections of sensations.

Consult Stumpf, *Tonpsychologie*, vol. II (Leipzig, 1890); Wundt, *Outlines of Psychology* (ib., 1907, Eng. trans.), id., *Grundzüge der physiologischen Psychologie* (ib., 1910); Kuelpe, *Outlines of Psychology*, trans. by Titchener (London, 1909); Titchener, *Experimental Psy-*

chology, I, II (New York, 1901); Kemp, "Zur Lehre von der Tonverschmelzung," in *Archiv für die gesamte Psychologie*, vol. XXIX (Leipzig, 1913).

FUSION DISK, or FUSING DISK See METAL-WORKING MACHINERY

FUSIYAMA, fū'sé-ya'ma See FUJIYAMA.

FUST, fūst, or **FAUST**, foust, JOHANN (?-c 1466) A German pioneer of the invention of printing. He was a well-to-do citizen of Mainz and became Gutenberg's partner in the new business of printing. He furnished the capital and took a mortgage upon the business, being shrewd enough to realize the value of Gutenberg's discovery. Gutenberg, on his part, provided the necessary apparatus. In 1455 Fust prosecuted Gutenberg for money advanced, and upon the latter's nonpayment seized enough of the apparatus to cover the mortgage, and continued the business with his son-in-law, Peter Schoffer. In 1462, at the sack of Mainz, the workmen were scattered and the secret of the art of printing became common property. By 1465 their shop was again active. Copies of the work of Fust and his partners are still in existence. The best-known publication of himself and Gutenberg is the Latin "Bible of 42 lines," or the Mazan Bible, of Fust and Schoffer, a *Psalter* (1457), the first book published with a complete date, and especially remarkable for the beauty of the initials, which are printed in red and blue from types made in two pieces. See GUTENBERG, PRINTING.

FUSTEL DE COULANGES, fūst'el' de kū'-lanzh', NUMA DENTS (1830-89) A French historian, born in Paris. He studied at the Ecole Normale Supérieure and in Athens. After teaching history in Amiens, Paris, and Strassburg, he returned in 1871 to Paris, where he became the successor of Geffroy at the University and in 1878 received a new chair of mediæval history. In 1880 he became director of the Ecole Normale. His principal works, all sincere but partly blemished by his theories, are: *Mémoire sur l'île de Chio* (1857), *Polybe, ou la Grèce conquise par les Romains* (1858), *La cité antique, Étude sur le culte, le droit, les institutions de la Grèce et de Rome* (1864, 17th ed., 1900), which greatly exaggerates the influence of religion, *Histoire des institutions politiques de l'ancienne France* (1874-92), a revision of the first volume of the last-named work, in three volumes: *La Gaule romaine*, *L'invasion germanique*, and *La monarchie franque* (1888-91), awarded the Grand Prix Jean Raynaud. For his biography, consult Guraud (Paris, 1896), and consult Langlois's sketch in *La grande encyclopédie* (ib., 1885-1903).

FUSTIAN, fūs'chan (from OF *fustaine*, from ML *fustianum*, fustian, from Ar *Fustāt*, a suburb of Cairo, from which the material first came) A cotton corded fabric which has a pile like velvet, but shorter, and which is manufactured in nearly the same manner as velvet, by leaving loops standing upon the face of the fabric, and then cutting them through so as to form upright threads, which are afterward smoothed by shearing, singeing, and brushing. The fabric is used in England for trouserings, etc., and the name has been applied to the lower, coarser grades of velveteens and cordings. See VELVET.

The different names given to fustian cloths depend upon their degree of fineness and the manner in which they are woven and finished.

Thus, smooth kinds, of a strong twilled texture, are called *moleskins* when shorn before dyeing, and *beavertees* when cropped after dyeing. Corduroy, or king's cord, is produced by a peculiar disposition of the pile threads. In all fustians there is a warp and filling, or woft thread, independent of the additional filling thread forming the pile, but in corduroys the pile thread is only "thrown in" where the corded portions are and is absent in the narrow spaces between them. For a technical description of fustians, velveteens, and corduroys, see Posselt, *Technology of Textile Design* (Philadelphia, 1895).

FUSTIAN See SYLVESTER DAGGERWOOD

FUSTIC (from Fr *fustoc*, ultimately connected with Lat *fustus*, stick). A name given to two kinds of dyewood used for producing a yellow color and, with chemical additions, other colors, such as brown, olive, and green. The name in France (*fustic*) seems to be connected with *fustet*, name of the Venice sumac (*Rhus cotinus*), a shrub found in the south of Europe, and to have been transferred to a very different plant (*Chlorophora tinctoria*), a tree of the family Moraceæ, a native of the West Indies, Mexico, and northern South America. *Fustic* is a large and handsome tree, with wood which is sometimes used in mosaic cabinetwork and turning, but chiefly in dyeing, for which its large content of yellow coloring matter specially fits it. Since the color is rather dull, it is more used for producing other colors. Old *fustic*, or yellowwood, is employed for dyeing woollens and also to impart to them, when mixed with indigo and salts of iron, green and olive colors. It furnishes a yellow coloring matter termed moritanic acid, which may be obtained in crystals by evaporating its watery solution. The bichromates of potash and of lead, as well as some of the coal-tar products, have to a great degree superseded the use of old *fustic*. Young *fustic*, the wood of *Rhus cotinus*, contains a yellow coloring matter, to which the name "*fustic*" has been given. It is generally used in combination with other dyes in order to strike some particular tint. These terms, "old" and "young," began to be employed about the beginning of the eighteenth century, from the mistaken notion that the one, in small pieces, was the wood of the young tree, and the other, in comparatively large logs, of the same tree in a more mature state. The osage orange (*Maclura pomifera*) of North America is nearly allied to old *fustic*, and its wood also affords a yellow dye. See OSAGE ORANGE, SUMACH, CLADRASTIS, DYEING.

FUSULINA, fū'sū-lī'nā (Neo-Lat, from Lat *fusus*, spindle). An important genus of fossil perforate Foraminifera, characteristic of the Upper Carboniferous and Permian limestones. The shell, which varies in size from $\frac{1}{4}$ to $\frac{1}{2}$ of an inch among the different species, is usually fusiform in shape and is made up of a number of spirally inrolled whorls, of which the chambers are divided into many chamberlets by primary and secondary partitions. The known species, about 15 in number, are found in the Upper Carboniferous limestones and often also in those of the Permian age, and in many places are so abundant that they actually constitute the mass of the rocks. Such *Fusulina* limestones, appearing as if made up of grains of wheat, are common in certain parts of Europe, Asia, Japan, and are also found in the Mississippian and Southwestern States of the United States and elsewhere in North America. The

Fusulina limestone of Japan has a fine dark-gray ground, with brighter-colored *Fusulina* grains scattered over the surface, and because of its beauty has been extensively cut into vases and other ornamental objects, in which form it may be seen in nearly every collection of Japanese curios. *Schwagerina*, with shell of spherical form, is an allied genus of quite similar horizon and distribution. See FORAMINIFERA, CARBONIFEROUS SYSTEM.

FUSUS (Lat, spindle). A genus of large gastropod mollusks, the spindle shells, allied to the British whelks and American conchs, and containing many well-known shells. For particulars and illustrations, see ROARING BUCKLE, SPINDLE SHELL, WHELK.

FUTA JALLON, fū'ta jā-lōn' (Fr *Fouta-Djallon*). A large, mountainous region of central French Guinea, West Africa. Its area is about 42,500 square miles. Owing mainly to the elevation, which is about 4000 feet, and at points exceeds 5000 feet, the climate is rather favorable, and the fine forests lend beauty to the region. The Senegal, Gambia, Niger, and other rivers head within its confines. Its fertile valleys produce coffee, rice, maize, and cotton. The country is well adapted for stock raising, and the number of cattle is considerable. The territory is regarded as among the best in that part of Africa, but it is as yet little developed.

Futa Jallon was divided into four administrative circles by the French in 1902, each circle is under a French administrator. At the head of the native government are the princes (called *almamys*, i.e., *emirs*) of the two leading ancient families. Each prince rules for two years, and his powers are subject to the action of an assembly of nobles. The crowning of the *almamy* takes place amid great festivities in the sacred town of Fugumba, in the oldest mosque in the land. The capital is Timbo, a village of 1500 inhabitants. Tuba is the largest town. Labe, also, is important. The population of Futa Jallon is given as about 700,000, mostly Fulah. They came from Senegal in the sixteenth century and subjugated the natives. (See FULAH.) In 1881 the French, through a representative of the French administration in Senegambia, first concluded a treaty of peace with the *almamy* of Futa Jallon. It was not, however, until 1893 that a French protectorate was established, and a firm footing secured in connection with the government of French Guinea (qv). Consult Dolter, *Ueber die Capverden nach dem Rio Grande und Futa Dschallon* (Leipzig, 1884), Noirot, *A travers le Fouta-Djallon et le Bamoué* (Paris, 1885), De Sanderval, *La conquête du Fouta-Djallon* (ib, 1899), Machat, *Les rivières du sud et le Fouta-Djallon* (ib, 1906), treating the geography and geology of the country.

FUTAK, HADIK VON. See HADIK VON FUTAK.

FUTA-TORO, or **FOOTA-TORO**, tō'rō'. A territory in West Africa, in the northern part of French Senegal. A portion of it was annexed by France in 1860. It is, for the most part, a level and fertile country, with extensive tamarind forests. There is iron ore, and considerable pig iron is produced. The estimated population is 150,000, chiefly Fulah (qv). A tribe of mixed blood, locally known as *Tucoleurs* (Two Colors), forms the remainder of the population.

FUTTEHPUR, fū'te-pūr'. See FATEHPUR.

FUTTYGURH, fū'ti-gūr'. See FATEHGARH.

FUTURE ESTATE An estate in lands which is limited to come into possession and enjoyment at some time in the future. By the common law of England the number of such estates was strictly limited, being confined to reversions and remainders. These had the common characteristic of fitting exactly upon some precedent estate less than a fee simple and could not take effect in derogation of a fee nor after an interval of time during which the fee was suspended or in abeyance. Thus, a future gift to B one year after A's death, or to C one year from date, would, at common law, have been simply void, as not coming within the description of a remainder. See **REMAINDER**, **REVERSION**.

As a consequence of the ancient practice of conveying land to one man to the use of another, and as the result of the Statute of Uses, passed in the twenty-seventh year of Henry VIII (1535), and of the Statute of Wills, five years thereafter, new classes of future estates of a more flexible character became possible. These were known as springing and shifting uses and executory devises. They consisted in future limitations, not coming under the description of remainders and reversions, but taking effect in the future without a preceding "particular" estate, or in derogation of a preceding estate in fee. Thus, a gift of land to the use of B, to take effect on the happening of some future event, or to the use of A and his heirs, and, in the event of B's returning from abroad, to the use of B and his heirs, would vest a future estate in B, the former as a springing use (qv) and the latter as a shifting use (qv). Either of these estates, if given by last will and testament, would take effect as an executory devise (qv). Though these distinctions are still valid in England and many of the United States, they have in many jurisdictions been abolished by statute, while in a few States, as in New York, all future estates of real property have been put on the same footing, even the fundamental distinction between remainders and the executory limitations above described having been done away with. In general, therefore, future estates of all kinds can now be directly created by deed as well as by last will and testament.

Strictly speaking, there can be no such thing as an estate in personal property, and it was formerly the law that the ownership of such property was indivisible. This meant that if a chattel, as a jewel or a leasehold estate, was given to one for life, it became his absolutely, and no legal interest therein could be given over to any one else. But by a series of judicial decisions of the last century in England and America this narrow rule of the common law has been changed, and it is now possible to create legal future estates, or interests, in personal property as well as in real. Such interests are not deemed to be remainders, however, even when they take effect, like legal remainders of real property, upon the determination of a precedent interest therein, but are classified as future interests of the executory type, like springing and shifting uses, and the like.

The foregoing enumeration exhausts the list of the future estates generally recognized in our legal system. Other rights in land looking to a future enjoyment thereof may, indeed, exist, but they all fall short of being estates or interests in the land, as those terms are understood in law. Of this character are rights of

entry for condition broken, rights of forfeiture for waste or other cause, rights of escheat and eminent domain, and the right remaining in one who has conveyed away a qualified or limited fee. None of these reach the dignity of future estates, though one of them, the right of entry for breach of condition, has been rendered alienable by statute in England and a few of the United States. Of an intermediate character, also, are the respective interests of husband and wife in the estate of the other, while the relation of coverture continues. The "inchoate" dower right of the wife and the curtesy "inchoate" of the husband are not, strictly speaking, future estates, but they approach closely to that description. See **ESTATE**.

Future estates of all kinds are generally alienable by deed or will and, if estates of inheritance, are transmissible by descent just like present estates. Though the property in which the estate is claimed is for the time being in the lawful possession of another, the future estate is secure from loss or destruction. It is unaffected by any conveyance or other act of absolute ownership which the present, or particular, tenant may choose to exercise over it. In this respect it differs from a mere equitable interest, present or future, in property, which may be lost by conveyance of the property to an innocent purchaser. But all future estates that are contingent in character are subject to the rule against perpetuities, which renders void any future interest which is not to vest within a lifetime and 21 years after the date of the creation of the estate. See **PERPETUITY**.

FUTURISM See **POST-IMPRESSIONISM**.

FUXUM See **FOIX**.

FUZE. See **FUSE**.

FYFFE, fif, CHARLES ALAN (1845-92). An English historian, born at Blackheath, Kent and educated at Balliol College, Oxford, where he graduated in 1868. He took his M.A. in 1870 and in 1871 was elected a fellow of University College and later was appointed bursar, which position he held for many years. He acted as war correspondent for the *London Daily News* during the early months of the Franco-Prussian War and in the same capacity was in Paris during the Commune, narrowly escaping execution as a spy. He studied law at Lincoln's Inn and the Inner Temple in 1873-76, and in 1877 was admitted to the bar, but never practiced. Fyffe was a Radical in politics, one of the founders of the Free Land League, and an unsuccessful candidate for Parliament from Oxford in 1885. In 1875 he published a small *History of Greece*, in a series of *History Primers*. His *History of Modern Europe*, published in three volumes in 1880, 1886, and 1890, is a vigorous and careful account of the political history of Europe from the outbreak of the French Revolution to the Treaty of Berlin in 1878.

FYNE, fin, LOCH. An arm of the sea running north and northeast from the Sound of Bute, in the south of Argyllshire, Scotland, to beyond Inverary, in the north, and bounded by the District of Cowal on the east, and by those of Argyll-Knapdale and part of Cantire on the west (Map Scotland, C 3). It is 43 miles long, 2 to 8 miles broad, and 40 to 70 fathoms deep, and receives at its head the waters of the Fyne River and a little farther south the Shira and Aray. It has important herring fisheries, and it is much visited in the season by pleasure seekers.

FYRD, ferd. An old English term for *mil-*

tia, i.e., the men of a nation able to bear arms, used during the Anglo-Saxon period as early as the year 605. The individuals forming the *fyrð* were usually employed for local defense only, and were subject to severe penalties, including fine and forfeiture of land, in case they failed to report for duty. See *MILITIA*.

FYT, *fit*, JOHANNES (1611-61). A Flemish animal and still-life painter and etcher. He was born in Antwerp, where he was a pupil of Jan van Beich and Franz Snyders. In 1629 he became member of the Guild of St. Luke, and in 1650 he was elected member of the Guild of the Romanists, becoming dean in 1652. In 1631 he visited France and Italy, where he spent some time studying in Rome, returning to Antwerp in 1641. His painting is characterized by sunny effects, harmony of color, and remarkable detail, especially in the painting of the fur of animals and the plumage of birds. His subjects embrace animals hunting, fighting, and dead, besides still-life pieces. He has been named the greatest animal painter of the Flemish school after Snyders, who excels him in line but is his inferior in pictorial effects. He was associated with Willeborts, Schut, and others; Willeborts painted the figures, while Fyt added the animals. He died in Antwerp in 1661. His etchings include three series of animal subjects; they show the same vigor and animation in style as his paintings. He is represented in nearly all the museums of Europe. There are four paintings by him in the Louvre and three fine

"Dead Game" pieces in the Metropolitan Museum, New York, the "Bear Hunt" and the "Boar Hunt," two of his masterpieces, are in Munich, and he is especially well represented in Vienna.

FYZABAD, or **FAIZABAD**, *fī'za-bad'*. A division of Oudh, United Provinces, British India (q.v.) (Map India, E 3). It is watered by the Gogra and Gumti, and embraces a region rich in antiquities. Agriculture is in an advanced state of development, rice, wheat, and other grains are extensively cultivated, while cotton, tobacco, opium, and indigo also are produced. Area, 12,113 square miles. Pop., 1901, 6,855,991, 1911, 6,646,362. Capital, Fyzabad (q.v.).

FYZABAD, or **FAIZABAD**. The capital of a division of the same name, United Provinces, India, near the Gogra, 78 miles east of Lucknow (Map India, E 3). With its ancient suburb, Ayodhya, the Jerusalem of the Hindus, which is said formerly to have covered 96 square miles, it contains 36 Hindu temples, 114 mosques, an Imambarah, and a vast number of ruins overgrown by jungle. The great fair of Ramnaumi is annually attended by half a million pilgrims. Its prosperity, which had declined after the death of Bahu Begam, in 1816, revived under British rule, is again decreasing. An important trade in wheat and rice is carried on. It has large sugar refineries. The city is the headquarters of a British commissioner. Pop., including military cantonment, 1901, 75,085, 1911, 54,655.

G

G The seventh letter and fifth consonant in the Græco-Roman alphabet. The greatest innovation made by the Romans when they took over the Greek alphabet was in the development of G. Up to the middle of the third century B.C. the letter C was employed in Latin inscriptions for both *c* and *g*. The familiar abbreviations C and CN for Gaius and Gnaeus prove this fact beyond question. The inconvenience, however, of having only one character to distinguish the two sounds made necessary a slight differentiation, which finally gave the form G for the sonant, or voiced, guttural (*g*), and C for the surd, or voiceless, guttural (*c* hard). The new character first appears in the epitaph on Scipio Barbatus, which Ritschl thinks cannot have been carved later than 234 B.C. This G took the seventh place in the alphabet, which had been occupied by Z in the old Italic alphabet. (See ALPHABET, LETTERS) With reference to the name it may be added that the Greek designation *gamma* has been usually supposed to be an adaptation of the Semitic *gaml* or *gm̄l*, and to mean a 'camel.' But in fact *gm̄l* and *gaml* mean nothing as words, and although either may be the Semitic triliteral root meaning 'ripe,' there is no word of any such form from that root. The modern lower-case or small-letter *g* arose by gradual development from the symbol ζ , which already appeared in the semiuncial style as early as the sixth century of the Christian era. Consult Prou, *Manuel de paléographie* (Paris, 1910).

Phonetic Character In English, *g* has the values (1) of a voiced guttural, or velar, plosive made by voiced breath being checked between the body of the tongue and the palate, as in *got*, *organ*, *glad*, (2) of the so-called "soft" or palatal *g*, consisting of a combination of the voiced dental and the dental fricative (*d* + *zh*), as in *generous*, *gentle* (this sound is sometimes aided orthographically by the addition of a *d*, as in *bridge*, *judge*), (3) in some words taken from French it has the value of *zh*, the voiced dental fricative, of which the phonetic symbol is *z*, as in *mirage*, *rouge*, (4) it is sometimes silent before *n* and *m*, as *gnaw*, *sign*, (5) in the combination *ng* at the end of syllables it denotes merely that the *n* is a guttural and not a dental nasal (this sign is indicated *ŋ* by phoneticians and is called the voiced velar, or back, nasal), (6) the combination *gh* has frequently the sound of *f*, as *slough*, *laugh*, or of *w*, as *bough*. The voiced plosive *g* comes chiefly from (1) Indo-Ger *gh*, as in Eng *goose*, Ger *Gans*, AS *gōs*,

Lat *anser* (orig. **ghanser*), Gk *χῆν*, Skt *hasās*, Eng *guest*, Ger *Gast*, AS *grest*, Goth *gasts*, Lat *hostis*, Eng *sty*, go upward, Ger *steigen*, AS *stigan*, Goth *steigan*, Lat *vestigium*, footprint, Gk *σείχειν*, go, Skt *steghnōmi*, (2) the *g* of words which have come into English from other languages, as *grain*, Lat *granum*. The following are some of the changes between *g* and other letters: *acre*, Ger *Acker*, Lat *ager*, Gk *ἄγρος*, Skt *ajra*, or again *knee*, Lat *genu*, *kin*, Lat *genus*, Gk *γένος*, Skt *janas*, *yester* (day), Ger *gestern*, Lat *hesternus*. There is a constant tendency towards palatalization of *g*, as in the Old English participles in *y* (initial), corresponding to Germanic *ge*. A modern instance of this tendency is seen in the pronunciation of *Morgen* as *Moryen* in the so-called *Berliner Dialekt* of Germany. The Normans in England could not sound the *w* and so substituted for it *gu*. This gives doublets in English like *guard* and *ward*, *guarantee* and *warranty*. *G* sometimes disappears, as in Eng *enough*, Ger *genug*, and Eng *master*, Lat *magister*.

As a Symbol \bar{G} in music is the fifth tone of the natural diatonic scale of C, and in the treble clef is written on the second line, or in the first space above. In the bass clef it stands in the first line, or in the fourth space. As a mediæval Roman numeral it stands for 400, and with a line over it (\bar{G}) for 400,000.

GAÁL, gal, JÓZSEF (1811–66) An Hungarian author. He was born at Nagy Károly in 1811, studied at the College of Buda and at the University of Pest, and entered soon afterward the administrative career, being attached to the Hungarian Council of Lieutenancy. He played a somewhat important part in politics and took part in the revolution of 1848. Gaál began writing early and proved equally successful when gossiping in the columns of Kossuth's famous *Pesti Hírlap*, translating a masterpiece of Cervantes, filling the periodicals with tales and novels, or furnishing original works for the National Theatre. The sketches of country life as it was, and as it still continues on the vast plains of Hungary, are nowhere more vividly and more truly exhibited than in Gaál's comedies and tales. The following are some of Gaál's original compositions: *Szürmay Ilona*, a novel in two volumes (1836), *Peleskei Notarius* (The Notary of Peleske, 1838), a comedy in four acts, based on a novel by the poet Gvadányi, *Szvatopluk*, a tragedy in five acts. Tales *Pusztai Kaland* (An Adventure on the Hungarian Prairies), *Tengeri Kaland az Alföldön* (Seafaring Adventures in Lower Hungary), *Hortobágyi éjszaka*

(A Night on the Heath of Hortobágy) During the sojourn of the Hungarian Diet at Debreczen (1849), Gaál was editor of a journal combating extreme radical views. As early as 1837 he was made a member of the Hungarian Academy. Consult the edition of Gaál's novels and tales by Badics (Budapest, 1880-82).

GABARET, ga'ba'ra', JEAN DE (c1620-97). A French colonial governor, born on the island of Ré, of a family famous in French naval history, his father, Mathurin (died 1671), and his brother Louis (who was killed at Tobago) being brave sailors. He was made a commodore in 1653 and lieutenant general of naval forces in 1689. At the siege of Tobago, West Indies, he was the first to enter the harbor (Feb. 27, 1677). He fought in the battle of La Hogue (May 29, 1692) and in 1693 was appointed Governor of Martinique, which he successfully defended against the English. He improved the "Black Code" and (in the interest of the slave population of the island) submitted a report which outlined a method of gradual emancipation, recommended the deportation of the negroes to the French possessions in South America, where they might prove valuable colonists, and pointed out that white immigration to Martinique would thus be encouraged.

GABB, WILLIAM MORE (1839-78). An American paleontologist, born in Philadelphia, where he attended the Academy of Natural Sciences. From 1862 to 1865 he was in charge of the paleontological branch of the geological surveying expedition in California under Josiah D. Whitney, and in 1868 and 1873 undertook geological surveys in Santo Domingo and Costa Rica. His principal publications, which refer chiefly to these expeditions, include the first and second volumes of the *Geological Survey of California* (1864), "On the Topography and Geology of Santo Domingo," in *Transactions of the American Philosophical Society* (1873), "On the Topography of Costa Rica, with Map," in *Petermann's Mittheilungen*, and "Ethnology of Costa Rica," in the *Transactions of the American Philosophical Society*.

GABBATHA, gāb'a-tha (Gk Γαββαθά). The name of the place to which Pilate, after having examined Jesus, brought him from the Prætorium, to pass judgment upon him before the people (John xix 13). The Aramaic word, of which the Greek is a transliteration and which so far has not been found in any extant Aramaic documents, is apparently derived from the radical gābhābh, whose primary meaning is 'curved' or 'convex,' and might indicate that the place itself was on a rounded eminence or under a dome or arched balcony. If this etymology be correct, the term cannot be considered, as is assumed in the New Testament passage, the equivalent of the Greek term Λιθοστρότος, *Lithostrōtos*, which implies a level tessellated surface.

The location of this place depends upon what is to be understood by the "Prætorium." If this was Herod's palace, as in Acts xxiii 35, then the "Pavement" would most probably be the inner open court of the building, if it was the Antonia, then it would be an open space, most likely outside the building. Recent excavations near the Ecce Homo Arch have uncovered an extensive area of Roman pavement, from which the ground sloped rapidly away on the east and the west and which must have been immediately adjoining, if not actually within, the Antonia.

Parts of the pavement were evidently used for traffic, but most of it is smooth, as though marked off from traffic and used for other purposes.

GABBRO (dialectic It, of obscure origin). A crystalline igneous rock of granitic texture, composed largely of the minerals lime-soda feldspar and pyroxene, but often containing also a considerable quantity of olivine. The average chemical composition is silica, 49 per cent, alumina, 20 per cent, iron sesquioxide, 3 per cent, iron protoxide, 7 per cent, magnesia, 7 per cent, lime, 9 per cent, soda, 3 per cent, water, 2 per cent. The proportions of the constituent feldspar and pyroxene in gabbros vary widely, hence they grade towards peridotite and pyroxenite (qqv) on the one hand by reduction of the proportion of feldspar, and on the other towards anorthosite (qv) by reduction of the proportion of pyroxene. Gabbro which contains olivine is distinguished as olivine gabbro. The usual pyroxene of gabbro is diaspase, but when the place of this mineral is partially or wholly taken by hypersthene the rock is known as a hypersthene gabbro, or norite. The processes known as weathering tend to change both the olivine and pyroxene of olivine gabbros into the hydrated magnesium silicate serpentine, hence olivine gabbros are very often found to alter to serpentinous or serpentine rock (qv), the alteration is even more common and complete in peridotite (qv). Gabbros have a very large development in the Adirondacks and in the Lake Superior region of America and in the Western Isles of Scotland. The word "gabbro" is derived from the Italian and is said to have been introduced into geological science by Von Buch in 1809.

GABELENTZ, ga'be-lents, HANS CONON VON DER (1807-74). A distinguished German philologist, born at Altenburg. He studied at the universities of Leipzig and Göttingen (1825-28) and held various positions in the Government of Saxe-Altenburg, rising in 1848 to the head of the ministry. He devoted himself to the study of little-known languages, Asiatic, African, and American, and strove to lay a foundation for the comparative study of all languages. In his work *Ueber das Passivum* (1860) he drew examples from 208 tongues. Among his other works are *Éléments de la grammaire mandchoue* (1833), *Grundzüge der syrischen Grammatik* (1841), a critical edition of the Gothic translation of the Bible by Ulfilas, with a Latin translation and a Gothic glossary and grammar (in collaboration with J. Lobe, 2 vols, 1843-46), *Ueber die melanesischen Sprachen* (2 vols, 1860 and 1873). He was one of the founders of the *Zeitschrift für die Kunde des Morgenlandes* and contributed to it and other periodicals many papers upon little-known languages and general philological science.

GABELENTZ, ga'be-lents, HANS GEORG CONON VON DER, son of Hans Conon von der Gabelentz (1840-93). A German philologist, born at Poschwitz, Saxe-Altenburg. After studying law in Jena and Leipzig and holding several state positions, he was appointed in 1878 professor extraordinary of Oriental languages at the University of Leipzig and to a similar chair in the University of Berlin in 1889. Besides numerous contributions to the philological journal which his father had founded, he translated a Chinese work on "The Absolute," entitled *Thaï-Ki-T'u*, and published (1876) a grammar of the

Chinese classical language, *Chinesische Grammatik* (1881), *Die Sprachwissenschaft* (1891), and *Handbuch zur Aufnahme fremder Sprachen* (1892)

GABELLE, ga'bél' (Fr, probably from AS *gafol*, tax, from the Celtic, cf Corn *gavel*, tenure, Ir, Gael *gabhail*, conquest, from *gab*, to give, to take, connected with Goth *giban*, Ger *geben*, Eng *give*) A term originally used in France to designate every kind of indirect tax, but more especially the tax upon salt This impost, first established in 1286, in the reign of Philip IV, was only temporary, but was declared perpetual by Charles V Salt was made a government monopoly, and every family in the kingdom was obliged to buy a certain weekly amount at a fixed price The price varied in the different provinces Those that were most heavily taxed were called *pays de grande gabelle*, and those that were least heavily taxed, *pays de petite gabelle* *Les provinces franches* and *les pays rédimés* were those provinces which had purchased exemption The tax was unpopular from the first, and attempts to collect it occasioned frequent disturbances It was finally suppressed in 1790 The name *gabelous* is, however, still given by the common people in France to tax gatherers

Consult J J Clamagérans, *Histoire de l'impôt en France* 1876 (Paris, 1876), and A Gasquet, *Précis des institutions politiques de l'ancienne France* (2 vols, ib, 1885)

GABELSBERGER, ga'bels-bérg-ér, FRANZ XAVER (1789-1849) The founder of stenography in Germany He was born and educated at Munich and was long engaged as private secretary in the Ministry of the Interior in that city After publishing various textbooks and charts for schools, he devoted himself exclusively to stenography, repeatedly gave public exhibitions of his proficiency, and ultimately received the unqualified commendation of the Academy of Sciences His method is based upon phonetics The system has been widely adopted in Germany and has been introduced also into about 25 European languages His principal works are *Anleitung zur deutschen Redenzeichenkunst* (1834, Eng trans, by Henry Richter, under the title of *Graphic Shorthand*, 1899), which has furnished the basis for all further investigations of the kind in Germany and has passed through numerous editions, *Neue Vervollkommnungen in der deutschen Redeschreibekunst* (2d ed, 1849), *Stenographische Lesebibliothek* (1838) A monument was erected to his memory in Munich in 1890

GAB'ERLUN'ZIE MAN, THE A Scottish ballad which belongs to the early sixteenth century and has been ascribed to James V It concerns the fortunes of a wandering beggar

GABE-RUD See **DIYALA**

GABES, ga'bés, or **CABES** (anciently, Tacape) An important seaport and capital of the Tunisian Province of Arad, situated on the Gulf of Gabes, on the eastern coast of Tunis (Map Africa, F 1) The harbor is too shallow for larger vessels, but the trade of the port is nevertheless of considerable importance and consists of dates, henna oil, hides, wool, and alfa The site of the Roman Tacape, it consists of several villages and contains an Arabic school, a French garrison, and is the seat of the Governor of the province The population was 12,600 in 1896 and has increased to about 20,000.

GABES, GULF OF An open gulf of the

Mediterranean, on the east coast of Tunis It is about 70 miles in width and extends between the islands of Kerkenna and Jerba (Map Africa, F 1) The town of Gabes is at the head of the gulf

GABH'RA, BATTLE OF A battle which the tribe of Fionn waged, about 284 A D, against its enemies, as recounted by the Irish-Gaelic legends

GABII, gā'bī-i An ancient city of Latium, 12 miles east of Rome It plays an important part in Roman legend, in particular in the story of its capture by Tarquinius Superbus (Livy, 1, 53-54) After this it is seldom mentioned, and, though it was later a municipium, it gradually fell into complete decay It again became prosperous during the reign of Tiberius, when its cold sulphur springs attracted attention, and after the time of Hadrian seems to have flourished until the third century, when its name disappears except as the seat of a line of bishops until the ninth century The principal relic of the ancient city is a ruined temple, probably dedicated to Juno, on a hill now crowned by the ruins of the mediæval fortress of Castiglione Excavations on the site have yielded many noteworthy works of art, among these are the "Artemis of Gabii," now in Munich, and busts of Agrippa, Tiberius, Caligula, Nero, Trajan, and Hadrian Quarries of an excellent building stone, peperino, which was largely used by the Romans, existed in the neighborhood of Gabii The Romans termed a peculiar method of girding the toga *cinctus Gabinus*, Gabine cincture It seems to have differed from the ordinary method in that instead of the belt a portion of the toga was itself the girdle, while another part of the toga was drawn over the head This mode of wearing the toga was used on certain solemn occasions, such as the opening of the Temple of Janus on a declaration of war and at certain sacrifices, it has been interpreted as proof of a period of warfare between Rome and Gabii A treaty of peace between Tarquinius Superbus (q v) and Gabii, written on a bull's hide, was said to be extant in the first century B C

GABINE CINCTURE, **CINCTUS GABINUS** See **GABII**

GABIN'IAN LAW. See **GABINIUS**, AULUS **GABIN'IUS**, AULUS (?-c 47 B C) A Roman politician As tribune of the plebs, 66 B C, he proposed and carried the famous Gabinian law, conferring upon Pompey the command of the war against the pirates, and control not only of the Mediterranean but over the adjacent countries for 50 miles inland Afterward he was prætor (61), and became consul in 58, when he supported the banishment of Cicero At the end of his consulship he went to Syria as proconsul (57) and, having invaded Egypt against a decree of the Senate, restored Ptolemy Auletes to the Egyptian throne (55) Since, during his absence in Egypt, Syria had been much disturbed by robbers, to the financial loss of the *equites* (see **EQUESTRIAN ORDER**), who farmed the revenues there (see **PUBLICANI**), on his return to Rome (54) he was accused of treason and extortion He was acquitted of treason, but, though defended by Cicero, was condemned to perpetual banishment for extortion He was recalled by Cæsar in 49, and in the next year was sent to reinforce Q. Cornificius in Illyricum, where he died Consult Stocchi, *Aulo Gabino e i suoi processi* (Torino, 1892).

GAB'ION (OF, Fr. *gabion*, from It. *gabbione*,

large basket, gabion, augmentative of *gabbia*, *gaggia*, cage, Fr., Eng *cage*, from Lat *cavea*, hollow place, from *cavus*, hollow) A device for strengthening earthworks, in field or temporary fortifications It may be constructed of whatever materials the circumstances afford, but usually it is a hollow cylinder of basketwork, open at both ends, in diameter about 24 inches, in height 3 feet It has the advantage of being readily portable and capable of many uses It is used in the construction of *revetments*, which are coverings or facings placed upon an earth slope to enable it to stand at an inclination greater than its natural inclination The advantages of the gabion revetment are very

GABION

great. It can be put in place without extra labor and faster and with less exposure than any other. It is self-supporting and gives cover from view and partial cover from fire quicker than any other form The gabions are filled with earth after they are placed in the revetment and may be used in one, two, or three tiers The gabion is usually woven with small brush cut in the vicinity Three men should make a gabion in an hour See FORTIFICATION

GABIROL, ga'bé-rôl', SALOMON BEN See AVICEBRON

GABL, ga'b'l, ALOYS (1845-93) An Austrian genre painter, born at Wiesen, Tirol He was a pupil at the Munich Academy of Schraudolph, Ramberg, and finally of Piloty His poverty, the result of a disease of the eye, drove him to suicide at Munich His genre scenes closely resemble in characterization and humorous conception those of his famous countrymen Defregger and Matthias Schmid, but surpass them in striking light effects They include "Recruiting in Tyrol" (1873), "His Excellency as Umpire" (1876), "A Munich Tavern" (1880), "The Story-Teller," "Vaccination Room in Tyrol" (1885), the last in the New Pinakothek at Munich, and one of the choice specimens in that collection, and "Return of the Huntsman" (1892)

GABLE (OF, Fr *gable*, from OHG *gabala*, *gabal*, Ger *Gabel*, fork, AS *geafl*, fork, from Ir *gabul*, *gobul*, Welsh *gafl*, Bret *gavi*, *gaol*, fork) The triangular upper part of a wall which receives the end of a roof having two slopes or pitches meeting in a ridge at the top The form appears first in the pediments (qv) of Greek temples which, on account of their rich sculptures, became so important a part of temple architecture There was greater variety in the

Roman than in the Greek gables, and when, after the fall of Rome, architecture began to develop in more northern countries, where the climate demands steeper roofs than in Italy, the gable assumed a new importance and received a wholly new treatment in the churches of the Romanesque style, especially in France The most notable change next to the steeper pitch was the complete suppression of the horizontal cornice of the classic pediment and with it of figure sculpture In time the gable began to be used as a termination for buttresses and an ornament of pinnacles, and in the Gothic styles, in which buttresses and pinnacles are so important, these decorative gables and *gablets* (as the lesser gables are called) became established ornament forms Gables were multiplied on tabernacle hoods, spire dormers, and shrines, and the openwork or traceried gable applied over windows and doors where it had no significance whatever except as pure ornament In the mediæval towns of northern and central Europe the gabled façades of houses on the street produce highly picturesque effects In the Gothic and Renaissance periods the simple outline of the gable in Belgium, Holland, and Germany became stepped and broken in the most fantastic manner, especially in Germany between 1550 and 1650 See CORBIE STEPS

Both in Roman and in Renaissance architecture the pediment form of gable occurs frequently as a decorative adornment over doors, windows, and niches, and this has become a recognized form of treatment for these features in modern architecture, but the term 'gable' is not commonly applied to them In New York the "gable walls" of houses built in a block are the party walls and side walls which receive the ends of the roof beams, though the roofs are nearly flat, this is a local usage

GABLENZ, ga'blents, LUDWIG KARL WILHELM, BARON (1814-74) An Austrian general He was born at Jena, Saxe-Weimar, entered the Austrian service in 1833, and fought in Italy and Hungary in 1848 In the War of 1859 against Italy he took a distinguished part in the battles of Magenta and Solferino, commanded the Austrian army corps in the Austro-Prussian War against Denmark in 1864 at Trautenau, and won the only Austrian victory of the War of 1866 against Prussia After Sadowa he became a member of the Austrian Upper House, was appointed commanding general in Hungary in 1869, and retired in 1871 Financial difficulties drove him to suicide

GABLONZ, ga'blonts (Bohemian *Jablonec*) A busy manufacturing town of Bohemia, Austria, situated in a mountainous district about 1650 feet above sea level, on the Neisse, 7 miles east-southeast of Reichenberg (Map Austria-Hungary, D 1) It has a gymnasium, a professional school for braziers, and a trade school Gablonz is one of the centres of the Bohemian glass industry, which here employs more than 12,000 men Its specialties are glass beads, buttons, and imitation gems, and glass painting There are also manufactures of bronzes, cotton and woolen goods, celluloid ware, machinery, belts, and colored papers, and printing and bookbinding establishments The expert firms number over 100 Mineral baths are found in the vicinity Pop, 1900, 21,086, 1910, 29,605

GABOON, ga-bōon' See GABUN

GABORIAU, ga'bô're'ô', EMILE (1835-73). A French novelist who conspicuously made crime

and its detection his subjects. He was born at Saujon, Nov 9, 1835. His first popular writings were humorous sketches contributed to minor Parisian journals. With little grasp of character or grace of style, with no true literary qualities indeed, he achieved a European reputation as a reviver of the romances of iascality, as an inaugurator of the detective story, and as the creator of the prototype of the modern Sherlock Holmes, M Lecoq, in connection with which he made a careful study of the Paris police system of his day. The best of his numerous volumes are *L'affaire Lerouge* (1866), *Le dossier No 113* (1867), *Monsieur Lecoq* (1869), *La corde au cou* (1873), *La dégringolade* (1876). Consult M Topin, *Romanciers contemporains* (Paris, 1881).

GABRIEL (Heb, Man of God). In the Jewish angelology, one of the seven archangels. His function seems to be especially to reveal God's will and purposes. He appears in the Book of Daniel as the interpreter of the prophet's vision regarding the ram and the he-goat (viii 16) and as bringing the explanation of the 70 weeks (ix 21). In the New Testament he announces to Zacharias the birth of John the Baptist (Luke i 19) and to Mary the birth of Christ (Luke i 26). In postbiblical Jewish literature Gabriel is frequently introduced. The Targum to 2 Chron xxxii 21 says that Gabriel destroyed the host of Sennacherib. According to the Talmud it was he who showed Joseph the way to his brothers (Gen xxvii 15-17), and he together with other angels buried the body of Moses (Deut xxxiv 6). He is the prince of fire, and the spirit who presides over the thunder and the ripening of fruits. It was he that prevented Vashti from obeying the King (Esther i 12) and rewrote the record of Mordecai's service in the history after it had been erased. Gabriel has also the reputation among the rabbis of being a most distinguished linguist, having, e.g., taught Joseph the 70 languages spoken at Babel. The Mohammedans also hold Gabriel in great reverence. According to the claim of Mohammed in the Koran, it was he who revealed the sacred book. He is called the spirit of truth and is regarded as the chief of the four most favored angels who form the council of God—a number corresponding to the system in the Book of Enoch (xl 9).

GABRIEL, BROTHERS OF SAINT (Institut des Frères de Saint-Gabriel). A religious congregation or brotherhood in the Roman Catholic church, founded in 1705 by Blessed Grignon de Montfort. Its purpose is the Christian education of the young, the care of institutions for the deaf and blind and of orphan asylums. The mother house of the community was originally at Saint-Laurent-sur-Sevre in La Vendée, but after the suppression of the teaching orders in France in 1905 it was transferred to Péruwelz in Belgium. In 1906 the order conducted 170 schools or colleges, 8 asylums for the deaf and dumb, 4 for the blind, besides several homes for orphans. The order was introduced into Canada by the Sulpician Fathers in 1888, and it conducts establishments in the dioceses of Montreal, Joliette, St Hyacinthe, Three Rivers, and also in Burlington, Vt. Number of professed brothers in America, 90, novices, 25. They take charge of 3 colleges, 1 asylum, and 15 elementary schools.

GABRIELEÑO, ga-bré-él-a'nyò, or **SAN GABRIEL INDIANS**. A Shoshonean (qv)

tribe, formerly occupying all the southern half of Los Angeles Co, Cal., and under the influence of San Gabriel Mission. There were but 11 survivors in 1910.

GABRIEL HOUNDS. A supernatural pack, which gives tongue at night, and thus gives warning of approaching sorrow. A peculiarity of the phenomenon is that the cry always seems to come from the sky instead of from the earth. The name is also applied to wild geese, whose noise when flying suggests that of hounds.

GABRIELI, ga-bré-à'le, ANDREA (c 1510-86). An Italian organist and composer, born in Venice. He was a pupil in composition of Adrian Willaert and became second organist of St Mark's in 1566. In 1574 he wrote the music for the reception of Henry III of France, two cantatas for 8 and 12 voices, respectively, printed in 1587. He was famed for his choral works, masses, motets, and madrigals, and was the first to write a fugue, a form hitherto not attempted by the contrapuntists. His best work is *Psalmi Davidici qui Pœnitentiales Nuncupantur* (1583). A number of his works were printed with those of his nephew Giovanni, such as some organ pieces, *Intonazioni d'organo* (1593, lib 1) and *Ricerari per l'organo* (1595, lib ii and iii).

GABRIELI, GIOVANNI (1557-1612). An Italian composer, born in Venice. He was the nephew and pupil of Andrea Gabrieli and became the first organist at St Mark's (1585). He was the greatest representative of the contrapuntal school of the sixteenth century and was considered the peer of Lasso and Palestrina, even surpassing the latter master in the richness of his tone color. He was noted as a teacher and had many scholars from Germany, where his compositions were early known and appreciated. He was one of the first to develop independent instrumental music in choral works. The early editions of his works are rare, but single pieces are to be found in many of the sixteenth and seventeenth century collections of music. His works are a *Benedictus* for 12 voices, *Psalmi Pœnitentiales 6 Vocum* (1583), *Madrigali a 6 voci o istromenti* (1585), *Madrigali e ricerari a 4 voci* (1587), *Ecclesiasticæ Cantiones 4-6 Vocum* (1589), *Sacra Symphonæ*, for 6-16 voices or instruments (1597), another book for 6-19 voices (1615), *Canzone e sonate a 3-32 voci* (1615). Consult Winterfeld, *Johann Gabrieli und sein Zeitalter* (Berlin, 1834).

GABRIEL'S INSURRECTION. In American history, an insurrection of negro slaves in the vicinity of Richmond, Va., in August, 1800, organized by a young slave named Gabriel, for the purpose of murdering the whites. The plot was discovered, Governor Monroe ordered out the militia, and many of the blacks were captured and executed.

GABRILOVITCH, ga-bré'lò-vich, OSSIP (1878-) A Russian pianist and conductor. He was born at St Petersburg and when still a child entered the conservatory there. He became one of Rubinstein's favorite pupils and, after winning the Rubinstein prize in 1894, continued his studies with Leschetizky in Vienna. Two years later he made his début at Berlin and thereafter gave concerts in Russia, England, Austria, Sweden, and the United States. His first appearance in the United States was in 1900, and then, as upon his subsequent visits, he received an enthusiastic welcome. In

1909 he married Clara Clemens, the daughter of Mark Twain. He is an exceedingly virile and sympathetic player.

GABUN, or **GABOON**, ga-bōōn'. A river, or more properly an estuary, on the west coast of French Equatorial Africa (qv), just north of the equator, about 40 miles long and about 10 miles wide (Map Congo Free State, A 2). It admits of the entrance of deep-draft vessels and formerly gave its name to the entire colony of French Equatorial Africa. It receives the waters of the Como and some minor tributaries.

GACHARD, ga'shar', LOUIS PROSPER (1800-85). A Belgian archivist and historian. He was born in Paris, removed to Belgium in 1830, and became a Belgian subject in 1831. In the same year he was made keeper of the public records. He was a member of the Belgian Academy, secretary of the Royal Historical Institution, and president of the Heraldic Bureau. Gachard traveled extensively in search of documents bearing on Belgian history and published many authoritative works based on his researches. His principal writings are *Correspondance de Guillaume le Taciturne* (1847-58), *Correspondance de Philippe II sur les affaires des Pays-Bas* (1848-59), *Retraite et mort de Charles-Quint* (1854), *Relation des troubles de Gand sous Charles-Quint* (1856), *Don Carlos et Philippe II* (1867), *Actes des Etats-généraux des Pays-Bas* (1866), *Histoire politique et diplomatique de Pierre-Paul Rubens* (1877).

GAD. According to the biblical account, a son of Jacob and his concubine Zilpah (Gen xxx 11), the eponymous ancestor of the tribe of Gad. This tribe was promised land on the eastern side of the Jordan on condition that they should help the other tribes to conquer the territory west of the river (Num xxxii). This condition they fulfilled (Josh i. 12-18, iv 12) and then settled in their own territory (Josh xii 1-9). It may be concluded from this tradition that Gad was a warlike tribe (see 1 Chron xii 8) and secured its east-Jordanic settlement through conquest. The territories of the tribe are ill defined. They lay between the settlements of Reuben on the south and those of Manasseh on the north, but there is a confusion in the biblical accounts, making it hard to determine the boundaries of the three tribes east of the Jordan. There is no literature preserved which originated in this region. When the kingdom was divided in the days of Rehoboam, Gad joined Jeroboam and the northern kingdom (1 Kings xii 20). The tribe was taken captive to Assyria by Tiglath-pileser IV (734 B.C.) and is heard of no more. The name "Gad," like that given to his brother Asher, may have been originally the designation of a deity of good fortune, worshiped in various parts of Palestine. The fact that a Hebrew clan settled in the district which is embraced under the term "Gilead" in the broader sense is considered as pointing to the cult of this deity as the patron of the clan, whose connection with the other Hebrew tribes was never very close. The district contained, however, a number of ancient sanctuaries, such as Penueel and Succoth, which must at one time have been places to which pilgrimages were made. See ASHER, GILEAD.

GADAMES, ga-da'mēs, **GHADAMES**, or **RHADAMES**, ra-da'mēs. An oasis and town in the Italian Colony of Libya, North Africa,

the centre of divergent routes to Tunis, Tripoli, Ghat, and Tidikelt, on the northern border of the Sahara, 310 miles southwest of Tripoli, and near the Algerian frontier (Map Africa, E 2). Gadames is an important entrepôt for manufactures and foreign goods from Tripoli to the interior and for exports of ivory, beeswax, hides, ostrich feathers, gold, etc., from the interior. The oasis contains 63,000 date palms, the produce of which is a source of considerable wealth to the town. Its gardens produce barley, wheat, millet, etc., and are watered by the hot spring (89° F) from which the town had its origin. The climate is dry and healthful, though very hot in summer. A wall surrounds the oasis and town, and the streets are covered over for protection from the rain and sand storms. Gadames has six mosques, seven schools, and two Roman Catholic churches. Pop., about 7500.

The town is the modern representative of the ancient city of Cydamus, a stronghold of the Garamantes, the capture of which by L. Cornelius Balbus gave the Romans a great part of the wilderness. The town constitutes an ethnic menagerie. The inhabitants, living in well-guarded inclosures, include Berbers, Arabs, the *Atraya*, or negro freedmen, and emancipated half-castes, each group speaking its own language and also Berber as a common medium of intercourse. They are called "born traders." Consult Keane, in Stanford's *Africa*, vol. 1 (London, 1907), for list of explorers and political history.

GAD'ARA. The modern Umm Keis, or Mkes, once a prominent city of Palestine, now in ruins. It was on the western extremity of a ridge of the Bashan plateau, 6½ miles east of the Jordan, and 6 miles southeast of the Sea of Galilee. The site, 1194 feet above sea level, commands a magnificent view of the Jordan valley. At the foot of the ridge, 3 miles to the north, flows the Sheriat el-Menadireh, the ancient Jarmuk, or Hieromax.

Gadara is first mentioned in the history of the Greek period. Josephus' statement that it was a Greek city implies that it was one of the many places in Palestine occupied by Greeks after Alexander's conquest (See DE-CAPOLIS, PALESTINE). Polybius states (v, 71, xvi, 39) that it was twice taken by Antiochus III of Syria, in 218 B.C., and again in 198 B.C., in his wars with Egypt for the possession of Palestine. It remained nominally subject to Syria until about 100 B.C., when with other Greek cities east of the Jordan it was taken, after a 10 months' siege, by the Jewish King, Alexander Jannæus, and partially destroyed. When Pompey reduced Syria to a Roman province (65-63 B.C.), he rebuilt Gadara, as a favor to his freedman Demetrius, a Gadarene. The restored city was thenceforward the fast friend of Rome. On its coins it made use of the Pompeian era in commemoration of Pompey's kindness. Augustus, after the battle of Actium, gave Gadara to Herod the Great, much against the wishes of its citizens. For its loyalty to Rome it suffered greatly at the hands of the revolted Jews in the war of 66-70 A.D. At the request of its wealthy citizens Vespasian gave it a body of troops for protection against the Jews. From notices in ecclesiastical history it appears that it continued to flourish until the Mohammedan conquest.

The situation of Gadara was favorable for

commerce, and it was a prosperous city, called by Josephus the metropolis of Perea. It was one of the important members of the Decapolis (qv) and a centre of Greek culture. Meleager the poet, Theodorus the orator, Philodemus the Epicurean, Menippus the cynic, and others prominent in postclassical literature were Gadarenes. Its ruins are extensive and magnificent. It had two theatres, and the remains of the colonnade that once lined the main street are among the most remarkable in Palestine. Its water was supplied by an aqueduct from the Batanean hills, over 40 miles distant. The ancient cemetery east of the city is noted for the construction of its tombs, each with several separate chambers with doors swinging on stone hinges. The present inhabitants live in these tombs. In Roman times the city was famous for its warm springs. They are in the river valley, mainly on the north bank. About them quite a suburb grew up, Amatha by name, and extensive ruins of baths and other buildings of the once famous resort are now found there. The springs are still frequented by Bedouin, who consider the place neutral ground. Probably Gadara has no connection with biblical history. See GERASENES, COUNTRY OF THE.

GADDI, gad'dé. A family of Florentine painters. The founder was GADDO GADDI (c.1260-c.1333). He is supposed to have been associated with Cimabue and learned mosaic work from Andrea Tafi. Modern authorities attribute to him the mosaics in the portico of Santa Maria Maggiore, Rome, illustrating the legend of the foundation of the church, which so closely resemble the frescoes on the ceiling nearest the portal in the Upper Church at Assisi that they are considered by Crowe and Cavalcaselle to be by the same hand. Vasari attributes to him the mosaics of the "Coronation of the Virgin" over the door of the cathedral of Florence, the "Assumption" in the cathedral of Pisa, and part of the mosaics in the dome of the Florentine baptistery, but there is no further basis for these attributions.—His son, TADDEO GADDI (c.1300-66), was a pupil of his godfather, Giotto, to whom, it is said, he was assistant for 24 years, and was preeminently the most talented of his followers, but merely developed Giotto's style, which he transmitted to his son and followers. His work is inferior in character and expression to Giotto's, being superficial in content, though animated, often vehement, in action, and bright in color. His masterpiece is the "History of the Virgin," in a series of frescoes in the Baroncelli Chapel at Santa Croce, Florence (1332-38). Signed altarpieces by him are at Berlin (1334) and in the Academy of Siena (1355), the latter painted originally for the sacristy of San Pietro at Megognano, near Poggibonsi. The "History of Christ" and that of St. Francis, formerly on the presses in the sacristy of Santa Croce, and now divided between the Florence Academy and the Berlin Gallery, and an altarpiece in the Naples Museum dated 1336, are attributed to him, as are also frescoes in the chapel of San Francesco, Pisa, and the "Last Supper" in the great refectory of Santa Croce. In the Brooklyn Museum is a predella with scenes from the Life of St. Laurence. As an architect he is reputed, mainly on Vasari's authority, to have continued Giotto's work on the Campanile at Florence and to have built the Ponte Vecchio. The frescoes of the Cappella degli

Spagnuoli, in the cloisters of Santa Maria Novella, are also attributed to him by Vasari. Many of his numerous works have perished.—His son, AGNOLO GADDI (c.1333-96), who became, after his father's death, the pupil of Giovanni da Milano, continued the artistic traditions of the family. One of his best works was the series of frescoes on the "Legend of the Virgin's Girdle" in the cathedral of Prato, which illustrate the lighter, more picturesque and genre-like style which he affected, preparing the way for Masolino (qv) and other early Quattrocentists. His ability as a decorator and composer is even better illustrated by the series of the "History of the Finding of the Cross" in the choir of Santa Croce at Florence, with numerous realistic details, which are further important as having inspired Piero della Francesca in his *Arezzo* frescoes. His figures are dignified, his color bright and clear, and the decorative effect is good, but the design is poor. Consult Vasari, *Lives of the Most Eminent Painters, Sculptors, and Architects* (10 vols, New York, 1912), and Crowe and Cavalcaselle, *History of Painting in Italy*, vol. 1 (London, 1903).

GADE, ga'dé, NIELS WILHELM (1817-90). A distinguished Danish musician and composer, and the foremost representative of the Romanticists of the Scandinavian school of music. He was born at Copenhagen, the only child of a cabinet and instrument maker, whose trade the son was required to adopt. Within a few months, however, the boy abandoned it and made known his determination of becoming a musician. A course of study under the leader of the court orchestra, Wexschall, and the practice and experience gained by his membership in the organization, enabled him at the age of 16 to make his début as a concert violinist. He also studied theory under Berggreen, a well-known organist, and became a devoted student of the classics and a disciple of the new Romantic school of music. In 1841 he won the prize offered by the Copenhagen Musical Association, submitting to the arbiters his first great composition, *Nachklang aus Ossian*. Aided by the King, he was enabled in 1843 to go to Leipzig to complete his studies and in 1844 undertook, in the absence of Mendelssohn, the direction of the Gewandhaus concerts, becoming permanent conductor upon the latter's death in 1847. In 1850 he settled in Copenhagen, where he became organist, director of music, and master of the Chapel Royal. He was elected one of the foreign members of the Berlin Academy of Arts, in 1874, and in 1876 the Danish Folkething voted life pensions of 3000 crowns to the two most eminent musical composers, selecting Gade as one. In addition to his prize compositions, he composed eight symphonies, five overtures, two suites, a quintet, an octet, and several vocal pieces, with orchestra, among them the well-known *Erl King's Daughter*, *The Springtide Phantasy*, *The Crusaders*, and many smaller compositions. He died at Copenhagen. Consult D. Gade, *Niels W. Gade* (Basel, 1894).

GADES, gá'déz. See CADIZ.

GADFLY, or **HORSE FLY**. A fly of the family Tabanidae, distinguished from other two-winged flies by having the last segment of the short antennæ ringed and not terminating in a bristle. The proboscis is fleshy and envelops pointed horny processes by means of which

the skin is punctured. The head is broad and short and the eyes are huge. About 1500 species are named. All are powerful fliers, and the females suck the blood of quadrupeds and man, although they, like the mules, can also live on the sweets of plants. As an extreme adaptation, the genus *Pangonia* of India and Nubia is remarkable, for the proboscis of the female is in some species three or four times as long as the body and is stiff and needle-like, so that it can easily pierce thick clothing. The larvæ of the Tabanidæ are some of them aquatic, others live in the earth, others in decaying wood. Like the adults, they are predacious, sucking the juices of insect larvæ, of worms, and of snails. The pupa looks much like the chrysalis of a butterfly.

The common representatives of the Tabanidæ may be uniform black, with a bluish tinge, as in the case of the large mourning horse fly (*Tabanus atratus*), or of medium size, with green heads or golden eyes, the latter are also known as deer flies. To protect horses driven over infested roads—such as those passing through pine woods—netting should be used. An application of fish oil and carbolic acid to points not easily reached by the tail is recommended. Consult, in addition to works mentioned under FLX. Osten-Sacken, "Prodrome of a Monograph of the Tabanidæ of the United States," in *Memoirs of the Boston Society of Natural History*, vol. 11 (Boston, 1875-78), Williston, "Notes and Descriptions of the North American Tabanidæ," in *Transactions of the Kansas Academy of Science*, vol. x (Lawrence, 1888), id., *Manual of North American Diptera* (3d ed., New Haven, 1908).

GADIDÆ (Neo-Lat. nom. pl., from Neo-Lat. *gadus*, cod, from Gk. γάδος, *gados*, sort of fish). A family of soft-rayed fishes of north temperate and Arctic waters, including about 25 genera and 140 species. Except one genus (*Lota*), all are marine, and among them are many of our most important food fishes, such as the common cod, pollack, haddock, etc. See COD, FISHERIES.

GADOLIN, ga'dô-lên, JOHAN (1760-1852). A Swedish chemist. He was professor of chemistry at the University of Åbo, Finland. His writings include *Einige Bemerkungen über die Natur des Phlogiston* (1788) and *Systema Fossilium, Analysis Chemica Examinatorum* (1825). The mineral *gadolinite* was named after him.

GADOLINITE (so called in honor of J. Gadolin). An orthosilicate containing glucinum, iron, yttrium, besides varying amounts of didymium, lanthanum, and other oxides. It crystallizes in the monoclinic system, and is dark green, brown, or black in color. This mineral occurs chiefly in coarse pegmatitic veins associated with allanite. It is found near Falun and Ytterby, Sweden, and also on the island of Hittero, Norway. The principal locality in the United States is Bluffton, Llano Co., Tex. Special interest attaches to gadolinite, owing to the rare metals which it contains. Velvety black, opaque gems have been cut from this mineral, but for collectors' use only.

GADOLINIUM. A metallic chemical element, first detected by Marignac in 1880, but distinctly recognized as a new element and named gadolinium by Lecoq de Boisbaudran in 1889. In 1896 Demargay devised a method for preparing gadolinium, or rather its oxide, in a

state of considerable purity, and since then gadolinium has been recognized as a well-defined element. In 1890 Lecoq de Boisbaudran showed that, while gadolinium gives no phosphorescence spectrum, it does give a beautiful spark spectrum. Gadolinium (symbol, Gd, atomic weight, 157.3) forms an oxide of the formula Gd_2O_3 , readily soluble in acids and absorbing carbon dioxide from the air. Among the salts of gadolinium, all of which are colorless, deserve mention the chloride, $GdCl_3 \cdot 6H_2O$, the sulphate, $Gd_2(SO_4)_3 \cdot 8H_2O$, and the nitrate, $Gd(NO_3)_3 \cdot 6H_2O$ or $Gd(NO_3)_3 \cdot 5H_2O$.

GADOW, ga'dô, HANS FRIEDRICH (1855-) A German-English naturalist, born in Pomerania. He studied at Berlin, Jena, and Heidelberg, in the last place under Gegenbaur. From 1880 to 1882 he was in the Natural History Department of the British Museum, and after 1884 he served as Strickland curator and lecturer on zoology at Cambridge University, England. He published *A Classification of Vertebrates* (1898), "Aves," in Bronn's *Classen und Ordnungen des Thierreichs, Amphibia und Reptiles* (1901), and *Through Southern Mexico* (1908), besides collaborating with Newton in his *Dictionary of Birds* (1893-96), and contributing extensively to the literature of investigation in zoology.

GADSEYS, THE STORY OF THE. A story by Rudyard Kipling, published in London in 1890.

GADSDEN. A city and the county seat of Etowah Co., Ala., 56 miles by rail northeast of Birmingham, on the Coosa River, and on the Chattanooga Southern, the Louisville and Nashville, the Southern, and the Nashville, Chattanooga, and St. Louis railroads (Map Alabama, C 2). It is in a productive timber and mineral region and has extensive trade interests, also a large steel mill, lumber mills, blast furnaces, foundries and machine shops, car works and manufactories of handles, sashes, doors, and blinds, flour, wagons, etc. The city contains a marble post office and fine school buildings. Settled about 1845, Gadsden was incorporated in 1867. The government is administered by a mayor and a municipal council, elected on a general ticket. The water works are owned by the city. Pop., 1900, 4282, 1910, 10,557, 1914 (U. S. est.), 13,326, 1920, 14,737.

GADSDEN, CHRISTOPHER (1724-1805). An American patriot, born in Charleston, S. C. He was sent to England by his father, a wealthy merchant, to be educated, and returned to Charleston in 1741. For some time he was employed in a counting house in Philadelphia, where later he embarked in a business of his own. Returning to South Carolina, he was repeatedly a member of the provincial legislature, and in 1762 his election was declared void by Governor Boone—which turned him against the crown. In 1765 he was elected a delegate to the Intercolonial Convention held in New York City to protest against the Stamp Act. He was a member of the first Continental Congress (1774-76) and urged an immediate attack on General Gage before he could be reinforced. After the outbreak of the Revolution he became colonel of the First South Carolina Regiment, and took part in the campaigns in the South and in the defense of Charleston in 1776, being promoted brigadier general in the fall of that year. In 1778 he was a member of the State Constitutional Convention of South Carolina;

and he quarreled and fought a duel (firing in the air) with Gen Robert Howe, commanding the patriot troops in South Carolina. As Lieutenant Governor of the State, he signed the capitulation of Charleston when that city fell into the hands of Sir Henry Clinton, in May, 1780. He himself was released on parole, but a few weeks later was arrested by order of Lord Cornwallis and conveyed to Fort Augustine, where he remained a prisoner for 10 months, refusing to accept freedom on parole. He was finally exchanged, before the close of hostilities, in 1781. In 1782 he was elected Governor of South Carolina, but refused to accept the office, pleading that he was too old. In 1788 he was a member of the South Carolina Convention which ratified the Federal Constitution, and in 1790 of that which drafted the new State constitution. Josiah Quincy hit him off well, calling him "plain, blunt, hot, and incorrect, though very sensible." He styled himself "Don Quixote Secundus." Consult Renick in *Publications of Southern History Association* (July, 1898), and McCrady, *South Carolina in the Revolution*, passim (New York, 1899-1902).

GADSDEN, JAMES (1788-1858) An American soldier and diplomatist, born in Charleston, S C. He graduated at Yale in 1806 and entered the United States army soon afterward. He served with marked efficiency in the War of 1812, was appointed aid-de-camp to General Jackson in 1818, participated in the Seminole War, was appointed military inspector of the Southern Division in 1820, and conducted the removal of the Seminole Indians to the southern part of Florida. In 1853-54 he was United States Minister to Mexico and in December, 1853, concluded the treaty which provided for the readjustment of the boundary between the two countries, and the acquisition by the United States of the tract of land subsequently known as the Gadsden Purchase (qv).

GADSDEN PURCHASE, THE. A tract of land lying partly within the present New Mexico and partly within the present Arizona, purchased from Mexico by the United States in 1854. It embraces 45,535 square miles, is bounded on the north by the Gila River, on the east by the Rio Grande, and on the west by the Colorado, and has an extreme breadth from north to south of 120 miles. For this the United States gave the sum of \$10,000,000, while Mexico, besides making the cession, agreed (1) to the abrogation of the eleventh article of the Treaty of Guadalupe Hidalgo (qv), and (2) to the abandonment of all damage claims arising from Indian incursions between 1848 and 1853. The land was regarded as of little use for agricultural purposes and was purchased largely with a view to settling boundary disputes in that quarter between the two governments and to securing a desirable route for the projected Southern Pacific Railroad. The treaty of sale was negotiated with Santa Anna by James Gadsden (qv), then Minister to Mexico, in December, 1853, and, after undergoing modifications in the United States Senate, was finally ratified and proclaimed on June 30, 1854, Congress passing the necessary legislation on August 5. The sale met with much opposition in Mexico and caused the banishment of Santa Anna in 1855. For the text of the treaty, consult Haswell, *Treaties and Conventions* (Washington, 1889). See the map in the

article UNITED STATES, EXTENSION OF THE TERRITORY OF THE

GADS'HILL A hill, 256 feet high, in the County of Kent, England, 2½ miles northwest of Rochester, on the London Road, celebrated by Chaucer, famous as the scene of Falstaff's encounter with Prince Henry, and noted as the home of Charles Dickens.

GADSKI, gad'ske (TAUSCHER), JOHANNA (1871-) A German dramatic soprano, born at Anclam, Prussia. She was educated at Stettin and made her operatic debut in Berlin in 1889. In 1895 she sang the principal Wagnerian rôles, alternating with Madame Klafsky, in Mr Damrosch's German company, and immediately won great success. In 1898 she became a member of the Metropolitan Opera Company, New York, where she was thereafter one of the chief attractions. She also sang at Covent Garden and Bayreuth. In 1892 she married H. Tauscher, an officer in the Austrian army. Her commanding presence, her beautiful and powerful voice, and her dramatic intensity make her one of the greatest interpreters of Wagner's heroines.

GAD'WALL (of doubtful etymology, hardly from *gad*, to run about + *well*, as the variant spelling *gadwell*, influenced by popular etymology, implies), or GRAY DUCK. A fresh-water duck (*Chaulelasmus streperus*), not quite so

BILL OF GADWALL

large as the mallard, nor often seen in the eastern United States, but common in the interior and in Florida. It breeds from Kansas northward and during the summer is circumpolar in its distribution. In the winter it migrates as far south as the Gulf of Mexico, southern Asia, and the north of Africa. In color the gadwall is chiefly black and white, with some brown, buff, and chestnut. This duck breeds in marshes and lays from seven to nine cream-white eggs. Except at the breeding season, it is usually seen in small flocks, and an individual is sometimes to be found in a flock of other ducks. It is a favorite game duck and highly esteemed for the table.

GÆ'A (Lat., from Gk *Gaia*, *Gaea*), or GÆ. The earth, honored among the Greeks as a goddess, though her personality is never very sharply defined. The theogonies of the mythologists, though differing in details, represent her as the first-born of Chaos, and by Uranus (qv), the mother of the Titans (qv), Cyclopes (qv), and the hundred-handed monsters (See *BRIAREUS*). Angered at Uranus' treatment of his children, she helped Cronus mutilate his father. When Cronus in his turn was deposed by Zeus, Gæa, angry at the fate of her children, the Titans, produced the Giants, who warred against the gods, after their overthrow she produced the monster Typhæus. When he was conquered by Zeus, Gæa became reconciled to

the new dynasty. In accordance with the varying points of view from which the earth was regarded, we find Gæa revered not merely as the universal mother, but as a goddess of death and the shades (within the earth was the abode of the dead), and as an oracular divinity, though Ægæ in Achæa, seems to have been the only place where an oracle of Gæa existed in historic times. In art Gæa appears chiefly in connection with the birth of Erichthonius (see ERECHTHEUS) and the Gigantomachia, in both scenes she appears as rising out of the earth, only the upper part of the body being visible.

GAEDERTZ, gäd'erts, KARL THEODOR (1855-1911). A German dialect poet and historian of literature. He was born at Lubeck, and was educated at Leipzig and Berlin. His extensive knowledge of cameralistics, law, philology, and Germanic literature secured for him an appointment, in 1880, in the Royal Library in Berlin, and in 1903 he became chief librarian at Greifswald. His publications include a number of valuable monographs on German poets, especially Fritz Reuter (qv), and on the history of the Low-German drama, among his best productions in this field being the following: *Goethes München* (1887), *Aus Fritz Reuters jungen und alten Tagen* (1897-1901), *Emanuel Geibel Ein deutsches Dichterleben* (1897), *Bismarck und Reuter* (1898), *Bei Goethe zu Gaste* (1900), *Silhouetten zu F. Reuters Stromtid* (1903), *Im Reiche Reuters* (1905). His original productions in Plattdeutsch comprise a comedy, *Eine Komödie* (2d ed., 1881), and a collection of poems, *Julkapp' Leeder un Lauschen* (3d ed., 1899).

GAEKWAR. See GAIKWAR.

GAELIC (gá'lik) **LANGUAGE AND LITERATURE**. See BRETON LANGUAGE AND LITERATURE, CELTIC LANGUAGES, IRISH GAELIC LITERATURE, SCOTTISH GAELIC LITERATURE.

GAELIC LEAGUE. An organization devoted to the preservation, cultivation, and extension of the Gaelic language, particularly in Ireland. From the time of the Statute of Kilkenny in 1367, when laws were enacted forbidding the use of the Irish language, dress, or surnames within the limits of the Pale, on penalty of death or confiscation, every effort had been made by the English government to crush out or discourage the native language, and on the establishment of the so-called national schools in 1833, the instruction in which was in the English language, the Gaelic language, even then spoken by a majority of the Irish peasantry, received its most decisive blow. Through the efforts of the Society for the Preservation of the Irish Language, about 25 years ago, some partial concessions were obtained for the language in the schools, but with little practical result, owing to the indifference of the local authorities. Matters were apparently at their lowest mark in all things national when, in 1893, the Gaelic League was organized, chiefly through the effort of Douglas Hyde (qv) and Father O'Growney (qv), the two most accomplished Gaelic scholars in Ireland. An active educational campaign was at once begun throughout the country, resulting in the establishment of branches of the league in every important centre. In 1898 the movement spread to America. Gaelic is now taught in a large number of national schools and in nearly all the Catholic church parish schools in Ireland, the last report showing about 3500 stu-

dents of Gaelic in Dublin alone. Trinity College, Dublin, and the Roman Catholic Seminary of Maynooth maintain Gaelic chairs, and a revival in Gaelic literature has since developed, including a revival of Gaelic music and the drama. In the United States and Canada there were in 1902 about 40 branches of the league, each of which conducted classes for the study of the language, besides rendering efficient help to the Irish organization. Gaelic or Celtic chairs are also established at Harvard University, the Catholic University of America, Washington, and at Notre Dame University, Indiana. Substantial aid has been rendered by the Hibernian Order, which endowed the Washington chair, and has regularly contributed to the work in Ireland. A similar movement has been inaugurated for Scotland and the Isle of Man by a Pan-Celtic organization which includes Wales, Brittany, and Cornwall in its scope of operations.

GAETA, ga-'ta (ancient *Portus Caietæ*). An episcopal city and seaport, and one of the strongest fortresses in Italy, in the Province of Caserta, on the Gulf of Gaeta, 74 miles by a winding railway northwest of Naples (Map Italy, D 4). To the northwest is the suburb of Elena. The promontory of Gaeta, on which it is situated, looks from the distance like a tumulus and according to tradition was the tomb of Caieta, the nurse of Æneas (consult Vergil, *Æneid*, vii, 1 ff.) hence the ancient name of the city, *Portus Caietæ*. The promontory is crowned by the Torre d'Oirlando, or tomb of Munatius Plancus, the friend of Augustus. It is 160 feet in height and 160 feet in diameter and resembles the much smaller tomb of Cæcilia Metella at Rome. The tomb is now used as a naval signal station and is inclosed within the modern fortifications. On the rocks below is the town, in a beautiful setting of country houses and orange groves, while the Torre Angioivina in the citadel affords a splendid prospect of coast and sea. Objects of interest are the campanile of the twelfth-century cathedral of St. Erasmus, with a banner presented to Don John of Austria by Pope Pius V, and the remains of a Roman amphitheatre, a Roman theatre, and a column inscribed with the names of the 12 winds. Along the coast, too, are many remains of Roman villas, some of which were built well out into the sea. Gaeta is a centre of the coasting trade and markets fish, oil, wine, and fruit, it also manufactures rope. It is the seat of an archbishop and has a seminary and a nautical institute. It was originally a Greek colony and in ancient times had many magnificent public buildings. Like Amalfi and Naples, it resisted the barbarian invaders and, becoming part of the Byzantine Empire—and later independent—was also a stronghold of civilization against the Lombards and the Saracens. In 1134, however, it fell before Roger II and was annexed to the Norman Kingdom of Sicily. During the centuries that followed it was under various masters. In 1806 it was defended for six months against Massena by Prince Ludwig von Hessen-Philippsthal, who is buried in the citadel. It was the refuge of Pius IX (qv) from 1848, when he fled from Rome, until 1850. From November, 1860, until Feb. 13, 1861, Francis II of Naples, the last of the Bourbon kings, was besieged here by the forces of Victor Emmanuel under Garibaldi, and compelled to surrender. Pop. (commune), 1901, 5528, 1911, 5344. Consult Merz, *Gaeta im fruhen Mittelalter* (Gotha, 1911).

GAETA, DUKE OF See CIALDINI, E
GÆTULIA (Lat., from Gk. Γαιτούλια, *Gaitoulia*) In ancient times, the name given to a region in northern Africa lying south of Mauritania and Numidia and embracing the western part of the Desert of Sahara. Its inhabitants belonged to the great aboriginal Berber family of north and northwestern Africa. They were not in general black, though a portion of them dwelling in the extreme south towards the Niger had approximated to this color through intermixture with the natives and through climatic causes. The Gætulians were savage and warlike, and skilled in the raising of horses. They came into collision with the Romans for the first time during the Jugurthine War, when they served as light horse in the army of the Numidian King. Cornelius Cossus Lentulus led a force against them and for his success received a triumph and the surname of Gætulicus (6 AD). Later Gætulians served as auxiliary troops of the Romans. They have been identified with the Tuaregs, the Gutzula of southern Morocco, the Godola of the coast, the Ghedala of northwestern Sudan, and the Gæstulas in Algeria.

GAFF (from OF. *gaffe*, hook, from Ir *gaf*, hook) A spar, to which the head, or upper edge, of a fore and aft sail is bent. The end next the mast is called the *jaw*, to form them two pieces of wood are bolted to the end of the gaff and the forward side of them cut out in the form of a semicircle so as to fit against the mast, to which it is held by a rope extending around it from jaw to jaw. The after end of the gaff is called the *peak*, because it usually stands much higher than the jaws when the sail is set. On board sloops and schooners gails are hoisted and lowered by ropes called *halyards*—those near the peak being the *peak halyards*, and those at the *throat*, near the jaws, being the *throat halyards*. In square-rigged ships the *spanker* and *trysail* are the only ones having gaffs. These gaffs do not ordinarily hoist or lower and instead of jaws have eyebolts holding the forward end to the mast or to a traveler working on a batten on the mast; the latter method is best, as it permits the gaff to be lowered when the sail is reefed. In furling, these sails are drawn in to the mast and up to the gaff by ropes called brails.

GAFFAREL, ga'fa-rêl, PAUL (LOUIS JACQUES) (1843–) A French historian, born at Moulins and educated at the Ecole Normale Supérieure. He held the chair of history at Besançon and then that of history in the faculty of letters at Dijon and at Marseilles. His contributions to colonial history are particularly valuable. His more important works include: *Étude sur les rapports de l'Amérique et de l'ancien continent avant Christophe Colomb* (1869), *Histoire de la Floride française* (1875), *Histoire du Brésil français* (1878), *Les colonies françaises* (1880), *L'Algérie histoire, conquête et colonisation* (1882), *Les explorations françaises de 1870 à 1881* (1882), *Les campagnes de la première République* (1883), *La conquête de l'Algérie jusqu'à la prise de Constantine* (1887), *Les Français au delà des mers. Les découvreurs français du XIV^{ème} au XVI^{ème} siècle, Côtes de Guinée, du Brésil et de l'Amérique du Nord* (1888), *Campagnes du Consulat et de l'Empire* (1888), *Campagnes du premier Empire* (1890), *Le Sénégal et le Soudan français* (1890), *Histoire de la découverte de l'Amérique* (2 vols,

1892), *La politique coloniale en France de 1789 à 1830* (1908).

GAFFKY, gaf'kà, GEORG THEODOR AUGUST (1850–) A German physician, born at Hanover and educated at Berlin. In 1888 he was appointed professor of hygiene at the University of Geissen. As a member of the Imperial Bureau of Sanitation, in 1883–84 he accompanied the expedition sent out, under the auspices of Robert Koch, the celebrated bacteriologist, to investigate the conditions attending the epidemics of cholera in Egypt and India. In this capacity he was enabled to accumulate the valuable material embodied in the report subsequently published in three volumes in collaboration with Dr Koch (1887). He was adviser to the Hamburg municipality during the cholera epidemic of 1892 and in 1897 headed a royal commission to India to study the plague. In 1904 he succeeded Koch as director of the Institute for Infectious Diseases at Berlin. He published *Zur Ätiologie des Abdominaltyphus* (2 vols, 1884), *Die experimentelle Hygiene im Dienst der öffentlichen Gesundheitspflege* (1895).

GAFFNEY. A city and the county seat of Cherokee Co., S. C., 115 miles north-northwest of Columbia, on the Southern Railway (Map South Carolina, C 1). It is in a cotton and grain growing region and has manufactures of vulcanized fibre, cotton goods, fertilizers, cottonseed oil, ice, and lime. Tin and monazite are mined in the vicinity. Gaffney contains a female college, a Carnegie library, and public parks. The water works and electric-light plant are owned by the city. Pop., 1900, 3937, 1910, 4767.

GAFF-TOPSAIL CAT. A sea catfish (*Felichthys felis*), common along the eastern coast of the United States and frequently ascending streams. It reaches a length of 30 inches, is not valued as food, and takes its name from the shape of its large dorsal fin, frequently exposed above the surface. See PLATE OF CATFISH.

GAUSA BUTTON. See BOIL.

GAG (corrupted from the Spanish name *aguaju*) A large grouper (*Mycteroperca micolepis*), of a variable bluish color, of the South Atlantic and Gulf coast of the United States. It frequents reefs and banks. It is an important food fish. See GROUPE.

GAGALI. See PODOCARPUS.

GAGARIN, ga-ga'rên A princely family of Russia. Some of its most prominent members were Matvei Petrovitch, Governor of Siberia, who suffered death in 1721 by order of Peter the Great on suspicion of aspiring to an independent sovereignty; Alexander Ivanovitch (died 1857) was a distinguished soldier of the Crimean War and was assassinated by the Prince of Suanethi, whose province he was about to annex to Russia; Pavel Pavlovitch (1789–1872) was a member of the council of emancipation of the serfs and in 1864 and 1865 President of the Council of Ministers; Ivan Sergeyevitch (1814–82) was Secretary to the Russian Embassy at Paris, turned Catholic in 1843, and became a Jesuit missionary. He was the author of *Les staro-vères, l'église russe et le pape* (1857), *Les hymnes de l'église russe* (1868), etc.

GAGE (Fr *gager*, from ML *vadium*, a pawn or pledge) An old term of English law, signifying a pledge or pawn of property as security for the performance of a legal obligation. It is now found in our legal system only in the com-

bination mortgage (*mort gage*, dead pledge) Estates in gage were of two kinds—*vivum vadum* and *mortuum vadum*, the live pledge and the dead pledge *Vivum vadum* was where an estate in lands was given in security for a debt, on condition that the estate should remain with the lender until he had made good the sum lent out of the profits of the land *Mortuum vadum* was a pledge of land or goods to be held by the pledgee until the debt be paid or the obligation performed by the pledgor. See MORTGAGE, PLEDGE

GAGE, FRANCES DANA BARKER (1808–84) An American reformer and writer, the daughter of Col Joseph Barker She was born in Marietta, Ohio, married James L Gage, a lawyer, in 1829, and lectured on total abstinence, woman's rights, and slavery She removed to St Louis in 1853, and her activity there in the anti-slavery cause made her very unpopular Returning to Ohio, she devoted herself largely to editorial work During the Civil War she was an agent of the Sanitary Commission and had charge of a refuge for freedmen on Paris Island, S C Under the pen name of "Aunt Fanny" she became widely known as a writer of stories for the young

GAGE, LYMAN JUDSON (1836–1927) An American financier He was born in De Ruyter, Madison Co, N Y, and was educated at an academy at Rome, N Y, where in 1859 he became a clerk in a bank In the following year he removed to Chicago, where, after working for three years in various capacities, he obtained a clerkship in the Merchants' Loan and Trust Company, of which in 1860 he became cashier In 1868 he left this position to become assistant cashier of the First National Bank, one of the leading banks in the West In 1882 he was promoted to the position of vice president and general manager and in 1891 became its president In 1892 he first became a figure of national prominence from his election as president of the board of directors of the World's Columbian Exposition, the success of which was probably due more to him than to any other one man He had never taken an active part in politics nor held political office, although he had been a delegate to the Republican National Convention of 1880, and the chairman of its committee on finance, but he actively supported Cleveland in the campaign of 1884 In 1892 the Treasury portfolio was offered him by President Cleveland, but declined In 1897 he was appointed by President McKinley Secretary of the Treasury, which office he continued to hold in McKinley's second administration, and in that of President Roosevelt up to January, 1902, when he resigned and was succeeded by Leslie M Shaw Elected president of the United States Trust Company, New York, in 1902, he continued in this office until his retirement from active life in 1906 Consult Handy, "Lyman J Gage A Character Sketch," in the *American Review of Reviews* (New York, 1897)

GAGE, SIMON HENRY (1851–) An American scientist He was born in Maryland, Otsego Co, N Y, and graduated in 1877 at Cornell University, where he taught until 1908, after 1896 as professor of histology and embryology In addition to many contributions to scientific periodicals, his publications include *The Microscope and Histology* (1881, 11th ed, 1911), *Anatomical Technology* (with Professor Wilder, 1882), the vocabulary and definitions in animal

histology for Foster's *Encyclopaedic Medical Dictionary*, and several articles for Woods *Reference Handbook on the Medical Sciences*

GAGE, THOMAS (1721–87) An English soldier and Colonial governor (military) of Massachusetts, born at Fittle, Sussex, son of the first Viscount Gage He received a lieutenant's commission in the English army in 1741, participated in the battle of Culloden, served as aide-de-camp to Lord Albemarle in Flanders, and in 1751 became lieutenant colonel of the Forty-fourth Foot, with which in 1754 he came to America under General Braddock In the latter part of the march against Fort Duquesne he commanded the advance guard of Braddock's army He was stationed for a time at Oswego, raised a regiment of provincial troops in 1758, and commanded it on Abercromby's disastrous expedition against Ticonderoga, and in 1759, after the death of Colonel Prideaux, was sent as brigadier general to replace Sir William Johnson at Niagara He then served in the last campaign under General Amherst, who made him Governor of Montreal in 1760, was promoted to be major general in 1761, and was commander in chief of the English forces in America from 1763 to 1772, when he returned to England In 1765 in New York he was called upon by Governor Colden to enforce the Stamp Act (qv), but refused on the ground that a fire from the fort would be "the commencement of a civil war" In 1768 he was ordered to Boston to assist the civil magistrates and revenue officers there in carrying out the measures of the British Ministry, but could not get permanent quarters or supplies for his men in accordance with the Billeting Act Early in 1774 he succeeded Hutchinson as Governor of Massachusetts, and again became commander in chief of the British army in America He was warmly welcomed on his arrival in Boston in May, but soon antagonized the popular party by his enforcement of the ministerial measures, especially of the Boston Port Bill (qv) and the regulation acts On June 30, 1774, he issued a proclamation against the "solemn league and covenant"—to purchase no articles imported from Great Britain On September 1 he seized the powder stored at Cambridge and soon afterward began to fortify Boston On the night of April 18, 1775, he sent an expedition to Concord to destroy the provincial stores there and to capture Samuel Adams and John Hancock This led to the battle of Lexington (qv) He ordered the assault upon Bunker (Breed's) Hill on June 17, and as soon as the news of the action reached England was recalled, sailing from Boston on Oct 10, 1775 In April, 1782, he was promoted to the rank of general Some of Gage's papers are in vol xxiv, *Collections, Massachusetts Historical Society*

GAGER, CHARLES STUART (1872–) An American botanist, born at Norwich, N Y He graduated from Syracuse University in 1895 and also studied at the New York State Normal School, Harvard Summer School, and Cornell University (Ph D, 1902) He served as vice principal of Ives Seminary (Antwerp, N Y), professor of biological science and physiography at the New York State Normal College (1897–1905), director of the laboratories of the New York Botanical Garden (1906–08), professor of botany at the University of Missouri (1908–10), and director of the Brooklyn Botanical Garden after 1910 He also taught in

Rutgers College, Morris High School, New York, and the Cornell Summer School. He is author of *Errors in Science Teaching* (1901), *Effects of the Rays of Radium on Plants* (1908), *Non-Technical Lectures* (1913), and translated from the German of De Vries *Intracellular Pangenesis* (1910).

GAGERN, ga'gern, HANS CHRISTOPH ERNST, BARON VON (1766-1852). A German statesman, born at Kleinmedesheim, near Worms, and educated at the universities of Leipzig and Göttingen. He became a member of the Imperial Diet in 1791 and later represented the Prince of Nassau-Weilburg at Paris until 1811. After attempting to stir up an insurrection against Napoleon in the Tirol, he joined the Prussian army and became a member of the administrative board of North Germany in 1813. Later he served as Prime Minister of the King of the Netherlands and represented him at the Congress of Vienna in 1815. In 1816-18 he represented Luxembourg in the German Diet, but retired in 1820. His writings include *Die Nationalgeschichte der Deutschen* (2 vols, 1813-26; 2d ed, 1825-26), an autobiography, *Mein Anteil an der Politik* (vols 1-IV, Stuttgart, 1822-26, vols v, vi, Leipzig, 1845), *Kritik des Völkerrechts mit praktischer Anwendung auf unsere Zeit* (1840).

GAGERN, HEINRICH WILHELM AUGUST, BARON VON (1799-1880). A German statesman. He was the second son of the well-known politician Hans Christoph Ernst Gagern (1766-1852) and was born at Bayreuth, Aug 20, 1799. He was educated at the military school of Munich (1812-14) and on Napoleon's return from Elba entered the army of Nassau, serving as lieutenant at Waterloo. He afterward devoted himself to the study of law at the universities of Heidelberg, Göttingen, Jena, and Geneva. While at Heidelberg, he aided in founding the liberal society of the Burschenschaft (qv). On returning home in 1821 he entered political life and served as Minister of the Interior and Justice in the Grand Duchy of Hesse. He was elected a member of the Lower Chamber in 1832, in which position he vigorously opposed the reactionary policy of the state governments and of the federal Diet. In 1836 he retired to his father's estates, but reappeared 10 years later and helped bring on the revolutionary movement of 1848 in Germany. In the National Assembly which met at Frankfurt on May 18, 1848 (see VORPARLIAMENT), Gagern, as the recognized leader of those who favored unity and constitutionalism, was elected President and for a long time succeeded, by the force of his enthusiasm and his magnificent personality, in guiding the action of the Assembly. In the strife over the question of admitting Austria as a Germanic power into the new Empire, Gagern sided with those who opposed Austrian pretensions, and on Dec 18, 1848, as head of the Imperial Ministry, submitted his "programme" to the Parliament providing for a federal state without Austria. The King of Prussia was to be the hereditary ruler, but was to be restrained by a constitution. Though the plan was accepted by the Parliament, it failed on account of the lukewarmness of the Prussian King, to whom all looked as the head of the new state, and the general reaction which followed in Germany during the early days of 1849. (See FREDERICK WILLIAM IV.) On May 20 Gagern withdrew from the Parliament, con-

vinced that the cause of German unity for the time was a hopeless one. He still took an active interest in politics, joining the party whose aim it was to bring about German unity under Prussian leadership, and in 1850-52 served as a major in the army of the duchies of Schleswig-Holstein (qv). On the conclusion of the struggle he retired to his estate at Monshheim, and only reappeared as the representative of the Grand Duchy of Hesse-Darmstadt at Vienna from 1864 to 1872. It seems that after 1859 he turned completely away from Prussia on account of her actions in the Italian War in that year. He espoused the cause of Austria and had his children brought up in the Catholic church, although he himself had been a Protestant. He was granted a pension in 1872 by Hesse and took up his residence at Darmstadt, where he died May 22, 1880. Besides several pamphlets and speeches, he was the author of a life of his brother, *Das Leben des Generals Friedrich von Gagern* (1856-57). His younger brother Maximilian was prominent in the service of the Duchy of Nassau and of Austria. Consult Heimenz, *Heinrich von Gagern in seinen politischen Grundanschauungen* (Tübingen, 1899), Biedermann, *Deutsche Geschichte, 1815-79* (Breslau, 1883-89), Von Sybel, *The Founding of the German Empire*, translated (New York, 1890-98).

GAGNON, gan-yon', CHARLES ALPHONSE NATHANAL (1851-) A Canadian author. He was born at Port Joli, Province of Quebec, and was educated at the public schools. He engaged in journalism in Montreal, afterward in Quebec, where he became a reporter for the law courts, and finally obtained a position in the Provincial Department of Public Works. He wrote a number of tales, sketches, and essays, including *Douleurs et joies* (1876), an historical novel, *Geneviève, St Jean, Port Joli* (1876), *Quelques considérations pour les temps actuels* (1882), *Les banques d'épargne scolaires* (1887), *Études archéologiques et variétés* (1894), *L'Amérique précolombienne, essai sur l'origine de sa civilisation* (1908).

GAGNON, ERNEST (1834-1915). A Canadian musician and author. He was born in Louiseville, Province of Quebec, and studied music first at home and at Joliette College, and subsequently in Europe. He was organist of the parish church, St John's suburbs, Quebec, in 1853-64, and in 1857 was appointed professor of music in Laval Normal School. He was organist at the Roman Catholic Basilica, Quebec, for 45 years (1864-1909). His career as organist and musical composer was varied by visits to Europe and by his position in the civil service. For more than 30 years (1876-1907) he was Secretary of the Department of Agriculture and Public Works. In 1863 he founded the Société de Colonisation de Québec, and in 1869 the Académie de Musique de Québec. His musical compositions are chiefly of a religious character. Among his writings are *Chansons populaires du Canada* (1865, 5th ed, 1908), *Le palais législatif de Québec* (1897), *Réponse à la brochure de Monsieur l'abbé H. R. Casgrain intitulée "Notes relatives aux inscriptions du monument de Champlain"* (1899), *Louis Joliet, découvreur du Mississippi et du pays des Illinois, premier seigneur de l'île d'Anticosti* (1902), *Choses d'autrefois, feuilles éparses* (1905), *Le fort et le château Saint-Louis, Québec* (1895, 3d ed, 1908). He also published.

Lettres de voyage, Au pays des ouananiches, Le drapeau de Carillon, and Palmes d'or

GAGNON, ga'nyōn', LUCIAN (?-1842). A Canadian political agitator, born at Pointe-à-la-Mule, Canada. He was among the earliest to take part in the struggle by the French Canadians and their English sympathizers in Lower Canada for responsible government. He was a member of the Assembly of the Confederate Counties at St Charles, Oct 23, 1837, and subsequently carried on a campaign of agitation against British rule. He was instrumental in mustering a force of rebels, who were defeated at Moore's Corner and compelled to take refuge in the United States. Another attempt at insurrection also proved unsuccessful, and Gagnon was arrested by United States troops on the charge of having violated the neutrality laws. After the engagement at Odelltown, Nov 10, 1838, he gave up the struggle and settled in the United States.

GAGNON, N D VILLE-. See VILLE-GAGNON

GAGNON, PHILEAS (1854-) A Canadian bibliographer and archivist. He was born in Quebec and after receiving his early education there engaged in commercial life, which he relinquished for the study of Canadian bibliography. An extensive and varied collection of Canadiana made by him, and said to be the best in existence, he sold in 1910 to the city of Montreal for a large sum. He was appointed archivist for Quebec District, contributed frequently to the press on his favorite subject, and for some time was active in municipal life, having sat in the Quebec City Council and served as promayor. In 1908 he was awarded a diploma of honor by the Royal Society of Canada for archaeological studies. In 1895 he published his well-known *Essai de bibliographie canadienne*.

GAG RULES. In American history, the name applied to certain rules passed by the national Congress in disregard of the First Amendment to the Federal Constitution, for the abridgment of the right of petition with reference to the abolition or restriction of slavery. After the beginning of the earnest agitation of the Northern Abolitionists against the institution of slavery about 1831, petitions of various kinds poured into the House and the Senate, praying for the abolition or the restriction of that institution. These were generally presented by John Quincy Adams, who as a member of Congress identified himself particularly with the struggle against any congressional abridgment of the right of petition. In May, 1835, the House passed the so-called Pinckney Resolutions, substantially renewed in January, 1837, which provided that all petitions relating to slavery should virtually be disregarded, should not be printed or referred, and should be laid on the table without action. The resolutions also asserted that Congress should not interfere with slavery in the District of Columbia, and that that body had no power, according to the Constitution, to take action with regard to slavery in the individual States. Adams's attempts to introduce petitions in disregard of these resolutions provoked animated debates, in which on some occasions considerable feeling was aroused between Northern and Southern members. In December, 1837, the House passed the so-called Patton Resolutions, introduced by J. M. Patton, of Virginia, which declared against the reading, referring, debating, or

printing of any petition praying for the interference of the national government with the institution of slavery in any part of the United States, including the Territories and the District of Columbia. In December of the following year the House passed the so-called Atherton Gag, covering much the same ground as the Patton Resolutions, and in January, 1840, passed the famous Twenty-first Rule to the same general effect. Adams continued to offer petitions, however, and at the opening of each new Congress endeavored to have the objectionable rule omitted. The majority against him progressively decreased, and in December, 1844, the rule was rescinded. Consult Adams's *Memoirs* (12 vols., Philadelphia, 1874-77), Benton's *Abridgment of the Debates of Congress, 1789-1856* (16 vols., New York, 1857-61), id., *Thirty Years' View* (2 vols., ib., 1854-56), Wilson, *Rise and Fall of the Slave Power in America*, vol 1 (3 vols., Boston, 1872-77).

GAGUIN, ga'gān', ROBERT (c 1425-1501). A French chronicler and diplomat, born at Calonne-sur-la-Lys. He studied at the University of Paris under Fichet and was made professor of canon law there (1463) and dean of the faculty. Erasmus and Reuchlin were his pupils. He was intrusted with various diplomatic missions by Louis XI and Charles VIII, traveled in Germany, Italy, England, and Spain, and was court librarian for both these kings. His chronicle went through many editions under the title *Compendium de Origine et Gestis Francorum a Pharamundo usque ad Annum 1491* (1495), and it was one of the sources of Fabyan's chronicle. He left some letters and discourses, *Epistolæ et Orationes* (1498). Consult Gauguin, *Denkschrift zum 400 Todestage des Robertus Gaguinus* (Heidelberg, 1901).

GA'HERIS. The Orestes of Arthurian legend. He was the son of Arthur's sister, Morgause.

GAIDOZ, gā'dōs', HENRI (1842-) A French Celtic scholar and anthropologist, born in Paris. He became professor of geography and ethnography at the École Libre des Sciences Politiques in 1872 and in 1876 professor of Celtic languages and literatures at the École des Hautes Études. He published *Esquisse de la religion des Gaulois* (1879-81), *La religion gauloise et le gui de chêne* (1881), *Les religions de la Grande Bretagne* (1885), *Le blason populaire de la France* (with Sébillot, 1884), *Études de la mythologie gauloise* (1886), *Les Roumains en Hongrie* (1894). He founded the *Revue Celtique* in 1870 and in 1877 with Eugène Rolland established *La Mélusine* for the study of folklore.

GAJETTY THEATRE, THE. A London theatre situated on the Strand and opened in 1868. It is the original home in England of opera bouffe.

GAIKWAR, gī'kwar (Marathi, herdsman). The designation of the Mahratta ruler of Baroda (qv), one of the native states in India. The Gaikwar originally was an officer in the establishment of the rajahs of Satara, who were nominally the supreme rulers of the Mahrattas (qv). The Gaikwar finally became hereditary second in command of the Mahratta armies. Pilaji, who became Gaikwar in 1721, by predatory excursions gradually acquired authority over Gujarat, and his son, Damaji, who succeeded in 1732, still further extended the bounds of his ample dominions. The latter threw off

his allegiance to the Peshwa, but, being taken prisoner by treachery, was compelled to yield one-half of his dominions and do homage for the other half. Anand Rao, who ascended the throne in 1800, was the first prince of the line who had intercourse with the British. The throne of the Gaikwar being contested by an illegitimate brother, Anand Rao secured the aid of the British government at Bombay and agreed by treaty, March 15, 1802, to receive a British subsidiary force. Sayaji Rao, who became Gaikwar in 1819, was frequently on hostile terms with the British government, and in 1838 his deposition was contemplated. In 1839 he made his submission and, among other concessions, abolished suttee. His successor, Malhar Rao, inherited the family vices and in 1875 was deposed on account of his general misrule. Sayaji Rao, of the Khandesh line, a boy of 13, was appointed his successor. After attaining his majority the young Prince ruled admirably and brought his dominions to a high state of prosperity. In 1906 he visited the United States. He is honored with the hereditary title of Maharaja Gaikwar of Baroda.

GAIL, gäl, JEAN BAPTISTE (1755-1829). A French Hellenist, born at Paris. He became professor of Greek at the College de France in 1792 and keeper of the Greek manuscripts in the Royal Library at Paris in 1814 or 1815. With infinite industry he wrote numerous works, dealing especially with Lucian, Theocritus, Anacreon and the Greek anthology, Homer, Thucydides, and Herodotus. Between 1814 and 1829 he edited *Le Philologue*, in 24 volumes, a collection of notes on Greek archæology, grammar, geography, etc. Though of modest ability, he did much to rescue Greek from neglect. For his many writings, consult Quérard, *La France litteraire* (Paris, 1829). See next article.

GAIL, JEAN FRANÇOIS (1795-1845). A French Hellenist, son of Jean Baptiste Gail (1755-1829). He was born in Paris, and in 1829 became a professor at the Military Academy of Saint-Cyr. His chief works were *Recherches sur la nature du culte de Bacchus en Grèce* (1821); and the *Geographi Græci Minores* (1826-31), containing, besides other extracts, the *Periplus* of Hanno, that of Scylax, and fragments of Scymnos.

GAIL HAMILTON. See DODGE, MARY A.

GAILLARD, ga'yär', (CLAUDE) FERDINAND (1834-87). A French engraver, one of the most prominent of the nineteenth century. He was born in Paris, studied under Léon Cogniet, and won the Prix de Rome for engraving in 1856. On his return from Rome he studied also under Sellier. Much of his best work was done for the *Gazette des Beaux-Arts*, and he particularly excelled in interpreting the early Renaissance masters. His power was first revealed in the plate of the "Condottiere," after Antonello da Messina (1865). Among his other celebrated plates are "Gattemelata," after Donatello's statue, "Œdipus," after Ingres, "The Man with the Pink," after Van Eyck, "Virgin and Child," after Botticelli, "St George," after Raphael, "Twilight," after Michelangelo's statue, "The Pilgrims of Emmaus," after Rembrandt. He also engraved from his own designs portraits of the Count de Chambord, Pius IX, Leo XIII, Monseigneur Pie, Sœur Rosalie, and Dom Gueranger. These especially show his particular faculty, an almost clairvoyant grasp of personality. His technical method, which was original and

varied, consisted in first etching the plate, which was then finished with the burin. Many of his proofs are preserved in the Cabinet des Estampes, Paris. Consult Henri Beraldi, *Les graveurs du dix-neuvieme siècle*, vol. vi (Paris, 1885-92).

GAIL'LARD, DAVID DU BOSE (1859-1913). An American soldier and engineer, born in Sumter Co., S. C. He graduated from the United States Military Academy in 1884, served on the International Boundary Commission of the United States and Mexico (1891-94), had charge of the Washington Aqueduct (1895-98), was colonel of United States Volunteer engineers during the Spanish-American War, and subsequently (1909) was promoted lieutenant colonel in the regular army. After 1898 he served on various stations until 1907, when he became a member of the Isthmian Canal Commission and director of the Panama Railroad Company, he took charge of dredging harbors and building breakwaters in the same year, and on July 1, 1908, became engineer of the central division of the canal from Gatun to Pedro Miguel. He published *Wave Action in Relation to Engineering Structures* (1904).

GAILLARD, EDWIN SAMUEL (1827-85). An American physician. He was born in Charleston District, S. C., graduated at the University of South Carolina in 1845, and at the State Medical College in 1854. During the Civil War he served in the Confederate army, holding various positions in the medical department. He was professor of principles and practice of medicine in the Louisville Medical College (1869-78). He was editor, successively, of the *Richmond and Louisville Medical Journal*, the *American Medical Weekly*, and *Guillard's Medical Journal*.

GAILLARD, ga'yär', GABRIEL HENRI (1726-1806). A French historian and academician. He was born at Ostel, near Soissons, took up the study of law, but abandoned his legal pursuits for history, and published a large number of works, characterized more by elegance of style than by strict adherence to facts. Among these are *Histoire de Marie de Bourgogne* (1757), *Histoire de Francois I* (1766-69), *Histoire de la rivalité de la France et de l'Angleterre* (1771-77), *Histoire de Charlemagne* (1782). Gaillard also wrote *Eloges* on Descartes, Corneille, Molière, Charles V, Henry IV, and his intimate friend, Malherbes.

GAILLARDET, ga'yär'dä', THÉODORE FRÉDÉRIC (1808-82). A French dramatist and author, born at Auxerre. He achieved notoriety through his duel with Alexandre Dumas, père, and his subsequent lawsuit over the rights to the play *La tour de Nesle*, which Dumas had placed upon the stage as his own (1832). He wrote two other dramas, *Struensée, ou le médecin de la reine* (1832), and *Georges, ou le criminel par amour* (1833), and also *Mémoires du chevalier d'Eon* (1836, revised, 1866). He founded in New York City (1827) the *Courrier des Etats-Uns*, which he directed until 1848.

GAIL'OR, THOMAS FRANK (1856-) An American Protestant Episcopal bishop. He was born at Jackson, Miss., and graduated from Racine (Wis.) College in 1876 and from the General Theological Seminary (New York) in 1879. In 1879-82 he was rector of the Church of the Messiah at Pulaski, Tenn. He served as professor of ecclesiastical history in 1882-90, chaplain in 1883-90, and vice chancellor in

1890-93 in the University of the South, where he became chancellor and president of the board of trustees in 1908. He was Coadjutor Bishop from 1893 to 1898, when he became Bishop of Tennessee. His writings include *Manual of Devotion* (1887), *The Apostolical Succession* (1889), *Things New and Old* (1891), *The Puritan Reaction* (1897), *The Master's Word and Church's Act* (1899), *The Episcopal Church and Other Religious Communions* (1904), *The Fruitfulness of Sacrifice* (1907), *The Christian Church and Education* (1910).

GAINAS, gā'nas (died 401). A Visigoth, commander in chief of the Roman army. He was an Arian and caused the downfall and execution of the eunuch Eutropius. He used his position for treasonable purposes, which he cloaked successfully for some years. At length he became openly hostile and attempted to seize Constantinople. His attempt was foiled and his army of Goths destroyed. He fled, but was captured by a chief of the Huns, called Uldin, who sent his head to Constantinople. Consult *Bury, History of the Later Roman Empire*, vol. 1 (London, 1889), and *Cambridge Mediaeval History*, vol. 1 (New York, 1911).

GAINÉ, gān. A French term (*gaine* = a sheath), adopted in English to supply the lack of any corresponding word to designate a sheath-like pilaster such as was often employed in the late Renaissance or baroque architecture of Europe and the Elizabethan and Jacobean in England. Derived from the classic terminus or boundary mark—a head upon a square post tapering downward—it was applied to gateposts, to all sorts of minor architectural objects, and in Germany and England even to more important uses, in place of the regular classic pilaster forms, sometimes with a human head at the top, oftener with a pilaster cap of moldings.

GAINES, EDMUND PENDLETON (1777-1849). An American soldier. He was born in Culpeper Co., Va., but was early taken by his father to North Carolina. He studied law for a time, but in 1799 entered the United States army as an ensign, and from 1801 to 1803 was employed in the making of a topographical survey from Nashville to Natchez for the location of a military road. In 1802 he became a first lieutenant, and two years later military collector of customs for the district of Mobile, in which capacity he arrested Aaron Burr (qv) on Feb. 19, 1807. In the War of 1812 he was a captain in the battle of the Thames, participated in the engagement at Chrystler's Field, was commander at Fort Erie (qv) in August, 1814, until wounded by the bursting of a shell, and for his gallantry at Fort Erie received a brevet of major general, the thanks of Congress, and a gold medal. He gradually rose to the rank of brigadier general. He was one of the commissioners appointed in 1816 to treat with the Creek Indians, was in command of the Southern Military District at the outbreak of the first Seminole War in 1817, was retained as brigadier general and placed in command of the Western District when the army was reduced in 1821, took an active part in the second Seminole War of 1837, being severely wounded at Outh-lacoochie, and at the outbreak of the Mexican War was in command of the Department of the Southwest, with headquarters at New Orleans, and was actively engaged in raising volunteers. He was court martialed, but released without

censure, for calling out militia at this time without authorization.

GAINES, JOHN P. (1795-1857). An American soldier and legislator, Territorial Governor of Oregon. He was born at Augusta, Va. (now West Virginia), but when very young removed to Boone Co., Ky. He served as a volunteer in the War of 1812, was a member for several years of the Kentucky Legislature, and in the Mexican War served first as a major of Kentucky volunteers and afterward as an aid to General Scott. He was a Whig member of Congress in 1847-49 and from 1850 to 1853 was Governor of the Territory of Oregon, and came into serious conflict with the Territorial Legislature, notably over the location of the capital. Consult H. H. Bancroft, *History of Oregon*, vol. 11 (San Francisco, 1888).

GAINES'S MILL, BATTLE OF. A battle fought on June 27, 1862, during the Civil War, between a Federal force of about 30,000 under Gen. Fitz John Porter and a Confederate force of about 65,000 under General Lee, on the left or north bank of the Chickahominy River, 8 miles northeast of Richmond, Va. It was the second of the famous Seven Days' Battles (qv) which marked the close of McClellan's Peninsular campaign. On the 27th of June General Lee, having crossed the Chickahominy with the greater part of the Army of Northern Virginia, attacked Porter's position at 2 P. M., the Confederate right, centre, and left being commanded by Longstreet, A. P. Hill, and Jackson respectively. Porter, though inadequately reinforced by McClellan, offered a magnificent resistance and stubbornly held his position in face of repeated assaults until 7 P. M., when his left centre at last gave way and compelled a reformation at some distance to the rear of the whole line, under cover of two fresh brigades from the left wing, commanded by French and Meagher. The main battle had been preceded by a sharp contest between the Confederate A. P. Hill, advancing from Mechanicsville, and the Ninth Massachusetts Volunteers at Gaines's Mill, slightly in advance of the main Federal position, and from this the whole battle takes its name. During the night of the 27th Porter joined the left wing south of the Chickahominy, and McClellan, compelled to abandon his old base at White House on the Pamunkey River, hastily made arrangements to transfer his army to the James. During the progress of the battle McClellan, with the left wing, numbering fully 55,000 men, had been held in check by 25,000 Confederates under Magruder and had been deceived into believing that a Confederate army, numbering over 100,000, lay between him and Richmond. Had he known the real state of affairs, it seems probable that he could easily have overwhelmed Magruder and captured the city while Lee was occupied north of the river. On the other hand, Porter's stubborn resistance gave Lee an erroneous impression of the Federal strength at this point. The total Federal loss in the battle of Gaines's Mill was 6387 men, besides 22 guns, while the Confederate loss, though never accurately determined, was probably as much as 1000 more. Two years later the battle of Cold Harbor (qv) was fought in this vicinity. Consult *Official Records*, vol. xi (Washington, 1885), Johnson and Buel, *The Battles and Leaders of the Civil War*, vol. 11 (New York, 1887), Ropes, *The Story of the Civil War*, vol. 11 (ib., 1894-98), Webb, *The Peninsula* (ib., 1881), Nicolay and

Hay, *Abraham Lincoln A History*, vol v (New York, 1890), Alexander, *Military Memoirs of a Confederate* (ib, 1907), Steele, *American Campaigns* (Washington, 1909)

GAINESVILLE A city and the county seat of Alachua Co, Fla., 70 miles southwest of Jacksonville, on the Seaboard Air Line, the Atlantic Coast Line, and the Tampa and Jacksonville systems (Map Florida, D 2) It is a popular winter resort and has the Florida State University and a public library In the vicinity are several points of natural interest, notably Alachua Sink, which alternately is prairie and lake, Warren's Cave, and the Devil's Mill Hopper Gainesville has important wholesale interests The principal industries are farming, stock raising, lumbering, and phosphate mining, and there are foundries, gineries, gristmills, wagon works, planing mills, etc An electric-light plant is owned by the city Pop, 1900, 3633, 1910, 6183

GAINESVILLE. A city and the county seat of Hall Co, Ga., 53 miles northeast of Atlanta, on the Southern, the Gainesville northwestern, and the Gainesville Midland railroads (Map Georgia, C 1) It is an attractive health resort, having several mineral springs, and is the seat of Brenau College and Conservatory of Music for young ladies, founded in 1878, and the Riverside Military Academy There is also a public park The manufactures include cotton goods, cotton yarns, asbestos, foundry and machine-shop products, cottonseed oil, buggies, wagons, brick, lime, tombstones, doors, sash, blinds, and meal Gainesville was first settled in 1821 and was first incorporated in 1870 It is governed, under a revised charter of 1885, by a mayor, elected every two years, and a council The city owns and operates the water works Gen. James Longstreet and Gov Allen D Candler lived and died in Gainesville Pop, 1900, 4382, 1910, 5925

GAINESVILLE A city and the county seat of Cooke Co, Tex., 65 miles north of Fort Worth, at the head of the Elm Fork of the Trinity River, and on the Gulf, Colorado, and Santa Fe, and the Missouri, Kansas, and Texas railroads (Map Texas, D 3) It is the centre of an agricultural and stock-raising district, and has an iron foundry and machine shops, and manufactures cottonseed oil, flour and food-stuffs, pressed brick, etc The city contains a fine post office and a city hall, Carnegie library, courthouse, city park, and fair grounds Gainesville was incorporated in 1873 and is governed, under a charter of 1879, by a mayor, chosen biennially, and a municipal council The water works are owned by the municipality. Pop, 1900, 7874, 1910, 7624

GAINSBOROUGH An ancient market town and port on the right bank of the Trent, in Lincolnshire, England, 16 miles northwest of Lincoln (Map England, F 3) It is at the junction of the Great Northern, Great Eastern, and the Midland railways The town was constituted a port in 1841, the canals connecting with the Trent making Gainsborough the eastern outlet for the Midland counties It has important manufactures of linseed oil, ropes, malt, tobacco, and machinery There are also shipbuilding and iron works The town consists mainly of one long street running parallel with the river, which is spanned by a fine stone bridge The Old Hall, or Manor House, built about 1480 and restored in 1884, a baronial

residence with a tower 75 feet high, is said to have been built by John of Gaunt and is now used as a corn exchange, public library, and a literary and scientific institute The John Robinson (1575-1625) Memorial Church, inaugurated in 1897, is dedicated to the pastor of the Pilgrim Fathers at Leyden, a reputed native of Gainsborough The town owns its water supply and maintains markets Pop, 1901, 17,660, 1911, 20,587 Consult Stark, *History of Gainsborough* (London, 1843)

GAINSBOROUGH, THOMAS (1727-88) One of the greatest English portrait painters, also a landscape painter of great importance He was born at Sudbury, Suffolk, the youngest of nine children His father was a woolen-crape maker, his mother an amateur flower painter, and the lad's bent to art was in every way encouraged He sketched proficiently at 10, and at 15 he was sent to London to study painting, he stayed with a goldsmith who introduced him to Gravelot, an engraver, from whom he gained his chief instruction The latter was a pupil of Watteau, whose influence may be seen in the dainty air of Gainsborough's figures, their small hands and feet, and the tufty foliage of his trees Later he was associated for some three years with Frank Hayman the historical painter After an unsuccessful attempt to establish a studio in London he returned to Sudbury in 1745 and continued his landscape studies Soon after his return he married Margaret Burr, a lady of great charm, whose placid influence was a source of great happiness in his life She was an illegitimate daughter of one of the exiled Stuarts or else of the Duke of Bedford, and her annuity of £200 placed the young couple above want Six months afterward he went to Ipswich, where for 14 years he lived quietly and worked earnestly In 1759 he sent 18 of his pictures to the exhibition of the Society of Arts, in 1760 he removed to Bath, remaining until 1774, when he returned to London In 1768 he was elected one of the original members of the Royal Academy His stay at Bath was marked by success, and he painted many portraits of fashionable beauties and the brightest spirits of the day George III, on hearing of Gainsborough's return to London, invited him to court and gave him orders for portraits of himself and Queen This seemed a signal for the fashionable world, which resulted in prosperity which lasted until Gainsborough's death. He died in London, Aug 2, 1788, and was buried at his request in Kew Churchyard, without name or inscription on the stone that marked his grave Gainsborough's landscapes are no less original than his portraits, and he has well been called the father of naturalistic landscape in England He treats by preference melancholy scenes, in faint or evening light—mysterious forest shades, or rough and broken country with clouded skies He rarely succeeded in selling a landscape, but, as he said, painted landscapes for love Characteristic examples are "The Watering Place," in the National Gallery, London, and a landscape of a fine, rolling green countryside, in the Metropolitan Museum, New York Especial mention should be made of his admirable drawings, which belong to the best produced by the British school His etchings also are worthy of mention

Gainsborough's portraits are distinguished for their noble and refined grace, they express al-

GAINSBOROUGH

"THE BLUE BOY," FROM THE ORIGINAL IN THE GROSVENOR GALLERY, LONDON

most invariably the moment of unconscious rest. They interpret the winning personality of the individual rather than such intellectual qualities as those suggested by Reynolds. Often faulty in drawing, the artist charms us by his color, which is cool, fresh, and transparent, the tones seem to follow each other like the chords of an instrument, without the slightest intimation of separation, fading away into a background of dreamy atmosphere. His canvas was thinly painted with a smooth and swift technique.

Of Gainsborough's 300 or more paintings, 220 are portraits, which are better represented in private than in the public collections of Great Britain. Of his best works the National Gallery possesses "Orpen, the Parish Clerk," and "Mrs Siddons," a simple and dignified representation of the great actress, the Wallace collection, London, has "Perdita Robinson" and "Mrs Haeverfield," the Royal Academy, a portrait of the artist, the National Gallery, Edinburgh, "Mrs Graham," one of his most refined and beautiful creations. Among the finest in English private collections are "The Morning Walk" and "Mrs Sheridan," belonging to Lord Rothschild in London, "The Three Ladies," Mr Alfred Rothschild, London, and the "Blue Boy," in Grosvenor House. Many of the best of Gainsborough's portraits have in recent years been bought by Americans. Thus, Henry C Frick possesses "Honorable Annie Duncan," E H Huntington, "Viscount Ligonier," "Countess Ligonier," and "Lady Petrie," and George J Gould, the musician "Abel"—all in New York. In the J P Morgan collection (Metropolitan Museum, New York) are three fine examples "Lady Gideon," "Mrs Tennant," and "Georgiana, Duchess of Devonshire." The last-named picture, also called "The Stolen Duchess," attracted much attention by its theft from London and remarkable return by the thieves from Chicago because of their inability to dispose of so valuable a painting. The Metropolitan Museum furthermore possesses four examples, the best of which (besides the landscape mentioned above) is a remarkable portrait of an unknown man, formerly thought to be Gainsborough himself.

Bibliography. The best work on Gainsborough is Armstrong, *Gainsborough and his Place in English Art* (London, 1898), a model monograph, with scholarly, critical text and excellent illustrations. Consult also the biographies by Colvin, in *Portfolio* (London, 1872), Brock-Arnold (ib, 1901), Gower (ib, 1903), Fletcher (New York, 1904), Fauli (Bielefeld, 1904), Boulton (London, 1905), Moier (Paris, n d).

GAIRDNER, JAMES (1828-1912). An English historical writer and editor. He was born and educated at Edinburgh and in 1846 was appointed a clerk in the Public Record Office. As his peculiar adaptability for the work became evident, he was rapidly promoted, and he was made assistant keeper of the public records in 1859. He edited *Memorials of Henry VII* (Rolls Series, 1858), *Letters and Papers Illustrative of the Reigns of Richard III and Henry VII* (Rolls Series, 1861-63), *Historical Collections of a London Citizen* (Camden Society Publications, 1876), *Letters and Papers of Henry VIII* (Rolls Series, vols v to xv, in continuation of the work of Professor Brewer, 1880-96), *Three English Chronicles* (1880), *The Paston Letters* (Arber reprints, 3 vols, 1872-75, new ed, 1904). In addition to con-

tributions to the *Dictionary of National Biography*, the *Cambridge Modern History*, and the *English Historical Review*, he published *The Houses of Lancaster and York* (1874), *Life and Reign of Richard III* (1878, revised, 1898), *Studies in English History*, with Spedding (1881), *Henry VII* (1889), *The English Church in the Sixteenth Century* (1902), and *Lollardy and the Reformation in England* (3 vols, 1908-11).

GAIRDNER, SIR WILLIAM TENNANT (1824-1907). An English physician, born and educated at Edinburgh. From 1862 to 1900 he was professor of medicine at the University of Glasgow in 1863-72, also serving as chief medical officer of the city of Glasgow. He took an active interest in securing reforms in municipal sanitation, and the enactment of the Glasgow Improvement Act in 1867 was due chiefly to his initiative. His publications include *On the Pathology of Bronchitis, and the Diseases Connected with Bronchial Obstruction* (1850), *Clinical Medicine, Observations Recorded at the Bedside, with Commentaries* (1862), *On the Function of Articulate Speech, and its Connection with the Hand and the Bodily Organs* (1866), *The Physician as a Naturalist* (1889), *The Three Things that Abide* (1903).

GAISERIC. See **GENSERIC**.

GAISFORD, THOMAS (1779-1855). A distinguished English classical scholar, born at Ilford. After studying at Christ Church, Oxford, he was appointed regius professor of Greek at the university (1812) and dean of Christ Church (1831-55). From 1815 to 1847 he was rector of the parish of Westwell. Besides his elaborate edition of the *Enchiridion* of Hephæstion (1810), with which he first won recognition as a critic, his valuable publications include an edition of the *Poete Græci Minores* (1814-20), of Stobæus (1822), of Herodotus (1824), of Sophocles (1826), of the lexicon of Suidas (Oxford, 1834), of the *Paræmographi Græci* (1836), of the *Scriptores Latini Rei Metricæ* (1837), of the *Etymologicum Magnum* (1844), and of Eusebius (1842-52). Consult Sandys, *A History of Classical Scholarship*, vol III (Cambridge, 1908).

GAISSIN, gî'sin. The capital of a district in the Russian Government of Podolia, situated on the Sobi, a tributary of the Bug, 180 miles east of Kamenetz-Podolsk. The chief occupation of the inhabitants is agriculture, the manufacturing industries of the town being insignificant. Pop, 1897, 9393.

GAITÉ, gâ'tâ', THÉÂTRE DE LA (Fr, Gaiety Theatre). One of the oldest theatres of Paris, originating in marionette shows instituted by Nicolet in 1753. A theatre was established in 1759 on the Boulevard du Temple, and in 1807, when the number of Paris theatres was restricted to eight by Napoleon, the Gaité was among those retained, presenting vaudeville, drama, and spectacular pieces. On the destruction of part of the boulevard in 1862, a new house was built in the Place des Arts et Métiers and is the present home of the theatre. Among the many directors was Offenbach, under whom the operetta came into special prominence, but at the present time performances of all kinds are given. Consult L H Lecomte, *Histoire des théâtres de Paris* (2 vols, Paris, 1905), and G Cain, *Les théâtres du Boulevard* (ib, 1906).

GA'TUS. A Roman jurist of the age of the Antonines, and the chief source of our knowl-

edge of Roman law prior to Justinian. His personal history is almost entirely unknown, and almost every subject connected with him a matter of controversy. It is not known whether he was a Roman citizen, a foreigner, or a freedman. As to the precise age of Gaius, this much is certain, that before the revision of the Roman laws and the reform of legal education by Justinian, the *Institutes* of Gaius, as well as four others of his treatises, were the received textbooks of the schools of law. His *Institutes*, moreover, formed the groundwork of the *Institutes* of Justinian. From his being thus preferred to Ulpian or Papinian, it is not to be inferred that he lived after them, but only that his work was more popular. The latest jurist whom he cites is Salvius Julianus, who lived under Hadrian, and the latest Imperial edict is one of Antoninus Pius, whence it may fairly be concluded that he survived Antoninus and probably wrote under his successor.

The works of Gaius were largely used in the compilation of the *Digest* of Justinian, which contains no fewer than 535 extracts from his writings. The principal are *The Edictum Provinciale*, in 32 books, the *Aurea*, in seven, the *Edictum Urbicium*, *On Trusts*, *On Mortgages*, and, above all, the *Institutes*, in four books. The last-named work is that by which Gaius is chiefly known, and it was probably the earliest complete and systematic textbook of Roman law. Although it was the basis of Justinian's *Institutes*, both as to its matter and its division, yet it was completely superseded by that work and after a time was entirely lost, the only knowledge of it which remained being that which was gathered from the detached extracts in the *Digest*, and from the Breviary of Alaric (q.v.), or code of the Visigoths, which was known to be derived from it. In 1816 Niebuhr, while on his way to Rome, discovered, in a palimpsest manuscript in the library of the Chapel of Verona, portions of the work of some ancient juriconsult, which were soon afterward pronounced by Savigny to be a part of the *Institutes* of Gaius. On the publication of his report the Berlin Academy of Sciences commissioned two German scholars, Goschen and Hollweg, in 1817, to make a copy of the entire palimpsest, which consists of 127 sheets. Nine-tenths of the entire work was recovered, and was published in 1821 by Goschen, and again, after a fresh collation of the manuscript, by Blume in 1824. A third and much-improved edition by Lachmann appeared in 1842. A comparative edition of the *Institutes* of Gaius and Justinian, by Klenze and Bocking, appeared at Berlin in 1829.

The first book was translated into German in 1824 by Von Brockdorff, and the entire work has been translated into French three several times—by Baulet in 1826, by Domenget in 1843, and by Pellat in 1844. In England it has been translated, with notes, by Poste (4th ed. 1905), and by Abdy and Walker (1886), the latter work containing also the text and translation of Ulpian's *Fragments*. Consult Huschke, "Zur Kritik und Interpretation von Gaius Institutionen," in his *Studien des römischen Rechts* (Breslau, 1830), also Mackeldey's *Handbook of the Roman Law*, translation (Philadelphia, 1883), Ortolan, *The History of the Roman Law*, translation (London, 1896), Savigny, *System des heutigen römischen Rechts* (Berlin, 1840-49), Stephenson, *History of Ro-*

man Law, with a Commentary on the *Institutes of Gaius and Justinian* (Boston, 1912).

GAJ, gĭ, LAUDEVIT (1809-72). A Slavic writer and agitator, born at Krapina, Croatia, and educated at Vienna, Gratz, Leipzig, and Pest, where he came under the influence of Kollar (q.v.). In 1835 he founded the *Novine Hrvatske* (*Croatian News*)—a title afterward changed to *Ihvske Narodne Novine* (*Illyrian National News*), while a literary supplement was separately issued as *Danica Ihvska* (*The Illyrian Day-Star*). These rapidly became popular and were followed by similar publications and by the establishment of patriotic societies of every description. The movement thus organized, which was largely instrumental in uniting the Croats and Serbs in their antagonism to the Magyars, excited considerable opposition in Hungary, and in 1843 the word "Illyrian" was prohibited. Nevertheless, through the efforts of Gaj, a literary bond had been established among the southern Slavs of the Hungarian crown. One of his patriotic songs, entitled "Još Hrvatska nij' propala" (Croatia is not yet lost), was extremely popular in its day. He also reformed the Croatian orthography after the analogy of the Czech. Consult the chapter on Gaj in Leger, *Serbes, Croates et Bulgares* (Paris, 1913).

GALABAT, ga'la-bat', or **KALABAT**. A small district in the northwestern part of Abyssinia, adjoining Anglo-Egyptian Sudan Area, about 1540 square miles, pop. 20,000. It was formerly an Egyptian province and is settled by Tokiuris from Darfur. Prior to the Italian-Abyssinian War it was in the Italian sphere of influence, but at present it forms an integral part of Abyssinia. Metamneh (Matama), the chief town, is situated close to the Egyptian frontier and was commercially important prior to the Mahdi uprising in 1883. The population of the town is estimated at 8000.

GALACTAGOGUE. A medicine that increases the lacteal secretion. The value of galactagogues in increasing the flow of milk from the breast is somewhat doubtful. The only drug that approaches a true specific action is pilocarpus, and its action is very transient. Anti-galactagogues are drugs which have the opposite action. Belladonna and potassium iodide are the most useful drugs given for this purpose.

GALACTIC CIRCLE. A great circle of the celestial sphere, passing approximately through the centre of the Galaxy, or Milky Way. According to Herschel, the northern pole of this circle lies in the constellation Coma Berenices, its declination being +27° and its right ascension 12 hours, 47 minutes. See GALAXY.

GALAC'TODEN'DRON (Neo-Lat., from Gk γάλα, *gala*, milk + δένδρον, *dendron*, tree), or **COW TREE**. A tree of the family Urticaceæ, indigenous to tropical South America, variously called *Brosimum galactodendron*, *Galactodendron utile*, and by the common names *palo de vaca*, and *palo de leche*. When tapped, it yields a milky juice which in its native countries is used in tea and coffee, turns sour on exposure to the air, and deposits a caseic substance. It is closely related to the breadfruit (*Artocarpus incisa*), the breadnut (*Brosimum alicastrum*), and to the fig (*Ficus carica*).

GALAC'TOSE. See SUGARS.

GALACZ, ga'lats. See GALATZ.

GALAGO, ga-lá'gô. A genus of lemurs, locally known as Bush Babies, native to the

continent of Africa, where various species are scattered from Senegal (whence the name is said to have come) to Natal, none, however, being found in Madagascar, where other lemurs abound. They vary in size from the bigness of a cat to that of a mouse and are some shade of gray or brown in color. They differ from the other lemurs in dentition, and conspicuously in the power of folding lengthwise, and laying close to the head, their unusually large and naked ears, their tails are long and bushy, and their hind legs of great length proportionately, due to the elongation of the bones of the ankle and foot. They are confined to forested regions, dwell in the trees, about which they leap with extraordinary agility, and where the smaller species are said to make nests resembling those of the mouse lemurs, but frequently go upon the ground, where their customary attitude is sitting upright on their haunches. They feed upon insects, birds' eggs, fruit, etc., searching for these things mainly at night, and spending the day coiled up asleep in some tree crotch or within the clustered fronds of a palm. They thrive well in captivity and are active and interesting when wakeful. The species longest known is that from Senegal (*Galago senegalensis*), one of the smaller ones, also found throughout equatorial Africa, a closely allied species (*Galago mahols*) ranges from the lower Zambezi to Natal. The largest species are those of the west coast (*Galago crassicaudata* and *monteiroi*), the least, Demidoff's galago, is only 5 inches long. Consult Elliot, *A Review of the Primates* (New York, 1913).

GAL'AHAD, SIR The son of Launcelot and Elaine, and the purest knight of the Round Table, who alone was able to sit in the Siege Perilous and to recover the Holy Grail. He saw and touched the Lord's body and died. He is the hero of Walter Map's *Quest of the Holy Grail*. Consult Morley, *English Writers*, vol. III (London, 1887-90). See **GRAIL, THE HOLY**.

GAL'AM BUTTER TREE See **BUTTER TREE**.

GAL'ANGALE (AS *gallengar*, from OF *galngal*, *garngal*, from *galange*, *galangue*, *galan-gale*, from ML *galanga*, from Ar *khalanjān*, *khōlīnjān*, from Pers *khālīnjān*, *khavālinjān*, *galangale*, from Chin *Ko-hang-k'iang*, mild ginger of Ko, or Kao-chow-fu, in the Province of Canton, from *Ko*, or *Kao*, name of a province + *hang*, mild + *k'iang*, ginger), *Alpinia*. A genus of plants embracing 30 or 40 species of the family Zingiberaceæ, with perennial stems, terminal inflorescence, succulent fruit, and rootstocks which when full-grown possess aromatic stimulating properties similar to those of ginger, for which it is much used in the East. The pure galangale is the product of *Alpinia galanga* and *Alpinia officinarum*, natives of and cultivated in, the Eastern Archipelago. It has a stem 6 or 7 feet high, broad leaves, and a branched panicle of greenish-white flowers. The rootstock, when young, yields a kind of arrowroot and is used as an article of food. The rootstocks of *Kæmpferia galanga* are used in a similar manner and the roots of a common British sedge, *Cyperus longus*, have similar properties.

GALAN'THUS A genus of spring-blooming bulbs of the family Amaryllidaceæ, popularly known as snowdrops. They are natives of Europe and western Asia, and about three species are known. The flowers, which appear often be-

fore the snow has melted, are normally solitary, pendulous, on scapes a few inches long, and with few exceptions white and green. The leaves, which appear with the flowers, but develop more slowly, are grasslike, and last usually until midsummer. Due to their easy culture, cheapness, extreme hardiness, and early blooming habit, snowdrops are general favorites. The bulbs are planted a few inches deep in good soil, frequently on the borders of lawns, in midautumn, and allowed to shift for themselves, which they often do to the great satisfaction of the grower where conditions are specially congenial. These conditions are partial shade, cool soil, and moisture.

GAL'AOB, gīl'a-ōr Son of Pelion, King of Gaul, and brother of Amadis of Gaul.

GAL'APA'GOS ISLANDS (*Sp* *pron* *gā-la'pa-gōs*), (*Sp*, tortoise). A group of small volcanic islands in the Pacific Ocean, crossed by the equator and extending from about long 89° to 92° W, about 600 miles west of Ecuador, to which it belongs (Map America, South, A 2). It consists of the larger islands of Albemarle, Indefatigable, Chatham, James, and Charles, and a number of smaller islands. The total area of the group is estimated at 2870 square miles, of which Albemarle occupies over one-half. The islands are volcanic in origin and mountainous. There are supposed to exist a number of more or less active volcanoes. The climate is less hot than is usual in regions of that latitude, owing to the cool Peruvian current, and the flora, though not rich, is interesting, including species peculiar to the group or even to separate islands. Turtles are very numerous and form the chief product. There is some sugar growing on the island of Chatham, and cattle are raised to some extent. The population is about 400. The group was known in the sixteenth century and was frequently visited by buccaneers, to whom the islands are probably indebted for their English names. They were annexed to Ecuador in 1832 and explored by Darwin in 1858. In 1911 proposals were made for the lease of the Galapagos as a manœuvre base for the United States navy, but the project caused popular tumult in Ecuador and was relinquished.

The Galapagos Islands are of extreme interest to zoologists in view of the peculiarities of their fauna and the bearing the facts have upon the evolutionary history of animals. It was the observation of them, during the voyage of the *Beagle*, which more than any other set of facts, perhaps, led Darwin to his subsequent speculations, and they figure largely in the reasonings of himself, Wallace, and all other evolutionists. While in general the fauna resembles that of South America (see **NEOTROPICAL REGION**), it is remarkable for having almost no species in common with the continent, and a great paucity of all forms of life except birds. The flora of the group is scanty, and more than half of its species are found nowhere else, so that it is natural to find that the land shells, insects (mainly beetles), etc., are few and peculiar. Reptiles are represented by the famous giant tortoises, two species of snakes and four of lizards. Of the last, two are of genera confined to the islands. One is a large burrowing iguana, and the other "an aquatic modification" of the same, living a semimarine life and subsisting on seaweeds. The giant tortoises, now greatly decreased in numbers, were formerly extremely numerous and tame and reached a huge size.

(See TORTOISE) The islands were named after them, and there were several species, each inhabiting a separate part of the archipelago. The only mammals were a mouse and a rat, which there is much reason to believe escaped from some early ship and had time to become modified by the time they were discovered by naturalists. Birds abound and present many interesting facts. While their resemblance on the whole is to the avifauna of Central and South America, some extraordinary relationships to the Hawaiian fauna are apparent. Forty-six genera, according to Ridgway (1896), are represented on the islands, 28 of which are water birds wandering throughout the American tropics. One rail (*Nesofela*) is peculiar, and a sandpiper is known elsewhere only in the Sandwich Islands. Of the 13 genera of land birds, six are also represented in South and Central America, one (the bobolink) in North America, and four genera are peculiar, two of them are thrush-like birds, and two are ground sparrows. These genera include a large number of species not known outside of the archipelago. A striking feature in all branches of the local zoology is the specific disparity between animals peculiar to the different islands, each of which has its own kind. The various facts lead to the belief that an immense period of time has elapsed since the islands were colonized, that this must have gone on very slowly and accidentally (except in the case of most birds), and at long intervals, and that to a great extent there has been no intercommunication of animal life between the various islands. The archipelago is also a most fruitful illustration of insular influences on animal life and of the effects of isolation (qv). Consult Darwin, *A Naturalist's Voyage* (London, 1866), Wallace, *Geographical Distribution of Animals* (New York, 1876), Salvin, *Transactions of the Zoological Society*, vol. ix (London, 1876), Ridgway, "Birds of the Galapagos," in *Proceedings of the United States National Museum*, vol. xix (Washington, 1896), and its bibliography, Gifford, "Birds of the Galapagos," in *Proceedings California Academy of Sciences* (San Francisco, 1913).

GAL'APAS. A great giant, in Malory's *Morte d'Arthur*, with whom King Arthur fights.

GALASHIELS, gal'a-shélz'. A municipal burgh and manufacturing town in Selkirkshire, Scotland (Map Scotland, F 4). It extends for 2 miles along the Gala Water, near its confluence with the Tweed, 33 miles south-southeast of Edinburgh. It has fine municipal buildings, a corn exchange, and a library. It is the chief seat of the Scotch tweed, tartan, and leather manufactures, also produces dyestuffs, hosiery, iron and brass ware, and machinery. The annual value of its products is over \$5,000,000. The United States is represented by a consular agent. In 1599 Galashiels was created a burgh of barony, and its woolen trade dates beyond 1778, when it possessed 30 looms and three "waulk" or fulling mills. Pop., 1901, 13,598; 1911, 14,917. Consult Craig-Brown, *History of Selkirkshire* (Edinburgh, 1886), and Douglas, *History of the Border Counties* (ib., 1899).

GALATA, ga-la'ta. A suburb of Constantinople (qv). The thirteenth region or ward of Byzantine times. It was largely settled by Venetian and Genoese traders engaged in the trade of the Levant. The descendants of these Italians constitute to-day the "Levantine" of Constantinople, many of whom dwell in Galata.

The commercial activity of the Turkish capital is centered largely in this suburb at present.

GAL'ATE'A (Lat., from Gk Γαλάτεια, *Galateia*). 1 In Greek mythology, a Nereid, loved by Polyphemus. She was surprised by the latter in a grotto with her preferred lover Acis, whom Polyphemus in a fit of jealousy crushed with a rock. Acis was turned into a stream. In other legends Galatea becomes by Polyphemus the mother of Galas. The myth has been a favorite subject for poets and sculptors of ancient and modern times. In English literature it is used in Gay's *Acis and Galatea*, Proctor's *Death of Acis*, Buchanan's *Polypheme's Passion*, and Austin Dobson's *Tale of Polypheme*. 2 A statue miraculously endowed with life by Venus at the prayer of the sculptor Pygmalion (qv). 3 In Vergil's *Third Eclogue*, a shepherdess who throws an apple to her lover, Dametas, and flees to the shelter of the willows, taking care, however, to be seen, hence a type of the coquette.

GALATEA. 1 A pastoral, in prose form interspersed with lyrics, written by Cervantes in honor of his future wife, in 1583. 2 A play (originally spelled *Gallathea*), produced before Queen Elizabeth at Greenwich, London, on Jan. 1, 1582. The scene is laid in North Lincolnshire, but the piece is directly taken from Ovid's *Metamorphoses*, book ix.

GALATEA. The challenger in the races for the America's cup in 1886, when she was twice beaten by the *Mayflower*. She was a steel cutter, built at Port Glasgow in 1885, from designs by Beavor-Webb. Her length was 102 feet, with a displacement of 157 tons and a draft of 13½ feet.

GALATEA, TRIUMPH OF. A beautiful fresco in the Villa Farnesina at Rome, designed and executed by Raphael in 1514. It represents the sea nymph drawn in a shell by dolphins over a calm sea and accompanied by nereids and cupids. See RAPHAEL.

GALATÉE, ga-la'té' 1 A pastoral romance by Florian (1783), the most successful of his works. It is drawn largely from a pastoral of Cervantes, which Florian supplemented with an additional book. 2 A two-act comic opera, based on the story of Pygmalion and Galatea, with music by Massé and words by Carré and Barbier, presented at the Opéra Comique in 1852.

GALATIA, ga-la'shi'a (Lat., from Gk Γαλατία). The ancient name of a portion of Asia Minor, so called from the Gauls (Gk Γαλάται) who settled there. Early in the third century B.C. Celtic armies appeared in the Balkan Peninsula, and, though driven from Greece by their defeat at Delphi, about 278 B.C., continued to terrify Thrace (See BRENNUS, 2). About 277 B.C. the first bands entered Asia Minor on the invitation of Nicomedes, King of Bithynia, whose service they at first entered in his war with his brother. They were from three tribes—Tolistobogii, Tectosages, and Trocmi. Of these, the first invaded Æolia and Ionia, in the neighborhood of Pessinus (qv), the Tectosages, the interior, about Ancyra (see ANGORA), and the Trocmi, the coast lands of the Hellespont, around Taviun. Northern Phrygia and the border regions of Cappadocia were later conquered as a permanent home. Each of the three tribes was divided into four tetrarchies, and the 12 tetrarchs formed the supreme government, with a council of 400 as advisers. The Gauls did not settle in the cities, where the native population continued with but little

change, but, serving as mercenaries in the armies of the Greek kings of the East, made the neighboring territories pay tribute to escape their ravages. A succession of defeats at the hands of Attalus I of Pergamum, about 235 B.C., seems to have checked their incursions and to have confined them to their later boundaries between Bithynia and Paphlagonia on the north, Pontus on the east, Cappadocia and Lycaonia on the south, and Phrygia on the west. Having sided with Antiochus against the Romans, the Galatians were severely punished by the consul C. Manlius Vulso, 189 B.C. They sided with Pompeius against Mithridates, and the Romans gave one of the tetrarchs, Deiotarus, the title of King. After the death of his successor, Amyntas, Augustus made the country a Roman province, divided under Theodosius into *Galatia prima*, with the capital Ancyra, and *Galatia secunda*, with the capital Pessinus. The majority of the Gauls of Galatia retained their old Celtic language as late as the time of Jerome (fourth century), who says that they spoke the same dialect as the people about Treves; it is certain, however, that the ruling classes, like the original inhabitants, used Greek. Galatia was twice visited by the Apostle Paul (Acts xvi 6, xviii 23). Just what part of the province was visited is not clear. In the latter passage what is meant is evidently the Lycaonian part of the Roman province Galatia, in which were the cities Derbe, Lystra, and Iconium, and also, probably, the Pisidian part, in which Antioch belonged. In xvi 6 the meaning is more uncertain, since we do not know just where the missionaries turned northward, but here also it is impossible that old Galatia proper is meant. Probably the churches of Antioch in Pisidia, Iconium, Lystra, and Derbe, founded by Paul on his first missionary tour (Acts xiii-xiv), were among the churches to which the Epistle to the Galatians was addressed. In so addressing his letter, Paul evidently had in mind the relation of his readers to the Empire, not their various ethnic affinities.

GALATIANS, gal-lí'shanz, EPISTLE OF PAUL TO THE. One of the four so-called *Hauptbriefe* (i.e., most important epistles) of the Apostle Paul. The introductory paragraph (i 1-10) is marked by unusual earnestness and self-assertion, indicating how intense was the Apostle's emotion when he wrote the letter. The first main division (i 11-ii 21) is of a personal and apologetic nature, being a vigorous defense of the validity of his apostolic status and of the genu-

ineness of the gospel he professed and preached. The next main division (iii 1-v 12) is definitely doctrinal in character and unfolds the real significance of the gospel—salvation as being through *faith*, not works. The Apostle here has in mind a different and contrary view of the gospel and his whole argument is framed to controvert the erroneous opinions to which the Galatians were in danger of yielding. The third main section (v 13-vi 10) is of a practical nature, containing advice as to the true marks of the Christian life. The conclusion (vi 11-17) is a serious reiteration of the main contention of the letter, penned apparently by Paul's own hand instead of being written by the amanuensis at Paul's dictation.

The occasion of the letter is clearly revealed by its contents. Paul's Galatian converts, who owed their Christian faith to his evangelistic work among them, and who had given themselves most heartily and unreservedly to the gospel he had preached and to him as a true Apostle of the Lord (cf iii 1-5 and iv 12-20), were being persuaded to accept a so-called gospel of an entirely different type, in which circumcision and legal observances took the place of faith in God's grace in Christ as the all-sufficient ground of salvation. In other words, a Judaizing propaganda was being carried on in one of Paul's own missionary fields, a propaganda similar to that which made necessary the Apostolic Council of which we read in Acts xv, and also probably in this Epistle (chap. ii 1-10), which took place c. 49 A.D. That which disturbed Paul so profoundly was that these propagandists should have presumed to invade one of his own mission fields and seek to undo his work by insinuating (1) that he was no true Apostle and (2) that his gospel was no true gospel. The issue thus raised was a vital one. Paul saw clearly how much was at stake. For if Christianity was only a mere appendage to Judaism, then its distinctive character was gone. Paul championed the independence of Christianity and the Christian's *liberty* (v 1) in Christ and thus checked the Judaizing reaction which, had it been successful, would have put an end to the triumph of Christianity in the Gentile world.

The "Churches of Galatia" to whom the letter is addressed may have been the churches founded by Paul and Barnabas on the first missionary journey (Acts xiii-xiv), i.e., at Antioch of Pisidia, Iconium, Lystra, and Derbe, all of which were within the limits of the Roman Province of Galatia. This view, the so-called South-Galatian theory, has had the strong support of many able scholars during the past few decades. Among British scholars its foremost champion is Sir W. M. Ramsay, who has found a large following. Its chief attraction is that through Acts xiii-xiv we are able to know something definite as to the origin and character of the churches addressed.

The older view, the so-called North-Galatian theory, still held by a large number of very able scholars, holds that the churches addressed were in old Galatia proper and were founded by Paul on his second missionary journey, of which work we have an obscure hint in Acts xvi 6, also a hint of a second visit in Acts xviii 23, cf Gal iv 13 (where "the first time," Gk. *πρῶτον*, may have its literal meaning of "the former," i.e., of two visits). The question is a complicated one, and the arguments in

favor of either one of the two theories are so nearly balanced by those in favor of the other that a final decision of the problem seems impossible. The date of the Epistle is also a matter of dispute. On the North-Galatian theory it must have been written after the visit of Acts xviii 23 and probably after his arrival at Ephesus (Acts xix 1), to which place he came not long after having visited the region of Galatia. How long it was, after leaving his churches in a satisfactory condition, before Paul received the surprising news that compelled him to write the letter, is nowhere indicated (in 1 6 "so quickly," R V, refers simply to the suddenness of the change of opinion). The view that seems to have most in its favor is that the letter was written soon after Paul left Ephesus (Acts xx. 1 ff) while *en route* to Corinth. Galatians, on this view, was written after 2 Corinthians, and not long before Romans, which in many respects enlarges and develops the argument of Galatians.

On the South-Galatian theory, in case *πρότερον* (iv 13) means simply "formerly," many dates, including the one preferred above, are possible. But if *πρότερον* is taken in its strict comparative sense, then the epistle cannot have been written later than some time between the second and third missionary journeys. Many advocates of the South-Galatian theory consider it the earliest of Paul's extant letters.

The literature on Galatians is very extensive and constantly increasing. The older literature is fully listed in J B Lightfoot's great commentary (11th ed, 1892). The more recent literature will be found adequately presented in James Moffat's *Introduction to the Literature of the New Testament* (New York, 1911). A carefully balanced survey of the two rival theories will be found in *Encyclopædia Biblica*, art Galatia (4 vols, ib, 1899-1903). Consult also Zahn, *Introduction to the New Testament* (Edinburgh, 1909); Kirsopp Lake, *The Earlier Epistles of Paul* (London, 1911), the forthcoming commentary by E D Burton in the *International Critical Commentary*, and for exegesis the very suggestive study by Frederick B Westcott, *St Paul and Justification* (London, 1913).

GALATINA, ga'la-tē'na. A city in the Province of Lecce, south Italy, 45 miles south-east of Brindisi, 14 miles south of Lecce. The fine Gothic church of Santa Caterina, dating from 1384, contains the grave of Balzo Orsini, Count of Lecce, and frescoes by Francesco d'Arezzo (1435). Galatina markets leather, oil, wine, and cotton, and has a gymnasium and a technical school. Pop (commune), 1901, 14,000, 1911, 15,400.

GALATZ, ga'lats, or **GALACZ** (Rum. *Galati*). A city of Rumania, in Moldavia, situated on the left bank of the Danube, between the mouths of the Pruth and the Sereth (Map Balkan Peninsula, F 2). It is divided into the old and the new town. The latter is well built and is the seat of a bishop and of the European commission for the control of navigation on the Danube. There are numerous extensive storehouses, grain elevators, a shipyard, and a large bazar. Galatz is one of the leading ports on the Danube. The imports, for the most part, consist of textiles and metal goods; the exports are mainly cereals, cattle, and lumber. The annual shipping amounts to about 1,000,000 tons. There are numerous foreign consular agents. Pop,

1890, 59 143, 1899, 62,678, 1909, 66,000. Galatz figured prominently in the wars between Russia and Turkey. It was a free port previous to 1883.

GALAUP, J F DE. See LAPÉROUSE.

GAL'AXY (from Lat *galaxias*, Gk γαλαξίας, *galaxias*, milky way, from γάλα, *gala*, milk), or **MILKY WAY**. The luminous band, seen at night, which forms a zone encircling the sphere almost in a great circle. This great zone has occupied the same position in the heavens since the earliest ages. Its course, as traced by the naked eye, following the line of its greatest brightness, conforms nearly to that of a great circle, called the "galactic circle," which is inclined at an angle of about 62° 30' to the equator, and cuts it in two points whose right ascensions are 6 h 47 m and 18 h 47 m, the former situated in Monoceros, the latter in Aquila. In Centaurus it opens up into two branches—one faint and interrupted, the other bright and continuous—which unite again in Cygnus after remaining distinct for about 120°. Throughout this space the galactic circle is intermediate to the two branches, lying nearer the brighter and more continuous left branch. The Galaxy is wanting in regularity of outline. Besides the two great branches into which it divides, it has many smaller ones which spring out from it. One such branch runs out towards Scorpio and envelops the bright star Antares. In Argo the undivided stream diffuses itself very broadly and opens out into a fanlike expanse of interlacing branches nearly 20° in breadth. In the same region the branches terminate abruptly, and a wide gap presents itself in the zone, on the opposite side of which it recommences its course with a similar assemblage of branches. At other points its course is irregular, patchy, and winding, while at more than one point, in the midst of its brightest parts, broad dark spaces occur. One of these, known from early times among navigators as the "coal sack," is a singular pear-shaped vacancy about 8° long and 5° broad, occurring in the centre of a bright area overlying portions of the constellations of the Cross and Centaur. The coal sack occupies about half the breadth of this bright space and presents only one star visible to the naked eye, though it contains many telescopic stars. Its blackness, which attracts the most superficial observer, is thus due to the contrast with the brilliant ground by which it is surrounded. Other dark spaces are to be found in Cygnus and Sagittarius. The Galaxy was examined by Sir William Herschel with his powerful telescope and found to be composed mainly of stars, with patches of nebulosity which even the best modern instruments have been unable to resolve. Modern photographic researches have added but little to Herschel's observations as to the structure of the Galaxy, but some of his conclusions concerning the form of the sidereal universe are no longer tenable. See **STAR**.

GAL'BA, SERVIVS SULPICIUS. 1. A Roman general, notorious because, when prætor in Spain, in 151 B.C., he murdered some Lusitanians, with their wives and children, after they had been induced to surrender to him by promises of grants of land. In Cicero's opinion he was the foremost orator of his time. 2 (5 B.C.-69 A.D.) Roman Emperor from June, 68 A.D. to Jan 15, 69. Born of a noble and wealthy family, he was raised to the consulship in 33, and, in the administration of the Province of

Aquitania under Tiberius, of Germany under Caligula, of Africa under Claudius, and of Hispania Tarraconensis under Nero, he distinguished himself for bravery, strictness, and justice. His friends had urged him, on the death of Caligula, to take possession of the throne, but he continued faithful to Claudius and therefore stood high in his favor. In 68 Julius Vindex rose with the Gallic legions against Nero and called on Galba to assume the Imperial dignity and thus rid the earth of its oppressor Galba, who had been informed that Nero was contriving his death, came forward against him at first as the legate of the Roman people, and it was only when he heard of Nero's death that he proceeded to Rome to take possession of the throne offered him by the Prætorians. Galba was now upward of 70 years old, and it soon appeared that his character had deteriorated, as, indeed, had already been manifested in his later administrations. Indulgence to greedy favorites, ill-timed severity—above all, avarice, which led him to withhold the usual donatives to the troops—made him unpopular. The legions in Upper Germany called on the Prætorians to choose another emperor, Galba thought to soothe them by adopting L. Calpurnius Piso Frugi Licinianus as his coadjutor and successor, but he thus offended Otho (qv), who, as administrator of Lusitania, had supported Galba and looked to be rewarded. The Prætorians, who had received no donative on the occasion of Piso's adoption, were easily excited to insurrection by Otho, and the Emperor, having gone out to quell the rebellion, was cut down by the soldiers as he crossed the Forum. Consult the lives by Plutarch and Suetonius, and Henderson, *Civil War and Rebellion in the Roman Empire* (London, 1908).

GAL'BANUM (Lat., from Gk χαλβάνη, *chalbanē*, from Heb *khebenah*, galbanum, from *khālab*, to be fat). A soft, ductile, white gum resin used in medicine like asafoetida, principally in cases of chronic catarrh, and, especially by the Germans, in amenorrhœa and chronic rheumatism. Though sometimes applied externally in plasters as a mild stimulant in indolent swellings, it is generally administered in the form of the compound galbanum pill, which contains galbanum, sagapenum, asafoetida, myrrh, and soft soap. It is brought from the Levant in tears or in large masses, which become yellowish with age, and which have a peculiar balsamic odor and an acrid, bitter taste. Although it is mentioned in Ex xxx 34, the plant from which it is derived has not been definitely determined. Since *Polylophium orientale*, *Ferula galbaniflua*, and *Ferula rubricaulis*, all of the family Umbelliferae, have been supposed to be the source of galbanum, it is highly probable that it is the product of an umbelliferous plant. But the confidence with which the species have been so represented has perhaps prevented travelers from making that inquiry into the subject which otherwise they might have made. *Peucedanum galbanum*, a plant of this order found at the Cape of Good Hope, yields a gum resin very similar to galbanum. See GUMS.

GALBRAITH, gal'brāth, JOHN (1846-1914) A Canadian civil engineer and educator. He was born in Montreal and was educated at Toronto University, where he graduated in 1868 at the head of his class. After a course in engineering and surveying he was employed at

various times as an engineer during the construction of the Intercolonial, Midland, and Canadian Pacific railways. In 1880 he organized a journey of exploration from Georgian Bay to Fort Churchill on James Bay, and then easterly to Lake Mistassini. Upon the opening in Toronto in 1878 of the School of Practical Science for Ontario, he was appointed professor of civil engineering therein, and in 1889 he became principal of the school. Later he was also made dean of the faculty of applied science and engineering in Toronto University. Galbraith was one of the founders of the Canadian Society of Civil Engineers, of which he was elected president in 1908. He was also elected an associate of the Institute of Civil Engineers, England, and vice president of the Canadian Institute, Toronto. After the collapse in 1907 of the great Intercolonial Railway bridge across the St. Lawrence River near Quebec, he was appointed a member of the Royal Commission to investigate and report thereon.

GALCHAS, gal'chaz The designation of a number of tribes in the plateaus and valleys of the Pamir and Hindu Kush, in Ferghana, the basins of the Zerafshan, Amu Darya, etc., who physically belong to the white race and linguistically to the Aryan stock. They are generally thickset, brachycephalic, and in some other respects resemble what Ripley (1899) calls "the ideal Alpine or Celtic European race"—a relationship recognized by Topinard in 1878, and since then by Ujfalvy, etc. They are thus one of the farthest Aryan outliers in Central Asia. In religion they profess, mostly, Islam of the Sunnite creed. Since their residence in this region their physical characteristics have been somewhat modified by intermixture with other peoples of the environment. The anthropology of the Galchas has been discussed by Ujfalvy in the *Revue d'Anthropologie* (Paris, 1879), Bidulph in *Tribes of the Hindu-Kush* (London, 1880), and the *Bulletins de la Société d'Anthropologie de Paris* for 1887, and more briefly by Ripley in his *Races of Europe* (New York, 1899) and by Keane in *Man Past and Present* (Cambridge, 1900).

GALDÓS, gal-dós', BENITO PÉREZ. See PÉREZ-GALDÓS, BENITO.

GALE (probably connected with Dan *gal*, Icel *galm*, furious, from *gala*, to chant). A strong wind varying in velocity (according to the technical classification) from 40 to 65 miles per hour. Gales are described as moderate, fresh, and strong, or whole gales. On sailing ships, ordinarily, very little sail is carried in strong gales; when they are very strong, only close-reefed topsails, staysail and spanker. If running with the wind free, a close-reefed foresail may also be set. In fresh or moderate gales more sail is carried. See WIND, BEAUFORT SCALE.

GALE, IN BOTANY. See CANDLEBERRY.

GALE, HENRY GORDON (1874—) An American physicist. He was born at Aurora, Ill., and graduated in 1896 from the University of Chicago (Ph D, 1899), where he taught physics after 1899, becoming associate professor in 1911 and dean in the Senior College in 1908. In 1906 he was physicist of the Solar Observatory, Mount Wilson, Cal., and in 1909-11 research associate in the Carnegie Institution's station at the same place. Besides his articles on optics in scientific periodicals, he is co-author with R. A. Millikan of *A First Course in*

Physics (1906) and *A Laboratory Course in Physics* (1906), and with Walter S. Adam and *An Investigation of the Spectra of Iron and Titanium under Moderate Pressures* (1912).

GALE, NORMAN ROWLAND (1862–) An English poet, born at Kew in Surrey, and educated at Exeter College, Oxford. Between 1888 and 1891 he published privately at Rugby several verse pamphlets. In 1892 appeared *A Country Muse*, which was followed later in the same year by a new series under the same title. These collections consist mainly of lyrics of love and nature. He later published *Orchard Songs* (1893), *A June Pastoral* (1894), which is an idyl in mixed prose and verse, *Songs for Little People* (1896), *Barty's Star* (1903), *More Cricket Songs* (1905), *Song in September* (1912).

GALE, SAMUEL (1783–1865) A Canadian jurist. He was born in St. Augustine, Fla., and in his youth was taken by his father, an English officer, to Quebec, where he was educated. He studied law and was called to the bar in 1808. Having been appointed a magistrate in the region then known as the Indian Territories, he went to the northwest in 1815 with the fifth Earl of Selkirk (qv). During the administration (1819–28) of the ninth Earl of Dalhousie as Governor-General of the British North American Provinces, widespread complaints were made in Lower Canada as to the arbitrary conduct of that official towards the politically disaffected in the province, and Gale went to England as a representative of the English-speaking inhabitants to defend Dalhousie's course. In 1829 he was appointed chairman of quarter sessions, and in 1831–49 was a judge of the Court of Queen's Bench of Lower Canada. As a judge, he upheld martial law as enforced in the rebellion of 1837–38. Though strongly Conservative in his political views, he was an uncompromising enemy of slavery and eagerly supported the agitation in 1860 which was started to prevent the extradition of John Anderson, a runaway colored slave from Missouri. He published in the *Montreal Herald*, over the signature of "Nerva," a series of papers decidedly Conservative in tone, they produced a deep impression. He died in Montreal.

GALE, THEOPHILUS (1628–78) An English Nonconformist divine. He was born at Kingsteignton, Devonshire, and was educated at Magdalen College, Oxford. After preaching at Winchester Cathedral for five years, he was dismissed because of his Nonconformist views (1662) and devoted himself to teaching. Shortly before his death he was appointed to the pastorate of an independent congregation in Holborn. His fame rests chiefly upon *The Court of the Gentiles*, or, *A Discourse Touching the Original of Humane Literature from the Scriptures and Jewish Churches* (1669–78), in which he expresses the view that all theology, philology, and philosophy may be traced to Jewish sources.

GALE, THOMAS (c1635–1702) An English author. He was born at Scruton, Yorkshire, and was educated at Westminster School and at Trinity College, Cambridge. He was regius professor of Greek at Cambridge from 1666 to 1672, high master of St. Paul's School in 1672–97, and afterward dean of York. Widely celebrated for his scholarship, he published *Opuscula Mythologica, Ethica et Physica* (10 parts,

1671), *Historiæ Poeticæ Scriptores Antiqui* (1675), *Historiæ Britannicæ, Saxonicæ, Anglo-Danicæ Scriptores* (1691), *Rhetores Selecti*, *Demetrius Phalereus*, *Tiberius Rhetor*, *Anonymus Sophista*, *Severus Alexandrinus*, *Græce et Latine* (1676).

GALE, ZONA (1874–) An American writer. She was born at Portage, Wis., and in 1895 graduated from the University of Wisconsin (M.L., 1899). Until 1901 she worked on the staffs of Milwaukee newspapers, and from 1901 to 1904 she was staff member of the *New York World* and wrote for other papers. She is author of *Romance Island* (1906), *The Loves of Pelleas and Ettarre* (1907, new ed., 1913), *Friendship Village* (1908), *Friendship Village Love Stories* (1909), *Mothers to Men* (1911), *Christmas* (1912), *When I Was a Little Girl* (1913).

GALEAZZO, ga'lā-at'sō, GIAN. See VISCONTI. **GA'LEN** (Gk Γαλνός, *Gallnos*), or **CLAUDIUS GALENUS** (130–201) A celebrated physician, born at Pergamus in Mysia. He first studied medicine at Pergamus, afterward at Smyrna, Couth, and Alexandria. He returned to his native city in his twenty-ninth year and was at once appointed physician to the school of gladiators. In his thirty-fourth year he went to Rome, where he stayed about four years, and was offered, but declined, the post of physician to the Emperor. He returned to his native country in his thirty-eighth year, but soon received a summons from the emperors M. Aurelius and L. Verus to attend them on the northeastern frontiers of Italy, whither they had gone to make preparations for a war with the northern tribes. He joined the camp towards the end of the year 169, but, a pestilence breaking out, the emperors and their court set off for Rome, whither Galen accompanied or followed them. The place and date of his death are not known with certainty, but it is believed that he died in Sicily.

The works that are still extant under the name of Galen consist of 83 treatises acknowledged to be genuine, 19 whose genuineness has been questioned, 45 undoubtedly spurious, 19 fragments, and 15 commentaries on different works of Hippocrates. Besides these, he wrote a great number of works whose titles only are preserved, and altogether it is believed that the number of his distinct treatises cannot have been less than 500. We may divide his works into (1) those on anatomy and physiology, (2) those on dietetics and hygiene, (3) those on pathology, (4) those on diagnosis and semeiology, (5) those on pharmacy and materia medica, (6) those on therapeutics, including surgery, (7) his commentaries on Hippocrates, and (8) his philosophical and miscellaneous works. We have most of these works in Greek, the language in which they were originally written, some are, however, preserved in Latin translations, and a few only in Arabic. His most important anatomical and physiological works are *De Anatomicis Administrationibus* and *De Usu Partium Corporis Humani*. His anatomical and physiological writings are by far the most valuable of his works. They contain undoubted evidence of his familiarity with practical anatomy, but whether he derived his knowledge from dissections of human bodies or those of the lower animals is uncertain. The latter is the most probable view, (1) because he frequently recommends the dissection of apes,

bears, goats, etc., and (2) because he mentions, as something extraordinary, that those physicians who attended the Emperor M. Aurelius in his wars against the Germans had an opportunity of dissecting the bodies of the barbarians. His pathology was very speculative and imperfect. In his diagnosis and prognosis he laid great stress on the pulse, on which subject he may be considered as the first and greatest authority, for all subsequent writers adopted his system without alteration. He likewise placed great confidence in the doctrine of critical days, which he believed to be influenced by the moon. In materia medica his authority was not so high as that of Dioscorides. Numerous ingredients, many of which were probably inert, enter into most of his prescriptions, and he seems to place a more implicit faith in amulets than in medicine. His practice is based on two fundamental principles: (1) that disease is something contrary to nature and is to be overcome by that which is contrary to the disease itself, and (2) that nature is to be preserved by that which has relation to nature. Judged by modern standards, his ideas and practice were of course absurd.

Before Galen's time the medical profession was divided into several antagonistic sects, including the Dogmatici, Empirici, Eclectici, Pneumatici, and Episyntectici. After his time all these sects merged into one, the Galenic. The subsequent Greek and Roman medical writers were mere compilers from his writings, and as soon as his works were translated (in the ninth century) into Arabic, they were at once adopted throughout the East, to the exclusion of all others. The Greek text has been published four times. The first edition was the Aldine, printed in 1525, in five folio volumes, the most complete edition is that of Kuhn, in 20 octavo volumes, the publication of which extended from 1821 to 1833. Galen's minor works were edited by Muller and Helmrich, and published in three volumes at Leipzig (1884-93). Several of Galen's works have been translated into French or German. Kidd, in the *Transactions of the Provincial Medical and Surgical Association*, vol. vi (London, 1837), gives a good account of Galen's anatomical and physiological knowledge. Consult Daremberg, *Exposition des connaissances de Galien sur l'anatomie* (Paris, 1841), an epitome of which in English has been published, from the pen of Coxe (Philadelphia, 1846). Consult also Ilberg, "Die Schriftstellerei des Klaudios Galenos," in the *Rheinisches Museum für Philologie* for 1889, 1892, and 1896. See EMPIRIC.

GALEN, ga'l'en, CHRISTOPH BERNHARD VON (1606-78). A German prelate and soldier. He was born in Bispinck, Westphalia, and was educated at the universities of Cologne, Mainz, Louvain, and Bordeaux. After being canon of Munster and commander of a regiment on the Rhine, he was made Prince Bishop of Munster in 1650. He was exceedingly ambitious and strove to increase his power, both by reducing his subjects to complete submission and by extending his possessions without. By 1661 he had made himself master of the city, and he turned at once to foreign alliances to carry out his designs. In 1664 he led his forces against the Turks. With a well-trained army he joined England against the Netherlands in 1665, but was forced to make peace in 1666. He joined Louis XIV against the Dutch (1672)

and waged war successfully against them and then turned his arms against the Elector of Brandenburg and the Emperor. In 1675 he joined the Emperor against France, he next helped the Danes against Sweden and secured the Duchy of Verden and part of the Duchy of Bremen, in 1677 he helped the Spaniards against the French, in 1678 he invaded East Friesland and extorted a large war indemnity. He died Sept. 19, 1678, during the negotiations leading to the Peace of Nymwegen. In spite of his military activity he found time to introduce many meritorious ecclesiastical reforms. Consult Minn, *Die Lebensbeschreibungen des Christoph von Galen* (Munster, 1907), and Heers, *Die Wahl Christoph von Galen zum Fürstbischof von Munster* (ib., 1908).

GALEN, PHILIPP. See LANGE, ERNST, P. K. **GALENA**. A city, port of entry, and the county seat of Jo Daviess Co., Ill., 17 miles by rail southeast of Dubuque, Iowa, on the Galena River, which affords good water power, and on the Illinois Central, the Chicago and Northwestern, and the Burlington railroads (Map Illinois, D 1). It has a public library, a fine United States government customhouse, a public hospital, an artesian water system, and Grant Park, in which is a statue of General Grant. Galena has extensive lead and zinc mines, two large iron foundries, machinery-manufacturing plants, iron-bridge works, furniture and cigar factories, brickyards, marble, granite, and cement works. Under a charter of 1852 the government is vested in a mayor, biennially elected, and a city council. The city contains a large electric-light plant, which furnishes light and power to the mines and towns within a radius of 60 miles. Pop., 1900, 5005, 1910, 4835. Galena (named from the abundance of lead sulphide or galena ore in the vicinity) was settled in 1827 and was incorporated as a city in 1839. Gen. U. S. Grant lived here from May, 1860, until the opening of the Civil War, and the Grant homestead still remains as one of the features of the city.

GALENA. A city in Cherokee Co., Kans., 7 miles west of Joplin, Mo., on the Missouri, Kansas, and Texas and the St. Louis and San Francisco railroads (Map Kansas, H 8). It is engaged chiefly in mining, being the centre of an important lead and zinc region. Among the industrial establishments are lead smelters, a large foundry, and a planing mill. The government is administered by a mayor, who holds office for two years, and a unicameral council, which elects the deputy marshals and police. The mayor nominates the collector, sexton, and engineer, other officials are chosen by the people. Galena was settled and incorporated in 1877. The water works are owned by the city. Pop., 1890, 2496, 1900, 10,155, 1910, 6096.

GALENA (Lat., from Gk. γαλῆνη, galēnē, lead ore), or LEAD GLANCE. A lead sulphide that crystallizes in the isometric system, notably in cubic or in octahedral crystals. It also occurs in fibrous, granular, or cryptocrystalline massive forms, and has a pure lead-gray color and a metallic lustre. Galena is characterized by a marked cubic cleavage and by its great relative weight. It occurs in beds and veins, both in crystalline and amorphous rocks, and is one of the most widely distributed of the metallic sulphides. It is found in Freiberg, Saxony, in Příbram, Bohemia, in Spain, in Cornwall, Derbyshire, and Cumberland, England, in New

South Wales, Mexico, and at various other localities throughout the world. In the United States it occurs in caves or gash veins in stratified limestone, especially at various localities in Illinois, Iowa, Missouri, and Wisconsin. When pure, it contains 86.6 per cent of metallic lead, but it is usually accompanied by other metals, such as antimony, bismuth, cadmium, zinc, and especially silver. It is an important ore of lead and is often worked also for silver, especially in Colorado, Idaho, Montana, and other Rocky Mountain States, and in British Columbia. A coarse-grained variety of galena is used to glaze pottery and is sometimes called *pottery's ore*. See LEAD.

GALENIC, GALENIST. Words having reference to the controversies of the period of the revival of letters, when the authority of Galen was strongly asserted against all innovations and particularly against the introduction of chemical methods of treatment into medicine. The Galenists adhered to the ancient formulas, in which drugs were prescribed either in substance or in the form of tinctures and extracts, etc., while the chemists professed to extract from them the essences, or quintessences—i.e., substances in small bulk, presumed to contain the whole virtues of the original drugs in a state of extreme concentration, or purified from all gross and pernicious or superfluous matter. Medicines prepared by decoction or infusion, as distinguished from those prepared by chemical processes, are still termed *galenic medicines*.

GALEOMYOMACHIA, gá'lé-ó-mi'ó-má'ki-a (Lat. from Gk γαλεομιομαχία, Battle of the Cats and Mice). A Greek mock-heroic poem by Theodorus Prodromus, a twelfth-century monk. In its general features it is only an imitation of the *Batrachomyomachia* (q.v.).

GALEOPITHECUS. See COBEO.

GALEOTTO, gá'lá-ó'tó, PRINCE. Another title of Boccaccio's *Decameron* (q.v.), suggested by the name of the book, to the reading of which Dante makes Francesca attribute her sin with Paolo.

GALERIE DES GLACES, gá'lé-ré' dá glas (Fr., Gallery of Mirrors). A famous gallery in the Palace of Versailles, France, so called because of the range of huge plate-glass mirrors which on one side of the room correspond to the great windows on the other. It is one of the most magnificent rooms in the world, and forms the chief feature of the new garden front or wing first added by Mansart, under Louis XIV, to the earlier palace of Louis XIII. It is nearly 250 feet long, 40 feet wide, and over 20 feet high, and is profusely adorned with paintings, etc., of the time of Louis XIV. It was designed for balls and fêtes and on particularly grand occasions was also used as the throne room. In it William I was crowned German Emperor in 1871 during the siege of Paris.

GALERIUS, VALERIUS MAXIMIANUS (?-311 A.D.). A Roman Emperor (305-311). He was born, of humble parentage, near Serdica in Dacia, entered the Imperial army, and rose from one grade of military rank to another until Diocletian conferred on him, along with Constantian Chlorus, the title of Cæsar (292) and gave him his daughter in marriage and the government of the Illyrian provinces. On the abdication of Diocletian (305), he and Constantian became *Augusti*, or joint rulers, of the Roman Empire. On the death of Constantian at York (306), the troops in Britain and Gaul immediately declared their allegiance to his

son Constantine (afterward Constantine the Great, q.v.), much to the chagrin of Galerius, who expected the entire sovereignty of Rome to fall into his hands. He died in 311. Galerius was a brave soldier and a skillful commander, but appears to possess no other claims to the respect of posterity. He hated the Christians, and it is believed that it was he who forced Diocletian to issue his famous edict against them, which caused the last of the Imperial persecutions. It is highly probable that his treatment of the adherents to the Christian faith was determined in great part by a politic opposition to Constantian and his son, who tolerated, and even respected, the new opinions and practices.

GALES, JOSEPH (1786-1860). An American journalist, born in Eckington, Yorkshire, England. His father, Joseph Gales (1760-1841), was a printer in Sheffield, who was compelled to emigrate to America in 1793 because of his republican principles. The son was educated at the University of North Carolina, followed the trade of his father, and in 1807 settled in Washington, where he became the assistant and partner of Samuel Harrison Smith in the publication of the *National Intelligencer*. In 1810 Gales became sole proprietor of the journal and made it a triweekly publication, and in 1813, he having previously formed a partnership with his brother-in-law, William Winston Seaton, the paper was issued daily and so continued until 1867, after the death of both publishers. For many years Gales and Seaton were the official printers to Congress, and the files of the *National Intelligencer*, containing a running account of the debates in both Houses, are one of the most valuable sources of United States congressional history for more than a quarter of a century. Under the title of *Annals of Congress* Gales and Seaton published (1834-56, in 42 vols.) the debates in Congress from 1793 to 1824, together with the more important documents and laws, and under the title of *Register of Debates in Congress* (29 vols.), continued the publication in similar form to cover the years 1824-37.

GALESBURG. A city and the county seat of Knox Co., Ill., 43 miles east by north of Burlington, Iowa, on the Chicago, Burlington, and Quincy and the Atchison, Topeka, and Santa Fe railroads (Map Illinois, D 4). It is the seat of Knox College (nonsectarian), founded in 1837, Lombard College (Universalist), established in 1852, Corpus Christi Lyceum, St Mary's School, and St Joseph's Academy (Roman Catholic). It is the scene of a famous Lincoln-Douglas debate of 1859. The city has an attractive situation and is widely known for its educational facilities. There are several fine parks, two hospitals, and a public library. Among the industrial establishments are the Burlington Railroad shops and stockyards, brickmaking plants, boiler and engine works, iron foundries, farming-implement works, cornice works, carriage and wagon factories, and overall, mitten, and typewriter factories. Galesburg also has extensive wholesale and jobbing interests. The government is administered under a general State law of 1872, by a mayor, elected every two years, and a unicameral council. The majority of subordinate administrative officials are appointed by the executive, subject to the consent of the council. The city owns and operates its water works and electric-light plant. Pop., 1900, 18,607, 1910, 22,089, 1914 (U.S. est.), 23,570, 1920, 23,834. Galesburg was settled in 1837.

by a company from New York State and was named in honor of the Rev. George W. Gale, who had planned the town as a site for a theological seminary and as a rallying place for "free-soilers," since the proslavery immigration was then threatening to make Illinois a slave State. The city was chartered in 1857. Consult *History of Knox County* (Chicago, 1878), and A. W. Dunn, *An Analysis of the Social Structure of a Western Town* (ib, 1896).

GALETON A borough in Potter Co., Pa., 50 miles southeast of Bradford, on the Buffalo and Susquehanna Railroad, and on Pine Creek (Map Pennsylvania, F 2). It has railway shops, lumber and knitting mills, a gasket factory, stove and heading mills, a hub factory, brewery, a tannery, and a stone quarry. Pop., 1900, 2415, 1910, 4027.

GALI, gá-le FRANCISCO (1539-91). A Spanish navigator, born in Seville. The Viceroy of Mexico engaged him to find a harbor on the western coast of America for Spanish vessels returning from the East Indies, and he set out from Acapulco with that object in view. He visited the Philippines and other neighboring islands and Japan and on his way home (1584) discovered the coast of California. Linschot translated into Dutch Gali's account of his expedition and included it in his work *Track Charts of the Indies* (1596), and Wolf made an English translation in 1598. From a French version of the same narrative a Spanish translation was also made (1802), and there are in the National Library of Mexico fragments of an account of the expedition written by Gali, under the title *Viaje, descubrimientos y observaciones de Acapulco á Filipinas*.

GALIANI, gá-lyá'né, FERDINANDO (1728-87). An Italian savant, born in Chiati in the Abruzzi. Philosophy, archaeology, history, and more especially the science of political economy, were his favorite studies, but he first attracted notice by a clever squib on the death of the public executioner. This consisted of a collection of essays eulogistic of the deceased, in which the style of the president and leading members of the Neapolitan Academy was admirably imitated. His next publication, *Della Moneta*, written when he was barely 20, evinced his great learning and powers of reflection and is a contribution to the science of political economy. In 1751 he visited the chief cities of Italy and was everywhere honorably received. On his return to Naples he collected a rich assortment of stones and volcanic matter of Vesuvius, which, accompanied by a thesis, he subsequently presented to the Pope. On one of the stone specimens he engraved the following suggestive inscription: "Beatissime pater, fac ut lapides isti panes fiant," and received, by way of answer, the rich prebend of Amalfi, for which he had previously qualified himself by entering into orders. In 1759 he became Secretary to the Neapolitan Embassy at Paris, from which period dates a voluminous correspondence with political, scientific, and literary personages of the day, an edition of which has appeared by Percy and Maugras (Paris, 1881). In 1767 he visited England, whose social and political institutions he studied. On his return to Paris he wrote another treatise on political economy, entitled *Dialoghi sul commercio del grano*, in which he argues against both the extreme protectionists and the pure free traders. Being recalled to Naples, he was successively appointed to

various posts of trust and importance. He died at Naples in 1787, leaving behind him rare collections of music manuscripts, cameos, etc. He was as remarkable for his gaiety as for his learning. Consult Diodati *Vita dell' abate Ferdinando Galiani* (Naples, 1878), Mattei, *Galiani ed i suoi tempi* (ib, 1879), Contes, *Lettres et pensées de l'abbé Galiani* (Paris, 1866), Du Bois-Reymond, *Darwin versus Galiani* (Berlin, 1876), Brunetiere in *Etudes critiques*, vol. II (Paris, 1889).

GALICIA, ga-lish'i-a (Ger *Galizien*). The largest of the Austrian crownlands constituting the northeastern part of the Empire, bounded by Russia on the north and east, Bukowina on the southeast, Hungary on the south and south west, and Austrian and Prussian Silesia on the west. Its area is 30,311 square miles. Separated from Hungary by the Carpathians, Galicia inclines towards the north, the interior consisting mostly of hills and elevated plateaus. The northern part is a gently rolling plain. Galicia is traversed by the Vistula and its affluents, and also by the Dniester, which drains the southern part of the crownland. The latter river flows southeast and is navigable from Sambor. The Pruth also flows through the southern part of Galicia. The Vistula is navigable at Cracow and, flowing northeast, forms part of the boundary of Russian Poland. Among its tributaries in Galicia are the San and Dunajec, both navigable, and the Bug. There are no lakes of consequence, but mineral springs abound, some of them of more than provincial repute. The climate, owing to the exposed northern position of the crownland, is colder than that of any other part of Austria-Hungary. The winters are generally long and severe, while the summers are hot. At Lemberg the mean annual temperature is 46.2°.

Galicia is more purely agricultural than any other of the crownlands of Austria, no less than 77 per cent of its population depending for a living directly on the soil. The soil, with the exception of some sandy and marshy districts, is fertile. The production of cereals is generally more than sufficient to meet the domestic demand, considerable quantities being exported. Of the total area of approximately 7,850,000 hectares, arable land amounted in 1910 to about 3,802,000 hectares, gardens, 108,700, meadows, pastures, etc., 1,646,200, woodland, 2,019,200, lakes, marsh, etc., 21,000, unproductive (untaxed), 252,000. In 1912 the arable land amounted to 3,806,700 hectares. The table below shows the area in hectares and production in metric quintals of the principal crops in 1911 and 1912, with the average production per hectare in 1912.

	Hectares		Quintals		Qs ha
	1911	1912	1911	1912	
Wheat	529,241	567,935	6,382,251	7,637,250	13.4
Rye	701,746	697,973	8,319,458	8,616,828	12.3
Barley	340,034	317,208	4,299,123	3,734,013	11.8
Oats	705,613	690,238	8,435,085	7,025,788	10.2
Corn	62,598	61,343	719,881	664,657	10.8
Buckwheat	61,347	61,007	612,951	463,506	7.6
Pulse	128,126	129,217	1,417,348	1,086,973	8.4
Hops	2,166	2,175	7,164	11,565	5.3
Potatoes	514,226	506,107	64,831,058	53,880,591	106.5
Sugar Beets	6,233	6,448	1,376,715	1,474,982	228.8
Cabbage	16,697	17,073	2,230,794	2,837,830	166.2
Tobacco	1,938	1,437	28,284	22,548	15.7

More than one-half of the horses of Austria are in Galicia, and more than one-fourth of the cattle and the swine. At the end of 1910 Galicia had 905,807 horses, 2,505,012 cattle (of which 1,591,548 cows), 1,835,935 swine, 358,959 sheep, and 19,284 goats. The unequal distribution of the land is shown by the fact that while one-third of the cultivable area is in the hands of large landholders owning estates of over 1400 acres each, about one-half consists of holdings of less than 14 acres in extent. This state of affairs, together with the industrial backwardness of the country, is chiefly responsible for the wretched condition of the agricultural classes. Most of the peasants are unable to make a living from their small farms, and consequently large numbers are obliged to emigrate for a part of the year to Russia, Russian Poland, and Germany, where they work for low wages, while their families attend to the farms at home.

The forests of Galicia occupy about 25.7 per cent of the total area of the country and yield large quantities of timber for export to foreign countries, chiefly to Germany. The mineral resources of Galicia are not important, with the exception of coal, salt, and petroleum. Of rock salt there are extensive deposits, those of Wieliczka being famous. Petroleum is obtained in large quantities, and the refining industry is assuming very great importance. In 1912 the coal output amounted to 1,910,532 metric tons, or a little less than one-eighth of the total output of Austria. The value of the salt production in 1911 was 18,046,000 kronen and in 1912 16,898,000 kronen. Austrian petroleum production is limited to Galicia. In 1900 the combined output of petroleum and ozocerite was 3,492,167 metric quintals, valued at 22,699,354 kronen, in 1910, 17,681,885 quintals, 46,992,059 kronen, in 1911, 14,897,824 quintals (of which 14,878,421 quintals petroleum and 19,403 quintals ozocerite), 49,608,865 kronen. The manufactured articles of Galicia are mainly the output of house industries. Weaving, brewing, and distilling, and the production of small wooden articles are the leading industries. There is, however, an improvement in some branches of manufacture, notably in that of textiles. The trade is almost exclusively in the hands of the Jews. The leading exports are petroleum, salt, ozocerite, lumber, grain, cattle, and linens. In 1911 there were 2560 miles of railway.

The constitution of Galicia dates from 1861. The Diet is composed of 154 members, consisting of the three archbishops, five bishops, two rectors of universities, 44 representatives of the landed aristocracy, 20 representatives of towns and industrial centres, 3 from the chambers of commerce and industries, and 77 from the rural communities. In the Austrian Reichsrat Galicia is represented by 78 delegates, of whom 15 are elected by all voters, while, of the remaining 63, 20 are sent by the large landholders, 13 by the town, 3 by the chambers of commerce and industry, and 27 by the rural communities. For the purpose of administration Galicia is divided into 82 administrative districts and the two cities of Lemberg and Cracow.

The population of Galicia increased from 6,607,816 in 1890 to 7,315,939 in 1900 and 8,025,675 in 1910 (census of December 31). The estimated population in 1912 was 8,160,783. The 1910 population was 28.089 per cent of the total for Austria. Pop., per square kilometer, 84 in 1890, 93 in 1900, and 102 in 1910. Males num-

bered 3,938,315 in 1910, and females 4,087,360, there being 1038 females to each 1000 males. Foreigners numbered 45,198 (about two-thirds Russians). The vernacular of the remainder (7,980,477) was almost limited to Polish and Ruthenian. Polish, 4,672,500 (58.55 per cent), Ruthenian, 3,208,092 (40.20), German, 90,114 (1.13), Bohemian, Moravian, Slovak, 8718 (0.11). Of the total population in 1910 Roman Catholics numbered 3,731,861 (46.50 per cent), Greek Catholics, 3,379,616 (42.11), Jews, 871,906 (10.86). Population of the larger cities and towns according to the 1910 census: Lemberg, the capital, 206,113, Cracow, 154,141, Przemyśl, 54,078, Kolomea, 42,676, Tarnów, 36,731, Drohobycz, 34,665, Tainopol, 33,871, Stanislaw, 33,328, Strivj, 30,895, Neusandez, 25,004, Jaroslau, 23,965, Rzeszów, 23,688, Podgórze, 22,322, Kmhinn Wiesz, 22,143, Sambor, 20,257, Brody, 18,055. Higher education is afforded by universities at Cracow and Lemberg, and by a technical high school at Lemberg.

The original Germanic population of what is now Galicia was replaced at the beginning of the Middle Ages, at the time of the great migration of nations, by the Slavic Poles and Ruthenians, who settled to the west and the east respectively of the river San. In the twelfth century the principalities of Halicz (Galicia) and Vladimir (Lodomeria) rose to prominence from among a host of petty states. Galicia in general acknowledged the suzerainty of the dukes of Cracow, while Lodomeria was under the control of the ruler of Kiev. The dissensions between the two principalities afforded an opportunity for the intervention of the Hungarians, the Russians, and the Poles, but such periods of foreign rule were brief. In 1198 Roman, Prince of Lodomeria, succeeded in annexing Galicia to his dominions and made himself virtually independent of Poland and Hungary, the two duchies were separated in 1215, but were once more united by Daniel Romanovitch (1222-66), who by his skillful diplomacy in his relations with Hungary and the Pope entrenched himself firmly in power. During his reign and those of his immediate successors the country enjoyed remarkable prosperity and attained to a high degree of civilization. In 1340 the house of Roman died out, and soon after Galicia and Lodomeria came under the sway of Casimir the Great of Poland, and except for an interval of a decade and a half (1370-86) formed a part of Poland till the first partition of that country in 1772. In that year the territory of Galicia, under the title of the Kingdom of Galicia and Lodomeria, was annexed by Austria, whose portion was increased in 1795 by the addition of West or New Galicia. Austria was forced in 1809 to cede West Galicia and Cracow to the Grand Duchy of Warsaw, and in 1810 a portion of East Galicia to Russia, but it recovered possession of the latter in 1814, while the former remained in the hands of Russia, with the exception of a fragment which was erected into the Republic of Cracow. In 1846 the Republic of Cracow, which had become the centre of the Polish revolutionary movement, was suppressed and handed over to Austria, which incorporated it with the Crownland of Galicia. The period since 1848 has been marked by a fierce struggle between the Polish and Ruthenian nationalities, the former seeming to retain their almost absolute ascendancy, and the latter striving to win their share of political rights and a voice in the government. Galicia

to-day shares more in the central government and has more local freedom than any of the other Austrian provinces. This condition was brought about first by the constitution of 1861 and then by successive steps of a similar nature. The province was the scene of extended operations by the Russians in the European war of 1914. For details see WAR IN EUROPE. Consult Jandaurek, *Das Königreich Galizien* (Vienna, 1884), and Lowell, *Governments and Parties in Continental Europe* (New York, 1897).

GALICIA, *Sp* *pion* ga-lé'thè-a. A political division of Spain, bounded on the north by the Bay of Biscay, on the east by the provinces of Asturias and León, on the south by Portugal, and on the west by the Atlantic (Map Spain, A 1). Area, 11,256 square miles. The surface is generally composed of numerous isolated mountains and hills intermingled with valleys and elevated plains, but there are few connected mountain chains. The chief river is the Minho. The climate is moist but not unhealthy, and the annual rainfall heavy. In the river valleys the soil is fertile and well cultivated. Agriculture and stock raising are the leading industries, lumber is produced. Minerals and precious stones are found in the mountains, there are many mineral springs, and the waters along the coasts abound in fish. The unequal distribution of land and the density of population are responsible for the impoverished state of the masses. Though many natives emigrate to Portugal and the more progressive parts of Spain, as well as to North and South America, the population has continued to increase, while modern improvements have not been installed. Pop., 1900, 1,980,515, 1910, 2,108,914. The inhabitants are called *Gallegos* and resemble the Portuguese rather than the Spaniards, speaking a distinct dialect. Administratively Galicia is divided into the four provinces of Corunna, Lugo, Orense, and Pontevedra. The seat of the captain-general is Corunna.

Galicia was originally occupied by a tribe known as the Callaici, or Gallaici, whence the name of the region. It was first subjugated by the Romans in the time of Augustus. Early in the fifth century, when the torrent of Suevi and Vandals swept across the Pyrenees, Galicia, which then included Old Castile, was occupied by the former. After remaining independent for almost two centuries, it became part of the Visigothic kingdom under Leogovild in the latter part of the sixth century. At the time of the Saracen invasion great numbers of the Visigoths fled thither. The Saracens were driven out in 739 by Alfonso the Catholic of Asturias. Galicia shared the fortunes of Asturias and of León and finally became part of the Kingdom of Castile. On the death of Ferdinand the Great of Castile and León, in 1065, it formed for a few years an independent kingdom under his son Garcia. Consult A. M. Meakin, *Galicia, the Switzerland of Spain* (New York 1909), and W. Wood, *A Corner of Spain* (ib., 1910).

GALIGNANI, ga-lé-nyá-né. A family of European publishers, of whom the most prominent were GIOVANNI ANTONIO (1752-1821), a distinguished linguist, and his sons JOHN ANTHONY (1796-1873) and WILLIAM (1798-1882). For a time the father, a native of Brescia, lived in London, where his sons were born, but, removing to Paris, founded there an English library and the periodical *Repertory of English Literature*. He began in 1814 the publication

of *Galignani's Messenger*. This paper, continued by his sons, was later known as the *Messenger*. Its aim was to establish cordial relations between France and England. It enjoyed a high reputation. In 1884 the Galignani family disposed of their interest in it, and it appeared as the *Daily Messenger* until discontinued in 1904. At Corbeil the brothers set up a hospital for needy Englishmen, and in 1889, at Neuilly, the Galignani Home for distressed printers.

GALILEE. See PALESTINE.

GALILEE. The name applied in England to a porch or chapel placed near the entrance to a mediæval monastic church, beyond which women were not permitted to pass. In abbeys, e.g., the monks came to the Galilee to see their female relatives. The term "Galilee Porch" was also used. The name is supposed to have been suggested by Mark xvi. 7 "He goeth before you into Galilee there shall ye see him" said to have been quoted by the monks in ushering into the Galilee the women who thus visited the abbey. A portion of the nave was sometimes marked off by a step, or, as at Durham, by a line of blue marble, to mark the boundary within which women were not permitted to pass. There are fine specimens of galilees at the cathedrals of Salisbury, Wells, Lincoln, Ely, and Durham, and the name is also applied to the little library in the central arch of the west end of Peterborough Cathedral.

GALILEE, SEA OF. A body of water in Palestine, through which flows the river Jordan. The old Hebrew name was Chinnereth, or Chinneroth (see Num. xxiv. 11, Josh. xii. 3, xiii. 27), also used of a city (Josh. xix. 35) and of a district (1 Kings xv. 20), both in the neighborhood of the lake. The designation, "Lake of Gennesaret," or, more correctly, "Gennesar," from the "Land of Gennesaret," on the north-west shore of the lake, was in use certainly as early as the first century B.C. (1 Macc. xi. 67). This is the name used almost without exception in Josephus. The derivation and exact meaning of both terms, Chinnereth and Gennesar, are not certainly known. The later name, Gennesar, is not thought to have been derived from Chinnereth. It may be a compound from *gan*, 'garden,' and *Nesar*, perhaps an old name for the region bordering on the northwest or west shore of the lake, or even for Galilee in general. In the Gospels "Sea of Galilee" is the usual designation. After Herod Antipas built the city of Tiberias on its shore it became known as the Sea of Tiberias, which is the basis of the modern name, Bahr Tabariyeh. The lake is 13 miles long by 7 miles wide, irregularly oval in shape widest at the northern end. It lies in a deep basin in the great cleft which extends from the Lebanon to the Red Sea. The surface is 682 feet below the level of the Mediterranean. Its greatest depth is not over 200 feet. It is completely encircled by a beach, the surrounding hills in no case touching the water's edge. Along the eastern shore the beach is but a narrow strip about ½ mile wide, beyond which the hills rise abruptly to a height of nearly 2000 feet above the lake. To the south is the low, rapidly descending Jordan valley, as wide as the lake itself. From the exit of the Jordan to Tiberias, on the west, a mile or so from the water, lies a black and barren ridge of the Galilean hills, while north of this, extending nearly to the entrance of the Jordan, is the broad and exceedingly fertile plain of Gennesaret. (Consult

Josephus, *Jewish War*, bk iii, chap. 10, § 8, for a description of its marvellous productivity.) The water of the lake is sweet, except in the neighborhood of the hot springs near Tiberias, and somewhat warm. The hot springs are evidence that the volcanic activity, which in ages past wrought such great changes in this locality, has not entirely ceased. The surface of the plateau east of the lake is the overflow of volcanoes once active in the Hauran. Shut in by high hills except to the south, the lake is subject to sudden and severe winds, which, rushing down the ravines, often lash the waters into dangerous fury (cf Mark iv 37, Luke viii 23). The neighborhood of the lake once teemed with population (cf Josephus, *Jewish War*, iii 2). Several of the great trade routes of southwestern Asia converged here. Communication with the whole world was frequent and easy. The waters abounded in fish and were covered with sailing craft, many of which were used in the extensive fishing industry. The fertile western shore was highly cultivated and yielded its products through all the months of the year. Around this small sheet of water were clustered some 9 or 10 flourishing cities, each, it is said, with not less than 15,000 inhabitants. Chorazin was on the slopes west of the Jordan's entrance, Capernaum and Magdala were in the plain of Gennesaret, on the western shore was Tiberias with its famous and popular baths, and, farther south, Tarichæa with its great fish-curing industry, whence the fish of Galilee were exported throughout the Roman world. Hippos and Gamala were on the eastern plateau, with Gadara a few miles southeast, Bethsaida was at the entrance of the Jordan, and Sinnabris at its exit, with Homonæa 2 miles down the valley. At present all these, except Tiberias, have passed away, the sites of some cannot be identified, the soil is cultivated in but few spots, and the hills are treeless and deserted. Quite recently, however, plans have been formed to revive the fishing industry.

It was about the northern part of this sea that Jesus passed the greater part of His public ministry. Four of the first disciples were Galilean fishermen (Matt iv. 18-22; Mark i 16-20), and the miracles of the walking on the water (Matt xiv 22-33), the miraculous draft of fishes (Luke v. 4-7), the stilling of the tempest (Matt. viii 23-27, Mark iv 35-41, Luke viii 22-25), the feeding of the multitude (Matt xiv 13-21, xv 29-39, Mark vi 31-44, viii 4-9, Luke ix 10-17, John vi 1-14), and many other miracles and events in the life of Jesus are closely associated with the lake. Consult Merrill, *Galilee in the Time of Christ* (New York, 1891), id., *East of the Jordan* (ib, 1881), George Adam Smith, *Historical Geography of the Holy Land* (London, 1894); F. Buhl, *Geographie des alten Palästina* (Leipzig, 1896), Masterman, *Studies in Galilee* (Chicago, 1909). See also PALESTINE.

GALILEI, ga-lé-lá'è, VINCENZO (c.1533-c.1600). An Italian musician and mathematician. He was born at Florence and was the father of Galileo Galilei the astronomer. As a composer, he is chiefly important for his songs with lute accompaniment, which are generally regarded as introducing the monody subsequently adopted by Peri, Caccini, etc., the accredited founders of the *dramma per musica*. More valuable are his writings, the most important of which are a polemical discourse on the works of Zarlino of Chioggia (1589), and the treatise *Il*

Fronimo, dialogo sopra l'arte del bene intavolare e rettamente suonare la musica (1583). He was an accomplished lute player and violinist, and a prominent member of the historic coterie of artists whose rendezvous was the house of Count Bardi. His death occurred at Florence.

GALILEO, gál'i-lé'ò, *It pron* ga'lé-lá'ò, or **GALILEO GALILEI**, ga'lé-lá'ò ga'lé-lá'è (1564-1642). An Italian physicist and astronomer, one of the founders of modern experimental science. He was born in Pisa, in February, 1564, of a Florentine family more ancient than opulent. By desire of his father, a mathematician of considerable ability, he directed his early studies to medicine and the prevailing Aristotelian philosophy, the dogmas of which he soon came to disbelieve. Later, however, while still at the University of Pisa, he devoted himself to the study of mathematics and physical science. At the age of 18 he made one of his most important discoveries. Happening on one occasion to observe, in the cathedral of Pisa, the oscillation of a lamp casually set in motion, he was struck with the apparent measured regularity of its vibrations, and having tested the correctness of this observation by comparing the beat of his own pulse with the action of the pendulum, he concluded that by means of this equality of oscillation a simple pendulum might become an agent in the exact measurement of time. This discovery he subsequently utilized by the successful application of the pendulum in constructing a clock for astronomical purposes. His bias towards mechanical construction and experimental science received a new impulse from his intercourse with a friend of his father's, Ostilio Ricci, who consented to give him systematic instruction in pure mathematics. Such was Galileo's absorption and delight in his new studies that his father at length sanctioned his abandonment of the art of medicine, in order that he might concentrate his powers on his chosen sciences. The first fruit of his geometrical investigations was the invention of a hydrostatic balance, by which the specific gravity of solid bodies might be ascertained with great accuracy. In 1589, the fame of Galileo's extraordinary learning having reached the Grand Duke of Tuscany, he was appointed professor of mathematics in the University of Pisa. About this period he turned his attention to the then very imperfectly comprehended laws of bodies in motion, and, in opposition to accepted notions, he propounded the theorem that all falling bodies, great or small, descend with equal velocity. This soon led him to the discovery of the law regulating the motion of falling bodies, which was proved correct by experiments made from the summit of the leaning tower of Pisa, greatly to the chagrin of the Aristotelians, whose enmity to Galileo had now grown more decided. In consequence he relinquished his chair at Pisa and retired to Padua, where, in 1592, he accepted the invitation of the Venetian Senate to lecture on mathematics in the university for the space of six years. It is also said, however, that Galileo lost his chair at Pisa from having ridiculed the mechanical pretensions of Giovanni de' Medici, son of Cosimo I. Galileo's engagement at Padua was eventually prolonged to the term of 18 years, but so urgent was his desire to return to his birthplace that he sought a restoration to his former post at Pisa and was gratified by an assent being accorded by Cosimo II, with exemption from any but a voluntary exercise of the

duties of professorship During his sojourn at Padua his course of lectures enjoyed extraordinary popularity, crowds of pupils flocked to hear him from all parts of Europe, and he was the first to adapt the Italian idiom to philosophical instruction Among his various discoveries may be noticed a species of thermometer, a proportional compass or sector, and, more important than all, the construction of the refracting telescope for astronomical investigation In 1609 he offered his first complete telescope to the Doge of Venice, Leonardi Deodati, by whom it was tested from the tower of St Mark In the same year he constructed a microscope, and then commenced his astronomical researches by means of his own telescope He speedily concluded that the moon, instead of being a self-luminous and perfectly smooth sphere, owed her illumination to reflection and presented an unequal surface deeply furrowed by valleys and mountains of great extent The Milky Way he pronounced a tract of countless separate stars, and these discoveries were crowned by a still more important series of observations, which led to the discovery of the four satellites of Jupiter on the night of Jan 7, 1610 (though it was not till the 13th of the same month that he came to the conclusion that they were satellites and not fixed stars), which he named the Medicean stars He also was the first to note movable spots on the disk of the sun, from which he inferred the rotation of that orb He returned to Tuscany in 1610, where renewed quarrels with the Aristotelians disquieted and embittered his existence In 1611 he visited Rome and was received with great distinction, being enrolled a member of the Lincei Academy, but four years later, on a second visit, his reception was widely different, as by that time, in his work on the solar spots, he had openly advocated the Copernican system and was in consequence denounced as a propounder of heretical views He repaired again to Rome, to demand an experimental inquiry into the soundness of his views, but the Grand Duke, apprehending inquisitorial dangers for his favorite, summoned him back to Tuscany, at the same time the Pope, through the famous Cardinal Bellarmín (a sincere friend of Galileo's), commanded him to abstain from all future advocacy of heretical doctrines Some time after, Galileo wrote his most famous work in the form of a dialogue between three fictitious interlocutors—the one in favor of the Copernican system, the second an advocate of the Ptolemaic, and the third a satirical personage who begins by agreeing with the Ptolemaic arguer, but usually ends by being convinced by the Copernican, and then assists in belaboring poor Simplicio, the supporter of Ptolemaic motion. In 1630 Galileo contrived to obtain the papal *imprimatur*, which was subsequently revoked, but, having got a similar authorization at Florence, he published, in 1632, this exposition of his opinions under the title of *Un dialogo dei due massimi sistemi del mondo* Hardly had the work been issued, when it was given over to the jurisdiction of the Inquisition Pope Urban VIII, previously Cardinal Barberini, and until now a friend and eulogist of Galileo, was led to believe that Galileo had satirized him in this work under the name of Simplicio, as one who is careless about scientific truth, and who timidly adheres to the saws of antiquity On Sept 23, 1632, Galileo was cited to appear for the second time before the Inquisition During his protracted trial he was

allowed to reside as a prisoner in the house of the Tuscan Ambassador His judges condemned him to abjure his scientific theory This he did That he was actually put to the torture is now no longer a question open to dispute, though it is true he was threatened with it His famous whisper, *E pur si muove* (But nevertheless it does move), is a fiction Galileo was sentenced to an indefinite term of imprisonment by the Inquisition This was soon commuted by Pope Urban, at the request of Ferdinand of Tuscany, into permission to reside at Siena and finally at Florence He died on Jan 8, 1642, at the age of 78, and was interred by ducal orders in the cathedral of Santa Croce, where a majestic monument symbolizes his great achievements

Galileo's disposition was truly genial, he enjoyed with keenness the social wit and banter of his friends and the pleasures of the banquet, and the readiness with which he offered or accepted atonement modified a somewhat irascible disposition The great deficiencies in his character were a want of tact to keep out of difficulties and a want of moral courage to defend himself when involved in them His biting, satirical turn, more than his scientific tenets, was the cause of his misfortunes Galileo was of small stature, but of a robust and healthy frame, his countenance was attractive, and his conversation cheerful He loved art and cultivated especially music and poetry. His style is nervous, flowing, and elegant

We may briefly recapitulate Galileo's most important contributions to physical science under the following heads (1) the relation between space and time in the case of falling bodies, (2) the path of projectiles is a parabola, (3) the isochronism of the pendulum, (4) the partial discovery that suction is owing to the pressure of the atmosphere, (5) the reinvention of Aristotle's theory respecting sound, (6) the invention of the telescope, (7) the discovery of the satellites of Jupiter, phases of Venus, and spots on the sun For the nature of these discoveries, see PENDULUM, FALLING BODIES, PROJECTILES, ETC

The best edition of Galileo's collected works is that by Alberi (16 vols, Florence, 1842-56) A new complete edition has been published (20 vols, 1b, 1890-1909) at the cost of the Italian government Bibliographies of the literature relating to Galileo have been compiled by Riccardi, Carl, and Favaro Consult Brewster, *The Martyrs of Science, or the Lives of Galileo, Tycho Brahe, and Kepler* (London, 1846); Chasles, *Galileo Galilei* (Paris, 1862); Berti, *Copernico e il vicende del sistema Copernicano* and *Il processo originale di Galileo* (Rome, 1876); Scartazzini, *Il processo di Galileo Galilei e la moderna critica tedesca* (Florence, 1878); Favaro, *Galileo Galilei e lo studio Padova* (2 vols, 1b, 1882); Scartazzini, *Galileo Galilei* (Milan, 1883); Wegg-Prosser, *Galileo and his Judges* (Eng trans, London, 1889); Gunther, *Geisteshelden*, vol xxii (Berlin, 1896); Paolo, *La scuola di Galileo nella storia della filosofia* (Pisa, 1900); Fahie, *Galileo His Life and Work* (London, 1903); Muller, *Galileo Galilei und das Kopernikanisches Weltssystem* (Freiburg, 1909)

GALIMBERTI, ga'lêm-bâr'té, LUIGI (1836-96) A Roman Catholic ecclesiastic and diplomat, born in Rome, where he was educated in law and theology He taught theology in the College of the Propaganda and at the University

of Rome and in 1868 was appointed canon of the Lateran. Leo XIII made him secretary of the congregation of extraordinary ecclesiastical affairs, canon of St Peter's at Rome, and Archbishop of Nicæa. He was sent on various embassies and was the author of the award which the Pope as arbitrator made in favor of Spain, in her contention with Germany for the sovereignty over the Caroline Islands. When, as a result of the struggle of Bismarck against the power of the Catholic church in Germany (Kulturkampf), the relations between the papacy and the German Empire were broken off, it was Galimberti who was sent in 1880 on a mission to Germany, with the result that the oppressive "May Laws" of 1872 were abrogated. In 1887-92 he represented the papacy at Vienna, and there also he was fortunate in securing a satisfactory settlement of long-standing differences between the Vatican and Austria-Hungary. In 1893 he returned to Rome and was made a cardinal and prefect of the papal archives.

GALINGALE (*Cyperus longus*) See CYPERUS

GALION A city in Crawford Co., Ohio, 80 miles southwest of Cleveland on the Cleveland, Cincinnati, Chicago, and St. Louis and the Erie railroads (Map Ohio, E 4). It is primarily a manufacturing and railroad town, with railroad shops, several carriage factories, brick and tile plants, wheel, wagon, and gear works, lumber mills, manufactories of grave vaults, road machinery, pipe, and automobile gears, and a foundry. Galion was laid out in 1831 and was chartered as a city in 1878. There is a Carnegie library here. Its government is administered by a mayor, elected biennially, and a unicameral council. The city owns and operates the electric light plant. Pop., 1900, 7282, 1910, 7214.

GALITZIN See GOLITZIN

GALTIUM See BEDSTRAW

GALL. See GALLS

GALL, gal, FRANZ JOSEPH (1758-1828). The founder of phrenology, born at Tiefenbrunn, Baden. He studied medicine at Strassburg and Vienna and settled in the latter place as a practicing physician. He became known by the publication of his *Philosophisch-medizinische Untersuchungen über Natur und Kunst im gesunden und kranken Zustande des Menschen* (1791). But he acquired a much more extensive reputation by his lectures on the structure and functions of the brain, which he began to deliver in 1796. His views were so subversive of received doctrines on the subject of mind that the lectures were prohibited in 1802 by the Austrian government. Along with his pupil, Spurzheim (q.v.), who became his associate in 1804, Gall quitted Vienna in 1805 and during his travels through Germany, Holland, Sweden, and Switzerland, expounded his views in many of the universities and principal cities. In 1807 he settled as a physician in Paris and there began lecturing and writing for the propagation of his opinions. On March 14, 1808, he and Spurzheim presented to the Institute of France a memoir of their discoveries, on which a committee of the members of that body (including Pinel, Portal, and Cuvier) drew up an unfavorable report. Gall and Spurzheim thereupon published their memoir, with a reply to the report, in a volume entitled *Recherches sur le système nerveux en général et sur celui du cerveau en particulier* (1809). This was followed by their larger work, *Anatomie et physiologie*

du système nerveux (1810-19), with an atlas of 100 plates, but, the two phrenologists having parted in 1813, the name of Gall alone is prefixed to volumes iii and iv, and it alone is borne by a reprint of the physiological portion of the work, entitled *Sur les fonctions du cerveau, et sur celles de chacune de ses parties* (1825). In answer to accusations of materialism and fatalism brought against his system, Gall had early published a part of the work under the title *Des dispositions innées de l'âme et de l'esprit* (1812). He continued his researches at Montouge till his death. Consult Möbius, *F. J. Gall* (Leipzig, 1905). See PHRENOLOGY.

GALL, LUISE VON See SCHUCKING, LEVIN

GALL, SAINT See SAINT GALL

GALLAGHER, WILLIAM DAVIS (1808-94). An American journalist and poet, born in Philadelphia, Pa. He was the son of an Irish patriot implicated in the rebellion of 1798. About 1816 his family removed to Ohio, where he learned the printer's trade and contributed to county newspapers. In Cincinnati he edited several journals, particularly the *Mirror* (1831), the *Western Literary Journal* (1836), and the *Hesperian* (1838). Much of the verse and prose which appeared in these publications was contributed by the best American writers of the day, and he constantly wrote for them himself. He next became connected with the *Cincinnati Gazette*. In 1850-53 he was confidential clerk to Thomas Corwin, Secretary of the Treasury. Upon his removal to Louisville, Ky., in 1853, he bought a half share in the *Courier*. During the Civil War he was again in the employ of the Treasury Department and in 1865 became a pension agent and later a farmer in Kentucky. Gallagher was most influential in promoting literary interests in the West. His poetical works include *Erato* (3 vols., 1835-37), containing "The Wreck of the Hornet," and *Miami Woods* (1881).

GALLAIT, gal'ä', LOUIS (1810-87). A Belgian historical, genre, and portrait painter. He was born at Tournai, studied there under the classicist Hennequin and afterward under Van Brée at Antwerp. "Christ Healing the Blind" (1833) was purchased by subscription for the cathedral of Tournai, and Gallait received a pension from the state enabling him to study in Paris. Here he came under the influence of Delaroche and produced many works, such as "Montaigne Visiting Tasso in Prison" (1836) for the Belgian King, the "Capture of Antioch by Godfrey de Bouillon" (Versailles), and other historical subjects for the French government, and, finally, his "Abdication of Charles V" (1841, Brussels Museum). Exhibited in Germany, where it profoundly influenced native art, and throughout Europe this last work brought him the highest honors. He was called by the government to Brussels, where he was the head of an influential school of historical painting. His work shows taste and judgment, but the technique is eclectic and his presentation theatrical and sentimental. Other celebrated subjects are "Last Honors to Egmont and Hoorne" (1851, Tournai), "Last Moments of Egmont" (1858, Berlin), and the "Plague at Tournai" (1862, Brussels). His once famous portraits and genre subjects are less important. He is represented in the Metropolitan Museum, New York, by the "Minstrel Boy," "The Prisoner," and two aquarelles, and in the Walters Gal-

lery, Baltimore, by four oil paintings and a water color. Consult Teichlin, *Gallart und die Malerei in Deutschland* (1853), Henne, in *Annales de l'académie de Belgique* (Brussels, 1890), Dujardin, *L'Art flamand* (ib., 1899), Muther, *Die belgische Malerei im 19ten Jahrhundert* (Berlin, 1904).

GALLAND, ga'lan', ANTOINE (1646-1715). A French Orientalist and numismatist, born at Rollot, near Montdidier, in Picardy. After finishing his course at the Lycée he studied Oriental languages at the Collège de France. In 1670 he accompanied the French Ambassador De Nointel to Constantinople and made two subsequent trips to the East in the interest of science, collecting a large number of inscriptions, etc. In 1701 he was made a member of the Académie des Inscriptions and in 1709 professor of Arabic in the Collège de France. The greater part of Galland's writings relate to numismatics and the East, but what secured for him a lasting reputation was his translation of the *Arabian Nights*, in 12 volumes (*Mille et une nuits, contes arabes*, 1704-17). This was the first translation of these stories ever made into any European language, and so little was known about them in Europe that Galland got the credit of being himself the author as well as the translator. The translation led not only to the popularity, but also to critical investigations, of the remarkable collection. (See ARABIAN NIGHTS.) Among his other writings may be mentioned *Paroles remarquables, bons mots, et maximes des Orientaux* (1694) and *Les contes et fables indiennes de Bidpai et de Lokman* (1724). His numismatic and archaeological writings will be found chiefly in the *Journal des Savants*, and the *Mémoires* of the Académie des Inscriptions et Belles-Lettres.

GALLA OX, or SUNGA. See HUMPED CATTLE.

GALLARATE, gal'la-ra'tà. A city of Lombardy, in the Province of Milan, north Italy, 2 miles northwest of Milan, with a technical school and important cotton and textile factories. It also produces machinery, cabinet-work, buttons, and vehicles. Six miles to the west are the electric works of Vizzola, developing 23,000 horse power from the river Ticino. Pop. (commune), 1901, 12,000, 1911, 15,868.

GALLAS, or OROMA (*Gallas*, Conquerors, *Ilm'-orma*, Sons of the Brave). An Ethiopian people in eastern Africa, south of the Abyssinian plateau, numbering 6,000,000, and occupying 400,000 square miles of territory. They represent the purest type of the Ethiopian branch of the Hamitic race, called Kushito-Hamites. Keane divides these Ethiopian peoples into Somali Hamites, Galla Hamites, Afar (Domakil) Hamites, Abyssinian (Agao) Hamites, Semitized and mixed Hamites, Himyaritic (Abyssinian) Semites, Arab (nomad) Semites, Negroes, and Bantus. He pronounces the Gallas to be the finest people in all Africa—tall, shapely, with high, broad foreheads and handsome faces. Their color is chocolate, the hair black and kinky. They are a pastoral and agricultural people, but their common dangers and mutual jealousies have made them warlike. They are divided into tribes and petty kingdoms, having two social classes—the aristocratic *prutuma* (herdsmen) and the plebeian *argatta*, or *kutto* (tillers). They are all more or less subject to the Negus Negusti of Abyssinia. In religion they are pagans, Mohammedans, and Sidamas, i.e., members of the Abyssinian Chris-

tian church. Consult A. H. Keane, in Stanford's *Africa*, vol. 1 (London, 1907), where all the tribal subdivisions are given, with their exact locations.

GALLAS, gal'las, COUNT MATHIAS, DUKE OF LUCERA (1584-1647). A German general in the Thirty Years' War, born in Tient. After serving as a mercenary in the armies of Spain and Savoy, in 1618 he became colonel of an infantry regiment in the army of the Catholic League and afterward became one of Wallenstein's most trusted officers. For his services at the taking of Mantua (1630), in the War of the Mantuan Succession, he was created a Count of the Empire. He commanded the right wing of Wallenstein's army at the battles of Nuremberg and Lutzen. From selfish motives he opposed Wallenstein, intrigued against him at Vienna, and after his assassination succeeded to his command. He won the decisive battle of Nordlingen over Bernhard of Weimar in 1634, but after varying successes and failures in the four following years he was succeeded as commander in chief, in 1638, by the Archduke Leopold. After Leopold's defeat by Torstenson and the Swedes at the second battle of Breitenfeld, in 1642, Gallas was again placed in command, but was defeated in Holstein and again superseded. He succeeded Hatfeld as commander in chief after the latter's defeat at Jankau in 1645, but soon fell ill and was compelled to retire. Gallas was called *Heerverderber*, 'army destroyer'. See THIRTY YEARS' WAR, and consult the article by Hallwich in *Allgemeine deutsche Biographie*, vol. viii (Leipzig, 1878).

GALLATIN. A city and the county seat of Daviess Co., Mo., 77 miles northeast of Kansas City, on the Chicago, Rock Island, and Pacific and the Wabash railroads and on the Grand River (Map Missouri, C 2). It has a trade in lumber, grain, live stock, and dairy products, and is the centre of an agricultural district, with valuable timber lands. The city contains the Grand River Academy and has municipal water works and an electric-light plant. Pop., 1900, 1780, 1910, 1825.

GALLATIN. A town and the county seat of Sumner Co., Tenn., 27 miles by rail northeast of Nashville, on the Louisville and Nashville Railroad (Map Tennessee, D 1). It is the seat of the Howard Female College and a training school. The town is in a fertile agricultural region and has planing mills, and manufactures of flour and spokes. Fine horses and cattle are raised here. The water works and electric-light plant are owned by the municipality. Pop., 1900 2409, 1910, 2399.

GALLATIN, ALBERT (1761-1849). One of the most distinguished of American public financiers. He was born in Geneva, Switzerland, Jan. 29, 1761, and graduated at the Academy of Geneva in 1779. In 1780 he and a friend, Henri Serre, came to the United States and spent a year at Machias, Me., in trade pursuits, with little success. Gallatin then moved to Boston, where he supported himself by teaching French, and in July, 1782, received permission to give instruction at Harvard College. In the following year he explored and invested in lands on the western frontier, and in 1784 established a country store in Fayette Co., Pa., near the Virginia boundary. He was in 1789 a delegate to the State Constitutional Convention, and in 1790, as also in the two following years, he was sent to the Legislature by Fay-

ette County, where he was conspicuously active in opposition to the Federal excise law, and where, also, the basis of his reputation was made by his report of the Committee of Ways and Means in the session of 1790-91. In February, 1793, he was elected to the United States Senate and took his seat on December 2, but in the following February the Senate decided, by a party vote of 14 to 12, that he did not possess the proper qualifications as to citizenship, it having been less than nine years, the time prescribed by the Constitution, since he had taken the oath of citizenship and allegiance to the State of Virginia. Gallatin was active at the time of the Whisky Insurrection (qv), and although he urged submission to law and the refraining from all improper and illegal acts, nevertheless he went so far in his relations with the insurrectionists as to give himself, both then and later, considerable political embarrassment. He was, at the end of the trouble, elected to the Pennsylvania Assembly and from 1795 to 1801 was a member of Congress, where he allied himself with those Republicans who under the leadership of Madison were opposing the administration of the Federalists. "In his first term," says his biographer, Stevens, "he asserted his point and took his place in the councils of the party. In his second, he became its acknowledged chief. In the third, he led its forces to final victory."

He served on important committees and steadfastly opposed the administration, especially in the matter of the Jay Treaty, the increase of the army and navy, and the relations with France. Particularly did he attack the administration of the finances, a field with which his pamphlets showed him to be familiar, and his services and abilities in this direction were recognized by Jefferson, who in 1801 made him Secretary of the Treasury, a post which he held until 1813. During these years a marked reduction was effected in the national debt, the practice as to appropriations was made more systematic, the sinking-fund system was improved, and the preparations were made which rendered a war and an increase of the national debt possible without a disorganization of the public financial system. Gallatin also rendered important service in the negotiations which were concluded by the Treaty of Ghent (qv). Of his services in this connection, one of his biographers, Henry Adams, has said "Far more than contemporaries ever supposed or than is now imagined, the Treaty of Ghent was the especial work and the peculiar triumph of Mr. Gallatin." Thereafter, declining both a nomination to Congress and an opportunity to resume charge of the Treasury Department, he became Minister to France, filling the post from 1816 to 1823. Three years later he went to London as Minister, remaining one year and concluding two important conventions. He had been nominated for the vice presidency by the Crawford Republicans in May, 1824, but withdrew in October to make room for Clay, and in 1843 he declined to enter Tyler's cabinet as Secretary of the Treasury.

After the conclusion of his diplomatic service he removed to New York (in 1828), and that city remained his permanent residence until his death. He was president of the National Bank there for some years, but the duties were light, and he had ample time for study and public service. He was much interested in the

problems of public education and of finance and took an active part in the movement which resulted in the founding of New York University, but his chief interest appears to have been in the study of ethnology, especially of American ethnology. He founded the American Ethnological Society in 1842, which for a brief period was a very serviceable agency for the promotion of such studies, and he wrote several valuable essays and monographs on ethnological subjects. He did not lose his interest in finance and in history, however, and in every way gave an example of scholarship and of public spirit rarely surpassed by any one in this country.

He was twice married, first, in 1789, to Sophie Allegre, who died within a few months and then, in 1793, to Hannah Nicholson, daughter of Commodore James Nicholson, whose death shortly preceded his own. He died Aug. 12, 1849, at Astoria, L. I. He published in 1796 a *Sketch of the Finances of the United States* and in 1843 memoirs on the *American Rights to the Northeastern Frontier*, and many minor essays on finance, history, and ethnology, his *Synopsis of the Indian Tribes within the United States, East of the Rocky Mountains, and in the British and Russian Possessions in North America* (1836), and his *Notes on the Semi-Civilized Nations of Mexico, Yucatan, and Central America, with Conjectures on the Origin of Semi-Civilization in America* (1845), being especially noteworthy. His *Writings*, which are of great value in the study of the political history of the United States in the first part of the nineteenth century, have been edited by Henry Adams (3 vols., Philadelphia, 1879). Consult Adams, *Life of Albert Gallatin* (Philadelphia, 1879), and Stevens, *Albert Gallatin* ("American Statesmen Series," Boston, 1884).

GALLAUDET, gál'la-dét', EDWARD MINER (1837-1917). An American educator of the deaf and dumb, son of Thomas Hopkins Gallaudet. He was born in Hartford, Conn., and in 1856 graduated at Trinity College there, and became a teacher in the institution for the deaf and dumb which his father had founded at Hartford. In 1857, at the instance of Amos Kendall, he removed with his mother, Sophia Fowler Gallaudet (who was herself deaf and had been a pupil of T. H. Gallaudet), to Washington, where they organized and took charge of an institution similar to that at Hartford, known as the Columbia Institution for the Deaf and Dumb. He became president of its two distinct departments, the Kendall School and the National Deaf Mute College, which in 1893 was named in his father's honor Gallaudet College. In 1867-68 he made an extended tour of Europe, visiting the principal institutions for the deaf and dumb, and publishing on his return the results of his investigations in a full and extremely valuable report. In 1880 he was a delegate to the international congress of instructors of deaf-mutes, held in Milan, Italy, and in 1883 was president of the convention of American instructors of deaf-mutes at Jacksonville, Ill. In 1886 he gave information on American methods of teaching the blind, deaf, and dumb, before a royal commission appointed to investigate and reorganize the system in England. His publications include *A Popular Manual of International Law* (1879) and *Life of Thomas Hopkins Gallaudet* (1888), his father.

GALLAUDET, THOMAS (1822-1902). An American clergyman and educator of the deaf

and dumb, a son of Thomas Hopkins Gallaudet. He was born in Hartford, Conn., and graduated at Trinity College (Hartford) in 1842. In 1843-57 he taught in the New York Institution for the Deaf and Dumb. He supported the "combined" system—partly oral, partly sign manual—in teaching deaf-mutes. Meanwhile he was ordained a deacon and priest in the Protestant Episcopal church, and in 1852 he organized St Ann's Episcopal Church in New York, where there were services for deaf-mutes. In 1872 he organized and became general manager of the Church Mission for the Deaf and Dumb and in 1885 founded the Gallaudet Home for Deaf Mutes at Wappinger's Falls, near Poughkeepsie. He became rector emeritus of St. Matthew's Episcopal Church and vicar of St. Ann's, which since 1897 has been associated with St. Matthew's parish and is exclusively a place of worship for deaf-mutes.

GALLAUDET, THOMAS HOPKINS (1787-1851). An American educator of the deaf and dumb, born in Philadelphia, Pa., of French Huguenot ancestry. He graduated at Yale in 1805, studied theology at Andover Theological Seminary, and was licensed to preach in 1814. Instead of preaching, however, he was sent (by persons in Hartford) to Europe in 1815, to study methods of caring for the deaf and dumb, familiarizing himself with the systems of the Abbé Sicard in Paris, and of Braidwood and Watson in London. In 1817, with Laurent Clerc, a deaf-mute, assistant of Sicard, he opened a school of instruction at Hartford, Conn., called the Connecticut (and later the American) Asylum, of which he continued to act as principal until 1830. In 1832-33 he was professor of education in New York University—the first American professorship of education. His sons, Thomas and Edward Miner Gallaudet (qq.v.), and his wife, were also engaged in work for deaf-mutes. He published, in addition to numerous pamphlets *Sermons Preached to an English Congregation in Paris* (1818), *Plan of a Seminary for the Education of Instructors of Youth* (1825), the germ of American normal schools, *Bible Stories for the Young* (1838), *The Child's Book of the Soul* (1850). Several of his devotional works were translated into other languages—modern Greek and Siamese, for instance. Consult Humphrey, *Life* (New York, 1858), and E. M. Gallaudet (his son), *Life* (ib., 1888). See DEAF-MUTE.

GALL BLADDER. See LIVER.

GALLE, gal. See POINT DE GALLE.

GALLE, gal'le, JOHANN GOTTFRIED (1812-1910). A German astronomer, born at Pabsthaus, near Grafenhainichen. He studied the mathematical sciences at Berlin, taught for a time in a gymnasium, and was subsequently made assistant observer in the Berlin Observatory, of which Encke was then director. He discovered three unexpected comets and was awarded the prize of the French Academy. But his principal achievement was the finding of the planet Neptune. It was to the Berlin Observatory that Leverrier addressed his request that a search be made for the hypothetical planet, whose place in the sky he had computed from the observed disturbances in the motion of Uranus. Galle made the search requested by Leverrier and was the first to see the new planet, Sept. 23, 1846. Galle was also perhaps the first astronomer to advocate (1875) the use of planet-

oid observations for the determination of the solar parallax (see PARALLAX)—a method now considered the best known. His researches on this subject were published at Breslau, where he had been made director of the observatory and professor of astronomy in 1851. Galle's published works include *Grundzüge der schlesischen Klimatologie* (Breslau, 1857), *Ueber eine Verbesserung der Planetenelemente* (ib., 1858), *Ueber eine Bestimmung der Sonnenparallaxe aus korrespondierenden Beobachtungen der Flora im Oktober und November 1873* (ib., 1875), *Mitteilungen der Breslauer Sternwarte* (ib., 1879), *Verzeichnis der Elemente der bisher berechneten Kometenbahnen* (Leipzig, 1894). His original contributions were published, for the most part, in scientific periodicals.

GALLEGO, gal'ya'go, JUAN NICASIO (1777-1853). A Spanish poet, born at Zamora. Educated at Salamanca, he took orders in 1800 and became a court chaplain in 1805. On the uprising of 1808 he wrote what is probably his best-known poem, *El dos de mayo*, a stirring patriotic ode. In 1810 he was a deputy in the Cortes of Cadiz, holding liberal views. This political activity caused his imprisonment after the restoration of Ferdinand VII, but he was liberated by the revolution of 1820. Elected to the Spanish Academy in 1830, he was made perpetual secretary in 1839. His works are few, but hold a high place in the literature of his country on account of their excellent style and intense patriotism. The best collection of his poems is in vol. LXVII of the *Biblioteca de autores españoles* (Madrid, 1875).

GALLEIN, gal'e-in. See COAL-TAR COLORS.

GALLENGA, gal'len'ga, ANTONIO (1810-95), early pseudonym, Luigi Mariotti. An Italian historian and publicist, born at Parma. He began the study of medicine at the University of Parma, but abandoned it for a literary career. After playing a part in the insurrection of 1831, he went into exile and visited France and the United States. Returning to Italy, he became prominent in the councils of Mazzini's party and was chosen as the agent to assassinate the King of Sardinia, Charles Albert. He could not bring himself to do this and in 1838 withdrew to London. In 1843 he was given the chair of Italian literature in University College and three years later became a naturalized British citizen. He was in Italy at the uprising of 1848, but left it when the fortunes of the revolutionists sank, to return in 1854, when he was elected a deputy to the Sardinian Parliament. The following year his *History of Piedmont* was published in London and aroused such dissensions in Mazzini's party by the statement of facts as to the intended assassination of Charles Albert that he had to resign his place in the Parliament. He returned once more to Italy in 1858, entered the Parliament at Turin as a deputy, and in 1874 accompanied King Victor Emmanuel to Berlin and Vienna. He was long a correspondent of the London *Times*, both in Italy and in other countries, including America, Denmark, and Spain. Among his works are *Oltremonte ed oltremare, conti di un pellegrino* (1844), *Italy, Past and Present* (1846), *Scenes of Italian Life* (1850), *Italy in 1848* (1851), *Two Years of the Eastern Question* (1877), *The Pope and the King* (1878), *L'Italia presente e futura* (1886). His *Practical Grammar of Italian* for the use of English-speaking students has passed through several

editions since 1851. He contributed many articles to English reviews. His command of English as well as of Italian was remarkable, and his influence counted for much in establishing the friendly feeling of England for his country.

GAL'LEON (from Sp. *galeón*, It. *galeone*, augmentative of *galea*, galley). A name formerly applied to ships of war of three or four gun decks, but subsequently transferred to the large merchant vessels which every year brought to Spain the gold, silver, and other wealth contributed by its Mexican and South American colonies. They were armed, but, being heavy, unmanageable vessels, and containing cargoes of immense value, were eagerly sought after as prizes whenever a war broke out.

GAL'LEOT. See GALLIOT.

GAL'LERY (OF *gallerie*, *galerie*, F1. *galerie*, probably a special use of OF *gallerie*, *galerie*, mirth, from *gale*, festivity, from AS *gāl*, OHG, Ger *geul*, wanton). A word with several applications in architecture: (1) a long open structure in the upper part of a building, whether projecting or not, inside or outside, (2) a long passage, corridor, or hall connecting or flanked by other apartments, (3) a large, well-lighted hall in a museum, especially one for works of art, (4) a large structure, comprising one or more streets or alleys roofed with glass and flanked by shops. Of class (1) interesting examples are the famous outside façade galleries on French Gothic cathedrals, such as the *galerie des rois* at Rheims, Amiens, and Paris, usually serving as a practical passageway, the interior galleries in so many mediæval churches, termed triforium galleries, the projecting rood lofts, or singing galleries extending across the inside façade, and the projecting galleries in many modern churches, theatres, opera houses, etc. The arrangement of galleries in tiers one over the other, now so much used in churches, theatres, etc., is entirely modern, dating from the seventeenth century. Of class (2) early and most interesting instances are the low and richly paneled gallery halls of the old châteaux and manor houses, especially in English mansions of the sixteenth and seventeenth centuries, where family portraits and collections of arms, armor, furniture, and bric-a-brac were kept, to it also belong such galleries as that which connects the Sainte Chapelle and the Palais de Justice in Paris, and the long gallery connecting the Pitti Palace and the Palazzo Vecchio at Florence. Class (3) is related to the château gallery, being a hall for public instead of private exhibition, and the name is often applied to an entire building containing several exhibition galleries. We are familiar with the Uffizi, Borghese, Louvre, National, and other such galleries. Finally, to class (4) belong the very modern and colossal glass-roofed galleries at Naples and Milan and those of the Palais Royal at Paris, of Brussels and of some of the German cities, which are in reality streets roofed with glass. Some galleries can hardly be classified, such as the famous Gallery of Mirrors at Versailles. See GALERIE DES GLACES.

GALLERY. In military fortifications, a covered passage, cut through the earth or masonry in the defenses, whereby effective musketry fire can be directed through loopholes. Galleries have been occasionally used in the counterescarpments of dry ditches enabling the defenders to maintain a flanking fire upon the

ditch. They are also used in the construction of military mines and form an important part of fortresses like Gibraltar, where there are galleries of communication and connection. In military mining *underground communications* are classed according to their directions as *galeries*, which are horizontal or nearly so, and *shafts*, which are vertical or nearly so. Galleries are classed, according to their size, as *great* or *grand galleries*, which are 6 feet high by 7 feet wide, *common galleries*, 6 × 3½ feet, *half galleries*, 4½ × 3 feet, *branches*, 3½ × 2½ feet, and *small branches*, 2½ × 2 feet. See FORTIFICATION MINES AND MINING, MILITARY.

GAL'LEY (OF *galee*, *galea*, It. *galea*, from ML *galea*, *galera*, MGk *γαλέα*, *galea*, *γαλαία*, *galata*, galley). The name generally applied to vessels using sails and oars. The ships of the ancients were practically all of this character, hence they are generally spoken of as galleys. A bas-relief at Thebes represents a naval victory gained by the Egyptians over the East Indians about 1400 B.C. The vessels shown have oars and sails, and the Egyptians had figureheads of metal in the shape of a lion's head. Herodotus says that the Egyptian war galleys had soldiers on board as the fighting force, archers and sling men being stationed on the raised platforms at bow and stern, while pikes, spears, javelins, battle-axes, falchions, swords, and other weapons were kept in convenient places for use in boarding or repelling boarders. The sail was square and carried on a yard on the single mast. The Egyptians never were such bold navigators as the Phœnicians, and their vessels were probably inferior in seagoing qualities to the Phœnician ships. After having been for centuries masters of the seas, the Phœnicians became subject to Egypt, and in 610 B.C., by order of the Egyptian King, Necho, a Phœnician expedition is said to have circumnavigated Africa. The advantages possessed by a war vessel propelled by oars over one at the mercy of the winds was early realized, and to attain the greatest possible speed the number of banks of oars was increased to two, three, four, and five. The increase beyond three seems to have resulted in very little gain, and the *trireme* remained for many centuries the standard type of war galley of the first class. In merchant galleys sails formed the principal motive device, and oars were auxiliary, in war galleys the reverse was the case.

The more modern galley appeared after sail power had begun to assert its supremacy as the propelling force of seagoing vessels. Its development reached its highest point at the end of the sixteenth century, Lepanto being the last great sea fight in which the galley appeared as the most powerful type of war ship. These vessels carried firearms, guns, and small arms, and had fairly good sail power as well as oars. During the Middle Ages the oars of galleys were largely manned by infidel prisoners and criminals, and in France convicts were used in the large boats working about the arsenals until recent times. Row galleys, fitted as gunboats, were extensively used during the Napoleonic wars in operations and caused much trouble to the British fleet. Like all galleys designed especially for oar propulsion, they were long and narrow, the length being seven or eight times the beam, and they were therefore very fast. In the British navy the term "galley" is applied to the captain's boat, or *gig*, and

other similar boats built for speed under oars. For further information consult Rawlinson, *Ancient Monarchies* (3 vols, New York, 1900), Parker, *Fleets of the World The Galley Period* (ib, 1877), Jal, *Archéologie navale* (Paris, 1840), Bouet-Willamez, *Batailles de terre et de mer* (Paris, 1855), Torr, *Ancient Ships* (Cambridge, 1895), Holmes, *Ancient and Modern Ships* (2 vols, London, 1906), Chatterton, *Ships and Ways of Other Days* (Philadelphia, 1913). See SHIP.

GALLEY SLAVE See BAGNES

GALLEY WORM See CENTIPEDE

GALL GNAT A minute fly of the family Cecidomyiidae, which makes galls (qv) on plants. See GALL INSECTS

GAL'LI A name given to the eunuch priests of Cybele (qv). See also ATTIS

GAL'LIA, or **GALLIA TRANSALPINA**, gal'i-a trāns'āl-pī'na. The name given by the Romans to a part of western Europe which is in the main identical with modern France. For the district as a whole and for its various divisions, Gallia Belgica, Gallia Braccata, Gallia Lugdunensis, Gallia Narbonensis, Gallia Provincia, see GAUL.

GALLIA CISALPINA, gal'i-a sīs'āl-pī'na. See GAUL.

GALLIARD, gá'yar' (Fr, merry). An old French dance for two dancers. It was of a stately character, written in three-quarter time, and was one of the precursors of the minuet.

GALLIA TOGA'TA See GAUL

GALLIC ACID (from Lat *galla*, gallnut), $C_6H_2(OH)_3COOH$. An organic acid that exists ready-formed in small quantity in gallnuts, in Chinese tea, in valonia (the acorn cup of *Quercus agrifolia*), in divi-divi (the pod of *Cassia coriaria*), in sumac, and in other vegetable products. It is formed from tannin when the latter is boiled with dilute sulphuric or hydrochloric acid, or, much more slowly, when gallnuts, reduced to a thin paste with water, are mixed with a little yeast and exposed to the air until a cover of mold is formed, the gallic acid separates out in the free state and is purified by recrystallization from boiling water. Gallic acid has also been prepared artificially by chemical methods. Pure gallic acid is a colorless substance, crystallizing in the form of silky needles that are slightly soluble in cold water, but require only three parts of hot water for their solution, and are also freely soluble in alcohol and in ether. When heated to the temperature of 220° C, gallic acid melts and decomposes into pyrogallol and carbonic acids, the reaction taking place according to the following chemical equation:

Solutions of gallic acid have an acid reaction and a sour, astringent taste, iron salts impart to them a blue-black color, and therefore gallic acid has been employed in the manufacture of ink. Further, as the acid possesses the property of reducing the salts of gold, silver, and platinum, it has been extensively employed in developing photographs. Gallic acid is also sometimes used in medicine, and finally, since solutions of its alkali salts rapidly absorb oxygen, the acid may be usefully employed in the chemical laboratory.

GALLICAN CHURCH The national

church of France. The term is frequently used, however, not so much in its historical or geographical sense as in the narrower signification attached to the word "Gallicanism"—a school of thought which asserts certain principles of more or less independent church government and prerogatives in administration claimed by the national church as opposed to certain rights of the Pope. The fact that France was the "eldest daughter of the Church," one of the countries in which the Christian faith became widely diffused even in the lifetime of the Apostles, gave the adherents of this view a powerful tradition of Church privileges to which they might appeal. Christianity flourished very early among the Greek colonies in the south of Gaul, as the old tradition of the visit of Lazarus to this region attests. In the numerous and populous towns along the Rhône and its tributaries, there arose important congregations professing Christianity. When persecution came, the Gallic Christians had then full share of hardships. They were closely in touch with those who shared the same faith in other parts of the world, and one of the most touching monuments of early Christian literature is the letter of the churches of Lyons and Vienna to the brethren in Asia concerning the martyrs of these churches, which Eusebius has preserved in his *Ecclesiastical History*. The works of Irenæus, Bishop of Lyons (died c 202), are important contributions to the history of Christian doctrine. In the next two centuries Sulpicius Severus, Hilary of Poitiers, Hilary of Ailes, Vincent of Lérins, Prosper, Victor, Eucherius, Salvian, and Gregory of Tours continued a tradition of great churchmen, of which Gaul was not without reason proud. The hierarchical organization of the Church of Gaul was from the earliest times the most complete and regular of all Western Christendom. As a result of this tradition of zeal and faith, many privileges were granted to it, and later on, the kings of France began to make themselves felt more and more in ecclesiastical affairs. This was an almost inevitable consequence of the close relations between the crown and the Church dignitaries, most of whom held the temporalities of their benefices by the ordinary feudal tenure, the royal authority soon came to assert a correlative claim to certain privileges in ecclesiastical matters. There were not wanting ecclesiastics who would compound with their consciences in order to uphold the claims of their sovereign, and for several centuries after the death of Charlemagne kings and bishops at times played into each other's hands.

In order to secure subservient ecclesiastics, monarchs insisted on the privilege of nominating to bishoprics. The wealth of the more prominent sees was very great, and rulers contrived at times to have their brothers, or even illegitimate relatives, nominated to them. Where such unworthy prelates ruled their flocks without due regard to Church principles, the only resort was an appeal to Rome, and that usually took a considerable time, during which abuses seemed to acquire the force of right. As the result of these appeals and their not infrequent decision against the wish of the King, there came a protest against having such causes decided outside the realm. More than one of the French sovereigns engaged in a conflict with the Roman see, and these conflicts naturally called out a division of opinion among the mem-

bers of the Church of France, one party supporting the papal claims, while the other maintained the alleged prerogatives of the French crown and privileges of the national church. The great contest between Philip the Fair and Boniface VIII was a turning point in the constitutional history of Europe—the beginning of a reaction on the part of the laity against ecclesiastical predominance, which, like most reactions, went further in the opposite direction, and the state succeeded in transferring to itself the greater part of the external dominion enjoyed previously by the hierarchy.

Gradually the principles of what is known as Gallicanism took definite shape, even thus early. Throughout its long career, while recognizing in theory the primacy by divine right of the Roman pontiff over the whole Church, it yet asserted the independence of national churches, and especially that of France in many details of local government, and held the exercise of papal prerogative to be limited by the canons and decrees of general councils. It must be added that while the Gallican theory to this extent claims an exemption from dependence upon the authority of the Pope, it acquiesces, on the other hand, to an almost proportionate degree in the assumption of ecclesiastical authority by the civil government, indeed, in many of the details of its later development it falls into the extreme form of Erastianism, the doctrine of state supremacy in matters spiritual as well as temporal. The conflicting claims of the rival popes in the Western schism (see SCHISM, WESTERN) tended to weaken the papal authority, especially in France. The expedient adopted of calling a general council to pronounce upon the respective claims of the rival popes gave prominence to what became one of the leading tenets of Gallicanism, the superiority in point of authority of a general council to the Pope.

Some of the disciplinary enactments of the councils of Constance (1414-18) and Basel (1431-45) were mainly directed towards the limitation of the papal authority in the exercise of Church patronage within the limits of the national church. These claims of privilege culminated in the Pragmatic Sanction (qv), passed at Bourges in 1438 by a national council of the French church in union with the King, Charles VII. This abolished papal reservations and restricted appeals to Rome to *causae maiores*. Though Louis XI attempted to repeal it, it was maintained in spite of papal protests until 1516, when it was superseded by the Concordat of Bologna (see CONCORDAT) between Leo X and Francis I. The most conspicuous alteration effected by the new compromise was the transfer of the right of nomination to bishoprics and other *benefices consistoriaux* from the capitular bodies to the crown, with a provision for papal veto upon any choice which did not satisfy canonical requirements. It was substantially a triumph of the absolutist principle, as represented by the King and the Pope, over the constitutional, as embodied in the "Gallican liberties", the upholders of the latter quoted it complacently as establishing them, whereas it was the most formidable blow which had been dealt at them.

Soon, however, new and more far-reaching complications arose with the introduction of the principles of the Reformation into France. The first Protestant place of worship in Paris was opened in 1555, at which time the adherents of

the Reformation in the kingdom probably numbered about a million and a half. Beginning as dissenters on spiritual grounds, the Huguenots were soon driven by the force of circumstances into the position of a seditious faction whose activity threatened the peace and stability of the state. Their history cannot be properly understood unless this fact is borne in mind. The story of the wars of religion is strangely complicated by its bearing upon their progress. Thus, the League, which took its rise from the strangely indulgent terms granted to the Huguenots by the "Peace of Monsieur" in April, 1576, four years after the Massacre of St Bartholomew (see BARTHOLOMEW, MASSACRE OF SAINT), was founded upon peculiarly assorted principles, politically it was democratic, while its religious views were the most ultramontane. At the time of its predominance, after the "day of the barricades" (May 12, 1588), the Huguenots became for a time the champions of order and constitutional authority, but the situation changed again with the conversion of Henry IV. That sovereign, when he issued the Edict of Nantes in 1598, was actuated not only by a general belief in toleration, but by his knowledge that French Protestantism was a struggle even more for political than for religious predominance, and his desire to bring that conflict to an end, in the interests of statesmanship, by depriving his Protestant subjects of any reasonable pretext for disaffection.

With the cessation of civil strife, a remarkable outburst of religious life manifested itself. There was need for it, three-fourths of the parochial churches and a third of the episcopal sees were without pastors, and miserable disorder was to be seen everywhere. Now, in all directions, new undertakings multiplied—colleges, schools, hospitals, congregations for the systematic training of the clergy, seminaries, and new monastic orders or reforms within the old ones. The names of St Vincent de Paul, of St Francis de Sales, and his devoted associate, St Jane Frances de Chantal, of Cardinal de Bérulle, and M. Olier, of La Trappe and Saint-Maur and Port Royal, speak eloquently of the great wave of zeal which passed over the land in the first half of the seventeenth century. When, however, the death of Richelieu removed the great personality which had stood for order and unity, this fair picture was marred by a new ebullition of strife, which proved full of peril and disaster, in the rise of Jansenism and Quietism (qv). Towards the close of the century, moreover, with the attempt of Louis XIV to enlarge the ecclesiastical prerogative of the crown as he had increased its political authority, the principles of Gallicanism assumed an importance which may fitly be treated here at length. Controversy arose over his attempt to enforce the so-called *droit de régale*, based upon his claim to receive the revenues of bishoprics during vacancies, and to appoint to all benefices in the Bishop's patronage, not involving the cure of souls, which might fall vacant during the interval. An effort to exercise this power brought on a collision between the crown and certain bishops. Their metropolitan decided against them, and they appealed to Rome, where Innocent XI upheld them, much to the displeasure of Louis and the courtier ecclesiastics. An assembly of the higher French clergy was convened to find a way out of the difficulty. At its opening Bossuet, just chosen Bishop of

Meaux, delivered his celebrated discourse on the unity of the Church. It was clear that his intention was not to deny the headship of Rome in any sense, but merely to reassert what were considered prescriptive privileges, yet it is difficult to understand how the prelate who pronounced so eloquent a defense of the rights of the Pope could, before the end of the assembly, have signed the Gallican articles.

These articles, four in number, are considered the charter of the Gallican church. The first declares that "the jurisdiction of St Peter and his successors in the Roman see as vicars of Christ on earth, although divinely bestowed, is confined to things spiritual, and does not extend to civil or temporal affairs." The second renews the declaration of the Council of Constance as to the superiority of a general council to the Pope, and declares that the articles passed in the third and fourth sessions of the council are not to be restricted in their application to a period of schism such as existed at the time of the council. The third asserts that the authority of the Pope is to be restricted by the canons of the universal Church, and that "the laws, customs, and constitutions of the realm and of the Gallican church remain in full force." The fourth declares that "the Pope has the principal share in the decision of questions of faith, his decrees regard all the churches and each church in particular, nevertheless, his judgment is not irreformable unless the consent of the entire Church be added to it." It has been pointed out that since the Vatican Council, adherence to this last proposition would amount, for Roman Catholics, to formal heresy. The chief laws and customs referred to in the third article are that the national church of France is not bound to receive all the decrees of councils and of popes in matters of discipline, and that only such decrees as are formally received are in force in France, that the Gallican church holds itself free to receive or reject the rules of the Roman chancery, that the Roman pontiff cannot levy any impost upon the French clergy without their consent, that he cannot bestow of his own motion on a foreigner any benefice properly belonging to the Gallican church, that neither the Pope himself nor his legates can hear French causes "in the first instance," and that even in cases of appeal he is bound to assign French judges to hear the cause, even should the appellant be a metropolitan or primate, finally, it is asserted that the French bishops shall not be required to attend any general council, unless with the permission of the crown. The last of these customs, as also those which make the reception of the general canons of discipline optional in France, and which practically throw the decision into the hands of the civil power, have been not unreasonably called the "slaveries" rather than the "liberties" of the Gallican church. It was not long before Bossuet declared that "the liberties of the Church are constantly appealed to against the Church and to her detriment." Fénelon wrote "In practice the King of France is now more the head of the Church than the Pope. Liberty towards the Pope, servitude towards the King. The King's power over the Church has fallen into the hands of the civil tribunal. Laymen lord it over the bishops. Secular judges go so far as to examine even those papal bulls which relate only to matters of faith."

Louis was resolved, nevertheless, to enforce the declarations absolutely. By royal edict he commanded the acceptance of the four articles and their incorporation into the acts of parliaments and universities. Professors were required to teach them and bishops to swear to them. The Sorbonne objected, but was compelled to submit. Outside of France, distinct disapproval marked the declaration, Pope Innocent XI received it in silence, but refused to raise to the episcopate any members of the assembly who were subsequently nominated. His successor, Alexander VIII, condemned the declaration in 1690. Two years later Louis wrote to Innocent XII that his edict concerning the Declaration of Rights no longer held, and that he wished all the world to recognize his veneration for the Pope. The declaration was not, however, formally withdrawn and was subsequently condemned by Clement XI in 1706, and again by Pius VI in 1794.

The revocation of the Edict of Nantes scarcely belongs in strictness to an ecclesiastical survey, since, like the original promulgation, it was supposed to be an act of political wisdom. The Huguenots, as Lavalée remarks, preserved towards the government the attitude of children in disgrace, and towards the Catholics that of disdainful enemies, they persisted in their isolation, they kept up a continual correspondence with their friends in England and Holland, even when those countries were hostile to their own. "France," says Michelet, "found a Holland in its own bosom which was rejoicing at the success of the other." On the eve of the formation of the League of Augsburg against him, Louis XIV could hardly have been expected to leave such a stronghold of anarchy within his kingdom as the privileges of the Edict of Nantes had come to constitute. The act of revocation was received with a chorus of enthusiastic applause from all sorts of people in France. Bossuet burst forth into a joyful panegyric, Fénelon, who has been represented as the apostle of toleration, laid it down clearly that "though no sovereign may require interior belief in religious matters from his subjects, he may prevent the public exercise, or the profession, of opinions or ceremonies which disturb the peace of the commonwealth, by the diversity and multiplicity of sects." The laity applauded the King not less than the clergy, the great Chancellor, Le Tellier, after a life of noble and high-minded service to his country, died with the *Nunc dimittis* upon his lips, saying that he had nothing left to wish for after this final act of his long ministry. The consequences to religion were not, however, altogether happy, and the gentle methods of persuasion employed by the Lazarists, Sulpicians, Doctrinaires, and Theatins, who went as missionaries among the Huguenots, were probably far more efficacious in producing real conversions than were the *dragonnades*.

The general tone of laxity which characterized the eighteenth century did not fail to have its effect upon the Church, infecting at least the higher clergy with a spirit of worldliness and selfish devotion to ease and pleasure. A terrible punishment came upon them in the Revolution. The Constituent Assembly first laid hands upon the property of the Church to meet its financial needs, and then assumed to tamper with her organic structure. The "Civil Constitution of the Clergy," decreed on July 12, 1790, was but a natural outcome of Gallican principles, yet

its arbitrary suppression of dioceses and establishment of others, its provision for the election of bishops and *cures* by the people and their payment by the state, whose stipendiaries they were to become, raised the weightier question as to whether, after all, the civil power was to impose laws upon the spiritual without the concurrence of its legitimate rulers. From this time Gallicanism, as a system, has steadily declined, and while it is true that French bishops in the nineteenth century were, as a rule, less ultramontane than others, they seem to have learned the necessity for the supremacy of the head of their church in religious matters.

The attempt of the Constituent Assembly to separate the French church from Rome and to make it a mere department of the newly organized state, brought about a condition very like a schism. Those who submitted to take the oath to support the new order—the Constitutional clergy, as they were called—were regarded by the stricter Catholics as having forfeited their rights, and in the more conservative provinces, like Brittany, the people refused to attend their ministrations. On the other hand, those who refused the oath were subjected to increasingly heavy penalties by the revolutionary government and either exiled as a last resort to the pestilential swamps of Guiana or executed. Their faithfulness, however, had its reward, when religion once more held up its head after the excesses of the Terror, the Constitutional organization gradually disappeared, and a *modus vivendi* was reached in the Concordat of 1801 by Napoleon, who was acute enough to see the advantage to his newly founded dynasty of the support of the Church. This, having proved not entirely satisfactory, was reviewed after the Restoration, in 1817, but the new instrument, which was in many particulars a return to that of 1516, was not approved by the Chambers, and the Church remained for several years uneasily fluctuating between two concordats, neither of which was fully executed, until in 1822 an arrangement was concluded by which 30 prelates were added to the existing hierarchy, its total number being thus fixed at eighty.

Among questions or movements of general significance which have agitated the French church since that date must be mentioned the stir caused about 1830 by the body of enthusiastic visionaries, of whom Lamennais, Lacordaire, and Montalembert are the best known, starting from a pure devotion to the cause of liberty and a conviction that the Church would gain by its fullest exercise, but ending in dangerous errors which received the condemnation of the holy see. In recent years the very serious aggressions made upon the Church with increasing bitterness by the government of the Third Republic have created a new order of affairs. Though Pope Leo XIII repeatedly laid down the principle that there is no reason why, theoretically, a good Catholic should not be a good republican, it is undeniable that the bulk of the monarchist parties is composed of members of the Church, and thus politics has become mixed up in the treatment accorded the Church by the government. The antagonism finally led to the suppression of the religious congregations in France and the confiscation of their property, a measure difficult to reconcile with the principles of democratic government. This was followed by the repeal of the Concordat, the agree-

ment under which the papacy and the French government have carried on their relations since the time of Napoleon. Thus, for the first time in modern history, church and state are absolutely separated in France. See FRANCE, *History*.

Bibliography Jervis, *The Church of France* (2 vols., London, 1872) and *The Gallican Church and the Revolution* (ib., 1882), by far the best books in English on the whole subject, Pithou, *Les libertés de l'église Gallicienne* (Paris, 1594), *Gallia Christiana* (13 vols., ib., 1715-85, vols. GALLICAN CONFESSION See GALLICAN CHURCH.

GALLICO, gal'lé-kō, PAOLO (1868-). An American pianist, born at Trieste, Austria. He studied under Julius Epstein at the Vienna Conservatory, where he graduated in 1886 after having won two first prizes for piano playing. The next few years he spent on concert tours through Austria, Italy, Germany, Holland, and Russia. In 1892 he came to the United States and settled in New York as a teacher. He frequently appeared in recitals and as soloist with the larger orchestras, at the same time being in great demand because of his fine qualities as an ensemble player. He published some meritorious songs and pieces for piano.

GALLIEN, gal'lén, JOHANNA. See WYTTEBACH, DANIEL ALBERT.

GALLIENI, gal'ye-né', JOSEPH SIMON (1849-1916). A French soldier and colonial administrator, born at Saint-Béat (Haute-Garonne). He graduated from the military school of Saint-Cyr in 1870, fought in the war with Germany, and in 1878 went as captain to Senegambia, where he was active in extending the French influence. In 1883-86 he served in Martinique, in 1886 he became Governor of Upper Senegal, and in 1893-95 he commanded a division in Tongking, where he succeeded in extirpating the prevailing brigandism. In 1896-1905 he was Governor-General of Madagascar and established French control there. He was created general of division on his return to France, and for several years was military governor of Lyons. For his part in the war in 1914 see WAR IN EUROPE. He wrote *Mission d'exploration du Haut-Niger* (1885), *Deux campagnes au Soudan français* (1891), *Trois colonnes au Tonkin, 1894-95* (1889), *Rapport d'ensemble sur la situation générale de Madagascar* (1899), *Neuf ans à Madagascar* (1908).

GALLIENUS, gál'lí-é'nūs, ARCH. OF. An

arch on the Esquiline Hill at Rome, erected in honor of Gallienus and his wife Salonina. One span of the arch is still standing. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

GALLIENUS, PUBLIUS LICINIUS (?-268 A.D.) Roman Emperor, 253-268 A.D. He was made joint ruler on the accession of his father, Valerian (qv), in August, 253. In 256 he took the field against the Alemanni, who were making incursions into the Roman provinces along the Danube. After several campaigns they were subdued in 258, but they rose again soon after and forced their way into Italy, where Gallienus gained a victory over them near Milan. (See ALEMANNI.) Meanwhile Valerian had been engaged in wars with Shapur, or Sapor, the Persian King, by whom he was taken prisoner in 260. Gallienus now became sole Emperor, but only in name, for self-appointed rulers arose in all parts of the Empire, this period being for that reason known in history as the "Reign of the Thirty Tyrants." Gaul became practically a separate kingdom under Postumus (258-267). The reign of Gallienus was a period of incessant turmoil until, in an attack on Milan, where he was besieging the usurper Aureolus, he was killed in a plot formed by some of his own officers.

GALLIFFET, ga'le'fâ', GASTON ALEXANDRE AUGUSTE, MARQUIS DE (1830-1909). A French soldier, born in Paris. He entered the army in 1848 and fought in the Crimean War. He was engaged in Mexico, was wounded at the battle of Puebla, and in recognition of his bravery was selected to deliver the captured Mexican battle flags to Napoleon III. During the Franco-German War he led the memorable cavalry charge of the *chasseurs d'Afrique* at the battle of Sedan, and afterward he acted with ability and severity in the suppression of the Commune—indeed, his execution of the Communards was the theme, his life through, of bitter political attacks upon him. In 1872-73 he was in Algeria, where he suppressed the revolt among the natives. In 1875 he became general of division, avowed himself a loyal Republican, and won the favor of Gambetta. In 1879 he was appointed commander of the Ninth Army Corps. He repeatedly conducted the French cavalry manœuvres and was justly famed for his knowledge of this branch of the service. The reorganization of the French cavalry in 1882 was largely his work. In June, 1899, he was appointed Minister of War, which position he resigned in May, 1900, after having done much by his rigorous discipline to carry the government safely through the crisis of the Dreyfus agitation.

GALLINÆ (Lat. nom. pl., hens), or **GALLIFORMES**, or formerly **RASORES**. An order of birds, containing at once the most important species domesticated as poultry and those most sought after as game. The common domestic fowl may be regarded as the type of the order. Like it, the Gallinæ in general have a small head, a rather short bill, with the upper mandible a little arched, nostrils placed on the sides of the bill, and usually in a soft membranous space at its base, the figure bulky, the wings short, and not governed by powerful muscles or adapted for a long or rapid flight, the feet with three toes before and one behind, adapted for walking on the ground and for scraping, which is much resorted to, in order to procure food and for other

purposes, the digestive organs complex, the crop large, the gizzard very muscular, the intestine long, with two very large cæca. The sternum is deeply double-notched, there are two carotids, the oil gland is tufted, the plumage has aftershafts, and there are usually more than 12 tail feathers. The head, at least of the males, is often furnished with appendages, as a crest, comb, wattles, etc. The legs of the males are also often furnished with spurs, and at least during the breeding season the males are very quarrelsome. The males of many species (e.g., pheasants) are birds of splendid plumage, that of the females is sober, but females of very advanced age sometimes assume a plumage similar to that of the males. Some of the Gallinæ are polygamous, some pair at the breeding season, the nest of all of them is artless, and the males take no part in incubation, and only occasionally aid in the rearing of the young. The young are precocial, i.e., they are comparatively feathered when hatched and are immediately able to run about and pick up food for themselves, but are for some time tended and protected by the mother, and by her the proper food is sought for them and pointed out to them or broken into sufficiently small pieces and laid before them. The Gallinæ have unmelodious voices. Except the curassows, they make their nests on the ground. Some of them are found in almost all parts of the world. The order contains seven families, Megapodidæ (see BRUSH TURKEY, MOUND BIRD), Cracidæ (see CURASSOW, GUAN), Tetraonidæ (see GROUSE, PTARMIGAN), Phasianidæ (see PARTRIDGE, QUAIL, PHEASANT, TRAGOPAN, JUNGLE FOWL, PEACOCK), Numididæ (see GUINEA FOWL), Meleagridæ (see TURKEY), Odontophoridæ (see QUAIL, PARTRIDGE).

GALLINETA (Sp., sandpiper). A remarkable rail (*Aramides ypecaha*) of the La Plata valley, South America, called "ypecaha" by the native Indians, which is noted for its shrieking cries, and for its gathering into companies which join in dances, the performers becoming almost frenzied with excitement, and with loud cries and outstretched wings rushing from side to side for several minutes. These performances are indulged in by jacanas, the Cayenne lapwing, and various birds in other parts of the world. For a detailed description and consideration of this and other habits, consult Hudson, *Naturalist on the La Plata* (London, 1892).

GALLINGER, JACOB H. (AROLD) (1837-1918). An American physician and Republican politician, born at Cornwall, Ontario, Canada. He became a printer in his teens, studied medicine in Cincinnati, practiced medicine and surgery at Concord, N. H., from 1862 until his appearance in public life, and contributed much to medical literature. In 1879-80 he was surgeon-general of New Hampshire, with rank of brigadier general. He was a member of the New Hampshire House of Representatives in 1872-73, of the State Constitutional Convention of 1877, of the State Senate in 1878, 1879, and 1880, and again of the House in 1891. From 1882 until his resignation in 1890 he was chairman of the Republican State Committee and in 1898 and 1900 was reelected to the post. He was chairman of the New Hampshire delegation to the Republican National Convention of 1888, in which he seconded the nomination of Benjamin Harrison for the presidency, and also chairman of the delegation to the convention of 1900. In 1885

he entered the Forty-ninth Congress. He was reelected in the Fiftieth, declined renomination for the Fifty-first, took his seat in the Senate in 1891, and was reelected in 1897, 1903, and 1909. In December, 1912, he and Senator Bacon of Georgia, were chosen alternating presidents of the Senate. He belonged to the conservative wing of the Republican party, being a "standpatter," particularly on the tariff question.

GALL INSECTS (from Lat. *galla*, gallnut). Until about 200 years ago galls were supposed to be purely of vegetable origin, and the maggots that grow within them were supposed to arise by spontaneous generation in the organic substances in the galls. Pliny knew that a fly came from galls and thought they grew like fungi in the night. Malpighi, in the second half of the seventeenth century, was the first to record the fact that the production of galls followed puncture of vegetable tissue by insects, and he came to the conclusion that the insects inject a substance, which he called ichor, into the plant tissue, and this substance produced a swelling similar to that which the sting of a bee causes in animal tissue. Réaumur held the theory that the gall is not the product of some specific irritating fluid, but is due to the irritation caused by the prick, and to the presence of the egg and developing larvæ in the tissue. Some galls begin to develop as soon as the eggs are laid, but, unfortunately for the universal application of Réaumur's theory, others do not begin to develop until after the eggs hatch, which may be months after they are deposited in the tissue.

Galls occur on a great many kinds of plants and are produced by a variety of insects, by mites, and by certain species of nematode worms. Each species of insect confines its activities to one or, at the very most, to a very limited number of species of plants. The same kind of insect will produce different kinds of galls on different kinds of plants, and different kinds of insects will produce different kinds of galls on the same plant. Each species of gall insect, however, infests a particular part of the plant, such as the leaf, flower, stem, or root, and that part alone, and it produces there galls with such precise qualities that it can be definitely stated, from the appearance of the gall, what sort of insect has caused its development. In rearing galls one cannot be certain, from merely observing the emerging insects, what species are the producers of the gall, for a number of different kinds of insects may develop within the same gall—some as guests, feeding on the tissue of the gall, and others as parasites on the larvæ of the true gall insect.

Nearly all the orders of insects have gall-making representatives. In addition there are the galls of mites and nematodes. The galls made by mites, like those produced by plant lice, have open mouths for the escape of the matured mites. An example of a gall produced by mites is the pear-leaf blister made by *Phytoptus pyri*. Nematodes of the genus *Anguillula*, which is allied to the vinegar worm, are the cause of smut in growing grain, particularly in wheat. The larvæ of these insects have the most extraordinary capacity of withstanding desiccation. The egg is laid by the parent in the growing ear, where the larvæ develop and are set free by the dying grain. They then live in the moist earth until the young wheat begins to grow. They

creep up the stem of the wheat, and when once lodged within the head they soon gain sexual maturity. In their wanderings in search of new, growing grain the larvæ undergo great vicissitudes. They may be compelled by drought to encyst a number of times, even on the very stem of the plant, and await moisture before they are able to reach their final destination. According to Spallanzani, they may retain their vitality for 20 years while awaiting their food plant.

The family Cynipidæ, of the order Hymenoptera, furnishes the greatest number of species of gall-producing insects. The majority of its species (called gallflies) infest some part of the oak, making closed galls. They are the best studied of all the galls, and a large amount of information concerning their life history has been gained by the painstaking studies of Adler, Riley, and others. Adler kept oak saplings until from four to six years old, and on these he isolated certain insects and observed the resulting galls. Some of the species that Adler bred were so nearly alike that he could determine them with certainty only by their galls. Moreover, certain species that had been given different specific or even generic names he found to be the alternating generations of other described species. Some winged generations he found to be composed entirely of females, and the next generation of both males and females. Thus, the individuals of one generation do not resemble their parents, but their grandparents. (See ALTERNATION OF GENERATIONS.) Not only are the insects of these two generations very different, but the galls that they produce are likewise different. Other forms are believed to reproduce entirely parthenogenetically without males ever appearing. Adler studied galls of the bud, leaf, bark, and root, and found that all of them are developed by abnormal activities of the cambium ring. The potentialities of the tissue growth are always present at the spot pricked and are merely called into activity by the prick or by the larvæ. He found that some of the galls are protected from attack by sweet juices, which attract guarding ants, and it is interesting to note that the honey-making ants (qv) of the southwestern United States gather honey from oak galls. Other galls are provided with a sticky secretion on long hairs which entraps marauders, the spongy parenchyma of some galls is so very thick that it acts as an effectual barrier against intruders. Other galls have an inner stony layer for the protection of the larvæ, others, a large, hollow chamber in which it is difficult for the enemy from without to locate the larvæ. The pine-cone-like arrangement of scales in certain galls is a sufficient protection to the larvæ. Other galls are exempt from attack by virtue of their bitter tannin or by their protective coloration. Insects, titmice, pheasants, and squirrels are the chief enemies of gall insects, the birds and squirrels tearing them open in winter to get the larvæ within them.

Three classes of hymenopterous insects may be reared from one and the same gall. 1. Psenids, or true gallflies, which lay their eggs in the tissue of the plant, many of these species cause those subsequent modifications in the development of the plant tissue that we call galls. 2. Inquilines, or guests, which lay their eggs and develop in the galls caused by the true gall makers. 3. Parasites, which prey on the larvæ of the true gall makers or their guests. Accord-

ing to Adler, Riley, and others, the growth of the gall probably depends upon the activity of the larvæ and is the result of some secretion or excretion thrown out by the larvæ.

The rate of growth of the gall will depend on that of the meristem—those that are formed on catkins and young leaves growing rapidly, while those on roots and bark require perhaps months to gain full size.

Some of the gall larvæ of the Diptera (especially the minute flies of the family Cecidomyiidae) transform in the plant tissue and others in the ground. The larvæ are maggot-like and without anal opening. The goldenrod gall, a round ball produced in the stem of the plant by a fly (*Trypeta solidaginis*), and the pine-cone galls on the heart-leaved willow (*Salix cordata*) are formed by dipterous insects. The Hessian fly of wheat, which stings the base of the leaf, and the wheat midge, which stings the flower, are also classed as gall insects. The Hemiptera have gall-producing representatives among the plant lice (aphids) of the Coccidae and of Phylloxera. The galls produced by plant lice have open mouths for the escape of the developed lice. Reproduction may take place within the gall. The cockscomb elm galls, on the upper side of elm leaves, are produced by the plant louse (*Colopha ulmicola*). The destructive grapevine phylloxera makes galls on the underside of the grape leaf and on the roots of the vine. The elongated galls on the goldenrod stems are produced by a tineid moth (*Gelechia gall-solidaginis*). In Australia several plants are infested by gall-producing thrips, and galls are also said to be caused by beetles.

Consult Osten-Sacken, "On the Cynipidae of North American Oaks and their Galls," in *Proceedings of the Entomological Society of Philadelphia*, vol. 1, pp. 47-72, 241-259, vol. 11, pp. 33-49, vol. 17, pp. 331-380 (Philadelphia, 1861-64), Cameron, *Monograph of the British Phytophagous Hymenoptera* (London, 1882-93), Rotham, "On the Etymology and Life History of Some Vegetal Galls," in *Natural Science*, vol. 11 (ib., 1893), Beutenmuller, "Catalogue of Gall-Producing Insects Found within Fifty Miles of New York," in *Bulletin of the American Museum of Natural History*, vol. 14 (New York, 1892), id., *The Insect-Galls of the Vicinity of New York City*, in *American Museum Journal*, vol. 14 (ib., 1904). See PHYLLOXERA, APHID, GALLS.

GALLINULE (Lat. *gallinula*, dim. of *gallina*, hen). A bird of one or other of the genera *Gallinula*, *Ionornis*, etc., of the family

marginal membrane. This membrane and the great length of the toes enable the gallinules to swim well, and all of them are aquatic. The species are about 30 in number, some of them confined to tropical regions. Two occur in the United States. The Florida gallinule (*Gallinula galeata*) is brownish olive above, grayish black beneath, and the bill is red. It is a little more than a foot in length and is found from New York State, Minnesota, and California southward through central and northern South America, though only a summer visitor in the most of the United States. Its nesting habits are like those of the coot (qv). The purple gallinule (*Ionornis martinicus*) is a trifle smaller, and a handsome olive green above, the head and underparts being a beautiful purplish blue. It is a South and Central American species, common to the West Indies and the South Atlantic states, where it is resident. (See Plate of RAILS, ETC.) All these birds are commonly known as mud hens, and are shot for sport, but the flesh is not good.

The common gallinule (*Gallinula chloropus*) of Europe is more usually styled in Great Britain water hen, or moor hen. It is widely diffused in the Old World and abundant in suitable situations, such as river marshes and the artificial ponds of parks, where these birds may often be seen in considerable numbers, swimming together, with a peculiar nodding motion of the head. They seek their food both on the surface of the water and by diving, partly also among the grass of meadows and river banks. A frequent jerking of the tail is very characteristic of them. When alarmed, they sometimes seek safety by flight, but more frequently by hiding among rushes or reeds. They make their nests near the water which they frequent, and usually on the ground, and lay from 7 to 10 brown and speckled eggs. The flesh is well flavored. See COOT, RAIL.

GALLIO, LUCIUS JUNIUS. A Roman rhetorician of the first century, a member of the senatorial order, who gained the ill will of Tiberius by proposing that retired members of the Prætorian Guard should have seats with the *equites* in the first 14 rows of the theatre. He was banished from Rome, then recalled and kept under surveillance, and finally put to death by Nero. His textbook on rhetoric has not survived. He was a friend of Ovid and of the older Seneca, the rhetorician, whose oldest son, M. Annæus Novatus, he adopted. Consult Schanz, *Geschichte der römischen Literatur*, vol. 11 (3d ed., Munich, 1911).

GALLIO, LUCIUS JUNIUS ANNÆUS. The name assumed by Marcus Annæus Novatus from that of Lucius Junius Gallio, the rhetorician, by whom, as a friend of his father, Marcus Annæus Seneca, he had been adopted. He was born at Cordova, but brought up at Rome. Gallio was an older brother of the famous philosopher and statesman Lucius Annæus Seneca, and of the geographer Lucius Annæus Mela, father of the poet Lucan. He appears to have been a highly cultured man, and to this fact, rather than, as is generally asserted, to the influence of Seneca, his appointment as proconsul of Achaia was due. The date of this appointment is now fixed beyond doubt by the recent discovery of an inscription of Claudius at Delphi belonging to the twelfth year of his reign (January, 52-January, 53 A.D.), in which Gallio is mentioned as proconsul and the Emperor's friend. As the office

HEAD AND FOOT OF GALLINULE

a, foot of purple gallinule (*Ionornis martinicus*), b, profile of head of the same, c, top of head of Florida gallinule (*Gallinula galeata*), showing shape and extent of frontal shield.

Rallidae, closely allied to the coots, and having the upper mandible similarly extending up on the forehead in a naked soft plate, but the toes usually furnished with an undivided narrow

was usually held for only a year, Gallio was proconsul either from spring of 51 to spring of 52 (or, as is much less probable, from spring of 52 to spring of 53). He was involved, though not immediately, in the same fate as befell his brother Seneca, who was disgraced by Nero in 65 A.D. and committed suicide. Gallio's death followed some months later. All that is known of him indicates that he was a man of high character with a lovable disposition.

In the latter part of Paul's first visit to Corinth the Jews, angered by the defection of leading members of the Synagogue to the Apostle's following, brought Paul before the proconsul on the charge that he was acting contrary to the [Roman] law. Gallio dismissed their case, however, with the statement that he was not minded to be a judge of such matters. And when Sosthenes, probably the leader of the accusing party, was taken by the [Greek] bystanders, with whom the Jews were generally unpopular, and beaten before the judgment seat, Gallio refrained from interposing, the narrative stating that he cared for none of these things (Acts xviii 14-17). From this last statement it has been inferred that Gallio was indifferent to Christianity. The words of his reply, however, while betraying an ignorance of the distinctive features of Christianity, disclose simply the usual attitude of Roman officials to the religions of the people of the provinces in accordance with Roman law. Its meaning is that Gallio was indifferent to the controversy, since it was a purely religious one, and considered this and the beating of Sosthenes in particular as matters outside of his judicial concern. Consult, besides the usual lives of Paul and commentaries on Acts, Ramsay, *St Paul the Traveler and Roman Citizen* (New York, 1896); Zahn, *Introduction to the New Testament*, vol. iii (New York, 1909), and especially Deissmann, *Paulus* (Tubingen, 1911, Eng. trans. London, 1912). See PAUL.

GALLIOT (from OF. *galiole*, from ML. *galeota*, diminutive of *galea*, galley). A galley of medium size, having one mast and 16 to 20 oars, and very generally used in the sixteenth, seventeenth, and eighteenth centuries as a cargo vessel and gunboat by the maritime nations of Europe. Also a Dutch or Flemish vessel with very full lines, an easy bilge (qv), and a flat bottom. It is rigged like a ketch with a high mast stepped in the centre of the ship and a much lower one farther aft. The head stays lead from the main (or higher) mast, and the head sails are large and numerous, both masts are square-rigged. Galliot's are usually of 400 to 500 tons' measurement. They were formerly much used as bomb vessels, the absence of a mast forward giving ample space for the operation of bombards, mortars, or howitzers.

GALLIPOLI, gal-lè'pò-lè (ancient Callipolis, a Greek name meaning Beautiful City). An episcopal city and seaport in the Province of Lecce, south Italy, 55 miles south of Brindisi. It is picturesquely situated in the Gulf of Taranto, on a rocky island which a bridge having 12 spans now connects with the suburb of Lizza on the mainland (Map Italy, F 4). It is protected by a castle which Charles I of Anjou constructed. The ancient Callipolis, founded from Tarentum, is hardly mentioned in ancient writers. In the first century A.D. the Romans called it Anxa. Gallipoli has a cathedral dating from 1629, a seminary, a gym-

nasium, and a technical school, also regular steamship communication with Brindisi and Taranto. It exports oil, wine, and fruit, and has long been famous for its oil cisterns cut in the solid limestone. It quarries stone and makes hoops for wine casks. Pop (commune), 1901, 13,552. 1911, 11,427.

GALLIPOLI (ancient Callipolis). A seaport of European Turkey, capital of a sanjak in the Vilayet of Adrianople, situated on the east coast of the peninsula of Gallipoli, at the north-east end of the Dardanelles (Map Turkey in Europe, F 4). It has crooked, ill-paved streets, and is built mostly of wood. There are manufactures of leather, silk, and cotton, but the commercial importance of the town is on the decline, and the well-fortified harbor has more strategical than commercial value. Gallipoli is a Turkish naval station, and the seat of a captain pasha and a Greek bishop. The population, largely Greek, is estimated at from 20,000 to 30,000. The town was of great commercial importance during the Middle Ages and at one time had a population of 100,000. It suffered terribly at the hands of the Catalans early in the fourteenth century and fell into the hands of the Turks in 1354, being the first Turkish possession in Europe.

GALLIPOLI, PENINSULA OF (the ancient Thracian Chersonesus). A portion of the Vilayet of Adrianople, European Turkey, separating the Strait of Dardanelles on the east from the Gulf of Saros on the west (Map Balkan Peninsula, F 4). It extends in a southwest direction for about 55 miles and varies from 4 to 13 miles in breadth. The principal town on the peninsula is Gallipoli (qv). The land is exceedingly fertile.

GALLIPOLIS, gal-li-pò-lès'. A city and the county seat of Gallia Co., Ohio, 116 miles south of Columbus, on the Ohio River, and on the Hocking Valley and the Kanawha and Michigan railroads (Map Ohio, F 8). It is the seat of the Ohio Hospital for Epileptics established 1893, and contains a Carnegie library, a public park, and Gallia Academy. The city is surrounded by undeveloped coal fields and is a distributing centre of some importance. There are iron and wood-working industries, and manufactures of furniture, stoves, flour, ice, brooms, lumber, leather, etc. The government is administered by a mayor, elected every two years and a city council. The water works are owned and operated by the municipality. Pop., 1900, 5432, 1910, 5560. Gallipolis, the third white colony in Ohio, was first settled in 1790 under the auspices of the Scioto Company, by a party of 500 Frenchmen, who named it Gallipolis (the city of the Gauls). It was incorporated as a village in 1842 and in 1865 was chartered as a city. Consult W. G. Sibley, *The French Five Hundred* (Gallipolis, 1901).

GALLISSONNIÈRE, ga-lè'sò'nyâr', AUGUSTIN FÉLIX ELISABETH BARRIN, COMTE DE LA (1742-1828). A French soldier. He was a nephew of Roland Michel Barrin, Marquis de la Gallissonnière, and was born at Anjou. He entered the navy while he was a boy and served under his uncle in Canada, then he fought in the Hanoverian campaigns. In 1788 he was appointed field marshal and, just before the Revolution, was invested with the grand sword of Anjou and was made president of the nobility in the States-General. When the Revolution came, he was a deputy to the Constituent As-

sembly and on its dissolution refused to leave the country, but later became an *émigré* and fought under Conde. But in 1801 he returned to France and was elected deputy in 1809. After the Restoration he was promoted to the rank of lieutenant general, but soon retired. He wrote on many contemporaneous topics.

GALLISSONNIÈRE, ROLAND MICHEL BARRIN, MARQUIS DE LA (1693-1756). A French naval officer and Governor-General of Canada (1747-49). He was born at Rochefort and at the age of 17 entered the royal navy. In 1745, although only a captain in rank, he was appointed Governor-General of Canada to succeed Beaulieu. He reached Quebec in 1747, and during the two years he remained in Canada displayed not only great energy, but broad statesmanship. He planned to advance the French possessions in America by building a chain of forts in the Mississippi valley to connect Louisiana and Canada, by settling 10,000 French peasants in the Ohio valley to check the migration that was beginning to pour over the Alleghenies from the English colonies, and by winning the friendship and alliance of the Iroquois tribes. He succeeded in establishing some forts and supported Abbé Piquet in his mission to the Iroquois country, but his request for new settlers remained unheeded. In 1749 he was recalled to France to act on the commission to fix the boundaries to be established under the Treaty of Aix-la-Chapelle and was succeeded by the Marquis de la Jonquière. On his return to France he was made chief of the naval Bureau of Charts and Plans, in which position he organized several important scientific expeditions. In May, 1756, he defeated the English fleet under Admiral Byng off Minorca, which led to the loss of Minorca by the English and the court-martial and execution of Byng. Gallissonnière died the same year.

GALLITZIN. A borough in Cambria Co., 12 miles northwest of Altoona, on the Pennsylvania Railroad (Map Pennsylvania, D 6). Coal is mined extensively here, and coke is produced in considerable quantity. The borough was named after Prince Gallitzin (qv), who started a settlement at Loretto in 1835. It was first incorporated in 1872. Pop., 1900, 2759, 1910, 3504.

GALLITZIN, gal-lét'sén, DMITRI AUGUSTIN, PRINCE (1770-1841). An American Catholic priest, of a noble Russian family. (See GOLITZIN.) Born at The Hague, where his father was Russian Ambassador, he received a Spartan training from his mother, who sent him to travel in North America in 1792. His observations led him to volunteer for missionary work in America. He studied at St. Mary's, Baltimore, became a priest in 1795, was settled at Port Tobacco, Md., and then at Taneytown, Md., but in 1799 he was transferred to Cambria Co., Pa. He was dissatisfied with the American system of trustee control and limitation of the priestly power and founded the Catholic town of Loretto, Cambria Co., Pa., from which colonies went out to St. Joseph, St. Augustine, Pa., and Carrolltown, Pa. In his work Father Smith (as Gallitzin called himself until 1809, when, after his father's death and his own disinheritance by the Czar, he resumed his family name) spent much effort and a large fortune. He wrote several pamphlets in controversies with Protestants. There is a monument to him in Loretto, with a bronze statue given by Charles M.

Schwab, and Gallitzin, Pa., is named for him. Consult Brownson, *Life of D. A. Gallitzin, Prince and Priest* (New York, 1873), and Kittell, *Souvenir of Loretto Centenary* (Cresson, Pa., 1899).

GALLIUM (Neo-Lat., from Lat. *Gallia*, Gaul, France). A metallic chemical element, discovered by Lecoq de Boisbaudran in 1875, by means of the spectroscope and isolated by the same investigator in the metallic state in 1876. Its properties had been previously (1870) described, from the periodic law (qv), by the Russian chemist Mendeléeff, who gave it the provisional name of *eka-aluminum*. It is found in minute quantities in various zinc ores and was originally discovered in the sphalerite of Pierrefitte, from which it may be obtained by dissolving the ore and decomposing the resulting solution by metallic zinc. The precipitate thus obtained contains gallium as a hydrated oxide, which is then further purified by repeated solution and precipitation, and the gallium finally thrown down in its metallic state by zinc.

Gallium (symbol Ga, atomic weight, 69.9) is a fairly hard gray metal that may be hammered into thin plates which can be bent without breaking. It melts at 30.15° C. (about 86° F.), and has a specific gravity of 5.9 when solid. Once melted, the metal may for years be preserved in the liquid state at temperatures considerably below its melting point, provided no trace of the solid metal is allowed to come into contact with the undercooled liquid. The metal is soluble in hydrochloric and nitric acids, but best in aqua regia. With caustic potash it produces an evolution of hydrogen. Its general properties are similar to those of the metal aluminum. Gallium combines with oxygen, forming a monoxide having the formula GaO, and a sesquioxide having the formula Ga₂O₃, and with chlorine to form a dichloride and a trichloride.

GALLIVATS, EAST INDIAN. Large row-boats, sometimes having as many as 50 oars, formerly and still to some extent used in Eastern waters. They rarely exceed 70 tons, carry two masts with high triangular sails, and are generally armed with a few small swivel guns, fastened on the bulwarks. The Malay pirates, now nearly exterminated, employ these swift but somewhat fragile vessels.

GALLIWASP (probably of West Indian origin). 1. A lizard of Jamaica and eastern Central America (*Diploglossus monotropis*), which is greatly feared by the people, though perfectly harmless. 2. A small species of lizard fish (*Synodus foetens*), common from South Carolina to Brazil. See Plate of LANTERN FISHES, LIZARD FISH.

GALL MITE. See MITE.

GALLON. A measure of capacity used in the United States and Great Britain and its colonies, but differing in value in the two countries, though its subdivision into four quarts is common. In the United States a gallon is 231 cubic inches (3785.43 cubic centimeters), being the old Bristol wine gallon dating from the reign of Queen Anne (5 Anne c. 27, § 17), a standard (1707) of which is still extant in England. There were in use also in England the corn gallon of Henry VII., amounting to 274½ cubic inches, a standard of which dating from 1495 still is in existence, and an ale gallon of 282 cubic inches was recognized by Queen Elizabeth in 1601. In 1824 these three gallons were abol-

ished in favor of the British Imperial gallon (5 Geo IV, c 74), which is defined as the volume of 10 pounds of fine distilled water at 62° F, corresponding to 277 420 cubic inches according to the best data now available, or approximately 20 per cent larger than the American gallons. The gallon is used now usually for liquid measures, but the term was also applied to a dry measure, consisting also of four quarts.

GALLOTANNIC ACID. See TANNIN

GALLOWAY. An ancient province in the southwest of Scotland, now merged in the counties of Wigtown and Kirkcudbright. The designation, though still in use, has no political significance. The district, about 70 miles long by 40 miles broad, is famed for its mountain, lake, stream, and moorland scenery, and forms the peninsula terminating in Scotland's southernmost point, the Rhynns of Galloway, projecting into the Irish Sea. It is purely a pastoral country, remarkable for its mild climate. Its breeds of small horses and large, hornless black cattle have been known for centuries.

The name "Galloway" is derived from *Gall-Gael*—foreign Gaels, so called because, topographically separated from their northern brethren, they preserved their identity as a distinct race down to the twelfth century and their language beyond the fifteenth. Ptolemy styled the inhabitants *Novantæ* and *Selgovæ* and described their towns *Lucophibia*, *Rerigonium*, *Uxellum*, *Carbantorigum*, etc, the sites of which have been identified. After the Roman evacuation Galloway came under the power of the Anglians and later of the Norsemen. Under the Anglians they acquired the name of the Picts of Galloway. In the twelfth century they were conquered by Malcolm Canmore, who made his son David Earl of Galloway. When David ascended the throne of Scotland, Galloway was united to the kingdom. The lords of Galloway, however, frequently revolted against Scottish rule, and the periodical troubles did not cease until the Lordship of Galloway was attached to the crown in 1455. Consult Skene, *Celtic Scotland* (Edinburgh, 1876), McKerlie, *History of the Lands and their Owners in Galloway* (5 vols, Edinburgh, 1870-78), id., *Galloway in Ancient and Modern Times* (ib, 1891), Maxwell, *A History of Dumfries and Galloway* (ib, 1900), Briggs, *Angling and Art in Scotland* (New York, 1908), Newbigging, *A Nook in Galloway* (Gateshead, 1911).

GALLOWAY, BEVERLY THOMAS (1863-

-) An American botanist. He was born at Millersburg, Mo., and was educated at the University of Missouri, where he was appointed assistant in the department of horticulture in 1884. In 1887 he became assistant pathologist in the Bureau of Plant Industry, United States Department of Agriculture, and in 1888 was put in charge of the division of plant pathology. In 1901 he was appointed chief of the Bureau of Plant Industry and in 1912 became Assistant Secretary of Agriculture, in charge of the scientific work of the department. He is the author of a number of works on botany, horticulture, and plant pathology.

GALLOWAY, CHARLES BETTS (1849-1909). An American bishop of the Methodist Episcopal Church, South. He was born at Kosciusko, Miss., graduated at the University of Mississippi, entered the ministry in 1868, and was pastor of several churches in his native State.

An earnest advocate of the prohibition of the liquor traffic, he was long president of the Prohibition Executive Committee of Mississippi, carried on a spirited controversy with Jefferson Davis on that subject, and wrote a *Handbook and Open Letters on Prohibition*. His publications include *A Circuit of the Globe* and *Modern Missions Their Evidential Value*. He was president of the Board of Education of his church and a trustee of the John F Slater Fund.

GALLOWAY, JOSEPH (1731-1803). An American lawyer and Loyalist pamphleteer. He was born in Kent Co., Md., but early removed to Philadelphia. Almost continuously from 1757 to 1774 he was a member of the Pennsylvania Assembly. He married a daughter of Lawrence Growdon, Speaker of the House, and for 12 years was himself Speaker. In 1764 he was associated with Franklin in the contest with the proprietary government, and, in opposition to Dickinson, advocated the erection of Pennsylvania into a royal province. On the approach of the Revolution he was a vigorous opponent of war and of independence. In 1774 he was sent by the Assembly to the first Continental Congress, where he signed the Association, and introduced (on September 28) his celebrated "Plan of a proposed Union" between Great Britain and her Colonies. This plan provided for a federation under British supervision of the American Colonies, each Colony to "retain its present constitution and powers of regulating and governing its own internal police in all cases whatsoever", for a President General, "to be appointed by the King," and for a Grand Council, "to be chosen by the representatives of the people of the several Colonies in their respective assemblies, once in every three years," and to meet once a year or oftener if necessary—the President General and Grand Council to constitute "an inferior distinct branch of the British Legislature, united and incorporated with it," for certain specific purposes. This scheme was supported in Congress by Edward Rutledge, John Jay, and James Duane, and was rejected by a vote of only six Colonies to five. It is summed up in *A Candid Examination of the Mutual Claims of Great Britain and the Colonies* (1775). In December, 1776, Galloway joined the English army under Sir William Howe, and received an immediate allowance of £200 a year. On the capture of Philadelphia he became superintendent of the port, of prohibited articles, and of the police of the city and suburbs. After the evacuation of Philadelphia he accompanied the British army to New York, and in 1778 went to England, where he passed the rest of his life. Soon after his departure his life was attainted, and his property, valued at about £40,000, was confiscated by the Continental Congress. He was a member of the board (for Pennsylvania and Delaware) on compensating claims of Loyalists. He was one of the ablest of the Loyalist pamphleteers, and wrote *Letters to a Nobleman on the Conduct of the War in the Middle Colonies* (1779), accusing General Howe of neglect of duty, *Historical and Political Reflections on the Rise and Progress of the American Rebellion* (1780); *Cool Thoughts on the Consequences to Great Britain of American Independence* (1780), *Letters from Cicero to Catiline the Second*, i.e., C. J. Fox (1781), *Political Reflections on the Late Colonial Governments* (1782), *The Claim of the American Loyalists* (1788). Galloway also wrote *Brief*

Commentaries upon such Parts of the Revelations and Other Prophecies as Immediately Refer to the Present Times (1802), and *The Prophetic or Anticipated History of the Church of Rome, Written and Published more than Six Hundred Years before the Rise of that Church* (1803). Consult Balch (ed.), *The Examination of Joseph Galloway by a Committee of the House of Commons* (Philadelphia, 1855), Tyler, *Literary History of the American Revolution* (New York, 1897), Baldwin, *Galloway, the Loyalist Politician* (New Haven, 1903).

GALLOWAY, LORD OF See DOUGLAS, FAMILY OF

GALLOWAY, MULL OF A rocky headland terminating the Rhynns of Galloway, in Wigtownshire, the southernmost point of Scotland (Map Scotland, D 5). It is $1\frac{1}{2}$ miles long, $\frac{1}{4}$ of a mile broad, rises to a height of 210 feet, and is crowned by a lighthouse 325 feet above sea level, visible 25 miles.

GALLOWS HILL. The name given to a hill in the neighborhood of Salem, Mass. On it during the witchcraft mania of 1692 a number of victims were hanged as witches. It is also called Witch Hill.

GALLS In plants, modifications of an organ or tissue due to the presence of another organism. Commonly the part affected is much enlarged, either through the expansion of existing cells or the formation of new ones, or more commonly through both combined. The technical term "cecidium" has been proposed as a substitute for "gall," with the purpose of using it with prefixes to indicate origin, e.g., mycocecidium for a gall produced by fungi, dipterocecidium for a gall due to flies, etc. Organisms producing galls are principally insects and fungi, although with the former may be included certain worms, and with the latter algae, bacteria, and slime molds (Myxomycetes). The presence of the foreign organism, either acting directly or through some substance secreted by it, appears to render a portion of the cells of the host more active and lead to the production of an exaggerated amount of tissue near the part infected. It is thought that, while this stimulus does not give the power of producing entirely new structures, it often awakens dormant characteristics and causes their expression. For example, galls upon perfectly smooth rose-bushes are often covered with thorns. Galls show a great diversity of form. Those caused by insects may be arranged into series passing from a slight depression of the epidermis of a leaf or stem to deep closed pouches, and from a slight swelling to masses of great size. Some gall insects injure the growing point and, checking elongation, produce cone-shaped galls, as seen on the willow and goldenrod. An interesting group of galls are the witches' brooms formed on various trees by fungi. Here many small twigs spring from the part affected, giving the appearance of a brush or broom.

One of the most remarkable features of galls is the development of nutritive layers rich in food, some of which is used by the parasite. Galls are also often rich in tannins, substances of no apparent use to the gall former, although occasionally utilized by man, as in the use of oak galls. Perhaps the greatest specialization is seen in the cynipid galls (formed by insects of the Cynipidæ) occurring upon the leaves of oaks and other plants. In these, in addition to the epidermis, three distinct concentric layers

of tissue are developed (Fig 1). Immediately beneath the epidermis is a region of thin-walled cells rich in tannin. Then come thick-walled cells termed the protective layer, although it does not seem clear what this protection is

FIG 1 Diagrammatic cross section of a cynipid gall upon a white-oak leaf. A, the larval chamber, B, the nutritive layer, C, the protective zone, D, the tannin region, E, the epidermis of the gall.

against, and, finally, there are the tissues rich in food, the nutritive layer, surrounding the central larval chamber. Here, as in many insect galls inhabited by larvæ, the parasite secretes a ferment changing the stored starch into sugar, and probably also stimulating increased cell production.

Galls produced by parasitic plants are usually due to the presence of the organism, and since these are immobile the initial cause must be looked for in the excreta of the attacking plant.

FIG 2 SHOOT OF JUNIPER

Enlarged and deformed by the presence of a fungus, *Gymnosporangium claviforme*.

Examples of galls produced by plants are the wens and tumors of various sizes and forms common upon leaves and stems infested by parasitic fungi (Fig 2). They are not easily distinguished in form from similar galls produced by insects. The club root (q.v.) of cabbage and

turnips, due to the attack of slime molds, and the tubercles upon the roots of Leguminosæ, due to bacteria-like parasites, are examples of root galls (Fig 3) See GALL INSECTS

FIG 3 ROOT TUBERCLES OF A LEGUMINOUS PLANT, THE PEA
Produced by the infection of the roots with *Bacillus radicola*

Consult H Adler, *Alternating Generations A Biological Study of Oak Galls and Gall Flies* (Oxford, 1894), E Kuster, *Die Gallen der Pflanzen* (Leipzig, 1911), A Cosens, "Morphology and Biology of Insect Galls," *Transactions, Canadian Institute*, vol ix (Toronto, 1912); E W Swanton, *British Plant-Galls* (London, 1912)

GALL STONE. See CALCULUS.

GALLUP. A town and the county seat of McKinley Co., N. Mex., 156 miles west of Albuquerque, on the coast lines of the Atchison, Topeka, and Santa Fe railway system and on the Puerco River (Map: New Mexico, A 3). It is in a cattle and sheep raising region, has extensive soft-coal mines and oil fields, and is the trading centre for the Zuñi and Navajo Indian reservations. Pop., 1900, 2946, 1910, 2204.

GALLUPPI, gal-lōōp'pē, PASQUALE (1770-1846). An Italian philosopher. He was born in Calabria of a noble family, and educated in the University of Naples. For the greater part of his life he had a position in the Finance Department. Though apart from academic influences, he pursued his favorite studies, and it was not till he had reached the age of 60 and had become widely known by his philosophical writings that he was called to a chair in the University of Naples, which he held till his death. Galluppi's first work was an essay on analysis and synthesis (1807). This was followed by the important *Saggio filosofico sulla critica della conoscenza* (6 vols., 1819-32). Among his other works is to be mentioned *Elementi di filosofia* (1820-27). He founded his system upon the "original fact of the ego, which perceives something existing outside of itself," thus closely affiliating himself with the Scottish

school, by which he was greatly influenced. But in the spirit of Kant he failed to see how experience can give a knowledge of relations, because he regarded relations as the result of conscious activity. Consult Lastrucci, *Pasquale Galluppi, studio critico* (Florence, 1890), Pagano, *Galluppi e la filosofia italiana* (Naples, 1897), Gentile, *Dal Genovesi al Galluppi* (Rome, 1903).

GALLUS. A famous story of Roman life by W A Becker (1838). The work is important for its faithful reproductions of Roman customs under Augustus and for the great amount of archaeological information contained in it.

GALLUS, GAIUS CORNELIUS (66-26 B C). A Roman poet, orator, and general, born of a humble family at Forum Iulii (now Fréjus) in southeastern Gaul. At an early age he went to Rome for an education and attended the lectures of the Epicurean philosopher Syron. He studied also under Parthenios of Nicæa. Vergil and Varius were his fellow pupils, and the three became firm friends. He had the fortune, also, to gain the good will and friendship of Asinius Pollio, one of the greatest Romans of the time, and when Octavius (afterward Augustus) returned to Italy from the East after the assassination of Julius Cæsar, Gallus heartily joined his party and received the important charge of assigning lands in north Italy to the veterans of Octavius' army. On this occasion he was able materially to help his friend Vergil, who was a native of Mantua. At the battle of Actium, Gallus commanded a division of Octavius' forces, and afterward was sent, as general, into Egypt, where he defeated the armies of Antonius and captured Cleopatra, whom he kept as a prisoner in her palace. Upon her death, in 30 B C, Egypt was turned into a Roman province, with Gallus as its first Governor. He ruled in Egypt for four years, largely with success, but not without making enemies, and an unfortunate remark about Augustus was brought to the Emperor's notice, with many other charges. Gallus was accordingly deprived of his rank and estates and ordered into exile, but he preferred death and committed suicide by falling upon his sword. Gallus was the author of four books of elegies concerning Lycoris (a notorious actress, whose real name was Cytheris), he imitated Euphorion (qv). Ovid claimed for him the first place among the Roman elegiac poets, but none of his writings has survived. It was at the request of Gallus that Vergil wrote his tenth *Eclogue*. In modern times he has been made the hero of a well-known story, *Gallus*, by W A Becker (qv), which was translated into English by Metcalf (London, 1844, 9th ed., 1888). Consult Nicolas, *De la vie et des ouvrages de C Gallus* (Paris, 1851), Plessis, *La Poésie Latine* (ib., 1909), Schanz, *Geschichte der römischen Literatur*, vol ii (3d ed., Munich, 1911), Skutsch, *Aus Vergils Frühzeit* (Leipzig, 1901) and *Aus Vergils Frühzeit II Gallus und Vergil* (1906). Skutsch ascribes to Gallus the poem called *Chris*, a view accepted by Mackail, in "Virgil and Virgilianism," in *Lectures on Poetry* (London, 1911). On the other side consult Smith, *The Elegies of Albius Tibullus* (New York, 1913).

GALLUS, GAIUS SULPICIUS. A Roman soldier, orator, statesman, and scholar. Under Æmilius Paulus (qv) he served as military tribune in Macedonia, against Perseus, and gained great and lasting fame because, on the basis of

his studies in astronomy (cf Cicero, *De Senectute*, § 49, Pliny the Elder, ii, 9), he predicted the eclipse of the moon which occurred on the night before the battle of Pydna, 168 B.C. The Romans, forewarned of the eclipse, escaped the panic which seized the enemy. Gallus was consul in 166. In 164 he was ambassador to Greece and Asia. Gallus was well versed in Greek as well as in astronomy.

GALLUS, GAIUS VIBIUS TREBONIANUS (c 205–c 254) Roman Emperor from 251 to 254. He served under Decius in the campaign against the Goths in 251, and is said to have contributed by his perfidy to the disastrous battle in which Decius was killed. Thereupon he was elected Emperor, and shortly afterward purchased peace with the Goths by permitting them to retain their plunder and their captives and promising them a fixed annual tribute. In 253 the Empire was again invaded by the Goths, but they were defeated in Mœsia by Æmilianus, whose troops proclaimed him Emperor. Gallus marched forth to suppress the rebellion, but was killed by his own soldiers before there had been any collision between the opposing armies.

GALLY, MERRITT (1839–1916) An American inventor, born near Rochester, N. Y. He learned the printing trade, graduated at the University of Rochester in 1863, studied at Auburn Theological Seminary, and in 1866 was ordained to the ministry of the Presbyterian church. After three years of pastoral work, however, he was compelled by the loss of his voice to withdraw from the pulpit, and turned his attention to mechanics. He invented the Universal printing press, built an establishment for the manufacture of presses, and obtained many patents on appliances connected with printing machinery. His experiments in regard to automatic musical instruments resulted in the invention of the "orchestrone" and of the so-called counterpoise pneumatic system employed in similar contrivances. His patents, more than four hundred in number, also include a machine for the manufacture of printer's types from cold metal by a process of swaging.

GALOIS, gá'lwa', ÉVARISTE (1811–32) A French mathematician, born at Bourg-la-Reine, near Paris, and killed in a duel at Paris at the age of 20½ years. While yet a pupil in the Lycée Louis-le-Grand he published in Gergonne's *Annales*, vol. xix (1828), a memoir entitled *Démonstration d'un théorème sur les fractions continues périodiques*. Entering the École Normale in 1830, he wrote in the next two years six memoirs on the theory of equations and the theory of numbers. Galois may justly be said to be the founder of the theory of groups (see SUBSTITUTION), and, with Abel and Cauchy, to have been one of the founders of the modern theory of functions. A well-known theorem on the solubility by radicals of irreducible equations of prime degree bears his name. His works attracted little attention when they first appeared, but their value became recognized when Liouville collected them in his *Journal*, vol. ii. His works were published under the auspices of the Société Mathématique de France, with an introduction by Picard (Paris, 1897).

GALOP, gá'lô' (Fr, gallop). A very lively German round dance in two-four time. It was introduced into France early in the nineteenth century, but its popularity is now confined chiefly to Germany. It is similar to the waltz (q.v.) but is less graceful and more animated.

GALSWORTHY, galz'wûr-thî, JOHN (1867–) An English author. His early fiction, published under the pen name "John Senjohn," was conventional and attracted little notice; it included *From the Four Winds* (1897), *Jocelyn: A Tale* (1898), *Villa Ruben* (1900, new ed., with other stories, 1909), and *A Man of Devon* (1901)—the author's home was at Manaton in Devon. His later novels and most of his plays are more serious and more individual, dealing with social problems. Among the novels are *The Island Pharisees* (1904, revised, 1908), an attack on British conventions, *The Man of Property* (1906), satirizing the modern capitalist, *The Country House* (1907), dealing with the life of the English country gentry, *Fraternity* (1909, in German, 1911), in large measure a study of class feeling, *The Patricians* (1911), and *The Dark Flower* (1913), a well-written story with a morbid theme of passion. His social dramas are even more serious, more individual, and more powerful. *The Silver Box* (1906), with its theme of different legal justice for rich and poor, has been compared to Hauptmann's *Biberpelz*, and *Strife* (1909), the story of a strike, to the same author's *Die Weber*. These two plays, with *Joy* (1907), a more conventional comedy, were published together in 1909. *The Little Dream* (1911) is a poetic fantasy with a touch of the morality play, it is entirely unlike the more characteristic "social dramas"—*Justice* (1909), dealing with prison life, *The Pigeon* (1912, and produced as a play in New York in 1913), a blend of comic and tragic that propounds a serious problem in poverty, and *The Mob* (1914). *Justice* and *The Pigeon* were published in 1912 with *The Eldest Son*, which was first played in November of that year. Galsworthy also wrote prose sketches, *A Commentary* (1908) and *A Motley* (1910), a volume of verse, *Moods, Songs, and Doggerels* (1912), and *The Fugitive* (1913). Consult A. R. Skemp, "Plays of John Galsworthy" in *Essays and Studies by Members of the English Association*, vol. iv (London, 1914).

GALT, galt A city in Waterloo Co., Ontario, Canada, on both sides of the Grand River, about 55 miles from its entrance into Lake Erie, and on the Grand Trunk and the Canadian Pacific railroads (Map Ontario, D 7). It is connected by electric railway with the towns of Berlin, Paris, Waterloo, and Brantford. The eastern and western parts of the city are connected with bridges. There are four parks. There are also a collegiate institute and an extensive library and public reading room in connection with a mechanics' institute. The manufactured products include edged tools, underwear, agricultural implements, boilers, engines, hats, leather, aerated waters, pumps, safes, stoves, soap and oils, wheels, boots, boxes, brass goods, etc. According to census returns the value of manufactured goods increased from \$2,225,343 in 1900 to \$5,252,600 in 1910, a gain of 136.04 per cent. The city is principally built of stone, and has gas, electric lighting, and water works. The United States is represented by a consular agent. The environs of the city are noted for their beauty. Pop., 1901, 7866; 1911, 10,299. The city was named after John Galt, the Scottish author.

GALT, SIR ALEXANDER TILLOCH (1817–93). A Canadian financier and statesman. He was born in Chelsea, London, was educated privately,

and in 1835 removed to Sherbrooke, Lower Canada, where he had been appointed to a clerkship in a colonization society. He remained in the service of this company until 1856, and during the latter half of the period was its manager. He began his public career as a Liberal member of the Canadian Parliament in 1849, but opposed the Liberal government and resigned in the same year. During the deep commercial depression of 1849 and the discouraging outlook, a movement for annexation to the United States was favored by eminent merchants and public men of both political parties. Galt was of those who signed an annexation manifesto addressed "to the People of Canada." He did not enter Parliament again until 1853, after which he served continuously until 1872. Such was the reputation he had established for integrity of character, and as an authority on trade and financial questions, that on the fall of the Brown-Dorion cabinet in 1858 he was called upon to form an administration, but declined. Being of independent and moderate views, he refused to identify himself permanently with either political party and consequently he had a small numerical following. Subsequently he joined the Cartier-Macdonald cabinet as Inspector General of the Finances. During his term of office he introduced a Tariff Act in 1859 which, together with an act passed in the previous year, was the beginning of governmental adoption of protection. He went out of office with the fall of the ministry in 1862 but held the Finance portfolio in the Taché-Macdonald administration from 1864 to 1866. He was active in the promotion of the plan for federation, was a delegate at the Charlottetown and Quebec conferences in 1864, and in 1865 was one of the delegates to England to urge Imperial support of the plan for union. In 1866, during the last session of the Canadian Parliament under the Act of Union (1841), he procured passage of the Currency Act, securing the issue of legal-tender notes which form the basis of the present currency of the Dominion. After the inauguration of the Federal government in 1867, he became first Finance Minister of the Dominion of Canada. He resigned in the same year, and afterward his public services were for the most part of a diplomatic nature. In 1877 he was appointed Canada's representative on the Halifax Fishery Commission (see *FISHING LAWS, International Aspect*), and from 1880 to 1883 was High Commissioner of the Dominion in England. He was the author of a number of important pamphlets of a political nature, including *Canada 1849 to 1859* (1860), *Church and State in Canada* (1876); *Civil Liberty in Lower Canada* (1876); *Future of the Dominion of Canada* (1881), *Relations of the Colonies to the Empire Present and Future* (1883).

GALT, JOHN (1779-1839). A Scottish novelist. He was born in Irvine, Ayrshire, May 2, 1779. The family removing to Greenock, Galt was educated there and then placed in the customhouse. He wrote poems and contributed to the newspapers. In 1804 he migrated to London. As a commercial agent, he traveled on the Continent, going as far east as Constantinople. On a part of the voyage he was associated with Lord Byron, whose life he afterward wrote (1830). As secretary of the Canada Company, he was in Canada for three years (1826-29). Returning to England and then to Scotland, he devoted the rest of his life to mis-

cellaneous literary work. He died at Greenock, April 11, 1839. Galt's poetry, plays, and biographies have little interest. But he holds a secure place in the progress of English fiction by his sketches of Scottish life, among which are *Ayrshire Legatees* (1820), and a good later edition, ed by G S Gordon, Oxford, 1909), *The Annals of the Parish* (1821), *Last of the Lairds* (1826), *The Omen* (1825) was praised by Scott, and *Lawrie Todd* (1830) has especial interest, as it contains admirable sketches of frontier life in America. Galt undertook to rival Scott in historical fiction, and failed miserably. Collected editions of his works were published in London (in 4 vols in 1868 and in 8 vols in 1899). Consult his *Autobiography* (London, 1833). His novels were edited by Meldrum (8 vols, London, 1895-96).

GALT, SIR THOMAS (1815-1901). A Canadian jurist, son of John Galt (qv), born in London, England. He was educated there and in Scotland, but emigrated to Canada in 1832. He found employment for six years with the Canada Land Company, of which his father was superintendent, and later became chief clerk in the office of the Attorney-General for Upper Canada. He afterward studied law, began to practice in Toronto in 1845, and in a few years took high rank as a corporation and criminal lawyer. He was made queen's counsel in 1858. In 1860 he was appointed a puisne judge of the Court of Common Pleas, and in 1887 became its chief justice. He was knighted in 1888 and retired in 1894.

GALTON, gal'ton, SIR DOUGLAS STURTT (1822-99). An English scientist and engineer, born at Spring Hill, near Birmingham. He was educated chiefly at Rugby and the Royal Military Academy (Woolwich), was appointed second lieutenant of engineers in 1840, and rose to be captain in 1855. In 1847 he was appointed secretary to the Railway Commission, and in 1854 secretary to the Railway Department of the Board of Trade, in which capacity he visited the United States in 1856 to inspect railways there. He became a member of the commission on sanitary conditions in military hospitals and barracks in 1858, and in 1859 chairman of the government committee for the investigation of submarine cables. From 1860 to 1862 he was assistant inspector general of fortifications, in 1862-70 Assistant Undersecretary of State for War, and from 1869 until his retirement in 1875 Director of Public Works and Buildings in the Office of Works. He was general secretary of the British Association for the Advancement of Science from 1871 to 1895, and a member of the council of the Institution of Electrical Engineers in 1888-90. He was best known for his studies in connection with army sanitation, and his improvements in the construction of hospitals and barracks won for him a high reputation both in England and on the Continent. A ventilating grate for fireplaces, invented by him and known under his name, was at one time widely used. His publications include *Sanitary Engineering* (1877), *The Construction of Healthy Dwellings* (1880, 2d ed, 1896), *Ventilating, Warming, and Lighting* (1884), *Army Sanitation* (1887), *Healthy Hospitals* (1893).

GALTON, SIR FRANCIS (1822-1911). An English man of science, born at Birmingham, England, the third son of S. T. Galton and Violetta, eldest daughter of Erasmus Darwin. He was educated at King Edward's School,

Birmingham, at the Birmingham General Hospital, at King's College, London, and at Trinity College, Cambridge, where he was graduated B A in 1844. During 1846-47 he traveled in Egypt far beyond the temples and cataracts of the Nile to the Sudan, at that time almost unexplored. As a result of the stimulus given by this expedition he started in 1850 to explore in South Africa. In company with J C Andersson, he landed his expedition at Walfish Bay, and from August, 1850, to January, 1852, he was engaged in the exploration of Damaraland (German Southwest Africa). In these travels he discovered the Ovampo race, a partly civilized, agricultural people. As a result of this exploration the whole country from Lake Ngami to the seacoast, between 18° and 23° S latitude, became known for the first time. The scientific results of the expedition were published in the *Royal Geographical Society's Journal* for 1852, and in his book, *Narrative of an Explorer in Tropical South Africa*. Galton also published *Art of Travel, or Shifts and Contrivances in Wild Countries* (1855), which has gone through several editions, has won well-merited appreciation, and exhibits Galton's characteristic ingenuity. About this time Galton turned his attention especially to meteorology, the result being his *Meteorographica, or Methods of Mapping the Weather* (1863), which is the basis of our present familiar weather maps. The theory of anticyclones, which is at the foundation of our weather forecasts, was also proposed by him, and various inventions relating to meteorological and geographical affairs were given out by him from this period to 1881. This interest in the statistical science of meteorology had an importance in Galton's future work. In 1869 was published his *Hereditary Genius* (reissue, 1914), and from that time on his anthropological and biological interests, first awakened in Africa, became uppermost. In 1873 he first began to apply statistics to anthropology. In 1874 appeared his *English Men of Science*, and in 1883 his *Inquiries into Human Faculty*. In the latter volume he discussed various psychological topics, such as color blindness, the capacity for distinguishing high tones (for the determination of which he invented a piece of apparatus see PSYCHOLOGICAL APPARATUS, Acoustics), criminality and insanity, gregarious and slavish instincts, mental imagery, number forms and colored hearing, composite portraiture and the relative sensitiveness of blind and seeing, savage and civilized individuals. In 1883 he sought for quantitative data on inheritance, and issued his blank *Record of Family Faculties*, of which 150 were filled out and sent to him for study. The results of these studies appeared in his *Natural Inheritance* (1889), in which the quantitative method of studying variation is developed. In 1892 was issued his *Finger Prints*, and in 1895 his *Index of Finger Prints*. He was joint editor with E Schuster of *Noteworthy Families* (1906), and in 1908 published *Memoirs of my Life*. For many years Galton's chief interest in the field of biology lay in the problem of inheritance, his aim being to formulate it in quantitative terms. This he succeeded in doing, first by his law of ancestral inheritance, and secondly by the application of the theory of probabilities to the measurement of variations. He thus laid the foundation for the new "science" of eugenics (qv). In 1905 he established a laboratory for eugenics at Uni-

versity College London, and in 1909 he published a collection of addresses under the title *Essays in Eugenics*. He was also a consulting editor of *Biometrika*, from its establishment in 1902 until his death, which occurred Jan 17, 1911. He had been knighted in 1909. Galton was one of the last of the great English series of nonprofessional men of science.

GALTON WHISTLE See PSYCHOLOGICAL APPARATUS, Acoustics

GALUPPI, ga-lōp'pē, BALDASSARE (1706-85). An Italian composer. He was surnamed IL BURANELLO, from the island of Burano, near Venice, the place of his birth. He was the pupil of his father, a barber, who was a good violinist. Although the composer of more than 100 operas and smaller works, all are now forgotten except a sonata for the harpsichord, which is included in the *Alte Klaviermusik* of Pauer. His principal success was in comic opera, by which he gained the title of "father of Italian comic opera." Apart from this, he is of some importance historically, owing to his connection with the growth of music in Russia. His principal appointments and tours were 1741, tour to England, 1762-64, master of music at San Marco, Venice, and director of the Conservatorio degli Incurabili, 1765-68, maestro to Catharine II of Russia, and afterward, up to the end of his career, director again of the Incurabili in Venice. He died in Venice. Consult A Wotquenne, *Baldassare Galuppi* (Leipzig, 1902).

GALVANI, gál-va'nē, LUIGI (1737-98). A famous Italian physician and anatomist, and the discoverer of current or "galvanic" electricity. He was born at Bologna and at an early age relinquished an intention of entering the Church, to follow the profession of medicine, devoting himself to the study of physiology and comparative anatomy. He married the daughter of Galeazzi, a distinguished member of the medical faculty of Bologna, whom he succeeded in 1762 as professor of anatomy. His writings, though not numerous, contain valuable scientific matter and are characterized by a rare precision and minuteness of detail. Two treatises which added considerably to his reputation are: *Considerations on the Urinary Organs of Birds* and *On the Organs of Hearing of Birds*. It is to a purely casual discovery, however, that Galvani owes the wide celebrity attached to his name. It is related that Galvani's wife happened one day to notice the convulsive muscular movements produced in a skinned frog when the nerve of the leg was accidentally touched by a scalpel which lay on the table and had become charged by contact with an adjoining electric machine. She communicated the phenomenon to her husband, who instituted a prolonged series of experiments (1790). He came to the conclusion that the source of electricity lay in the nerve, and that the metals which are necessary served merely as conductors. (See ELECTRICITY, ELECTRICITY, ANIMAL.) In consequence of his refusal to take the oaths prescribed in 1797 by the Cisalpine Republic, of which Bologna formed a part, he was deprived of his position and income, but was subsequently restored. A statue of Galvani was unveiled at Bologna in 1879. His writings have been chiefly published in the memoirs of the Bologna Institute of Sciences, including the treatise entitled *De Viribus Electricitatis in Motu Musculari Commentarius* (1792), which con-

tained an account of his discovery and experiments, and translated into German is to be found in Ostwald's *Klassiker der Exakten Wissenschaften*, No. 52 (Leipzig, 1894). A complete set of his works was published at Bologna in 1841. See GALVANIC BATTERY, VOLTAIC CELL OR BATTERY.

GALVANIC BATTERY. The names of Galvani and Volta have both become inseparably associated with the earliest device to produce a continuous current of electricity—a device now commonly known as a *voltare cell*. In its simplest form it consisted of a strip of zinc and one of copper immersed in a solution of salt, or of an alkali.

Galvani, in 1786, made the capital discovery that freshly prepared frogs' legs, hung by a copper wire on an iron balcony, twitched convulsively whenever the flesh touched the iron. He rightly ascribed this effect to electricity, but erroneously supposed that it proved the existence of animal electricity generated by nerves and muscles. Volta showed by experiment that Galvani was wrong, but he made the equally erroneous assumption that the electricity was due to the contact of the two dissimilar metals. His experiments led, however, to the invention of the celebrated "crown of cups" about 1800, consisting of a number of simple elements or cells joined in series, the copper strip of one being connected with the zinc of the next. Such cells and their less simple successors are therefore properly called voltaic cells, though the word "galvanism" is still retained in medical literature to denote the current obtained from them.

When Davy, in 1801, substituted dilute acid for Volta's salt or alkaline solution, it was found that there was local action which caused the zinc to waste away. Kemp and Sturgeon in 1830 drew attention to the fact that a diminution of this local action was brought about by the amalgamation of the zinc plate. The amalgamation consists in forming a mercury-zinc alloy on the surface of the zinc. This is best done by first cleaning the zinc by rubbing it with dilute sulphuric acid and then applying a small quantity of mercury. The amalgamated zinc plate acts like pure zinc, and wasteful local action is largely prevented. See VOLTAIC CELL OR BATTERY for a full discussion of primary cells and batteries.

GALVANISM. See ELECTRICITY.

GALVANIZED IRON. Iron which has been coated with zinc to prevent it from rusting. The iron is simply dipped or immersed in melted zinc, not coated by any galvanic process, as its name would imply. The process of galvanizing iron is now practiced on a most extensive scale. The French chemist Dumas states that so long ago as 1742 Malouin knew of a plan for coating iron with zinc. At all events, it is stated in Bishop Watson's *Chemical Essays*, issued in 1786, that a method (essentially the same as that now in use for zincing iron) was then practiced at Rouen for coating hammered iron saucepans with zinc, and some details of the operation are given. The first English patent for galvanizing iron was granted to H. W. Craufurd in 1837, and another for the zincing of iron which had been previously tinned was taken out by E. Morewood in 1821. The process as employed by Craufurd, which is still essentially unchanged, was first to remove the rust and scale from the iron by *pickling*, i. e., immersing it

in dilute sulphuric or hydrochloric acid, either hot or cold, although the former state was preferred, and for this purpose the acid was kept warm in a large leaden bath, sunk in the ground for easier access. After the sheets or other articles of iron had been acted upon by the acid for a few minutes, more or less according to their requirements, they were plunged into cold water, to remove the acid, and afterward scoured with sand, and again washed clean with water. The iron being now ready to receive its coating of zinc, it is plunged into a bath of that metal, which, previous to its being melted, is coated with a thick layer of dry sal ammoniac (chloride of ammonium), this melts also, and forms a viscid coating over the metal, which prevents that rapid oxidation to which the molten metal is otherwise liable.

For inferior material the scouring with sand is usually dispensed with. The sheets of iron are then made to pass between two iron rollers in the zinc bath and are thus more easily drawn through and kept perfectly smooth. Ships' bolts, nails, screws, chains, etc., are dipped in, in bundles, or in the case of nails, etc., in iron strainers, when removed, the zinc makes them adhere together, and to effect their separation, they have to be placed in a crucible with powdered charcoal, in which they are heated to redness, and repeatedly shaken as they cool, by this means they are easily separated.

Galvanized iron is largely used in the form of sheets, both plain and corrugated, for roofs, sheds, and cisterns, in the state of wire, besides that used for telegraph or telephone conductors, a large quantity is employed for wire ropes, netting, and the like, and it has innumerable minor applications, such as for water vessels, ship fittings, and many other articles formerly made of wood, copper, brass, slate, etc. For most of these purposes the zinc coating on castings or forgings is much more lasting and less troublesome than the natural materials would be, but still in certain situations, as where it is exposed to the action of sulphurous compounds in smoke, and where its surface is to be abraded or brought directly into contact with deleterious chemical substances, its use cannot be recommended, and in these circumstances other plans should be resorted to for the protection of the iron.

The plan adopted for making the variety of galvanized iron called *galvanized tinware* is as follows. The sheets or other articles, after being pickled and scoured and washed, as in the usual process, are transferred to a large wooden bath. On the bottom of the bath is first placed a layer of finely granulated zinc, then a sheet of iron, then another layer of granulated zinc, and so on as far as convenient, and the bath is filled up with a diluted solution of chloride of tin, so that by means of the galvanic action produced the tin becomes deposited thinly over the sheets of iron. The plates are then taken to the zinc bath, prepared exactly as in the ordinary process, where they are dipped or passed through the rollers. By this process a very even deposit of zinc is produced, and the material so made is preferred for some purposes to ordinary galvanized iron, although its properties are much the same.

GALVANO CAUTERY. See CAUTERY.

GALVANOMETER (from *galvanic* + *Gk. μέτρον, metron*, measure). An instrument for detecting the presence of an electric current and

measuring its magnitude. Originally it consisted of a coil of insulated wire surrounding a magnet, freely hung or pivoted so as to be easily deflected by the passage of a current through the coil. The wire forming the coil is so wound that each turn lies in a plane approximately parallel to the axis of the needle or magnet when at rest. The current in passing through the coil or bobbin of insulated wire produces a magnetic field in the space in which the needle hangs and tends to swing the needle around until it hangs crosswise in the coil. The force tending to deflect the needle is proportionate to the strength of this field, or, what is the same thing, the strength of the current producing it, and to the length and strength of the needle, while the magnetic force of the earth acts to keep the needle in the direction of the magnetic meridian. Under the influence of these two forces the needle will come to rest in a position where they are in equilibrium. As the shape and strength of the magnetic needle, speaking broadly, remain the same in a given galvanometer, the instrument affords a means of measuring the strength of any current passed through it, by the amount of motion imparted to the needle.

These conditions can be reversed and the coil suspended and the magnetic field produced by a permanently mounted magnet, as in the case of the D'Arsonval galvanometer described below. Galvanometers are constructed in a great variety of forms, specially suited to various uses, from simple instruments for merely indicating the presence of a current to extremely elaborate apparatus for making measurements of great accuracy. The action of the galvanometer depends upon the following principle discovered by Oersted in 1820. When a magnetic needle is placed under a straight wire, through which a current passes, it is deflected to a certain extent, and when the wire is bent, so as also to pass below the needle, it is deflected still more. The north pole of the needle is deflected to the left if the current is flowing from south to north in a conductor which is placed above the needle, and vice versa when the conditions are reversed. The direction of the deflection can be remembered by Ampère's rule which states that, supposing a man swimming along the conductor in the direction of the flow of the current and always facing the needle, the latter will be deflected towards his left hand. The current in the upper and the lower wire moves in opposite directions, but, as they are on opposite sides of the needle, the deflection caused by both wires is in the same direction. By thus doubling the wire we double the deflecting force. Schweigger and Poggendorf soon ascertained that if the wire, instead of making only one circuit round the needle, were to make two, the force would be again double, and, if several, the force (leaving out of account the weakening of the current caused by the additional wire) would be increased in proportion. If the circuits of the wire are so multiplied as to form a coil, this force would be enormously increased, and the galvanometer rendered more sensitive. These early galvanometers were called multipliers and have been much used. The next improvement in the instrument was due to Nobili, who employed two needles, placed parallel to each other as nearly as possible, with their poles turned opposite ways and suspended by a thread without twist. These needles have little tendency to

place themselves in the magnetic meridian, for one tends to move in a contrary direction to the other. If they were exactly equivalent, they would remain indifferently in any position,

ASTATIC NEEDLE AND COIL

but they cannot be so accurately paired as this, for they almost always take up a fixed position, arising from the one being somewhat stronger than the other. Such a compound needle is called *astatic*, as the magnetic influence of the earth does not determine the direction in which it will point. If an astatic needle be placed in a coil, so that the lower needle be within

the coil, and the upper one above it, its deflections will be greater than those of a simple needle, for two reasons. In the first place, the power which keeps the needle in its fixed position is small, and the needle is consequently more easily influenced, in the second place, the force of the coil is exerted in the same direction on two

ASTATIC GALVANOMETER

needles instead of one, for the upper needle being much nearer the upper part of the coil than the lower, is deflected alone by it, and the deflection is in the same direction as that of the lower needle. An astatic needle so placed in a coil constitutes an astatic galvanometer. The coil is formed of fine copper wire, insulated with silk, and wound on a frame or bobbin. The astatic needle is placed in this bobbin,

THOMSON REFLECTING GALVANOMETER
(SINGLE COIL)

which is provided with a vertical slit, to admit the lower needle, and a lateral slit, to allow of its oscillations, and is suspended by a cocoon fibre from a hook supported by a brass frame

The upper needle moves over a graduated circle, and the entire system hangs freely, without touching the bobbin. The instrument is inclosed in a glass case and rests on a stand, supported by three leveling screws. When used, the bobbin carrying the divided circle with it is turned until the needle stands at the zero point of the scale, and the wires through which the current is sent are joined to the bending posts, which connect with the terminals of the coil. The number of degrees that the needles are deflected under the action of the current may then be read off, showing the strength of the current.

For most kinds of testing and measurement extremely sensitive galvanometers are required. Of these, the reflecting galvanometer, designed by Sir William Thomson, is one of the standard types. One form is shown in the illustration. In this instrument a reading is made by the use of a ray of light reflected upon a screen from a

THOMSON DOUBLE COIL
GALVANOMETER

mirror attached to the needle so that even the smallest motion is shown. The Thomson galvanometer consists of a pair of astatic needles attached by shellac or other adhesive material to a mirror made of very thin microscope glass. This is suspended by a single fibre of raw silk in the centre of a coil containing many thousand turns of fine wire. The whole is suitably protected from currents of air by a glass case, and the base is mounted upon leveling screws, so that the hanging needle may be adjusted to swing freely in the centre of the coil. The needle is caused to point to zero of the

scale by a powerful magnet outside of the case, which is adjustable as to direction by a tangent screw, and may be removed to any distance to weaken its effect upon the needle or increase its sensitiveness. This galvanometer is much used in all kinds of testing work and was originally employed for reading the delicate signals in ocean telegraphy, where it still is used in testing. Increased sensitiveness may be obtained by using two sets of coils and needles, while there are Thomson galvanometers in which there are four such sets of coils.

For experimental work and laboratory demonstrations the tangent galvanometer is used. This instrument is shown in the illustration. It consists essentially of a thick strip or wire of copper bent into the form of a circle, from 1 to 2 feet in diameter, with a small magnetic needle with pointers of thin glass fibres moving on a graduated circle, at its centre, supplied with a mirror. When the needle is small compared with the ring, it may be assumed that the needle, in whatever direction it lies, holds the same relative position to the disturbing power of the ring. This being the case, it is easy to prove that the strengths of currents circulating in the rings are *proportional to the tangents of the angles of deviation of the needles*

Thus, if the deflection caused by one voltaic cell was 45° , and of another 60° , the relative strengths of the currents sent by each would be as the tangent of 45° to the tangent of 60° , viz., as 1 to 1.73. The needle can never be deflected 90° , for, as the tangent of 90° is infinitely

MIRROR TANGENT GALVANOMETER

large, the strength of the deviating current must be infinitely great—a strength manifestly unattainable. The tangent galvanometer can consequently be used to measure very strong currents.

A common or detector galvanometer is an instrument used in ordinary shop work, and for outdoor testing where a portable instrument is required, and the other forms are too delicate. It contains a large magnetic needle or compass swinging upon a pivot. A small cavity formed in an agate let into the centre of the needle is usually employed to prevent friction in swinging upon the pivot. The coils of wire are placed underneath the dial bearing the graduations over which the needle swings, and the whole is inclosed in a round brass box, with a glass cover over the needle. For convenience, a circuit-closing key for admitting current to the coil is often built into the case and permanently connected with the coils. Such a galvanometer is often used in connection with a set of resistances for making measurements of resistance by the Wheatstone bridge ($q\sqrt{r}$), and in that case the apparatus is known as a combination or portable testing set.

The D'Arsonval Galvanometer is quite different in its underlying principle from the instruments already described, for, instead of having the magnet suspended and deflected under the influence of the current in a surrounding coil of wire, the coil itself is suspended between the poles of a compound horseshoe magnet. This

SIMPLE D'ARSONVAL
GALVANOMETER

coil is made of fine copper wire, wound on a rectangular frame of thin copper, and suspended by a fine wire of silver or copper, through which the current flows to the coil. The other end of the coil is connected to a similar wire, which leads to one of the binding posts, the supporting wire being connected with the other. The coil can thus oscillate freely in the space between the two magnets and is in a strong magnetic field. When a current flows through the coil, an opposing field is set up, and the coil, being free to move, is deflected. The motion of the coil can be determined either by a light pointer or by means of a mirror and a reflected beam, as in the case of the Thomson galvanometer. The D'Arsonval galvanometer is, perhaps, at the present time the most used of all forms of galvanometer, since it is not affected by any external magnetic influences and is easily adjusted. It is also aperiodic, or "dead beat," the coil coming to rest almost instantly and thus saving much time to the observer. For these and other reasons this galvanometer is extensively used for making tests and measurements, and certain modifications, such as the substitution of jeweled bearings for the suspension, have been introduced, so as to render the apparatus portable, and appropriate shunt and other resistances, so as to indicate current and electromotive force directly by means of a pointer and scale. Such instruments form most accurate ammeters and voltmeters.

The **Ballistic Galvanometer** is intended to measure currents of extremely brief duration, such as those produced by the discharge of a condenser or by induction, and a magnetic needle of considerable mass is employed which has a period of vibration amounting often to several seconds. Instead of coming to rest after its deflection by the current, the needle will continue to oscillate, as there are no damping devices, and as the needle itself has considerable mass. When used to measure a momentary current, the deflection does not begin to move practically until the current has passed, and then the throw of the needle is noted. This instrument is used to determine the capacity of a condenser and to measure self-induction.

Recent progress in the design and construction of galvanometers has been confined more to the attainment of greater sensitiveness and the adaptation of special types for the measurements to be made than in any radical change of operating principle or methods of control. The recent marked improvement and more dependable accuracy of portable and commercial measuring instruments, such as ammeters and voltmeters (qqv), has led to their introduction on a large scale in the physical laboratory, and the consequent displacement by them of galvanometers. Several special types of the latter have, however, found extended use in certain kinds of testing. For example, for the absolute measure of resistance in which two-phase alternating currents are employed, a vibration galvanometer has been successfully used, and by suitable adjustments it can be made sensitive only to the fundamental wave of the alternating current, or to such of the harmonics as it is deemed necessary to include. Another test in which this type of galvanometer is used is in the examination of steel for use in transformers, where it is also found highly satisfactory. Almost all recent designs are patterned after the D'Arsonval type of instrument, which it should

be noted is the principle of operation of a large number of the commercial ammeters and voltmeters referred to above. While the vibration galvanometer is useful in alternating current testing for ordinary frequencies, say from 15 to 100 cycles per second, it is now very common to employ a combined electrical and optical instrument called an oscillograph (qv).

Bibliography. Consult Kempe, *Handbook of Electrical Testing* (7th ed., London, 1908), and Thompson, *Elementary Lessons in Electricity and Magnetism* (rev ed., Chicago, 1906), which contains a full elementary description of galvanometers and the theory of their action. Consult also the catalogues of the leading European and American electrical instrument makers.

GALVANOTAXIS See ELECTROTAXIS

GALVANOTROPISM See TROPISM

GALVESTON A city, port of entry, and the county seat of Galveston Co., Tex., on the east end of Galveston Island, at the mouth of Galveston Bay, 48 miles by rail southeast of Houston, on the Galveston, Harrisburg, and San Antonio, Gulf, Colorado, and Santa Fe, International and Great Northern, Missouri, Kansas, and Texas of Texas, Galveston, Houston, and Henderson, and the Gulf and Interstate railroads, and Galveston-Houston Electric Railway (Map Texas, E 5). A regular steamship communication is maintained with all important European, Asiatic, Latin American, and Cuban ports, and all important American ports by coastwise steamship lines. Commercially Galveston is the greatest cotton port in the world, alternates with New Orleans as second greatest port in value of exports and imports in the United States (next only to New York). As a seaside and health resort Galveston holds first place in the Southwest, this feature attracting more than 1,000,000 visitors annually.

The city of Galveston has a total area of nearly 15 square miles. It is built on the east end of Galveston Island, covering the entire width of the island westward to the city limits. The wharves of the port are built on the north shore of Galveston Island, the deep-water channel on which they abut being an arm of Galveston Bay, lying between Galveston Island and Pelican Island, the latter having been greatly augmented by material dredged from the Galveston Channel. The south side of Galveston Island is washed by the surf of the Gulf of Mexico. A hard level beach, 200 feet wide and 38 miles long, provides a natural automobile speedway upon which automobile racing meets are held during Galveston's annual summer Cotton Carnival.

The United States government has expended through various departments nearly \$30,000,000 in Galveston. A strategic point of great importance in the Gulf of Mexico, here are located the coast artillery posts of Fort Crockett, Fort San Jacinto, and Fort Travis, guarding the harbor with mortar batteries and 10-inch disappearing coast-defense rifles. Here also are located a United States quarantine station, a United States immigrant station (through which, during the fiscal year ending June 30, 1914, there entered 11,633 immigrant aliens, bringing with them \$619,884 in cash), the office of the United States Marine Hospital Service, and the State branch of the United States Weather Bureau.

Galveston's educational institutions include the State Medical College (the department of

medicine of the University of Texas), St Mary's University (Roman Catholic, opened in 1854), Ursuline Convent (Roman Catholic, opened in 1848), nine public schools (six for white and three for colored children), including the Ball High School for white pupils and the Central High School for colored pupils, St Joseph's School, Cathedral School, Dominican Convent, St Patrick's School, and the Sacred Heart Academy (the last five being Roman Catholic), and the Rosenberg Library, costing \$250,000 and endowed with \$400,000. The city possesses the Galveston Orphans' Home, St Mary's Orphanage, the Lasker Home for Homeless Children, the Letitia Rosenberg Home for Aged Women, and two magnificently equipped hospitals—St Mary's Infirmary and the John Sealy Hospital, the latter operating in connection with State Medical College. Fronting on State Medical College campus are also the recently completed Nurses' Home and the Women's Hospital. Other notable structures are Galveston County Court House, the United States Custom House and Post Office, the City Hall and Auditorium, the Union Depot and General Office Building of the Gulf, Colorado, and Santa Fe, the Young Men's Christian Association Building, the Masonic Temple, Scottish Rite Cathedral, American National Insurance Building, Trust Building, Security Building, Hutchings-Sealy Bank Building, and numerous other modern business buildings.

Since the West Indian hurricane of 1900 Galveston has been insured against disaster by storm through the completion of three tremendous engineering enterprises—the sea wall, the grade raising, and the causeway. The sea wall covers the entire frontage of the city facing the Gulf of Mexico. This is a concrete steel-reinforced battlement, 17 feet high, 16 feet wide at base, 5 feet wide at crest, with a concave face, its base protected by a riprap of huge Texas granite blocks. It cost \$2,000,000. The causeway, joining Galveston Island with the Texas mainland at Virginia Point, is a 2-mile concrete steel-reinforced structure, costing \$2,000,000 and spanning Galveston Bay. Passage is permitted ocean-going steamships by a Scherzer type roller lift bridge, the largest in the world. Three railroad tracks give entry to six lines of steam road and the Galveston-Houston Interurban, an electric road. In addition there is a roadway for vehicles and pedestrians. The grade raising was an engineering feat literally lifting the city to a maximum of 19 feet above its former level, overlooking at the crest by 2 feet the crest of the sea wall. Houses were raised on stilts, street-car lines run as elevated lines, elevated planks substituted for sidewalks, while 20,000,000 cubic yards of sand was dredged from the bed of the Gulf of Mexico and pumped into the city at a cost of nearly \$2,500,000, after which sidewalks, paved streets, and car tracks were relaid, fences rebuilt, and all vegetation replanted.

Equally great engineering feats were accomplished by the United States government in bringing deep water to Galveston harbor, a total of \$15,000,000 having been spent in this improvement. Granite jetties 12 miles long were built to form a vestibule to the harbor, which is now maintained at a minimum depth of 31 feet. The jetties alone cost \$8,000,000. Six miles of improved wharf frontage utilizing the "ship system" permit 104 ocean-going

freighters to dock in key berths simultaneously in position to take on and discharge cargoes. On these wharves and in the yards directly abutting them are nearly 75 miles of terminal railroad track running direct to shipside. Four export grain elevators have a total storage capacity of nearly 4,000,000 bushels. Cotton concentration plants, ranging from open-air sheds to modern concrete storage warehouses, can accommodate 1,000,000 bales of cotton for storage, and in the course of a season handle as high as 4,000,000 bales. A cleaning and conditioning elevator, coal elevator, dry dock and marine ways, marine works, creosoting plant, iron and steel material warehouses, broom-corn warehouses, and general storage warehouses and distribution headquarters are also located on the water front. These commercial interests were brought to the Galveston water front through the admirable location of the port as a storage and distributing point for the entire Southwest, equipped with excellent rail and water transportation facilities.

Commercially Galveston has steadily climbed in importance from 1890, when her total exports and imports were valued at \$24,862,623—seventh port of the United States—to her record year ending June 30, 1913, when exports and imports were valued at \$289,278,496—second only to New York. For the fiscal year ending June 30, 1914, imports and exports were valued at \$268,003,129. A short Texas cotton crop was the reason of the decrease from the record of the previous year.

During the fiscal year ending June 30, 1914, Galveston's exports were valued at \$255,767,608, the imports being valued at \$12,245,062. Chief among the exports were 3,040,675 bales of cotton, valued at \$234,249,290, wheat, 10,057,589 bushels, valued at \$9,469,228, cottonseed cake 319,124,093 pounds, valued at \$4,874,961, cottonseed oil, 2,755,139 pounds, valued at \$193,262, linseed cake, 5,890,050 pounds, valued at \$89,678, flour, 343,791 barrels, valued at \$1,762,994, lumber and lumber products, \$2,567,915. Mill and mining machinery, agricultural implements, rice, scrap iron, lard, lard compounds and substitutes, oils, etc., were also important export factors. Coffee, sugar, Mexican cattle, Argentine corn, German toys, and bananas were important items in the import list. Export and import trade between Galveston and Latin America totaled \$15,766,019 in value during the fiscal year ending June 30, 1914, an increase of \$6,380,928 over the previous fiscal year. In spite of internal war in Mexico, Galveston's exports and imports with Mexican ports totaled \$3,350,566, an increase of \$1,712,051 over the business of the previous year. Cattle, bananas, valuable woods from Mexico, grain from the Argentine, sugar from Cuba, and bananas from Central America formed the bulk of Galveston's Latin American imports. Packing-house products (hams, bacon, lard), breadstuffs, lumber, and machinery formed the greater proportion of Galveston's exports to Latin America. Galveston's manufacturing interests are varied and of considerable importance. Beer, cement, pipe, ice, iron, ship machinery, sashes, doors, blinds, cottonseed oil, cottonseed cake, cottonseed flour and meal are produced. The greatest cottonseed-cake grinding plant in the world is located on the Galveston water front.

Galveston gave the world the city commission form of municipal government. Its city affairs

are in the hands of a board of commissioners, consisting of a mayor president and commissioners of streets and public property, finance and revenue, police and fire, and water works and sewage. This plan, first put in operation in Galveston in 1901, has since been copied widely throughout the United States and Europe. The mayor president and commissioners are elected by direct vote of the people, the mayor president running for that office alone. The four candidates for city commissioner receiving the highest number of votes form the commission. Upon taking office the commission by vote of its four members assigns to each commissioner the department which he shall supervise during his two-year term of office. The mayor president is paid \$2500 per year, and each commissioner \$1200 per year. All members of the board are vested with equal power. All the city officers are appointed by the board and are responsible thereto.

Galveston's history ranges back into the kaleidoscopic days of romance and adventure in the Southwest. The settlement was named "Galveston" after Count Bernardo de Galvez, Spanish Viceroy of Mexico. In 1816 the notorious Baratarian pirate, Jean Lafitte, took possession and made the town his headquarters. He was later driven out by the United States government. In 1836 Col. Michael B. McNair organized the Galveston City Company and purchased the site of modern Galveston for \$50,000 from the Republic of Texas. In 1837 Audubon, the world-famous ornithologist, made his home here. That year Galveston was made a port of entry, Gail Borden, Jr., building the first customhouse. In 1838 President Sam Houston, of the Republic of Texas, created Galveston the seat of justice for Galveston County. The first wharf of the present \$15,000,000 system was built by Col. Amasa Taylor in 1838. The port was blockaded by the Federal fleet throughout the Civil War. The battle of Galveston was fought in the harbor and won by the Confederate forces, Jan. 1, 1863. In June, 1865, Federal troops occupied the city.

Galveston was practically razed by a destructive fire in November, 1885. On Sept. 8, 1900, the greatest disaster, resulting from purely natural causes, in the history of the North American continent took place. A West Indian hurricane drove a tidal wave across the city, inundating Galveston to a depth of 4 to 16 feet. Property worth \$20,000,000 was destroyed overnight, and approximately 8000 deaths resulted. Help was poured in from all parts of the world, and out of the storm emerged a wrecked city with a nucleus of 20,000 left from a prosperous community of 38,000. Since the storm the population has passed the 50,000 mark, a model municipal government has been established, a wrecked community's credit restored, and gigantic engineering projects carried to a successful completion. The city owns and operates the water works, sewage disposal, and electric-light plant. The street-railway system comprises 38.72 miles of track. Over 20 hotels have been built to accommodate resort crowds, one of these being a community hotel, Hotel Galvez, built from \$1,000,000 raised by popular subscription. Pop., 1890, 29,084; 1900, 37,789; 1910, 36,981; 1914 (U. S. est.), 40,289; 1914 (City Directory figures), 49,879; 1920, 44,255.

GÁLVEZ, gal'vath, BERNARDO DE, COUNT DE (1755-86). A Spanish administrator, Governor

of Louisiana and Viceroy of Mexico. He was born near Malaga, a member of a powerful Spanish family, entered the army in 1771, studied military science in France in 1772-75, served under O'Reilly against the Algerians in the latter year, rising to the rank of brigadier, and in 1776 was sent to Louisiana as Lieutenant Governor under Luis de Unzuaga, whom he succeeded Jan. 1, 1777. During the Revolutionary War his sympathies were largely with the Americans, whom he assisted in various ways, even before Spain's declaration of war against England in June, 1779, after which he prosecuted hostilities with considerable energy against the English possessions in this part of the country, and succeeded in capturing Fort Manchac, Baton Rouge, and Fort Panmure de Natchez (1779), Mobile (1780), and Pensacola (1781). From 1781 to 1783 he was in command of the army of operation against the English, in the West Indies. As a reward for his successes and his administrative ability, he was raised in 1783 to the rank of Count and promoted to be lieutenant general. In 1784 he was appointed Captain General of Cuba, retaining the same rank in Louisiana and the Floridas. The next year he succeeded his father, Matías de Gálvez, as Viceroy of New Spain (Mexico), where he and his wife, Doña Felicitas San Maxent, of a French family of New Orleans, were well received and became very popular. Because of the ostentation in his life, and his construction of the fortified palace at Chapultepec, he was accused of planning to create an independent Mexican kingdom, with himself as king. The attitude of the home government towards the pardon of three criminals brought on melancholia, and he died when only 31 years old. He introduced many important reforms, in both Louisiana and Mexico, and has been regarded as one of the ablest Spanish administrators sent to America. Consult Gayarié, *History of Louisiana*, vol. III (last ed., New Orleans, 1885); H. H. Bancroft, *History of Mexico, 1516-1887* (San Francisco, 1883-88); Zamacois, *Historia de Méjico* (Barcelona, 1878-88).

GÁLVEZ, gal'vath, JOSEPH (or José), MARQUÉS DE LA SONORA (1729-87). A Spanish statesman and Minister of the Indies, born at Macharaviaya, near Malaga. He studied law at the University of Alcalá, and after taking his degree went to Madrid, where he proved his ability in the defense of a number of important cases. Of a literary turn of mind, and a lover of the French language, he made friendships among the French colony and was appointed counselor to the French Embassy. His efficient services brought him to the notice of the Marqués de Grimaldi, the Prime Minister, who made the young lawyer his private secretary. Later he was appointed a judge of the King's Court. In 1761 he was sent to Mexico as *visitador general* to investigate the abuses in the colonial administration. Possessing ample powers, he settled the dispute between the Viceroy and the Audiencia over prerogative by siding with the Viceroy, removed the complaints of the miners by bettering the mining regulations, and restored tranquility among the discontented colonists by promising reforms. In 1764 his powers as *visitador* were made almost unlimited, and, working in harmony with the new Viceroy Marqués de Croix, he introduced beneficial reforms in the financial system and visited many parts of the viceroyalty remedying

abuses In 1767 he went to Sonora to settle the Indian troubles, reform the Missions of Lower California, and provide for further colonization in the northwest Under his direction the expeditions were fitted out, in 1769, which made the first settlements in Upper California Returning to Spain in 1774, he was rewarded for his labors by the King, despite the complaints lodged at the court by his enemies He was made President of the Council of Indies and in 1776 was chosen Minister of Indies Because of his knowledge of colonial affairs he was able to introduce many reforms in their administration In 1778 he issued a decree extending greater freedom to commerce, opening many ports in Spain and the Indies, and in 1782-86 he put in force the *Ordenanza de Intendentes*, which provided for a reorganization of the colonial administration, abolishing the *alcaldes mayores* and *corregidores* and their abuses In 1786 he was created Marques de la Sonora He was one of the ablest ministers of the enlightened despot Charles III (qv), and Spain's greatest colonial administrator The Gálvez family built a school and a church for their native town, and the remains of Joseph de Gálvez lie in the burial vault under the church His *Informes as visitador* in Mexico exist in manuscript in the Archivo de Indias and in the Bancroft collection of the University of California, the *Informe general* was published in Mexico (1767) No life of Gálvez has yet been published

GALWAY, gal'wā A maritime county of Connaught, Ireland, and, after Cork, the largest of the Irish counties (Map Ireland, B and C 5) It is bounded on the east by the Shannon and its affluent the Suck, and on the west by the Atlantic Ocean Area, 2372 square miles, of which bog and marsh make up about 15 per cent In the west is the mountain land, including Joyce's Country, Jar Connaught, and Connemara, one of the wildest and most mountainous districts in Ireland, while most of the east is plain extending to the banks of the Shannon Between the two parts lie Lough Corrib and Lough Mask The coast line is about 400 miles in length, and the shore, much broken, is fringed with numerous islands Copper is the only mineral of importance Agriculture and fishing are the leading pursuits, production of kelp is large; and woollens, linens, friezes, and felt hats are manufactured Chief towns, Galway, the capital, Ballinasloe, Loughrea, and Tuam Pop, 1841, 440,700, 1851, 322,430, 1901, 192,540, 1911, 182,224

GALWAY The capital of Galway Co., Ireland, a municipal and parliamentary borough, seaport, and civic county at the mouth of the Corrib on the north shore of Galway Bay, 50 miles north-northwest of Limerick, and 130 miles west of Dublin (Map Ireland, B 5) It is built on both sides of the river, and on two islands in its channel, its parts being united by two bridges It is connected with Lough Corrib by a canal and forms the terminus of the Midland Great Western Railway Galway has numerous flour and other mills, brush and bag factories, and breweries, distilleries, foundries, works for polishing marble, salmon and sea fishing, and a good harbor It exports agricultural produce, wool, bacon, fish, kelp, and a fine black marble, and imports grain, timber, petroleum, and manure The old town of Galway is poorly built and irregular, many of its older

houses have a Spanish appearance One, known as Lynch's Castle, marked with a skull and crossbones, was the residence of James Lynch Fitzstephen, a mayor of Galway, who in 1493 condemned his son to death for murder and to prevent his rescue caused him to be hanged from his own window The new town consists of well-planned and spacious streets, built on rising ground, which slopes gradually towards the sea and the river Claddagh, a suburb, is inhabited by fishermen, who once excluded all strangers from their society and married solely within their own circle These fishermen spoke the pure Irish language, and the Irish costume was worn by the women They annually elected a "mayor," whose function was to administer the laws of their fishery and to superintend all internal regulations, but all such customs slowly died, though vestiges still remain Attached to the Anglican diocese of Tuam, Galway is also a Catholic episcopal see Chiefly interesting is the parish church of St Nicholas, founded in 1320 and built in the form of a cross Other interesting buildings are St Augustine's Catholic Church, three monasteries, and five nunneries, the county courthouse, barracks, and University College The last named was founded as Queen's College in 1845, but charter and name were changed by the Irish Universities Act in 1908 It has about 140 students The town returns one member to Parliament

Galway was taken by Richard de Burgo in 1232, and the ancestors of many of the leading families resident in this quarter settled here about that time It rose in commercial importance through its Spanish trade, from the thirteenth to the middle of the seventeenth century During the latter century it suffered for its adherence to the Royalists In 1652 it was taken by Sir Charles Coot after a blockade of several months, and in July, 1691, it was compelled to surrender to General Ginkell Pop, 1901, 13,426, 1911, 13,255 Consult Hardiman, *History of the Town and County of Galway* (Dublin, 1820)

GALWAY BAY An inlet of the Atlantic Ocean, on the west coast of Ireland, between the counties of Galway and Clare (Map Ireland, B 5) It is 30 miles long from west to east, with an average breadth of about 10 miles The islands of Aran form a natural breakwater at its entrance between the north and south sounds There are lighthouses on Inisheen, Mutton, Eeragh, and Straw islands, and at the entrance to Galway docks

GALYZIN, ga-lét'sén See GOLITZIN

GAMA, ga'ma, DOMICIO DA (1862-1925) A Brazilian diplomat, born at Ponta Negra, Rio de Janeiro He began his career in newspaper work, serving as Paris correspondent of the *Gazeta de Notícias* in 1887-88 He quickly won recognition as a writer, being a regular contributor to Brazilian and foreign magazines In 1893 he was secretary of the special commission on the Argentine-Brazil boundary dispute, which was arbitrated by President Cleveland Later he was sent on special missions to Bern and Paris and in 1900 was associated in the Brazil-Guiana boundary question He was appointed chargé d'affaires at Brussels in 1901, Minister to Peru in 1907, Minister to Argentina in 1908, and Minister to the United States in 1911 In 1914 he was a member of the A B C (Argentina, Brazil, Chile) Mediation Conference between the United States and Mexico.

GAMA, ga'ma, JOSÉ BASILIO DA (1740-95) A Brazilian poet, born at São José (Minas Geraes). He became a novice in the Jesuit College at Rio de Janeiro. Upon the expulsion of the order in 1759, he continued his studies at the seminary of São José, and subsequently went to Portugal and then to Rome, where in 1763 he was admitted as a member of the literary circle known as the *Arcadia*. Having returned by way of Portugal to Rio de Janeiro, he was there denounced as a Jesuit and was sent to Lisbon on a ship of war. Here he openly declared against the Jesuit Order, found a patron in Pombal, the Portuguese statesman, wrote an ode celebrating the dedication of an equestrian statue of José I, was elevated to the nobility in 1771, and in 1774 received an official post in the Ministry of Foreign Affairs. When his protector was dismissed from office in 1777, he proceeded to Rio de Janeiro, where he organized an *Arcadia Ultramarina*, in imitation of that at Rome. This society having been dissolved in 1790 by the new Viceroy, the Count of Rasende, who suspected plots, and its members having been threatened with imprisonment, Da Gama returned to Lisbon and there lived in retirement until his death. His chief work, which enjoyed high popularity in Brazil, is the epic *O Uruguay* (1769), in which he endeavors to show that the Jesuits of the Seven Missions sought to found in Uruguay an independent theocratic state. He also wrote shorter poems entitled *Declamação tragica, Qutubra*, and *Cantico aos Campos Elysios*.

GAMA, LUIZ FELIPE SALDANHA DA (1841-95) A Brazilian naval officer and diplomat, born in Rio de Janeiro. After years of service in the navy, he reached the rank of rear admiral. He fought in the war against Paraguay (1865-70) and later was sent to China and Japan to establish friendly relations between those nations and Brazil. In 1889 he attended the International Marine Conference at Washington. In 1893, while at the head of the naval school, he joined the naval revolt against the government. Upon the failure of the rebel cause he escaped on board a Portuguese war vessel to Buenos Aires (January, 1894). Later he joined the revolt in Rio Grande do Sul, and after a defeat of the rebel forces he took his own life (June, 1895).

GAMA, ga'ma, VASCO DA (c 1460-1524). A Portuguese navigator and the first European to reach India by the maritime route round Africa. He was descended from a noble family and was born at Simes, a small seaport of Portugal. After some years at court he was chosen to command the expedition dispatched by King Emmanuel to India by the all-sea route, the possibility of which had been revealed by the rounding of the Cape of Good Hope by Bartholomeu Dias in 1488, and confirmed by the explorations of Covilhão, who had reached India by way of the Red Sea and had crossed the Indian Ocean from Goa to Sofala. Vasco da Gama sailed from Lisbon July 8, 1497, and, doubling the Cape of Good Hope in November, reached in December the Rio do Infante, the farthest point attained by Dias. There he had to suppress a mutiny of his sailors, who shrank from facing the unknown dangers that awaited them. They breasted the strong Agulhas current and on Christmas Day, 1497, sighted the coast, which Da Gama, in honor of the day, named Natal (*dies Natalis*). Past Delagoa Bay, Quillhmane,

and Mozambique they sailed, until, on April 15, they anchored off Malindi, where they took on board an Indian pilot, a native of Gujarat. A voyage of 23 days across the Indian Ocean brought the vessels to the coast of Malabar, which was sighted on May 17, 1498. The ruler of Calicut did not receive the Portuguese very favorably, and Da Gama was forced to fight his way out of the harbor when he started homeward. He rounded the Cape once more in March, 1499, and on September 8 reached Lisbon. A fleet was immediately dispatched for India under Pedro Alvarez Cabral, whose ships were driven out of their course westward, the discovery of Brazil being the result. In 1502 Da Gama sailed again for India, planting Portuguese colonies on the way at Mozambique and Sofala. On reaching Calicut he bombarded the place, destroyed the fleet of the Rajah and forced him to conclude peace. In December, 1503, he was back in Portugal with a fleet bearing rich cargoes and was received with great honor and given the titles of Count Vidigueira and Admiral of the Indies. For 20 years Da Gama saw no active service. In order to reform the abuses in the administration of Portuguese Asia, the King appointed him Viceroy in 1524, and he was dispatched with a fleet to India, but soon after his arrival he died at Cochim on Christmas Day, 1524. The fame of Da Gama is due, perhaps, less to the merit of his exploits than to the place assigned him by Camões in his epic, *Os Lusíadas*. Consult Correa, *The Three Voyages of Vasco da Gama and his Viceroyalty* (Hakluyt Society Publications, London, 1869), *Roteiro da viagem que em descobrimento da India pelo cabo de Boa Esperança fez Dom Vasco da Gama em 1497-1499* (trans by Ravenstein, Hakluyt Society Publications, London, 1898), Teixeira de Aragão, *Vasco da Gama e a Vidigueira* (3d ed, Lisbon, 1898), Cordeiro *Os primeiros Gamas* (1b, 1898), Jayne, *Vasco da Gama and his Successors, 1460-1580* (London, 1910).

GAMA (ga'ma) **GRASS**, or **SESAME** (sēs'a-mê) **GRASS** (*Tripsacum*). A genus of grasses indigenous to America, sometimes said to be named from the Spanish gentleman who first attempted its cultivation in Mexico. Only two or three species are known, of which the gama grass (*Tripsacum dactyloides*), occurring from Connecticut to Mexico and southward, is distinguished by usually having two or three spikes together. It produces a large quantity of coarse fodder, for which it is cultivated, not only in Mexico, but in the United States and to some extent in Europe. In favorable circumstances it yields a very abundant crop and attains a height of 9 or 10 feet, its root leaves measuring 6 feet in length. It possesses what for some climates is an almost invaluable property of enduring excessive drought without injury, but suffers from frost. It seems eminently adapted to the climate of Australia. *Tripsacum fasciculatum*, a native of Mexico, attains a height of 15 to 20 feet. Consult W J Beal, *Grasses of North America* (2 vols, New York, 1887-1900), and M E Francis, *Book of Grasses* (1b, 1912).

GAM'ALA. An ancient fortress of Palestine, situated on the Lake of Tiberias and supposed to be either the modern *El-Hussu* or *Khan-el-akbah*. In the Jewish war of 66-70 Gamala, which had been fortified by Josephus, was vainly besieged by Agrippa, but was finally taken by

Vespasian, who slaughtered 9000 of the defenders

GAMALIEL, ga-mā'li-ēl (Heb., 'God is a reward') 1 **GAMALIEL I** A noted Pharisee, twice referred to in the Book of Acts (1) in v 34-39, where, as a member of the Sanhedrin, he counseled, from the point of caution, moderate measures regarding Peter and the other Apostles, and (2) in xxii 3, where Paul speaks of him as his instructor in the law Jewish tradition identifies him with the famous Rabbi Gamaliel, the elder, the son of Simon and the grandson of Hillel, the founder of the more liberal of the two Pharisaic schools This Gamaliel was the first of the seven Jewish doctors who received the honored title of Rabban, as president of the highest religious council of the Jews, and was held in such reputation that when he died, according to Mishna (Sota ix. 15), "reverence for the law ceased, and purity and piety died away" At the same time, in Gamaliel's day, instruction in the law was much more in sympathy with the spirit of practical life than was the case in the time of the later law schools of Palestine and Babylon In fact, Gamaliel himself at several points modified the restrictive customs of Jewish exclusivism and Jewish Sabbatism, while he protected the interests of wives in the matter of divorce and the interests of fatherless children in the matter of inheritance He was even liberal enough to be a student of Greek literature, which was held in abhorrence by narrow-minded rabbis In view of these facts it is not difficult to understand his tolerant position in the Sanhedrin council of Acts v, though it is to be doubted whether any appreciation of Christianity entered into his motives, the legend of his subsequent conversion to the Christian faith being worthless It is also not difficult to understand the attraction to him of Saul of Tarsus, and the fact that Saul afterward became a persecutor should not be made a ground for denying the historicity of the narrative in Acts v or the actuality of any relations between him and Saul Gamaliel died evidently some time before 70, since his son Simon was then in public life, while he himself seems to have been forgotten Many traditions are ascribed to him which belong to his grandson, Gamaliel II, with whom he is constantly confused

2 **GAMALIEL II** Grandson of the preceding, and the leading personality among the Jews of Palestine from c 80-110 A.D. He labored hard to unify the Palestinian Jews after the terrible struggle with Rome He succeeded Johanan ben Zakkai as head of the learned council of Jabneh, which had replaced the old Sanhedrin of Jerusalem He was a strong, just, and determined man, yet of a remarkably liberal spirit towards Gentile culture For both of these men, consult W Bacher's article in the *Jewish Encyclopædia*, vol v (New York, 1901-06); Schurer, *Geschichte des jüdischen Volkes*, vol. II (Leipzig, 1907); H Strack, *Einführung in den Talmud* (ib, 1908).

GAMARRA, ga-mar'ra, AGUSTÍN (1785-1841) A Peruvian soldier and politician, born at Cuzco He was educated at the College San Buenaventura Entering the Spanish army, he attained the rank of lieutenant colonel, in 1821 he joined the revolutionary cause, and became general and then grand marshal In 1829, after the deposition of General Lamar, he was inaugurated as President of Peru In 1834, after

the close of his rather unsuccessful administration, he led an insurrection against his successor, Orbegoso, afterward escaping to Bolivia Subsequently he fought under Santa Cruz (qv) and Salaverry, and in 1835 was banished by the latter to Costa Rica for an attempt to incite revolt When war was declared between Chile and the Peru-Bolivian Confederation formed by Santa Cruz, he commanded the reserve of the Chilean army sent to invade Peru, and after the defeat of the troops of the Confederation in 1839, near Yungay, was declared provisional President He was elected constitutional President by Congress with the title of "Restorer," and obtained the abolition of the liberal constitution of 1834 In 1841 he declared war against Bolivia, commanded the army of invasion, and was killed at the defeat of Yngavi (November 20) Despite frequent tyrannical acts, he sought the progress of his country and dictated many beneficial decrees In 1849 a mausoleum was erected in his honor in the Pantheon of Lima

GAMBA, gam'ba, BARTOLOMMEO (1776-1841). An Italian bibliographer, born at Bassano, who gave himself entirely to the study of the literature of Italy For many years he was vice librarian of St Mark's, Venice He was a member of many academies His most important work is the *Serie dei testi di lingua* (1805, 4th enlarged ed, 1839), which contains the bibliography of the authors mentioned in the dictionary of the Academy of Crusca and that of the best editions of other authors from the fifteenth century to the beginning of the nineteenth Other works are *Galleria dei letterati ed artisti delle provincie venete nel secolo XVIII* (1824), *Vita di Dante* (1825), *Catalogo delle più importanti edizioni della Divina Commedia* (1832), and *Bibliografia delle novelle italiane in prosa* (1833) He also made an excellent translation of Don Quixote

GAMBARELLI, gam'ba-rē'lē The family name of five brothers, who were architects and sculptors in Rome during the early Renaissance The two foremost, Antonio and Bernardo, are best known by their surname, Rossellino (qv).

GAM'BELL See ST LAWRENCE ISLAND, ALASKA

GAM'BESON, or WAMBAIS (AS *wamb*, from OF *gambeson*, *wambaisson*, from ML. *gambeso*, *wambasum*, from OHG, Goth *wamba*, stomach, Eng *womb*) In mediæval armor, a protection for the body, composed of layers of cloth, tow, or similar material, quilted on a lining canvas or leather It was worn by the infantry as their only defense and by knights under their mail shirts It is the most ancient of all armor and was used by the ancient Egyptians. Consult Ashdome, *Arms and Armour* (New York, 1909), and Demmin, *Arms and Armour* (London, 1877)

GAMBETTA, Fr pron gan'ba'ta', LÉON (1838-82). A French statesman He was born April 3, 1838, at Cahors, of a family which had come originally from Genoa, and which is said to have been of Jewish origin In 1854 an accident caused the loss and removal of his left eye In 1859 he began the practice of law at Paris His first great success, however, did not come until 1868, when he attacked the coup d'état of 1851 while defending a journalist who had come under the ban of the Empire He was returned to the Chamber of Deputies from Paris and Marseilles in the elections of 1869, and on

May 5, 1870, he delivered a speech containing a panegyric of the republican form of government, which attracted great attention. After the disaster of Sedan and the fall of the Empire, he became Minister of the Interior in the provisional government and remained for some time in Paris after it was invested by the Germans. It was he who announced the fall of the Emperor and the establishment of the Republic. In order to arouse the provinces he escaped from the city in a balloon (October 7), proceeded to Tours, and established a virtual dictatorship. He urged his countrymen to fight to the bitter end and denounced the capitulation of Metz as an act of treason on the part of Marshal Bazaine. He left France and went to Spain as a protest against the treaty signed with Germany. When a National Assembly was resolved upon in 1871, Gambetta sought to give it an exclusively republican character by a decree directing that no official of the Second Empire should take part in the election. The decree was canceled at the instigation of Prince Bismarck, and Gambetta resigned office, Feb. 6, 1871. He subsequently entered the Assembly as a member for Paris and became the leader of the Extreme Left, violently attacking the monarchical parties. After the retirement of M. Thiers his political action became more moderate. The Republicans owed to his leadership their success in the elections of 1877, and their defeat of the attempts of the Conservatives to deprive them of its results. In the same year he was twice prosecuted for violence of speech and once condemned to imprisonment. He strongly attacked the clerical party, who wanted to restore the temporal power of the Pope. On the election of Jules Grévy to the presidency of the Republic in 1879, Gambetta became President of the Chamber of Deputies (January 31).

Upon the fall of the Ferry ministry in November, 1881, Gambetta was asked to form a new cabinet. Prevented by Léon Say and others from bringing the various factions of the Republic together by giving the representatives of each a place in the ministry, he startled the nation by a selection which it could not but regard with apprehension and alarm. The Roman Catholics were directly insulted by the choice of Paul Bert, an open skeptic, as Minister of Public Worship. The Conservatives, agitated by his proposed curtailment of the powers of the Senate, joined with the Church in opposing his policy. The Extreme Left also had reasons for opposition. At an early date Gambetta reintroduced his favorite schemes of *scrutin de liste* (qv) and senatorial abridgment. The Lower Chamber was to share in the election of senators, and the vote of the latter upon financial measures was to be taken away. The *scrutin de liste* was defeated in the Senate, and Gambetta immediately resigned (Jan. 14, 1882). Although his influence over national affairs was still felt through his newspaper, the *République Française* (established 1871), he seldom appeared in public after his resignation. The Republicans, who had not wholly trusted him while in power, were thrown into confusion by the news of his death, as it deprived them of the one man whose strong opposition the Royalist and Bonapartist factions especially feared. A pistol wound in the hand aggravated a malady from which he had long suffered, and he died Dec. 31, 1882. Gambetta's *Discours et plaidoyers* have been edited in 11 volumes by

Reinach (Paris, 1881-85). Consult Reinach, *Léon Gambetta* (Paris, 1884), Harrison, *Léon Gambetta, a Positivist* (London, 1892), Coubertin, *The Evolution of France under the Third Republic* (trans. by Hapgood, New York, 1897), Tournour, *Gambetta en 1869* (Paris, 1904), Ghensi, *Gambetta Life and Letters* (London, 1910). See FRANCO-GERMAN WAR.

GAMBIA A British colony in West Africa at the mouth of the river of the same name (Map Africa, C 3). Its area is only 69 square miles, but territory under British protection extends some 250 miles up the river, and the total area is stated at 4500 square miles with a population in 1911 of 138,400. Since 1902 all of the Gambia except St. Mary's Island has been under the protectorate system of administration, the island comprises about 2500 acres, with 8807 inhabitants. The population of the Gambia is chiefly negro and Mohammedan. The capital and principal town is Bathurst (qv), on St. Mary's Island. Imports and exports (including bullion and specie) amounted to £303,615 and £248,140 respectively in 1902, in 1912, £756,853 and £735,172 (bullion and specie, £285,223 and £196,579). The only important export of merchandise is ground nuts, amounting in 1911 to £437,472 and in 1912 to £502,069. Gambia was included in the British West African settlements from 1866 until it was constituted a separate colony in 1888. Consult F. B. Archer, *The Gambia Colony and Protectorate* (London, 1906), and H. F. Reeve, *The Gambia Its History, Ancient, Mediæval, and Modern* (ib., 1912).

GAMBIA (African *Ba-duman, Fourer*) A river of West Africa, rising in the mountains of Futa Jallon, Senegal, and flowing through the British Colony of Gambia (qv) (Map Africa, C 3). It falls into the Atlantic at Bathurst by a wide estuary. There is a bar a short distance from its mouth, which obstructs navigation at low tide. The river rises 150 miles from the sea, but follows so sinuous a course that its length is about 700 miles. The lower part of the river flows through mangrove swamps. Seagoing steamers ascend as far as Fort George, about 170 miles, while lighter vessels reach the Barraconda Rapids, about 220 miles from its mouth. The river incloses a number of islets.

GAMBIER. A village in Knox Co., Ohio, 50 miles northeast of Columbus, on the Cleveland, Akron, and Columbus Railroad (Map Ohio, F 5). It is the seat of Kenyon College (qv), Harcourt Place School, for girls, and Bexley Theological Seminary. Pop., 1900, 751, 1910, 537.

GAMBIER. See GAMBIER.

GAMBIER, JAMES, LORD (1756-1833). An English admiral. He was born at New Providence, Bahamas, Oct. 13, 1756, while his father was Lieutenant Governor of the islands. He entered the navy in 1767, was post captain in 1778, and in 1780 took part in the capture of Charleston, S. C. He commanded the *Defence* in the battle off Ushant, June 1, 1794, and was the first to break through the French line. He received a gold medal for his services and was made colonel of the marines. The following year he became rear admiral and Lord of the Admiralty. In 1799 he was made vice admiral. In 1802 he was appointed Governor of Newfoundland and commander in chief of the naval station. In 1804 he returned to the Admiralty, and in 1805 attained the rank of ad-

miral For his share in the bombardment of Copenhagen and the capture of the Danish navy in 1807 he was raised to the peerage as Lord Gambier In command of the Channel fleet he blockaded the French fleet in Aix Roads, but did not support Cochrane, Lord Dundonald, whom the Admiralty had deputed to destroy it. When Cochrane complained, Gambier demanded a trial and received a qualified acquittal by a friendly court-martial As a chief commissioner, he took part in the peace negotiations of the United States at Ghent in 1814 and for this service was honored with the G C B In 1830 he was promoted to be admiral of the fleet He died April 19, 1833

GAMBIER ARCHIPELAGO. An important group of 10 islets in the south Pacific, lat 23° 8' S, long 134° 55' W, discovered by Wilson in 1797 They rest upon the south end of the extrusion mass which constitutes the Tuamotu and are of moderate elevation, on Mangareva the two peaks of Mokoto and Mangareva measuring about 1300 feet in altitude The four largest islands are Mangareva, Aokena, Taravai, and Akamaru, and these are the only spots inhabited The area of the land surface of the group is about 10 square miles A census in December, 1911, records the population at 529, vital statistics covering the 15 preceding years show 245 births and 286 deaths In recent years Mangareva has received a considerable colony from Easter Island The population is a mixture of the elder and the junior branches of the Polynesian race and finds its closest affinity with the people of the Tuamotu, it is singular as being the only Polynesian people which has lost the art of canoe craft The rich soil affords abundance of coconuts and other fruits, coffee has been planted with satisfactory success, several banks of pearl shell are known to exist in the lagoons The Gambier Archipelago is a part of the French possessions and is administered from Papeete The chief village is Rikitea. Consult Churchill, *Easter Island, the Rapanui Speech, and the Peopling of Southeast Polynesia* (Washington, 1912)

GAM'BIR, or **GAMBIER** (Malay), *Terra japonica* A crystalline plant extract similar to catechu (qv) Like catechu, it is largely used in tanning and dyeing, for the production of "catechu brown" on cotton "khaki," fast to light and washing. It is occasionally used in medicine as an astringent It can be obtained from the leaves and young twigs of *Uncaria gambir*, which is extensively cultivated at Singapore. To prepare it, the leaves and twigs are extracted in boiling water, the solution is strained and evaporated to a thick sirup, cast into small cubes, and allowed to harden

GAM'BIT See **CHESS**

GAM'BLE, FRANCIS CLARKE (1848-). A Canadian civil engineer He was born in Toronto and was educated privately and at Upper Canada College He began work as a civil engineer in 1869 in connection with the Intercolonial Railway, became assistant engineer of the Great Western Railway in 1872, and was assistant engineer of the Intercolonial and Canadian Pacific railways during construction In 1881 he became assistant engineer for the Department of Public works of British Columbia, and in 1887-97 he was resident engineer and agent, in 1898-1911 public-works engineer and inspector of dikes, and after 1911 chief

engineer and inspecting engineer of railways. He was elected a member of the Canadian Society of Civil Engineers in 1887, and in 1891 of the Institute of Civil Engineers, London, England, and of the American Society of Civil Engineers

GAM'BLE, HAMILTON ROWAN (1798-1864) An American statesman, "War" Governor of Missouri He was born at Winchester, Va, studied at Hampden-Sidney College, was admitted to the Virginia bar, and in 1818 removed to Missouri, where in 1823 he was elected Secretary of State He acquired an extensive legal practice at St Louis and became presiding judge of the State Supreme Court He was elected in 1861 to the Missouri Constitutional Convention, and when on July 31 that body established a provisional government, he was appointed Governor to replace Claiborne F Jackson, who had joined the Secessionists In 1862 he issued an order commanding the enrollment of the total fighting population, and giving authority to General Schofield to place in active service a force adequate to the maintenance of peace This order occasioned an uprising among the partisans of the South, who looked upon it as a draft measure and believed that in having given oath not to take up arms against the State or Federal government they had become noncombatants On June 15, 1863, at his summons, a convention assembled which adopted an ordinance providing for a method of gradual emancipation of slaves This did not satisfy the ultra-Republicans, who demanded an immediate emancipation, and thereby gained the election of November, 1864 He died in office

GAM'BLING, or **GAM'ING** (from AS. *gamen*, *gamen*, *gomen*, game, sport, joy) The art or practice of playing a game of hazard, or one depending partly on skill and partly on hazard, with a view to pecuniary gain Games of this nature were forbidden by the Romans, both under the Republic and the Empire The ground on which this was done was the tendency of such practices to render the Roman people effeminate and unmanly It devolved upon the ædiles to protect the public interest by punishing violations of the gaming laws During the Saturnalia, which was a period of general license, games of chance were permitted, and a like indulgence was extended to old men at all times both among the Greeks and the Romans This vice has not been confined to civilized nations, either in the ancient or the modern world; Tacitus mentions its existence among the ancient Germans, and it is known to prevail among many half-civilized and even savage tribes at the present day.

It is remarkable that in England, as in Rome, the ground on which gambling was first prohibited was not its demoralizing, but its effeminating, influence on the community The Act 33 Henry VIII, c 9 (1541), had in view the double object of "maintaining artillery and debarring unlawful games" At a much later period and on broader grounds of public policy were enacted the statutes 16 Chas II, c 7, and 9 Anne, c 14, the latter of which declared that all bonds or other securities given for money won at play, or money lent at the time to play with, should be utterly void, and all mortgages or incumbrances of lands made on the same consideration should be made over to the use of the mortgagor Such continued to be the law till 1845, when there was passed the Act 8 and 9 Vict., c 109,

which, though it repealed the obsolete provisions of 33 Henry VIII and 16 Chas II and 9 Anne, reenacted the former prohibitions against card playing and other games of chance, and was followed up (in 1853 and 1854) by the acts for suppressing betting houses (16 and 17 Vict, c 119) and gaming houses (17 and 18 Vict, c 38). By 8 and 9 Vict, c 109, the common law of England was altered, and wagers, which with some exceptions had hitherto been considered legal contracts, were declared to be no longer enforceable in a court of law. This prohibition does not affect contributing to prizes for lawful games. In Scotland an opposite rule had been followed, the judges having held, irrespective of the character of the game, or of any statutory prohibition regarding it, that "their proper functions were to enforce the rights of parties arising out of serious transactions, and not to pay regard to *sponsiones ludicras*." But partial assimilation has now been effected in this respect between the laws of the two countries by a statute which also provides that cheating at play shall be punished as obtaining money under false pretenses. The mode of enforcing the Act 8 and 9 Vict, c 109, was defective, and the Act 17 and 18 Vict, c 38, put heavy penalties on those who obstructed the police by putting chains or bolts against the doors of gaming houses or otherwise delaying the entry into such houses, and any apparatus or arrangement for giving alarm to the persons inside was declared to be evidence that the house was a gaming house. The Summary Jurisdiction Acts of 1879 and 1884 have provided effective remedies against the violators of gaming laws. The Betting-Houses Act (16 and 17 Vict, c 119) was passed to put down another kind of gaming, viz, in houses where money is received as or for the consideration for any undertaking to pay money in the event of any horse race, or other race, fight, game, sport, or exercise. All such betting houses are declared to be gaming houses within the Statute 8 and 9 Vict, c 109, and similar powers of search may be resorted to. But nothing in the act extends to a person holding stakes to be paid to the winner of any race or lawful sport, game, or exercise. Besides these statutes, the Intoxicating Liquors Licensing Act of 1872 puts a penalty on the keeper of any house for the sale of liquors allowing any gaming for money or money's worth on the premises. By the vagrant acts all persons are liable to penalties for playing at games on a public highway or public place. These enactments do not interfere with gaming in private houses.

In most of the states of Germany gaming was allowed, and the extent to which it was practiced at the German watering places is well known. The princes of the petty states often derived a large portion of their revenue from the tenants of their gaming establishments, whose exclusive privileges they guaranteed. Recently these German gaming tables have all been closed. Monaco has now the chief public gaming tables of Europe.

In the United States, as in England, one who keeps a gaming house is indictable at common law for maintaining a nuisance; and one who wins another's money with false dice, or the like, is punishable as a common-law cheat. Legislation in our States against gambling has taken a course similar to that above described in Britain. The tendency has been towards greater precision in defining the offenses of

gambling and of keeping gambling houses and implements, towards more summary methods of dealing with the violators of these statutes, and towards severer punishment of violators. Such legislation is so diverse in matters of detail as to render even an outline of it impracticable. There has been difficulty in arriving at a correct definition of gambling. It cannot be said that a mere contest of skill or strength, however great may be the prize, is indictable at common law, for in England and the United States such contests have at all times been sanctioned by public policy and protected by the courts. Of course there may be contests not objectionable upon this ground which may be prohibited for other reasons, as, e.g., cockfighting, which is properly regarded as a cruel and wanton sport, but it is "gaming" for persons to stake money on chance. The chance must be the controlling factor in the game. It is not enough that chance should enter into a contest to make it gambling, for it cannot be denied that there is a certain element of fortune in almost any contest or undertaking. But this does not make such contest gambling. All competitive examinations are affected somewhat by chance, yet no competitive examination is gambling. So in games of skill, as chess and billiards. In such games chance may have very little part. If so, playing these games, even for a prize or reward, is not gambling. It is otherwise when the game depends more largely on chance than on skill, so that it may be said that gambling as a penal offense may be defined as a staking on chance. Consult. *Encyclopædia of the Laws of England* (London, 1897-98), Bishop, *On Statutory Crimes* (3d ed, Chicago, 1901), Rowntree, *Betting and Gambling* (New York, 1905), Coldridge and Hawksford, *The Law of Gambling, Civil and Criminal* (London, 1913).

GAMBOA, PEDRO SARMIENTO DE See SARMIENTO

GAMBOGE, gām-bōj' or -bōōj', or **CAMBOGE** (from *Camboja*, *Cambodia*, Skt *Kambōja*, where the tree abounds). A gum resin brought from the East Indies and believed to be the produce chiefly of *Garcinia cambogia*, also known as *Garcinia cambogioides*, a tree of the natural order Guttiferae, a native of Ceylon, Siam, Cambodia, etc. The gamboge tree attains a height of 40 feet, has smooth oval leaves, small polygamous flowers, and clustered succulent fruit. When the bark of a tree is wounded, gamboge exudes as a thick, viscid, yellow juice, which hardens by exposure to the air. The finest gamboge comes from Siam. *American gamboge*, which is very similar and used for the same purposes, is obtained from *Vismia guianensis* (natural order Hypericaceae), a native of Mexico and Surinam. Gamboge occurs in commerce in three forms (1) in rolls or solid cylinders, (2) in pipes or hollow cylinders, and (3) in cakes or amorphous masses. The first two kinds are the purest. Good gamboge contains about 70 per cent of resin and 20 per cent of gum, the remainder being made up of woody fibre, fecula, and moisture. The resin of gamboge, known as gambogic acid, is a bright yellow substance soluble in alcohol and in ether. Its composition is represented by the formula $C_{40}H_{22}O$. It is much used by painters to produce a beautiful yellow color. It is also employed for staining wood and for making a gold-colored lacquer for brass. It has a shelly fracture, is destitute of smell, and has an acrid

taste If taken internally, it acts as a cathartic, producing a large amount of secretion It is but rarely used in medicine, and never alone, as it causes griping and irritation of the alimentary canal See MANGOSTEEN, GUMS

GAMBRI'NUS. A mythical king of Flanders, to whom is ascribed the invention of beer His figure is familiar in German beer cellars and elsewhere, seated astride a cask with a tankard in his hand The name is said to have arisen out of that of Jan Primus, Duke of Brabant (1251-94) He obtained the presidency of the Brussels guild of brewers, and his portrait, with a foaming glass of beer in his hand, was hung up in the hall of the guild The name may perhaps have been converted into German, the prince of the story made a king, and the invention of beer ascribed to him But this explanation may itself have been a fiction

GAME See HUNTING

GAME FOWL. See FOWL, COCKFIGHTING

GAME LAWS Statutes enacted either for the purpose of protecting persons in the enjoyment of certain sporting rights or of protecting game from improper destruction

Previous to the Norman Conquest of England there were no restrictions against the hunting of game, except a general law prohibiting the hunting of game on Sundays, so far as is known this was the earliest game law A subsequent law prohibited monks hunting in the woods with dogs All other classes of society were at liberty to hunt over the country at large, except that the King's hunting was not to be interfered with, i.e., wherever the King elected to hunt, all others had to vacate until the King and his followers had passed With the advent of the Normans in 1066, hunting became the sole privilege of the nobles, and the common people were prohibited, under severe penalties, from the hunting of game Stringent game laws were enacted, which became known as the Forest Laws, and which frequently drove the Saxons, and common people generally, into rebellion Many of them, as in the case of the historic Robin Hood, became outlaws During the Middle Ages the game laws of England were framed so as to secure to the landed aristocracy the exclusive right of taking game Under their provisions, according to Blackstone, 'All persons of what property or distinction soever, that kill game out of their own territories, or even upon their own estates, without the King's license expressed by grant or franchise, are guilty of the offense of encroaching on the royal prerogative And those indigent persons who do so without having such rank or fortune, as is generally called a qualification, are guilty not only of this offense, but of the aggravations also created by the statutes for preserving game' One of the "qualifications" for killing game in Blackstone's time was the ownership of a freehold estate of £100 per annum, "there being fifty times the property required to enable a man to kill a partridge," remarks the great commentator, "as to vote for a Knight of the Shire" Early in the last century all the old statutes on the subject were repealed, and the Night Poaching Act, 1828 (9 Geo. IV, c 69), and the Game Act, 1831 (2 Wm. IV, c 32), were substituted for these

In the United States game laws have been framed on different lines from those of England Their primary object has been the protection of game itself, not the grant of exclusive rights to persons possessed of large property qualifica-

tions In 1623 Plymouth Colony declared fowling, fishing, and hunting to be free, except on certain private property Class legislation is dead, all wild game and fishes are the property of him that reduces them to possession by killing or catching, with due regard to the law of trespass on private property, be it land or water, wild game and fishes must not be molested during the season of reproduction, and they must be allowed free and unobstructed passage to their breeding grounds or waters

The rule governing the acquisition of property in game in the United States differs in some respects from that in England There, if a hunter captures game upon the land of another, it belongs to the landowner, while here it belongs to the captor, although he may be liable to an action for trespass, and in some States to a criminal prosecution, for entering upon the premises of another without permission By the common law the right of fishing in the sea and in tidewaters generally is public and common to every person, but the owners of lands on the banks of fresh-water rivers above the tide line have the exclusive right of fishing to the middle of the stream If the same person owns lands on both sides of the river, he has the sole right of fishing in the river as far as his lands extend So the sole right of fishing in ponds or lakes belongs to him who owns the fee of the soil beneath the water Moreover, a person rightfully navigating a river becomes a trespasser when he shoots at or kills wild ducks thereon, in case the bed of the river is the property of adjacent landowners

This right of fishery, however, is not an absolute or unqualified right of property It is subject to the police power of the State Persons may be prohibited by legislation from fishing or hunting even upon their own lands, during certain seasons, and their sale of game which has been killed during the open season may be regulated This rule rests upon the doctrine that the wild game within a State belongs to the people in their collective sovereign capacity It is the subject of private ownership only so far as the people may elect to make it so, and they may absolutely prohibit the taking of it, or the traffic and commerce in it, if this is deemed necessary for the protection or preservation of the public good Hence State laws prohibiting the citizens of other States from planting oysters within the tidewaters of the enacting State are constitutional So are laws regulating the catching of fish within the bays of the enacting State, or prohibiting the catching of fish or the killing of game for the purpose of carrying the same beyond the limits of the State All State laws having for their object the protection of game from unnecessary slaughter, and the propagation of game, have been treated with favor by both State and Federal courts and have received a liberal construction Indeed, the Supreme Court of the United States has not hesitated to declare that it is the duty of the Legislature to enact such laws as will best preserve game of every kind and secure it as a valuable food supply for the future use of the people of the State Even the sale of fish propagated in private ponds may lawfully be restricted during the close season In short, the right to take game is a boon or privilege rather than a vested legal right

Modern game laws do not stop with prohibitions against killing game out of season. They

extend to the sale of such game, and even to its possession, during the period of prohibition. They have become more stringent and minute in their restrictions. The machinery for the enforcement of this provision is far more effective than formerly, and civil suits for heavy fines are more frequently resorted to than criminal prosecutions under indictments.

The lack of uniformity of the various State laws dictating the seasons during which birds and animals shall be protected frequently defeats the very purpose for which the laws were framed, and, moreover, makes compliance with the provisions of the Federal law difficult for both shippers and game dealers, who have to consider the open seasons in the State in which the game was killed, and that to which it is their purpose to ship it. Still more confusion is caused by the general diversity in defining the seasons. In some States the open seasons are given, and in others the closed, while in all their statements is to be found every possible variety of inclusion and exclusion of the dates named. In some States the regular killing season is checked by the prohibition of shooting or killing on certain days of the week.

Shipment of Game. This also is an important subject of game legislation, for one of the greatest factors in the rapid destruction of game in recent years has undoubtedly been the illegal shipment of game from one State to another. It has also been an exceedingly difficult problem to cope with, largely because interstate commerce is outside the jurisdiction of the several States. There was passed by Congress on May 25, 1900, an act, popularly termed the Lacey Act, which gave to the Secretary of Agriculture all duties and responsibilities connected with the preservation of game and at the same time prohibited interstate commerce in game killed in violation of local laws. The Lacey Act is based, to a degree, on State laws, so that its proper enforcement requires a knowledge of certain local provisions which are subject to periodical change. Section 4 of this act ordains that every package containing game animals or birds, when shipped by interstate commerce, must be clearly marked, so as to show the name and address of the shipper as well as the nature of the contents. In addition to this the laws of Colorado, Connecticut, Louisiana, Michigan, Mississippi, Montana, Nebraska, North Carolina, Ohio, Oregon, Wisconsin, New Brunswick, and Ontario require packages of fish or game to bear a statement clearly indicating the nature of the contents, which must cover the *kind* of game and the *amount* in the package. The majority of the States prohibiting exports place no restrictions on shipments within the State, but a few States impose restrictions on the shipment of certain kinds of game, and Kansas prohibits the shipment of all protected game within the State. An important event in the development of modern State laws was the establishing by the Supreme Court of the constitutionality of the Connecticut statute prohibiting export of certain game (*Geer v Connecticut*, 11 U S 519). As a result, non-export laws have been adopted throughout all the States, every State prohibiting the export of certain kinds of game. In some States the sportsmen may carry a limited amount of game out of the State, but only under special restrictions. In most of the States the sale of all or certain kinds of game is prohibited at all seasons, and most States prohibit sale of all game

during the close season. The most general prohibition among game birds is that against the export of quail, which, with two exceptions, Wyoming and Maryland, is in force in every State of the Union.

The Dominion of Canada has a general law, covering and prohibiting the export of wild turkeys, partridge, prairie fowl, quail, woodcock, and deer, except in the case of deer raised on private reserves, and an exception which provides that nonresident sportsmen may export two deer each in a calendar year at certain ports of export within 15 days after the close of the open season.

Licenses for Hunting and Shipping Game. In Arkansas nonresidents are denied the privilege of hunting. Throughout Canada and in 36 States of the Union nonresidents must secure licenses before it is lawful for them to hunt certain kinds of game. In 16 States and four Canadian Provinces a similar restriction is imposed on residents, but the fee is usually nominal, and in all cases considerably less than that imposed on nonresidents.

With regard to *fishing*, both for food and game fishes, all that has been said on the subject of hunting also applies. Most of the States have their own laws regulating the fishing for food and game fish—the open seasons varying according to the State and the species of fish. In some States it is illegal to take fish under a certain size or weight, while in most it is forbidden to take trout, bass, and other fish by netting or spearing, or by any method other than with hook and line. The laws apply to fishing in private waters as well as in those that belong to the State.

Trespassing. The same laws govern trespass in fishing as in hunting, although some States have made special laws on the subject. As a rule, however, the general law throughout the States on this subject decides that if the bottom of a lake or stream is subject to private ownership, the owner has the sole right of fishing, even though the water is deep enough to float a boat and is subject to public use as a highway. In public waters the right belongs to the State, and consequently is usually free to the public, although there are instances when the State grants it to particular persons.

Consult the Game Laws of the United States and of the separate States. See *FERRÉ NATURE, FISHING LAWS*.

GAMELYN, gām'e-lin. The hero of an English verse tale of the same name written in the fourteenth century. It was formerly ascribed to Chaucer, for the reason that all extant copies of the poem are found in the manuscripts of the *Canterbury Tales*. It is interesting as furnishing Thomas Lodge with an outline for the first part of *Rosalind*, upon which Shakespeare afterward based *As You Like It*. Consult the appendix to the *Variorum* edition of Shakespeare's play by Furness (3d ed., Philadelphia, 1908), and *The Tale of Gamelyn*, ed. by W. W. Skeat (Oxford, 1894).

GAME OF CHESS, A. A political comedy by Thomas Middleton, satirizing Spain and Roman Catholicism, produced at the Globe Theatre in August, 1624, and published in quarto the same year. It was suggested by the notorious Spanish Match and drew much of its abundant detail from contemporary tracts which dealt with that fiasco. The Spanish Minister immediately protested to King James concerning it, and

the author was temporarily imprisoned. The vogue which the play enjoyed at the time was remarkable, its nine performances netting £1500. Consult Doran, *English Stage* (3 vols., Edinburgh, 1887).

GAME PRESERVE. A park stocked with game, or a tract of country, sometimes enclosed, and set apart for the protection of game. At the beginning of the Middle Ages the rulers of Europe maintained their own hunting grounds or forests, a practice which was soon followed by the landed nobility, and out of which grew the present system, by which the right of hunting and the ownership of game is vested in the ownership of the land. (See **GAME LAWS**.) Austria-Hungary and Germany contain many hunting estates, as also did France before the Revolution. Under such conditions, however, the preservation of game is essentially a private undertaking. In the British Isles game preserving has attained a high degree of development, but, as on continental Europe, this is due to the individual landowner rather than to the government, and the impelling motive is a selfish rather than a public-spirited one. Scotland possesses the largest single areas set apart for shooting and hunting in the United Kingdom, and the preserve of the Duke of Sutherland ranks as one of the largest in the world. The setting apart of vast tracts of arable or grazing land for these purposes has become a very real grievance with the Scottish people.

African Preserves. The greatest game preserves are those which have been established in Africa by the British Government. Only the most important of these can be mentioned here. In British East Africa are the great Athi Plains Preserve, between the Uganda Railway and the northeastern boundary of German East Africa, roughly pear-shaped, about 200 miles long, northwest by southeast, by about 40 miles wide, and the Jubaland Preserve, which lies about 50 miles north of Mount Kenya, which is roughly rectangular, and about 170 miles long, northeast by southwest, by about 130 miles wide. Here also are seven other smaller reservations for the protection of certain mammals, such as the rhinoceros, the hippopotamus, the eland, and the roan antelope. Another great preserve—with undefined boundaries—lies in the Egyptian Sudan, between the Nile, the Blue Nile, and Abyssinia. It is about 215 miles long north and south by about 125 miles wide. In the Transvaal are the Sabi-Singwita Preserve, lying along the northeastern boundary of the colony, about 200 miles long by about 50 miles wide, the Rustenberg Preserve, comprising about 3500 square miles north and south of the headwaters of the Limpopo River, and the smaller Pretoria Preserve. Other important African game sanctuaries are as follows in Central Angoniland (British Nyassaland) a preserve—especially for elephants—about 50 miles wide, lying chiefly along the west shore and extending about 200 miles south of Lake Nyassa; in Somaliland, the Hargeis and Mirso reserves, of about 1800 and 300 square miles respectively; in Uganda, the Bondo Reserve, lying along the eastern shore of Lake Albert Nyanza, and the Toro Reserve, situated between that lake and Lake Albert Edward Nyanza.

Canadian Preserves. In Canada there are several extensive and many smaller game preserves, most of which were established by the governments of the provinces in which they are

situated. In Ontario is the great Algonquin National Park, with an area of 1930 square miles, well stocked with moose, caribou, white-tailed deer, black bear, and beaver. In Alberta are the following national parks: Rocky Mountains, near Banff, 4320 square miles, Yoho and Glacier, 2812 and 2304 square miles respectively, Buffalo, near Wainwright, 600 acres, for American bison, Elk Island, near Fort Saskatchewan, 62 square miles, for bison, elk, and moose, Jasper, on the Athabasca River, near Strathcona, 5450 square miles, and Watetown Lakes, in the southeastern corner of the province, 54 square miles, chiefly for mountain sheep. In British Columbia are the Elk River Game Preserve, of about 450 square miles, in the East Kootenai District, the Fraser River Preserve, of about 2250 square miles, between the North and South Forks of the Fraser River, and the Yakom Preserve, of about 215 square miles, on the north side of the Bridge River, a tributary of the Fraser.

In Manitoba are four preserves—the Duck Mountain, of 324 square miles, the Riding Mountain, of 360 square miles, the Spruce Woods, of 64 square miles, and the Turtle Mountain, of 100 square miles—the maintenance of which is exceedingly important to the United States, since within them lie the systems of lakes and marshlands which are among the most important breeding places for North American waterfowl. The Province of Quebec has two very large preserves—the Laurentides National Park, of 3565 square miles, in the region bounded by Lake St. John, the Saguenay, the St. Lawrence, and the St. Maurice rivers, and the Gaspesian Forest, Fish and Game Preserve, of 2500 square miles, in the eastern part of the province.

United States Preserves. In 1914 there were ten national parks in the United States which served as game refuges, as follows: Yellowstone, Wyo. (established, 1872), 2,142,720 acres, National Zoological Park, D. C. (1889), 167 acres, Rock Creek, D. C. (1890), 1606 acres, Sequoia, Cal. (1890), 161,597 acres, Yosemite, Cal. (1890), 719,622 acres, General Grant, Cal. (1890), 2536 acres, Mount Ranier, Wash. (1899), 207,360 acres, Crater Lake, Oreg. (1902), 159,360 acres, Wind Cave, S. D. (1903), 10,522 acres, and Glacier, Mont., 915,000 acres, total 4,320,490 acres, or about 6,719 square miles. Most of these parks shelter more or less big game, the presence of which adds greatly to their educational value. Yellowstone Park has much the largest faunal population, which included in 1914 about 500 antelope, 210 mountain sheep, 50 wild buffalo, 162 buffalo in the fenced herd, 33,000 elk—the largest herd on the continent—and many bear, deer, moose, and beaver.

In addition to the national parks just mentioned, there were in the United States in 1914 nine national game preserves and other refuges for wild life, as follows: the Wichita, (Okla.) Game Preserve, chiefly for American bison and elk (1905), 57,120 acres, Grand Canyon (Ariz.) Game Preserve (1906), 1,402,928 acres, the Muir Woods (Cal.) National Monument (1908), 295 acres, the Montana National Bison Range (1908), 18,521 acres, the Mobera (Neb.) Reservation, about 1200 acres; Mount Olympus (Wash.) National Monument (1909), 608,640 acres; Billy Meadows Pasture, Oreg., 2560 acres, Munkunyuweap (Utah) National

Monument (1909), 15,840 acres, and the Colorado National Monument (1911), 13,883 acres.

The national bird reservations in the United States are altogether too numerous to mention in this connection. They numbered more than 65 in 1914, and are established by executive order, chiefly for the purpose of protecting large breeding colonies of water birds (many of them game species), or of affording refuges for migratory species in their northward or southward flights, or in winter. Generally they are small, rocky islands or tracts of marshland, or areas adjoining reclamation projects in the West. Some, however, are of considerable extent, as, e.g., the Yukon Delta Reservation, and the Hawaiian Islands Reservation. Besides the reservations just referred to, there are a few refuges for aquatic mammals and birds, and for fish, some of which are maintained in connection with lighthouse or naval stations. The largest of these are the Afognak Forest and Fish Culture Reserve, of 800 square miles, north of Kodiak Island, Alaska, and the Aleutian Island Reservation, Alaska (also a bird reservation).

Several States have set aside considerable tracts of woodland for the preservation of game. The most considerable of these reserves is the famous Adirondack State Park, New York. It includes about 2030 square miles of splendid forest land, with scores of beautiful lakes and streams, and many fine mountain peaks which command superb views. Many of the lakes and streams are kept stocked with trout and bass by the State, and there is still good deer hunting in much of the forest. The park was established in 1892, and is maintained and policed under the direction of the State Conservation Commission. Pennsylvania has adopted the policy of establishing game preserves within state forest reserves, and five of these reservations (of about 3200 acres each) had been set aside in 1913. In 1911 Montana established the important Snow Creek Game Preserve, of 96 square miles, in Dawson County, while Wyoming has five large refuges, including the Teton State Preserve (1905), of about 900 square miles, adjoining Yellowstone Park, and the Big Horn Game Preserve (1909) in the mountain range of that name.

There are in the United States a very large number of game preserves which are owned by individuals or associations. Probably the first extensive undertaking of this kind was the preserve of about 200 acres established about 1859, near Ottawa, Ill., by John Dean Caton, author of *The Deer and Antelope of America*. An important preserve is that which was founded in 1885 near Newport, N. H., by Austin Corbin. This is still maintained by Mr. Corbin's son and others. It is known as the Blue Mountain Forest Park, contains a large herd of bison (from which have been recruited several other herds), and includes about 27,000 acres of fine forest land. In the Adirondacks there are many large private preserves, some of which are maintained under conditions which have caused much resentment among the natives and have resulted in two homicides. On St. Vincent Island, near Apalachicola, Fla., Dr. Ray V. Pierce established a preserve of about twenty square miles in 1909, and here much effective work has been done in the protection of waterfowl. In 1912 Mrs. Russell Sage (q.v.) bought Marsh Island, off the coast of Louisiana, as a refuge especially for

waterfowl, and this, with the neighboring Louisiana State Game Preserve of 13,000 acres, near Marsh Island, and the Ward-McIlhenny Wild Fowl Preserve of about 11,000 acres adjoining, constitutes one of the most important bird refuges on the southern coast. In 1914 George Vanderbilt offered to the United States Government the major part of his great estate, Biltmore, N. C., and the offer was accepted.

For an interesting account of the great game preserves in Africa and on this continent, consult Hornaday, *Our Vanishing Wild Life* (New York, 1913). Stevenson-Hamilton's *Animal Life in Africa* (London, 1912) contains maps which show with some precision the location of the African preserves. For readable descriptions of these latter regions, consult Dugmore, *Camera Adventures in African Wilds* (New York, 1910), and Roosevelt, *African Game Trails* (ib., 1910). The various reservations in the United States are enumerated and described by Dr. T. S. Palmer, in *National Reservations for the Protection of Wild Life*, Circular No. 87, issued by the United States Department of Agriculture, Bureau of Biological Survey (Washington, 1912). See FISHING, HUNTING, WILD LIFE, CONSERVATION OF.

GAMES, ANCIENT. The public games of Greece and Rome were athletic contests and spectacles of various kinds, generally connected with religious observances. It is hard to overestimate the influence of the public contests of Greece in developing the extraordinary appreciation of physical beauty among the Greeks, and its reflection in art and literature. They also exercised a powerful influence in promoting a feeling of national unity in opposition to the many rivalries which tended to disrupt the Grecian world. As the contests came to take on more and more of the professional character, the admiration for the athletes decreased, and the games lost much of their early character. In the Homeric poems we find games a part of the funeral of a great chief, but with the fall of the nobility they become associated with some special sanctuary or religious festival. The Romans called their public games *ludi*. The *ludi* were performed first in payment of vows, usually in connection with war, later they became annual celebrations. They were under the care of state magistrates, usually the aediles, less often the praetor. A sum of money was granted for the *ludi* by the state, but to this ever-increasing amounts were added by the magistrates themselves. The *ludi* were known as *ludi amphitheatrales*, *ludi circenses*, or *ludi theatrales*, according to the kind of spectacle that formed the chief attraction. Some of the *ludi* lasted 16 days. The Romans preferred to play the part of spectators, and their shows were often gladiatorial and bloody—things entirely foreign to the feeling of free Greece. Consult Beq. de Fouquières, *Les jeux des anciens* (Paris, 1869), and E. N. Gardiner, *Greek Athletic Sports and Festivals* (London, 1910). See ATHLETICS, GREEK FESTIVALS, ROMAN FESTIVALS, OLYMPIC GAMES, PYTHIAN GAMES, NEMEA; ISTHMIUS, PANATHENAEA, CIRCUS, AMPHITHEATRE, GLADIATOR, LAMPADEPHORIA, MEGALIESIA, NAUMACHIA, PENTATHLON, SECULAR GAMES, THEATRE. For the *ludi Apollinares*, see APOLLO. For private games, see such titles as COTTABUS, GAMBLING.

GAMES, SECULAR. See SECULAR GAMES.
GAME/STER, THE. 1. A comedy by Shirley

(1633) It is founded on a novel by Celio Malespini, and in its turn suggested Johnson's *The Wife's Relief* (1711), Garrick's *The Gamesters* (1758), and Poole's *The Wife's Stratagem* (1827). Charles I approved it highly, and is said to have even assisted in the construction of its plot. 2 A comedy by Mrs Centlivre (1705). It was taken from Regnard's *Le joueur* (1696), and suggested Destouche's *Le Dissipateur* (1736). 3 A bourgeois tragedy in prose by Edward Moore, produced with success at Drury Lane, Feb. 7, 1753. Garrick wrote the scene between Lewson and Stukely in the fourth act, and played the principal part.

GAM'ETAN'GIUM (Neo-Lat, from Gk γαμέτιν, gametē, wife + ἀγγεῖον, angeion, vessel). The organ of plants in which the sexual cells (gametes) are developed. In its narrow sense, the name is used only in connection with the lower algæ and fungi, in which the gametes are alike in appearance. In the higher plants the gametes are very dissimilar (eggs and sperms), and the organs which produce eggs are called oogonia or archegonia, and those which produce sperms antheridia.

GAMETE, ga-mēt' or gām'ēt (Gk γαμέτιν, gametē, wife, from γάμος, gamos, marriage, from γαμεῖν, gamen, to marry). The sexual cell which fuses with another in the process of fertilization. In the lowest plants gametes are similar in appearance, and there is no apparent distinction of sex. In most plants, however, the pairing gametes are strikingly different. One of them is a small and usually ciliated body called the sperm, while the other is a comparatively large and passive body called the egg. In every case the gamete is a naked cell. The organ in which the gametes are formed is called a gametangium; and when the gametes are differentiated, the gametangium which produces the sperms is called an antheridium, while that which produces the egg is called the oogonium in the algæ and fungi (thallophytes) and archegonium in the higher groups. See FERTILIZATION.

GAM'ETOPHYTE (from Gk γαμέτιν, gametē, wife + φυτόν, phytōn, plant). That phase in alternation of generations of plants which bears the sex organs. For example, in mosses the ordinary leafy moss plant is the gametophyte, while in ferns the prothallium is the gametophyte. The alternating asexual phase is called the sporophyte. See ALTERNATION OF GENERATIONS, PROTHALLIUM.

GAME'WELL, FRANCIS DUNLAP (1857-). An American Methodist missionary, born at Camden, S C. He studied civil engineering at Rensselaer Polytechnic Institute and at Cornell University, and graduated from Dickinson College in 1881. He was engaged in educational work at Peking, China, in 1881-84, superintended the West China Mission in 1884-87, and was professor of chemistry at Peking University from 1889 to 1900. In 1900 he was chief of staff of the Europeans and Americans who defended themselves in the British Legation at the time of the siege of Peking during the Boxer uprising. From 1901 to 1908 he served as field secretary and executive secretary of the Board of Foreign Missions of the Methodist Episcopal church, was superintendent of education for China for the Methodist Episcopal church in 1909-12, and in 1912 became general secretary of the Educational Association of China. He also became editor of the *Educational Review*.

GAM'GEE, ARTHUR (1841-1909). An English physiologist, born in Florence, Italy, educated at Edinburgh University, and was there assistant in medical jurisprudence from 1863 to 1869, in 1873 was appointed the first Brackenbury professor of physiology in Owens College, Manchester. He was also professor of physiology at the Royal Institution of Great Britain from 1882 to 1885, and in 1887 became lecturer on materia medica in St George's Hospital, London. After his retirement from Owens College as professor emeritus, he practiced medicine and conducted private investigations. He became known for his researches in physiology and physiological chemistry. In 1903-05 he pursued studies in the physiology of nutrition for the Carnegie Institution at Washington. His writings include a translation and edition of Hermann's *Grundriss der Physiologie* (Berlin, 1863), and a *Text-Book of the Physiological Chemistry of the Animal Body* (1880-93).

GAMICZER, WENZEL. See JAMNITZER.

GAMING. See GAMBLING.

GAM'MA RAYS. Radiations from radium and other radioactive substances. They cannot be deviated by an electric or magnetic field, and are considered to be a "hard" type of Roentgen rays (qv).

GAM'MER GUR'TON'S NEEDLE. The title of an English comedy, performed at Cambridge in 1566, and printed in 1575. It has been ascribed on insufficient grounds to John Still (?1543-1607), Bishop of Bath and Wells. In order of time it is the second of the English comedies founded on Latin models, the first being *Ralph Roister Doister*, by Nicholas Udall, printed in 1566. The theme of the play is the loss of a needle by Gammer Gurton, a village housewife, while she is mending her husband's breeches, and the consequent disturbance in the household and the village. The wit is coarse, homely, and boisterous. The play contains the oldest and one of the most famous drinking songs in the English language—"Back and side go bare, go bare." Consult Dodsley, *Old Plays*, ed by W C Hazlitt, vol III (London, 1874-76).

GAM'OPET'ALÆ. Another name for the Sympetalæ, one of the divisions of the dicotyledons (qv).

GAMP, MRS SAIREY. A professional nurse in Dickens's *Martin Chuzzlewit*, husky, tearful, and given to stimulants during her night watching. She constantly refers to her mythical friend Mrs Harris in confirmation of her own views, and is noted for her plethoric umbrella, which has given the name "gamp" to others of similar shape.

GAM'TOOS (gam'tōs) **RIVER**. A river of Cape of Good Hope, South Africa, which rises in the plateau of the Great Karoo in a number of wady-like streams. At the east end of the Zwarté Berge it becomes a permanent watercourse, flowing southeasterly to the Indian Ocean, which it enters through St Francis Bay about 50 miles (coastwise) west of Port Elizabeth. A number of tributaries are received by the main stream from both the east and the west, the Konga River from the latter being the chief one.

GAM'UT. The name given to a system of musical notation invented by Guido Arezzo (qv), a Benedictine monk of the tenth century. He called the lowest tone of the musical system gamma (Greek letter g), and then, taking the syllables from an old Latin hymn, called the notes of the hexachord ut, re, mi, fa, sol, la.

The scale thus formed, with the later addition of *si* for the seventh, acquired the name *gamut* (gamma-ut), or French *gamme*.

GANANCIAL (ga-nān'shal) **SYSTEM** (from Sp *ganancia*, gain, profit). The Spanish law governing the title and disposition of property acquired by husband and wife during the existence of the marriage relation. It is almost identical with the community system of the French law and many of our Western States, the chief point of difference being that under the Spanish rule the conjugal community of ownership cannot be renounced or modified by any stipulation or agreement of the parties except in case of a judicial separation, whereas under the other system they are permitted to regulate the ownership of their separate or jointly acquired property by contract.

Several of the States acquired by the United States from Spain have retained this system without material modification, and it exists in most of the Spanish-American countries. In Spain it is regulated by the Civil Code. The term is not generally employed in the United States. See **COMMUNITY OF PROPERTY, HUSBAND AND WIFE**.

GAND, gan. See **GHEENT**.

GANDA, BAGANDA, ba-gān'dā. Names applied to the Uganda Protectorate and the native population.

GANDAK, gūn'dūk', or **SALIGRAMI**, sa'lé-gra'mé. A snow-fed river of the Northwestern Provinces and Behar, India, a northern tributary of the Ganges. It rises in the Nepal Himalayas and joins the Ganges opposite Patna, after a southeasterly course of about 400 miles. Only a small portion of its course is navigable below Bhelunji, but rafts of timber are floated down from Nepal. It drains an area of about 40,000 square miles.

GANDAMAK, or **GUNDAMUK**, gūn'da-mūk'. A village in the eastern part of Afghanistan, 28 miles west of Jelalabad. On the fatal retreat from Kabul in 1842 a body of about 100 British soldiers and 300 camp followers were massacred here. Only one man escaped. In 1879 a treaty was concluded at Gandamak between the British and Yakub Khan.

GANDARA, gān'da-ra. A town of Samar, Philippines, situated on the left bank of the Bac-hao Bangahón, 17 miles north of Catbalogan. In 1900 it was nearly destroyed during a battle with insurgents. Pop., 1903, 12,014.

GANDHI, MOHANDAS KARAMCHAND (1869--). Indian nationalist, born at Poibandar, India, and went to London to study law in 1888. After careful study and observation of Christianity and Western civilization, he returned to India in 1893, but soon went to South Africa to practice law. He was brutally mistreated by the white men in South Africa, but he bore his burden by developing a philosophy of passive resistance. Before and during the Great War he had been a strong supporter of the British Empire, but after it was over he became the nationalist leader. He was sentenced to imprisonment in 1922 for his policy of civil disobedience, etc., see **INDIA, HISTORY**.

GANDÍA, gan-dé'a. A town in the Province of Valencia, Spain, 47 miles by rail south-southeast of the city of Valencia, on the Río Séripis, or Alcoy, about 2 miles from the sea (Map Spain, E 3). The river valley is here very rich and fertile. Gandía's ancient walls are still standing, it has a hospital, a modern Jesuit

convent, a town hall, the palace of the dukes of Osuna, the Colegio de Escuela Pia, founded by St Francis of Borgia, who was born in Gandía, and the collegiate church, a Gothic structure with fine paintings and sculptures. There are plazas and promenades. The town is situated in an extremely fertile valley which produces grain, rice, oranges, raisins, wine, oil, and silk. Through the port at the mouth of the river Gandía carries on a considerable coastwise and foreign trade, its principal industrial establishments include silk mills, ribbon and velvet manufactories, and tanneries. Flour, timber, guano, and coal are the principal articles of trade. Pop., 1900, 9,924, 1910, 11,659. Consult A F Calvert, *Valencia and Murcia* (New York, 1911).

GANDIER, gan'dér', ALFRED (1861--). A Canadian clergyman and educator. He was born in Hastings Co., Ontario, and was educated at Queen's University, Kingston, where he graduated with high honors in 1884. His theological studies were pursued at Edinburgh University. Ordained to the Presbyterian ministry in 1889, he filled pastorates at Brampton, Ontario (1889-93), Halifax, Nova Scotia (Fort Massey Church, 1893-1901), and Toronto (St James's Square, 1901-08). He was lecturer on apologetics at Knox College in 1902-08 and in 1908 became principal of that institution.

GANDO, gan'dō, or **GANDU**, gan'dōō. A former subordinate sultanate of the Sokoto Empire, now merged (since a treaty between France and England in 1898) in the colonies of Nigeria and in Dahomey and Upper Senegal and Niger, reaching along both sides of the Niger from Gomba up to Birni (Map Africa, E 3). Sokoto is on the east, the region of the Mossi on the west, and the District of Ilorin on the south. Gando is embraced among the Hausa states, being inhabited by the Hausas, Fulbes, and Sushais. The Sultanate of Gando was founded in 1817, and titular sovereigns still remain, the last Emir being appointed by the British in 1903, he has, however, little or no authority, as most of Gando is governed as an integral part of Nigeria. Total population of the sultanate, about 5,500,000. The former capital, Gando, is situated halfway between Sokoto and Gomba, with a population of about 12,000.

GANDOLFO, gān-dōl'fō. See **CASTEL-GANDOLFO**.

GAND'ON, JAMES (1743-1823). An English architect, born in London, of Huguenot descent. He began the study of drawing as a boy, became a pupil of Sir William Chambers, and was the first to receive a gold medal for architecture from the Royal Academy (1769). Two years later he went to Ireland and followed his profession there until his death, with a break of two years spent in London. Some of the most prominent buildings in Dublin were planned by him, such as the House of Commons (1786), the customhouse (1791), Carlisle Bridge (1791-94), and the Four Courts (1802).

GANDU, gān'dōō. See **GANDO**.

GANELON, ga-ne-lon. One of Charlemagne's paladins, who plays an important part in the Carolingian cycle of romance. It is said that his castle was built on the Blocksberg, the loftiest peak of the Harz Mountains. Ganelon was jealous of Roland, and in order to destroy his rival he treacherously planned with Marsillus, the Moorish King, the attack of Roncesvalles. He is represented as a man of more than ordinary

build, fierce in his demeanor, and a lover of solitude. His name became a synonym of treason. He is mentioned in Chaucer's *Nun's Priest's Tale* and in Dante's *Inferno*.

GANESA, ga-nā'sha, or **GANESH**, ga-nēsh' (Skt., lord of the host, from *gana*, host + *īśa*, lord). One of the most popular Hindu minor divinities, the god of wisdom and remover of obstacles. His temples, shrines, or images are to be seen even in the smallest villages in India, and his grotesque figure, with an elephant's head, four arms, and a huge protruding belly, usually painted red, is not only familiar by the wayside, but is employed as a sign over the doors of shops, to bring luck in business. As a remover of difficulties, he is invoked at the beginning of Sanskrit literary works, with the formula *Namō Ganeśāya* (Homage to Ganesa), and he is likewise prayed to for success in all sorts of enterprises and undertakings. In Hindu mythology Ganesa is the son of Siva and Parvati (qv), or of Siva alone, and various legendary accounts are given to explain the presence of his elephantine head with its single tusk. His name, which is found also in the form *Gana-pati*, means lord or leader of the company of minor divinities that attend upon Siva. He is often represented as riding upon a rat, a creature symbolic of the god's familiarity with out-of-the-way places and dark or obscure matters. Consult Wilson, *Hindu Mythology* (London, 1900), Dowson, *Classical Dictionary of Hindu Mythology and Religion* (5th ed., ib., 1913), Bandharkar, *Tantricism, Saivism* (Strassburg, 1913). See PLATE OF HINDU DEITIES in article INDIA.

GAN'GA (Catalan, grouse). A local name for three birds: (1) any sand grouse, especially the pin-tailed species (*Pterocletes alchata*) common in southwestern Asia and in winter in northern India; (2) a South American carrion hawk, or caracara, of the genus *Ibycter*; (3) the helmeted cockatoo (*Callocephalon galeatum*) of southeastern Australia and Tasmania—it is prevalently gray, with a head and crest of flaming red and the feet nearly black.

GAN'GA SAGOR. See **SAGOR**.

GANGES, gān'jēz (Skt. *Gangā*, stream). An important river of north India, rising in Garhwal, in lat. 30° 56' 4" N and long 76° 6' 40" E. It drains the southern ranges of the Himalayas and after a southern and eastern course of 1557 miles flows into the northern section of the Bay of Bengal through a multi-channelled delta 283 miles long (Map India, D 3). Its basin, lying between the Himalaya and Vindhya ranges, one of the finest and most fertile portions of the world, covers an area of over 390,000 square miles, and this basin is one of the densest populated areas of the globe. The Ganges has its main source in a snow field embedded between three Himalayan mountains over 22,000 feet high. It issues as the Bhagirathi from an ice cave, 10,300 feet above sea level, and with a fall of 350 feet in a mile descends 10 miles to Gangotri, the first temple upon its banks, and a favorite pilgrim resort. Seven miles below Gangotri it is joined from the right by the Jahnvi, and at Deoprayag (qv), 133 miles from its source, the Bhagirathi joins the Alaknanda, the united streams being from this point called the Ganges. The Ganges leaves the Himalayas at Sukhi and reaches the border of the great plain of Hindustan at Hardwar, 157 miles from its source and 1024 feet above the sea, after a de-

scent of 9276 feet, or nearly 60 feet in a mile. From Hardwar it flows past Allahabad and Farukhabad, near which it receives the Ramganga, and continues past Kanauj and Cawnpore to Allahabad after a winding course of 488 miles, beset by shoals and rapids, and with an average fall of 22 inches per mile. The stream is navigable for river craft to Hardwar, for small-draft steamers to within 100 miles of the mountains, and for loaded barges to Cawnpore, 140 miles northwest of Allahabad. At Allahabad the Ganges is joined by the Jumna from the southwest, and thence the increasing river flows east to Mirzapur, Benares, Ghazipur, Patna, Monghyr, and Bhagalpur, receiving from the right the Son and from the left the Gumti, Goga, Gandak, and Kusi. This section, which has a fall of about 5 inches a mile, varies in breadth and in depth according to the season of the year, but, notwithstanding many shoals, is navigable even in the dry season for vessels drawing 18 inches of water. Around the Rajmahal Hills, at the head of its delta, 563 miles from Allahabad, the Ganges bends southward and commences a descent of 283 miles to the Bay of Bengal. Near Pakaur (assuming the early name of the river) the Bhagirathi, and 70 miles lower down the Jalangi, branch off and, after individual courses of 120 miles each, unite to form the Hughli, the westernmost and principal channel of navigation, on which Calcutta (qv) stands. The main branch, throwing out various minor offsets, continues as the Padma, or Padda, to Goalundo, where it unites with the Jamuna, the main branch of the Brahmaputra, and finally flows through the wide estuary of the Megna into the Bay of Bengal, between this estuary and the west channel of the Hughli lie the numerous mouths of the deltaic channels. The delta, which in the northern part is fertile and well cultivated, in the south bordering the sea is a dismal network of swamp land, known as the Sundarbans (qv), infested by crocodiles, tigers, and other wild animals. Three distinct species of crocodiles are found in the Ganges—the fresh-water long-snouted gavia, the man-eating koomiah, and the mugger.

The Ganges, as a whole, cannot be accurately described. From year to year it exchanges old channels for new ones, more particularly in the alluvial basin of its lower sections. Even as high as Fathipur, above Allahabad, this characteristic is marked. In this part the river bed has an average width of 4 miles, within the limits of which it changes its course annually, in the lapse of four or five years shifting from the one limit to the other. Between seasons the fluctuations in some places are more conspicuous, at Benares the stream ranges, according to the time of the year, from 1400 feet to 3000 feet in breadth and from 35 feet to 78 feet in depth. Lower down these vicissitudes produce more striking results. Towards the end of July a proportion of the delta is inundated over an area of more than 100 miles in diameter, presenting to the eye nothing but villages and trees and craft of every sort. To mitigate this evil, expensive dams have been constructed with a collective length of over 1000 miles. The influence of the tides extends, at the dry season, a distance of 240 miles from the sea. The minimum outflow of water per second has been estimated at 36,000 cubic feet, and its maximum at 494,000 cubic feet. Like all rivers subject to floods, the Ganges holds in suspension a large admixture

of mud and sand, depositing in the sea annually millions of tons of solid matter

The Ganges—or, as it is called, the Gangā (feminine)—occupies an important position in Hindu mythology of the classical and the Purāṇic periods and is the subject of numerous traditions and legends. In the religion of all classes of Hindus it is held in particular veneration as the holiest of rivers, the cleanser of sins, and the entrance to Paradise, when death and sepulture occur upon its banks. Temples and shrines with ghats or flights of steps, giving easy access to its waters, stud its banks almost from its source, the most conspicuous examples are the temples and ghats of holy Benares. The most famous cities of India have developed at critical points on the banks of the Ganges, as, e.g., the confluence of a tributary, and these have become sanctified spots, that of the Jumna at Allahabad is considered the most sacred and is the most frequented place of ablution, annually visited by thousands of pious pilgrims, who also convey the water to all parts of India for use in their religious rites.

GANGES CANAL, UPPER AND LOWER A navigable channel of India, which obviates the difficulties in the navigation of the Ganges above Allahabad, and with numerous branches irrigates the Doab, or country lying between this river and the Jumna. The Upper Canal, commenced in 1848 and opened in 1854, extends on the right bank of the Ganges from Hardwar to Cawnpore and Etawah and irrigates an area of 978,000 acres. The Lower Canal, opened in 1878, continues to Allahabad. The total length of the main channel is 700 miles, and its irrigating branches amount to nearly 3000 miles, covering 830,000 acres. A magnificent aqueduct of 15 arches which crosses the Solani, and the weir wall at Narora, 3800 feet long, with 42 sluices, are monumental works upon its course. The entire work cost about \$25,000,000. Consult P. T. Cantley, *The Ganges Canal* (London, 1864). See CANAL.

GANGHOFER, gang'hō-fēr, LUDWIG (1855–1920). A German novelist and playwright, the son of August Ganghofer, a celebrated Bavarian forester. He was born at Kaufbeuren and studied at the universities of Würzburg, Munich, Berlin, and Leipzig. In 1879 he published his first book, a volume of poetry entitled *Von Stammes Asra*. In 1880 his first play (in collaboration with Hans Neuert), *Der Herrgottschützer von Ammergau* (10th ed., 1904), achieved success at Munich. Two other dramatic successes, *Wege des Herzens* and *Der Anfang vom Ende* (1881), were followed by his appointment as dramatic author to the Ringtheater at Vienna, for which he wrote a number of comedies, mostly imitations of Anzengruber (qv). From 1886 to 1892 he was one of the editors of the *Vienna Tageblatt*. Besides his plays and some volumes of verse, he published the following stories and novels, rather better than his plays: *Der Jäger von Fall* (1882, dramatized as *Der Zweite Schatz*), *Bergluft* (1883), *Aus Heimat und Fremde* (1884), *Die Sünden der Väter* (1886), *Edelweisskönig* (1886), *Oberland* (1887), *Der Unfried* (1888), *Der Besondere* (1890), *Die Fackeljungfrau* (1901), *Der Klosterjäger* (1892), *Die Martinsklause* (1894), *Der laufende Berg* (1897), *Das Gotteslehen* (1899), *Das Schwoegen im Walde* (1899), *Der Dorfapostel* (1900), *Das neue Wesen* (1902), *Der hohe Schein* (1905), *Gewitter im Mai*

(1905), also the plays *Der heilige Rat* (1912), *Die letzten Dinge* (1912), *Der Wille zum Leben* (1913).

GANGI, gan'je. A city in the Province of Palermo, Sicily, 2800 feet above sea level, on the slope of a steep mountain, 65 miles south-east of Palermo (Map Italy, E 6). A great ancient fortress towers above it. Near by is the convent of San Benedetto, built on the ruins of the old town that was destroyed in 1299 by Frederick II. Some scholars have identified Gangi with ancient Enguon or Engyon, Enguun, whose celebrated temple of the Great Mother was, according to Cicero, despoiled by Verres (qv). There is no real evidence, however, for the identification. Pop. (commune), 1901, 11,376, 1911, 10,393.

GANGLION, gān'gli-on (Lat., from Gk γάγγλιον, tumour). In surgery, a term applied to small, tense, rounded swellings containing fluid that develop in the course of tendon sheaths and are most often situated on the dorsum of the hand and wrist. In anatomy, small masses of nerve tissue, by which communication is established between various nerve trunks. See NERVOUS SYSTEM.

GANGOTRI, gan-gō'trié (Hind., Descent of the Ganges). A temple erected on the highest accessible spot on the Ganges (qv), about 10,000 feet above sea level, on the right bank of the river (here called the Bhagirathi), some 10 miles from its source. Immediately in front the stream expands into a small bay, which is subdivided into pools, taking their names respectively from Brahma, Vishnu, and other gods. Though the water is specially sacred, and ablution peculiarly efficacious, yet, from various causes, the pilgrims are by no means numerous. Besides the length and ruggedness of the journey, and the difficulty of procuring subsistence by the way, there is no accommodation for visitors, the only dwelling house in the locality being occupied by the officiating Brahmans. However, flasks of the holy element, sealed by the attendant priests, are exported.

GANGRA, gan'gra. COUNCIL OF. A council held at Gangra, in Paphlagonia, dated variously from 320 to 370 A.D., against Eustathius of Sebaste, who was the first preacher of the ascetic life in the countries around Pontus, where his disciples became numerous. He taught that it is unlawful to marry and to eat certain meats, separated several married persons, and advised those who disliked the public offices of the Church to communicate at home. He wore, and imposed on his disciples, a distinctive dress, compelled women to cut off their hair, and directed his followers to shun, as profanation, the communion and benediction of a married priest. In opposition to these and similar views the council published 20 canons condemning those who pronounced marriage unlawful, who forbade the eating of meat, refused to receive the communion at the hands of a married priest, wore a peculiar dress as a mark of unusual strictness, forsook their husbands through a false horror of marriage, and deserted their children or their parents under pretext of leading an ascetic life. Consult Hefele, *History of the Councils* (Eng. translations by Clark, Oxenham, and Buch, Edinburgh, 1876–96).

GANGRENE, gān'grēn (OF *gangrene*, from Lat. *gangræna*, from Gk γάγγραινα, *gangraina*, eating sore, from γάγρειν, *gágrein*, to devour, Skt. *gar*, to swallow). The loss of vitality in a

part of the living body, whether external or internal, the part becoming often, in the first instance, more or less red, hot, and painful, then livid, and finally dark and discolored, black, or olive green, according to circumstances, and later putrescent, after which a separation takes place gradually between the living and dead parts, and if the patient survive, the disorganized tissue sloughs off, and the part heals by the formation of a cicatrix (See CICATRIZATION) Gangrene is classified into two main varieties, *moist* and *dry*, according to the condition found in the part. Examples of moist gangrene are inflammatory and traumatic gangrene, hospital gangrene, *cancrem oris* or *noma* (qv), bed-sores, carbuncles, and diabetic gangrene. Varieties of dry gangrene are Raynaud's disease, senile gangrene, severe frostbite, and that arising from ligation of large arteries and from embolism. The first variety is usually characterized by rapid, the second by slow, development. Gangrene may be brought about by local agencies, such as pressure, extreme heat or cold, chemicals, or disease or injury of the blood vessels, or it may be due to constitutional disturbances such as accompany certain mental and nervous affections, cardiac disease, fevers, exhausting diseases, nephritis, and diabetes mellitus, or follow the administration of certain drugs, as ergot. The treatment requires that the strength of the patient be maintained by a nourishing and stimulating diet, to counteract constitutional causes, and that amputation be done or natural separation favored by the surgeon, according to his judgment. In gangrene from frostbite or in senile gangrene, to await natural separation is the rule.

GANGS, AGRICULTURAL. A name applied to groups of women, girls, and boys brought together for labor in the fen districts of England, or the low tracts south of the Wash in the counties of Lincoln, Cambridge, Norfolk, Suffolk, and Rutland. Not long ago this part of the country was a marsh, but since dikes and canals have been constructed to drain it, it has become one of the most fertile districts of England. Instead of erecting houses on this land to be used as homes by farming tenants, the landlords escaped the exactions of the poor laws by employing laborers from the villages on the highlands near by. As women, girls, and boys worked more cheaply than men, they were exclusively employed. Near the close of the session of 1866-67 an Act was passed regulating agricultural gangs. It provided that no woman or child should be employed in the same gang with men or boys, and that no woman or girl was to be employed under a male gangmaster, unless a woman licensed to act as superintendent was also present with the gang. The effect of this act was most salutary. A commission was appointed in 1867 to inquire into the employment of women and children in agriculture, to investigate how far the principles of the factory acts could be applied to agriculture, with the special view of securing the better education of the children. On Aug. 5, 1873, was passed the Agricultural Children Bill, which provided that no child should be employed under the age of 8, none between the ages of 8 and 10 who had not a certificate showing 250 days' attendance at school the previous year, and none between the ages of 10 and 13 who could not produce a certificate showing 150 days' attendance.

GANGUE, gāng (Fr., from Ger *Gang*, vein). A term applied to the useless minerals occurring in ore. Quartz is the most common gangue mineral, but calcite, barytes, fluor spar, and other minerals, even of metallic character, are not uncommon. Portions of the gangue are sometimes worked and submitted to metallurgic processes, since they may contain enough metallic material to be classed as low-grade ore.

GANGWAY A passageway or thoroughfare in a ship, now generally applied to the opening in the ship's rail leading to the gangway ladder, or gangplank, and to the part of the deck in this vicinity which is forward of the quarter deck. In old-type ships the term is applied to the passages or parts of the upper deck between the quarter-deck and fore-castle. In the days when the quarter-deck was only a partial deck, the gangway was a raised platform connecting it with the fore-castle. When a ship is not lying at a wharf, the gangway is reached by means of an *accommodation ladder*, which is a portable flight of steps bolted to a gangway platform (sometimes called the *upper grating*) at the upper end and reaching down nearly to the water. At the lower end it is supported by an iron span and ropes from above or rests on a lower platform or grating. When at sea, the platforms and ladder are unshipped and placed on deck, the side may then be climbed by means of iron brackets or wooden cleats secured to the side of the ship, forming a fixed *sea ladder*. Portable sea ladders are made of rope with flat wooden steps about 18 inches long and 3 or 4 inches wide. These are hung over the side at any places where they may be needed.

GANGWAY, IN GEOLOGY. See LEVEL.

GAN-HWUY, gōn hwū'ē See NGAN-HWEI.

GANISTER A hard, siliceous variety of clay, occurring in different formations. Owing to its refractory character, it is used as a lining for furnaces, particularly in iron smelting. See FIRE CLAY.

GANNAL, ga'nāl', JEAN NICOLAS (1791-1852) A French chemist. He invented the elastic rollers used in printing and made important improvements in the manufacture of borax and the preparation of tallow. He also discovered the method of preserving anatomical preparations and of embalming bodies by means of solutions of aluminium salts, etc. He wrote *Histoire des embaumements et de la préparation des pièces d'anatomie normale* (1837).

GANNAT, ga'nā' The capital of an arrondissement in the Department of Allier, France, pleasantly situated on the Anelot, a tributary of the Allier, amid hills covered with vines and timber trees, 34 miles south-southwest of Moulins (Map France, S, H 2). In former times it was fortified by walls and ditches, the ruined castle is utilized as a prison. The church of Sainte-Croix presents interesting architectural features of the eleventh to the fourteenth centuries. Gannat has mineral springs, breweries, tanneries, manufactures of cutlery, and a trade in corn, wine, and cattle. Pop., 1901, 5324, 1911, 4931.

GANNET (AS *ganot*, *ganet*, OHG *ganazzo*, MHG *ganze*, gander, connected ultimately with Lat *anser*, Gk *χην*, *chēn*, Skt *hansa*, goose). A large gregarious sea bird, closely allied to the pelicans. Gannets frequent the coasts of most parts of the world offering rocky cliffs upon which they may breed in fair security, and nine species are known, constituting the genus *Sula*.

and family Sulidae. Most of the species inhabit the tropics and the Southern Hemisphere and are called boobies (see BOOBY) by sailors.

The typical and best-known member of the family is the gannet of the north Atlantic (*Sula bassana*), which derives its specific name from its frequency on Bass Rock in the English Channel, it is also called solan (i.e., Solent) goose for the same reason. It is scattered in summer at suitable places all around the British and Scandinavian coasts, about the islands of the north Atlantic, and from southern Greenland down to the Gulf of St. Lawrence. Nevertheless their colonies are scattered and steadily diminishing. This gannet has a body much like that of a goose, but weighs less, its total length is about 3 feet, much of which belongs to the neck and long, strong, conical beak. Its general color when adult is white, with the head and neck buff, and the primaries of the long wings black and very conspicuous as they lie crossed above the tail when folded. Young specimens are mottled brown until three or four years old. In winter the gannets migrate to the northwest coasts and islands of Africa, or to the Gulf of Mexico, but early in the season they go north again, appearing at their breeding haunts in April, where by May they are collected in thousands about the sea-fronting cliffs. The gannets of Bass Rock were estimated in 1831 at 20,000, and in 1869 at 12,000, and at present number about 6500. The decrease there and in the Hebrides is due to the excessive gathering of their eggs and downy young. The latest estimate of all the gannets in the Northern Hemisphere places the number at 101,000. On the American coast they nest along the shore of Labrador, and at Percé Rock and Bonaventure Island, off the Gaspé peninsula, and on Bird Rock, an outlier of the Magdalen group, in company with murre, kittiwakes, etc., but even in these almost inaccessible places they are growing less in numbers, although somewhat protected. Upon the summits and ledges, wherever a square yard of room may be found, a gannet places its shallow nest of seaweed and lays and incubates its single chalky-white egg. The sitting females crowded along the ledges make them look sometimes as if covered with snow, while the neighborhood will be full of their mates, roosting, flying about, or darting down into the sea. They sail about at a considerable height, their eyes searching the surface for fish, and when one is seen they turn downward, shut the wings, and seem to drop upon it with amazing velocity, rarely missing a capture. They also make long excursions seaward, and towards the close of the breeding season are of service to the fisherman by finding and disclosing to him shoals of herrings and the like, which they follow and prey upon in great numbers. For the gannets in the Gulf of St. Lawrence, consult the following richly illustrated books: Chapman, *Bird Studies with a Camera* (New York, 1900), Job, *Among the Waterfowl* (ib., 1902), and especially the admirable monograph on this bird by J. H. Gurney, *The Gannet* (London, 1913).

GANNETT, EZRA STILES (1801-71). An American Unitarian clergyman, son of Rev. Caleb Gannett, and grandson of Ezra Stiles, president of Yale College. He was born in Cambridge, Mass., and was educated at Harvard. In 1824 he became assistant to Channing in the Federal Street Church and in 1842 succeeded him as pastor. His incessant toil as the first

secretary of the American Unitarian Association, one of the prime movers in the formation of the Benevolent Fraternity of Churches, founder and editor of the *Scriptural Interpreter*, and in many other interests, resulted in his breaking down in 1836, and soon after he was crippled by a paralytic stroke. But his mental activity was not abated. He edited the *Monthly Miscellany of Religion and Letters* and the *Christian Examiner*, besides attending alone to his large parish. He was an overseer of Harvard College from 1835 to 1858 and received its degree of D.D. in 1843. He retired from pastoral work in 1869 and was killed in a railroad accident. He was a Unitarian of the more conservative type, an excellent preacher, and an ardent reformer. Consult the memoir by his son, William Channing Gannett (Boston, 1875).

GANNETT, HENRY (1846-1914). An American geographer. He was born in Bath, Me., graduated at Harvard in 1869 and at the Hooper Mining School in 1870, was an assistant in the Harvard College Observatory in 1870-71, in 1872-79 was topographer to the Hayden Survey, and in 1882 became chief geographer of the United States Geological Survey. He was geographer for the tenth, eleventh, and twelfth censuses of the United States and assistant director of the census of the Philippines (1902) and of Cuba (1907-08). From 1897 to 1909 he was a vice president of the American Statistical Association, and he became president of the National Geographic Society. He contributed much geographical matter to the *NEW INTERNATIONAL ENCYCLOPEDIA*. His publications include *A Manual of Topographic Methods* (1893), *Dictionary of Altitudes* (3d ed., 1899), *The Building of a Nation* (1895), *Gazetteer of Cuba* (1902), *Gazetteer of Texas* (1902), *Origin of Certain Place Names in the United States* (1902).

GANNETT, WILLIAM CHANNING (1840-) An American Unitarian clergyman, born in Boston, Mass., the son of Ezra Stiles Gannett. Graduating from Harvard College in 1860 (A.M., 1863) and from Harvard Divinity School in 1868, he at once entered the Unitarian ministry, and was pastor at Milwaukee, Wis. (until 1870), East Lexington, Mass. (1871-72), St. Paul, Minn. (1877-83), and Hinsdale, Ill. (1887-89). His last charge, the First Unitarian Church of Rochester, N.Y., he held for 19 years, until 1908, when he became pastor emeritus. Harvard University conferred upon him the degree of D.D. in 1908. Dr. Gannett came to be known, not only as a leader in his denomination, but as a writer of unusual culture and insight. Besides helping to found *Unity* (1878) and serving as one of the editors of *Unity Hymns and Chorals* (1880, rev. 1911), he published a biography, *Ezra Stiles Gannett* (1875), *A Year of Miracle* (1881), *The Childhood of Jesus* (1884), *The Thought of God in Hymns and Poems*, with F. L. Hosmer (1885, 1904), *The Faith that Makes Faithful*, with J. L. Jones (1886), *Of Making One's Self Beautiful* (1899), *A Wicket Gate to the Bible* (1907).

GAN'ODONTA. An order of Tertiary mammals, allied to the Edentata (q.v.), and apparently representing the ancestral forms from which they, or some of them, were derived. The oldest type (*Hemiganus*) is found in the earliest Eocene strata of North America and is highly generalized, combining in its skeleton characters now marking the armadillos and

ground sloths. It had a full complement of teeth and powerful jaws. The next representative is *Psittacotherium* (Upper Puerco beds) and is noticeable for its reduced dentition and the fact that incisors (only one pair in each jaw) have enamel only upon their anterior faces. The foot is decidedly edentate. *Calamodon* is larger and shows progress towards the modern edentate type, and a still later form, *Stylinodon*, advances this progress. A review of the series shows "a gradual diminution of the incisors, a gradual loss of enamel on the teeth generally, and the production of hypselodont teeth growing from persistent pulps, all of which are features of the later edentates" (Beddard). The order, however, includes another family, Conoryctidae, including the genera *Conoryctes* and *Onychodectes*, whose position with reference to the Edentata is more doubtful. Consult Wortman, "The Ganodonts," etc., in *Bulletin of the American Museum of Natural History*, vol. ix (New York, 1897); Beddard, *Mammalia* (London, 1902); Scott, *The History of Land Mammals in the Western Hemisphere* (New York, 1913).

GANOIDEI (Neo-Lat. nom. pl. from Gk γάνος, *ganos*, brightness + εἶδος, *eidos*, appearance), or **GANOIDEA**. One of the four orders of fishes in the classification of Agassiz. They are characterized by ganoid scales, horny plates covered with enamel, and angular (rhomboidal or polygonal) shiny scales. The small number of ganoid fish living at the present time do not form a natural group, for they have been found to be members of the three orders Crossopterygii, Chondrostei, and Holostei, examples of which are, respectively, the bichir (*Polypterus*), the sturgeon (*Acipenser*), and the gar pike (*Lepisosteus*). In Paleozoic and early Mesozoic times ganoid fish were the prominent types of Teleostomes, and their remains are found in abundance in the Carboniferous, Permian, Triassic, Jurassic, and Cretaceous rocks of Europe and North America. With the close of Cretaceous time the ganoid types began to disappear and to give way to the teleost fishes, which are the predominating types at present. Thus, the ganoid structure is seen to represent an ancient, more primitive stage in the evolution of teleost fishes. Some well-known fossil ganoids are: *Holoptychius*, of the Upper Devonian; *Macropoma*, of the Chalk; *Palaeomseus*, of the Permian; *Platysomus*, of the Permian; *Catopterus*, of the Triassic shales of Massachusetts, Connecticut, and New Jersey, and *Chondrosteus*, *Lepidotus*, *Eugnathus*, and *Mesturus*. See BICHR, GAR, STURGEON, and the generic names mentioned above.

GANONG, gá-nóng', WILLIAM FRANCIS (1864–) An American botanist, born at St. John, New Brunswick, Canada. He graduated from the University of New Brunswick in 1884, from Harvard University in 1887 and received his Ph.D. from the University of Munich in 1894. He taught botany at Harvard from 1887 to 1893 and in 1894 became professor of botany and director of the Botanical Garden at Smith College. He served as secretary of the Society of Plant Morphology and Physiology from 1897 to 1905, and as president of the Botanical Society of America in 1908. He wrote *The Teaching of Botany* (1899, 2d ed., 1910), *Laboratory Course in Plant Physiology* (1901, 2d ed., 1908), and *The Living Plant* (1913), and translated and edited Denys's *Natural History of*

Acadia (1908) and Jellieg's *New Relation of Gaspesia* (1910).

GANS, gans, EDUARD (1798–1839) A German jurist, son of a Jewish banker born in Berlin, and educated there, at Göttingen, and at Heidelberg. After his conversion to Christianity (1825), he was appointed professor at Berlin (1826). He was a philosopher rather than a jurist, a strong Hegelian, and one of the foremost opponents of the historical method in jurisprudence, as represented by Hugo and Savigny. The philosophic theory of jurisprudence is presented by him in *Ueber romisches Obligationenrecht* (1819), *Das Erbrecht in weltgeschichtlicher Entwicklung* (1824–35), *System des römischen Civilrechts* (1827), and in his edition of Hegel's *Grundlinien der Philosophie des Rechts* (3d ed., 1854). The Prussian government prohibited his lectures on contemporary history, later published as *Vorlesungen über die Geschichte der letzten fünfzig Jahre*, in the *Historisches Taschenbuch* (1833–34). His other works include *Vermischte Schriften* (1834), the personal *Rückblicke* (1836), describing his travels in England and France, and the periodicals *Beiträge zur Revision der preussischen Gesetzgebung* (1830–32) and the Berlin *Jahrbücher für wissenschaftliche Kritik* (1827), on which Von Ense and Hegel assisted him. Hegel, just before his death, quarreled with Gans.

GANS, G. H. See PUTLITZ.

GANSEVOORT, gans'vōört, PETER (1749–1812) An American soldier, born in Albany, N. Y. On the outbreak of the Revolutionary War he joined the patriot army, and in 1775 was appointed major of the Second New York Regiment. He accompanied Montgomery on his expedition against Canada, was made lieutenant colonel in March, 1776, was placed in command of Fort George, on Lake George, in July, became a colonel in November; and from Aug. 2 to Aug. 22, 1777, defended Fort Schuyler (formerly Fort Stanwix) against St. Leger until the arrival of reinforcements under Arnold (See FORT STANWIX). He was a brigadier general in the militia of New York State from March, 1781, until the close of the war, and in 1809 received the same rank in the regular army.

GANSFORT. See WESSEL, JOHANNES.

GANTANG (gan'tung) **PASS**. A desolate mountain pass leading eastward from Kunawar, a district of Bashahr, in the Punjab, India, into Tibet. Its height is 18,295 feet above the sea, and it is overhung by a peak of its own name about 3000 feet loftier.

GANTEAUME, gan'tōm', HONORÉ JOSEPH ANTOINE, COUNT (1755–1818) A French naval officer, born at La Ciotat. He entered the navy in 1771 and saw service during the American Revolution. In 1794 he attained the rank of captain, in 1798–99 participated in the expedition to Egypt, and, with the rank of rear admiral, commanded the naval forces at the sieges of Jaffa and Acre. In 1799 he received the title of Councillor of State. In 1800 with seven ships he got out of Brest harbor, past the English blockaders, and did some damage by capturing an occasional man-of-war. His fleet entered the Mediterranean early in 1801, but met with no success in repeated efforts to aid the army in Egypt. In 1804 he became vice admiral, in 1808 commander of the Mediterranean squadron, and in 1810 a member of the Council of the Ad-

miralty He supported the Bourbons and was elevated to the peerage by Louis XVIII

GANTT, HENRY LAURENCE (1861-) An American mechanical engineer, born in Calvert Co., Md. He graduated from Johns Hopkins University (A.B.) in 1880 and from Stevens Institute of Technology (M.E.) in 1884, between these dates having taught in the McDonough School. In engineering practice after 1884, he became known as an expert in the installation of the most improved manufacturing methods. He was chosen a vice president of the American Society of Mechanical Engineers. His *Work, Wages, and Profits* (1910, 2d ed., revised and enlarged, 1913) is well known.

GANYMEDE (Lat., from Gk Γανυμήδης) According to the *Iliad*, the son of Tros, or, according to other authorities, of Laomedon, Ilus, or Erichthionus. The most beautiful of mortals, he was carried to heaven or to Olympus to become a cupbearer of Zeus, he was thus a masculine counterpart to Hebe (qv). The legend gradually developed, and it was the common belief that he had been borne away by the eagle of Zeus, or by Zeus himself in the form of an eagle. The rape of Ganyমেদে by the eagle was often portrayed in ancient art, notably in a bronze group by Leochares. Ganyমেদে was also identified with the divinity who presided over the sources of the Nile, he was thus cupbearer in heaven and giver of water on earth. The Greek astronomers likewise placed him among the stars, under the name of Aquarius (the water bearer).

GANZ, RUDOLF (1877-) A Swiss pianist and composer, born in Zurich. In his native town he began to study the piano under R. Freund and the violoncello under T. Hegar, appearing first as a cellist when only 10 years of age. In 1893-96 he studied piano with Carl Eschmann-Dumur and composition with Charles Blanchet. He then went to Strassburg, continuing his piano study under Fritz Blumer, and in 1899 he was a pupil of Busoni (piano) and H. Urban (composition) in Berlin. Having made his debut as pianist in Berlin in 1899, he came to the United States, where he lived till 1912. From 1900 to 1905 he was head of the piano department of the Chicago Musical College. In 1905 he resigned and devoted himself exclusively to the concert stage, playing with great success in recitals and with all the large symphony orchestras of the United States and Canada. After he had thus established his reputation in America he toured the principal countries of Europe, meeting everywhere with signal success. He is especially fond of placing upon his programmes works seldom performed and new works of merit. His compositions include a symphony in E, op. 1, a Konzertstück for piano and orchestra in B, op. 4, variations on a theme of Brahms, op. 21, male choruses, a number of pieces for piano, and about 150 songs.

GAP, gáp The capital of the Department of Hautes-Alpes, France, pleasantly situated on the right bank of the Luye, 84½ miles from Grenoble by rail (Map France, S., L. 4). The chief public buildings are the handsome Renaissance cathedral, dating from the seventeenth century, but entirely rebuilt between 1866 and 1905, the bishop's palace, the prefecture building, containing a museum and the marble mausoleum of the Constable de Lesdiguières; a lyceum, a seminary, a library, and

a theatre. The city has been the seat of a bishop since the fifth century, and for 300 years its bishops ruled as counts palatine over the surrounding district. It has a court of assize and a commercial tribunal. It manufactures hats, cement, leather, etc. Pop., 1901, 11,018, 1911, 10,647. Gap (the ancient *Vapincum*) was formerly capital of a district of Dauphiné to which it gave the name of Gapençais. Its decay dates from 1692, when it was sacked and almost wholly reduced to ashes by Victor Amadeus of Savoy.

GAPÁN, ga-pán' A town of the Province of Nueva Ecija, Luzon, Philippines. It is in a level region 4 miles east of San Isidro. The surrounding country produces gold and tobacco. Pop., 1903, 11,278.

GAPER, gáp'er The soft clam (*Mya truncata*) of Great Britain, highly esteemed as food. See CLAM.

GAPES, gáp (from gape, Icel *gapa*, a yawn). A disease of poultry, due to the presence of a round gapeworm (*Syngamus trachealis*) of nearly universal distribution, in the trachea of gallinaceous birds. Many experiments seem to show that the earthworm is a host of the gapeworm, which gains entrance to the fowls when earthworms parasitized by gapeworms are eaten. On the other hand, the eggs may develop and grow to adult worms within the trachea of the same fowl. A favorite remedy is turpentine applied with a feather inside the windpipe. The most effective and convenient method is to make the fowls breathe the dust of air-slaked lime. This irritates the mucous membrane of the respiratory passages and produces violent coughing, during which the gapeworms, already affected by the lime, are thrown out. During the operation the fowls should be in a box or coop. Infested soil should be treated with air-slaked lime and spaded, or with a 1 per cent solution of sulphuric acid before the fowls are allowed to run upon it. The feed troughs and water dishes should be scalded and the houses and coops disinfected. Potassium permanganate should be used in the drinking water in sufficient strength to give the water a rather deep wine color. Consult V. Shaw, *Encyclopedia of the Poultry Yard* (New York, 1913).

GAPON, gá-pón', GEORGE (c. 1870-1906). A Russian revolutionist. He was born at Biliki in the Government of Poltava, was educated for the priesthood, and began mission work among the factory population of the capital. In 1903, according to his own account, he won the consent of the secret police to his plans for organizing labor unions. In April, 1904, the St. Petersburg Industrial Workers' Association was formally opened, and branches were rapidly organized throughout the city. In December, 1904, influenced by the more prominent members of the newly formed labor organization, Gapon became convinced that the reform movement set on foot by the Zemstovs should be backed up by a labor strike, and began systematic propaganda with this end in view. His following grew very rapidly, and on Jan. 15, 1905, the 12,000 Putilov employees stopped work. For succeeding events, including the massacre of January 22, see RUSSIA. Gapon, miraculously saved by his friends from the slaughter at the Narva Gate, was helped to cross the Russian frontier successfully and finally reached London, where he published an account of his life in the *Strand Magazine*. Mystery surrounds the rest of his

career On April 11, 1906, the police found in a Finnish villa not far from St Petersburg the body of a man who had either been hanged or had committed suicide, and who was identified as the revolutionary priest On May 2 the St Petersburg newspapers received a letter from Berlin signed "The Secret Tribunal," stating that Gapon had returned to St Petersburg in December and that he had entered into an agreement with the government and the police to reveal the secrets of the revolutionaries For this he had been condemned to death, and sentence had been duly executed Consult Gapon, *The Story of my Life* (London, 1905)

GAR (from AS *gār*, spear) The name of two different sorts of fishes having an external similarity, viz 1 The gars of the family Esocidae These are round, slender fishes, sometimes 5 feet long, having the jaws prolonged into a stout bill, and studded with sharp teeth, they are found in all warm seas, and are classified in four genera with about 50 species They are voracious carnivorous fishes and powerful surface swimmers, often leaping high out of the water in their eagerness to seize the flying fish The best-known species is the Old World garfish (*Belone vulgaris*), or greenbone, congeners of which dwell in the south Pacific and along the Asiatic coast, a prominent Oriental species is the great *Belone gigantea*, illustrated on the Colored Plate of PHILIPPINE FISHES This genus is characterized by the presence of gill rakers On the tropical American coasts occur many species of the genus *Tylosurus*, popularly known as needlefishes, spearfishes, longjaws, agujones, houndfishes, etc One of these (*Tylosurus marinus*) is common as far north as Cape Cod See AGUJA, and Plate of NEEDLEFISH

2 The fresh-water gars, billfishes, bony pikes, or pikes, which form a family of ganoid fishes (Lepidosteidae), the only living representatives of the order Rhomboganoidea (See GANOIDEA) They have an elongated, nearly cylindrical body, covered with a bony case of rhomboidal scales The head, whose external bones are very hard and rugose, terminates in a long beaklike snout, with nostrils near the end of the upper jaw, and the jaws are set with several series of sharp recurved teeth The dorsal fin is set well back, above the anal fin There is a single genus, *Lepidosteus*, comprising five species, inhabiting the lakes and rivers of North America and China The most familiar species is the common billfish or gar pike of the United States (*Lepidosteus osseus*), which under favorable conditions becomes 5 feet long and is numerous found in lakes and rivers from Vermont to Texas It lives by preying upon other fishes and is not itself good for food It is nocturnal in its activities, and in early summer seeks shallow places in which to lay its eggs, which are glutinous and adhere to the first object they come in contact with When the fry hatches from the egg, it has a row of suckers above a very large mouth with which it clings to submerged stones The short-nosed gar (*Lepidosteus platostomus*) is smaller and has a shorter bill, it has a northerly range The great or alligator gar, or manjuari (*Lepidosteus tristæchus*), belongs to the Southern States, Cuba, and Mexico, and sometimes reaches 16 feet in length A fourth species inhabits the west-coast streams of Central America, and a fifth is found in China Cf BICHIR

GARAMANTES, gār'a-mān'tēz. An ancient

people of Garama (Jerma), northwest of Murzuk, in the oasis of Fezzan (Phazania), Tripoli, north Africa This was the southern limit of the Roman Conquest At the end of the seventh century the Arab Mohammedans swept away the vestiges of the Roman power With perhaps a strain of negro blood, there are mixed in the veins of the present inhabitants that of Hamite, Mediterranean, and Semite They are akin closely with the native population of Ghadames, in common with whom they were conquered by the quaestor Cornelius Balbus in the reign of Augustus

GAR'ANCINE (Fr *garance*, Lat *garantia*, madder) A red dye stuff which may be derived from madder, and which was formerly much used on an industrial scale It was originally obtained by Robiquet and Colin in 1827, who treated the ground madder with an equal weight of concentrated sulphuric acid One hundred parts of madder yielded 30 to 40 parts of garancine, which possessed four or five times the dyeing power of madder and therefore dyed more readily, yielding brilliant reds and pinks with yellow tone and blues with a gray shade

GARASHANIN, gā'ra-sha'nēn, ILIYA (1812-74) A Servian statesman, born at Garasha He studied at the normal school of Semlin, entered the civil service, was exiled in 1839 for a plot against the Obrenovitch house, but returned in 1842, worked for the election of Alexander Karageorgievitch, and in 1844 became Minister of the Interior From 1852 to 1854 he was President of the Council and in 1857-58 again Minister of the Interior In 1862 he was again at the head of the cabinet, being Minister of Foreign Affairs until 1867 As Minister of the Interior, he inaugurated many reforms, particularly in connection with the system of public education and the administration of justice His policy was strongly anti-Russian

GARAT, gā'ra', DOMINIQUE JOSEPH (1749-1833) A French statesman and man of letters He was born at Bayonne and as a youth came to Paris, where he soon became known as a writer of *éloges* and editor of the *Journal de Paris* After 1786 he enjoyed immense vogue as a lecturer on history at the Lycée He was elected a deputy to the States-General in 1789 Going over to the partisans of the Revolution, he became a slavish adulator of Danton, whom he succeeded as Minister of Justice in 1792, becoming Minister of the Interior the following year He proved himself to be incapable of holding either one of these positions He was imprisoned during the Reign of Terror, but was freed after the fall of Robespierre and became Minister of Public Instruction He was Ambassador to Naples in 1798 and member of the Ancients in 1799 Made a senator and Count by Napoleon, he remained faithful to him after the first Restoration and was consequently ousted by Louis XVIII from the Institute of France, to which he had been elected in 1795 After 1830 he became a member of the newly established Academy of Moral and Political Science Garat's character, like his brilliant literary style, was inherently weak, resting on no steadfast principles He wrote, among other things, *Mémoires sur la Révolution ou exposé de ma conduite* (1795).

GARAT, JEAN PIERRE (1764-1823) A French singer, born at Ustariz He began to study law and went to Paris to finish his course; but his great talent for music was al-

most immediately recognized, and he was patronized by the Count d'Artois, who introduced him to Marie Antoinette. He gave her lessons in singing and became a court favorite. During the Revolution he went to Germany with Rode the violinist, where his success was astonishing. He returned to France in 1794 and sang in the concerts at the Théâtre Feydeau (1795). He then went abroad again and sang throughout the Continent with equal success. About 1796 he was made professor at the Conservatory and was a popular teacher. He is said to have been the most wonderful singer France ever produced. His voice ranged from tenor to barytone and suited all styles of music.

GARAY, gör'oi, JÁNOS (1812-53). An Hungarian poet, born at Szegszárd. He was an ardent patriot, and all his poems deal with national subjects, although they are formed on German models. He held a chair in the University of Pesth for a year (1848) and was librarian there from 1850 until his death. His works include *Csatár* (1834), an epic, which made him widely known, and the tragedies *Arbocz* (1837), *Ország-hlona* (1837), *Bátori Erzsébet* (1840), and historical ballads (*Árpádok*, etc). There is an excellent edition of his complete works by Ferenczy (1888), who also wrote his life (Budapest, 1883). Garay's propensity for bombastic declamation has now turned against him the tide of popular favor. His lyric poems, however, are not void of genuine feeling. His poems were translated into German by Kertbeny (Vienna, 1856).

GARAY, ga-ri', JUAN DE (1541-84). A Spanish soldier, born in Biscay. He went to Paraguay about 1565, was appointed secretary to the Governor, made a voyage up the Paraná River, and in 1573 founded the city of Santa Fé de Vera Cruz. In 1575 he was made *Adelantado*, and the next year he assumed the government of Paraguay. He carried on successful wars against the natives, performing many heroic exploits. In 1580 he founded the present city of Buenos Aires, on the site of the earlier settlement of Mendoza. While returning to Asunción, he was massacred by hostile natives. In his dealings with the Indians he was humane and beneficent. His doings are celebrated by Barco Centenera in the poem *La Argentina* (Lisbon, 1602).

GARB, or **GARBE** (OF *garbe*, *jarbe*, Fr. *gerbe*, from OHG. *garba*, Ger. *Garbe*, sheaf, ultimately connected with Lith. *grapti*, Skt. *grabh*, to grasp). In heraldry, a sheaf of any kind of grain. If it is blazoned simply "garb," wheat is understood, if any other kind of grain is intended, the kind must be mentioned, as a "garb of oats," etc. See **HERALDRY**.

GARBAGE AND REFUSE, DISPOSAL OF (ME *garbage*, entrails of fowls, probably from OF *garbage*, tribute paid in sheaves, from *garbe*, sheaf). Garbage is a term used in the United States to designate kitchen wastes of animal and vegetable origin, incident to the preparation and serving of food. Associated with it there is likely to be more or less inorganic matter, some of which, such as tin cans and bottles, have been in contact with food materials. It is not uncommon to place all household wastes, other than sewage, in the garbage can or box, including ashes. In England all the wastes named are classed under the general head of refuse and are placed in a common receptacle, or dustbin. Aside from household wastes there

are various classes of trade and manufacturing refuse, such as paper, rags, and shavings, also green stuff from vegetable markets, and the odds and ends from butcher shops, such as bones, scraps of meat, grease, and offal.

Much of the organic matter named, when fresh, is similar to, and generally quite as inoffensive as, the food supplies from which it was rejected, but its unstable character renders it liable to offensive decomposition. Hence it must be removed promptly from dwellings and other buildings, and so transformed or otherwise disposed of as to give rise to no offense. The most primitive means of disposal are dumping on land or in water. A slight improvement on these processes is the burning of a portion of the wastes in the open air, but this rarely affects more than certain light combustibles, like paper and shavings, that have been mixed with the garbage proper. As the population of a city and its suburbs increases, land disposal becomes intolerable except by burial and finally impracticable by that means. The dumping of garbage and refuse at sea is expensive at best, besides being likely to cause the fouling of beaches and harbors.

By keeping organic and inorganic wastes in separate receptacles their final disposal is greatly simplified, but the difficulties incident to their storage and prompt removal from the premises of householders is thereby increased. Ashes, as they come from stoves and furnaces, are composed of inert inorganic matter, with no harmful or objectionable qualities save those due to dust and dirt. In America town ashes seem to be of little use for any purpose except filling, for which they are most excellent, but, with the growing adoption of modern high-temperature refuse destructors, some portion at least of the ashes will probably be taken to the destructor for the sake of the fuel value of the unburned coal. Paper, like many other classes of light, dry household and industrial wastes, is not necessarily offensive, but its unsightliness and possible association with organic wastes make its speedy and complete disposal highly desirable. Occasionally wastes of this nature are made to yield a revenue sufficient to pay a part of the cost of their collection and disposal.

Considering the vast quantities of material and large number of cities and towns concerned, the problem of the final scientific disposal of city wastes is still in its infancy. Their collection, however, is on a far better basis, although leaving much to be desired. Only a relatively small number of the cities and towns of the world have adopted thoroughly modern sanitary methods of garbage and refuse disposal, and many of the cities falling within this class have made but a beginning as yet. Great Britain and the United States seem to be far in the lead in matters of final disposal. Outside of some of the larger American cities, nearly all the improved processes of disposal employ burning in specially designed furnaces. In Europe the practice is to make the refuse consume itself without extra fuel. In America large quantities of extra fuel were almost always required in the older types of furnaces. In Great Britain for many years and now throughout the world in the case of the later installations the destructors are fitted with boilers, which generate steam for use about the plant or for electric lighting, electric power, pumping sewage, or pumping water. Besides utilizing the

heat, the clinkers from the English furnaces are often put to a variety of uses, being ground up and mixed with cement for making slabs or tiles for sidewalks, or being used for the foundations of pavements. In the United States but little steam or clinker from destructors had been utilized up to 1914, although means to that end were commonly being provided in new plants. In contrast with the rest of the world, the larger cities of the United States have separated their garbage from other refuse and treated it by reduction processes so as to extract grease and to make the tankage, left after separating the grease and water, into a fertilizer base.

Great Britain took the lead in the installation of garbage furnaces, both in point of time and in superior results attained. From 1870 to 1876 several crude furnaces were tried. In the latter year the city of Manchester put in operation the prototype of the more recent and more successful furnaces, thus antedating by many years the first furnace built for a city in the United States, which was erected at Des Moines, Iowa, in 1887. The practice in America has been, and to a large extent still is, to exclude ashes, tin cans, bottles, old or broken crockery and the like, from garbage. This was partly due to the American practice of feeding garbage or swill to hogs and, in the earlier days, even to cows. Farmers from the surrounding country would gather the swill for their stock, but would refuse that containing foreign matter. These food wastes were, and are yet, sometimes gathered by the municipality or by a general contractor and delivered to farmers at the outskirts of the city. Originally householders may have received a small sum for their swill, but latterly they have been fortunate if they could get it taken away without expense. At present, collections by or for American farmers are generally restricted to small towns or to the hotels and restaurants of the larger places, but from about 1910 on the practice of feeding garbage to hogs seemed to be on the increase, as did also disposal by dumping and covering with earth, but in both cases for the middle class and smaller rather than the larger cities. Properly supervised, either means of disposal may be harmless and without serious nuisance. In most cases the garbage should probably be boiled before it is fed to hogs, and it may often be wise to sprinkle it with some chemical agent to keep down flies and odors where garbage is dumped. The recovery of salable materials from miscellaneous city wastes (other than garbage and ashes) is on the increase in the United States.

Collection. Before describing garbage furnaces and reduction plants a few words regarding the collection of city wastes may be said. Garbage proper should be collected in carts or boxes provided with water-tight, nonabsorbent boxes or tanks, with closely fitting covers. Steel is now considered to be the best material for such tanks. Ashes and other dry wastes should be gathered in tight carts, well covered to prevent scattering by jolting or wind. The best material for the ash-wagon boxes, or tanks, is also steel, but this matters comparatively little from a sanitary standpoint, so long as the conditions named are fulfilled. The frequency of collection should vary with the character of the wastes and the population. Market wastes, the garbage of hotels and restaurants, and of houses in crowded districts, often require daily

collection, particularly in the summer. Domestic garbage, under ordinary conditions, requires collection from two to three times a week in warm, and once or twice a week in cool or cold weather. Ashes, paper, and all other inorganic wastes, so long as not mixed with garbage, may be collected to suit the convenience of the householders and the municipality, the tendency being to increase the frequency with the density of population and consequent lack of room for storage. Cleansing or disinfection of garbage cans and wagon boxes or tanks is practiced in the most progressive communities. Whether garbage and refuse collection and disposal should be performed by contract or directly by the municipality is a question for each community to settle for itself. Many sanitarians favor direct municipal performance, as giving better sanitary results. An efficient city government can secure good work under either plan, but perhaps complaints of poor service may receive more prompt attention when the work is done by the municipality. In many American cities the collection, and in still more the final disposal, of garbage and refuse is left entirely to private scavengers, under little or no municipal control. The results are that the people having most need of good service get none whatever, being unwilling or unable to pay for it, while the work as a whole is generally poorly done. The final disposal, under this plan, is almost always a makeshift. Whatever may be done as to ashes and inorganic wastes, good sanitation demands that the collection and disposal of garbage, offal, and dead animals should be attended to by the municipality, either under the contract or day-labor system. As a matter of economy, it is probable that all the wastes considered in this article should be handled by or under the direction of the city or town.

Garbage Furnaces, or Refuse Destructors, as they are called in Great Britain, consist of one or more grates upon which the garbage is burned, ash pits, flues, and chimneys, together with the necessary feeding holes for the garbage, and stoking holes or doors. In the best plants a boiler for steam raising is generally used, and it is becoming more and more common to use either steam jets or blowing fans to produce a forced draft. To carry heat utilization to the highest possible degree the water feeding the boilers and the air used for forced draft are heated by the gases of combustion before they pass to the chimneys. The destructor furnaces are usually composed of small units, or cells, of uniform size, each having a grate surface of 25 square feet. Any desired capacity is secured by increasing the number of cells, which are commonly placed back to back, with a central flue. Some form of *dust arrester* is often used in the later furnaces to hold back the fine ashes which might otherwise pass up through the chimney and cause a nuisance in the surrounding territory. These are chambers or passages designed to bring the dust to rest and to retain it for future removal. The *temperature* of a garbage furnace should be in the vicinity of 2000° F., in order to insure complete combustion and to prevent odors from the chimney gases. *Boilers* for utilizing heat from garbage furnaces should not be placed directly over the fire, since the water in the boiler will lower the temperature in the furnaces. To avoid this, the boilers are placed between the furnaces and the chimney, or between two

furnaces This causes a loss of heat for steaming, but sanitary considerations should come first

The value of refuse for steam-raising purposes appears to run from 5 to 15 per cent that of coal, assuming a coal that will evaporate 10 pounds of water from and at 212° F per one pound of coal This is omitting extremes Probably 10 per cent is the maximum safe figure upon which to base estimates for continuous work, and even that may be too high

The combined refuse destructor and electric-lighting plant at Shoreditch, England (a part of the administrative county of London), attracted so much attention at the time it was installed that it may be described here as originally built The destructor was opened on June 28, 1897 There are 12 furnaces, or cells, each having a grate area of 25 square feet, six water-tube boilers, with 1300 square feet of heating surface, and a thermal storage tank, 8 feet in diameter and 35 feet long, designed to store water heated by the steam at times of small demand for electric lighting The thermal storage tank does not seem to have been tried at any other garbage furnace and is of questionable value, even if still used at Shoreditch A forced draft, rated at 8000 cubic feet per minute, is supplied by three fans, driven by electric motors The chimney is 150 feet high, with a dust arister at its base Each furnace has a capacity of 8 to 12 tons of refuse in 24 hours, or 96 to 144 tons in all The aggregate horse power of the connected boilers is about 1200

American garbage furnaces have not been so fully developed as English, such superiority as can be claimed for American sanitary engineers in treating garbage being for the reduction rather than the burning of refuse Just how large a part of the difference between the two countries is due to variations in the character of their respective wastes it is hard to say, since there are few thoroughly satisfactory data on this point, and the English refuse is almost invariably mixed, while in the United States various degrees of separation of garbage, ashes, and other refuse are practiced It is believed that American garbage, even when mixed with ashes, contains more organic matter than does British and that its percentage of moisture is far higher in the summer The moisture must be evaporated before the combustible matter can be burned A great drawback to the development of American garbage furnaces (and reduction plants as well) is the practice of awarding short-term contracts for disposal, or changing the methods in vogue with each change of city administration Another drawback, happily now losing its force, is the common failure of cities to put their garbage-disposal problems in the hands of competent engineers, or any engineers at all Under all these circumstances it is not strange that American garbage furnaces have not been brought to a higher state of perfection, nor that it is hardly known what they might accomplish in long service under favorable conditions The most successful furnaces in America follow English practice very closely or are actually of the British type Passing with bare mention early plants built after British models at Montreal and San Francisco, Cal, the latter of a rated capacity of 600 tons per day, it may be noted that in the early part of 1906 a combined refuse destructor and electric-light plant was put in operation

at Westmount, Province of Quebec, a town of some 12,000 inhabitants The destructor is of the Meldrum type and was imported from Manchester, England Garbage, ashes, and other refuse are collected together by the town, hauled to the disposal plant, and dumped from the carts into a storage hopper, made from steel plates From the base of this hopper the refuse is moved forward a short distance and dropped through top feed holes on a flat drying hearth at the rear of the flat grates of the destructor The refuse may be pushed forward onto the grates from doors at the rear or pulled forward from the stoking doors at the front of the destructor At intervals of two or three hours the clinker formed from the refuse is raked out at the front and dropped through trap doors for removal from below after cooling A relatively small amount of ashes drops through the grates to the ash pits The gases of combustion pass to a 200-horse-power boiler, provided with no other heat, and these are utilized to raise steam for the electric-light plant Two coal-fired boilers are available for use when the steam raised by the destructor heat is insufficient to run the lighting plant The destructor is equipped with forced draft to aid the combustion of the refuse and produce a high temperature, and also with a regenerator and an economizer to utilize to the utmost such heat as passes the destructor boiler The regenerator heats air for the forced draft, and the economizer heats the feed water for the destructor boiler An 8½-hour test of the destructor on May 3, 1906, showed an average evaporation of 112 pounds of water per pound of refuse burned, equivalent to 136 pounds of water evaporated at and from 212° F During the 8 hours and 32 minutes covered by the test

SECTION OF FRYER REFUSE DESTRUCTOR, THE EARLIEST BRITISH TYPE

the destructor burned 38,090 pounds of mixed refuse, of which about 65 per cent was ashes, cinders, and unburned coal, only 15 per cent was garbage, and the balance was of a miscellaneous character The clinker taken from the destructor after the test was 42 per cent, by weight, of the original refuse The three grates together burned the refuse at the average rate of 4402 pounds per hour Each of the three grates has an area of 25 square feet, so the combustion was at the rate of 587 pounds per square foot of grate surface per hour See *Engineering News* (New York) for May 24, 1906

The first permanent English furnaces, built at

Manchester, England, were designed by Alfred Fryer. Since then many other styles have been put in use, including the Warner, Horsfall, Meldrum, Heenan and Froude, and Sterling. The first American garbage furnace, opened at Des Moines, Iowa, about September, 1887, was designed by Andrew Engle. In December of the same year a Rider furnace was fired up at Pittsburgh, Pa. The Engle furnace was widely built throughout the United States and subsequently had the Dixon furnace as chief of many rivals. Later the Morse-Boulger and the Decarie furnaces came to the front. The successful introduction of the British type of furnace at Westmount, already described, was soon followed by the same and other types of British furnaces in Richmond Borough, New York City, Seattle, Milwaukee, and other cities of the United States, and in various Canadian cities. The new Milwaukee furnace displaced a furnace of the American type, an improved Engle, built

ready for shipment. At Buffalo a similar refuse-disposal plant was subsequently built and equipped with a boiler to raise steam to pump a portion of the sewage of the city. A few other American cities have refuse-sorting plants. A 100-ton installation built for a refuse-disposal contractor at Pittsburgh, Pa., was described soon after completion in *Engineering News* of April 30, 1914. It is similar in general object and method to the Boston plant. It is housed in a four-story building, about 50 × 200 feet in plan. The refuse wagons drive onto the fourth floor, the plant being on a steep hillside, and dump into hoppers which extend down to the picking belt in the story below. From the belt the sorted material is thrown into bins, and from these it is taken for baling and packing on the floor below. The unsalable material continues upward on the conveyor and is dumped into two high-temperature destructors and burned. The heat from these destructors raises steam to generate electric current for works purposes. It was expected in 1914 that the surplus current would be sold.

Garbage Reduction aims to recover grease and fertilizing material from animal and vegetable household and market wastes, while at the same time affording a sanitary means of final disposal. The process requires, for its greatest success, a rigid exclusion of all other wastes from those named, both to reduce the bulk of inert and unprofitable refuse and to prevent damage to the plant. The first step is the extraction of grease. This is effected by melting with steam heat, combined with pressure, or by means of such solvents as naphtha and benzene. Sulphuric acid has been tried and found unsatisfactory. In most of the plants, and for the greater part of the garbage now being treated, steam is used. Where a solvent is employed, naphtha is more often chosen than benzene, but the general process is much the same in either case.

In the steam plants the grease is extracted in rendering tanks, after which the residue, or tannage, is pressed and then dried to free it from moisture. Where naphtha is employed, the drying generally takes place before the solvent is applied. The rendering tanks, or digesters, are cylindrical, some 5 feet in diameter and 15 feet high, with tightly fitting covers for the charging holes and a horizontal valve at the foot of the conical bottom, to empty the charge. Pipe connections are provided for admitting steam or chemicals, as the case may be, and pipes or other channels for leading away the various liquids after the garbage has been treated for a sufficient length of time, generally a number of hours. The tannage is sometimes pressed by steam in the rendering tank and sometimes in presses of either the cheese-cake or roller type. The driers are generally steam-jacketed horizontal cylinders, fitted with revolving stirring arms, mounted on a longitudinal axis. Grinding mills are sometimes provided for such of the tailings from the screens as are of value, chiefly bones. The dried and screened tannage is generally sold to fertilizer manufacturers, but at a few plants phosphates and other rich fertilizers are mixed with it, so as to produce a finished or commercial fertilizer. The grease and water are separated by gravity, in tanks, the grease rising to the top and being skimmed off. In some cases the grease is refined at the reduction works, but usually there is little attempt to do

SECTION THROUGH HEENAN REFUSE DESTRUCTOR AT MONTGOMERY, ALA.

only a few years earlier. (See *Engineering News*, Jan 23, 1902, and July 21, 1910, for illustrated descriptions of these two Milwaukee plants. The earlier article reviews the varied history of garbage disposal at Milwaukee up to that date.) Contracts for British types of destructors for two large American cities were completed in 1914 at San Francisco and Atlanta, Ga.

Refuse Sorting and Utilization Plants.

Boston has the distinction of being the first city in the United States to install a well-equipped refuse-sorting plant. Light refuse from a part of the city was brought to this station, dumped, shoveled onto an inclined conveyor, from which men and boys sorted out various grades of paper, rags, and all other merchantable refuse as the particular kinds passed the person to whom the task of removing it was assigned. The residue was dumped automatically into a furnace and readily burned, producing more than enough steam to run the plant. The paper and like salable material were

much refining. It may be shipped to buyers in tank cars or in barrels. Where naphtha is used it is recovered by distillation. The water from the digesters is sometimes discharged directly into a sewer, stream, or lake. In other cases it is evaporated to "stick," and mixed with the dried tankage, increasing the value of the latter, and at the same time not polluting any body of water. In the best plants all objectionable vapors are condensed, and the gases are purified by scrubbing, or else conveyed to and burned in the boiler furnaces. Reduction plants require an extensive equipment of boilers, engines, pumps, tanks, driers, and other apparatus, the capital charges on which, together with the expenses for fuel and other supplies, and for labor, make up a large total. On the other hand, there is a considerable revenue from the sale of grease and tankage. Until 1905 all of the many garbage-reduction plants in the United States were owned by private companies, and information regarding their operating results could not be obtained. In 1905 the city of Cleveland, Ohio, bought the reduction plant which had served that city for a number of years, and on July 20, 1910, Columbus, Ohio, put in operation the first reduction plant ever built by a city. Each of these Ohio cities prints yearly reports on the financial and other operations of its reduction works which contain much valuable information. The reports show that the returns from grease and fertilizer are in excess of operating and capital charges, taking the garbage after it is delivered to the plant. (For illustrated description of the Columbus plant, see *Engineering News*, Nov. 17, 1910.)

Possibly because of the publicity given to the success of the municipal garbage-reduction plants at Cleveland and Columbus, Ohio, several cities let garbage-reduction contracts in 1913, under which they were to receive a revenue from the garbage instead of paying the contractor for the disposal service. Beginning in 1914, New York is paid for garbage delivered by it at the water front, as follows: first year, \$62,500, second year, \$87,500, third year, and also fourth and fifth years, if the contract is renewed at the option of the city, \$112,500 a year. This is an average of \$97,500 a year, as compared with \$50,000 a year being paid under the old contract and \$130,000 a year bid by the old contractor. The saving in five years, under the new contract, would be \$1,137,500. In 1913 the city of Los Angeles let a contract under which it was to receive 51 cents a ton for garbage delivered by it to a private reduction plant. This plant was under construction in 1914. Springfield, Mass., is also getting a free garbage-reduction service.

The first reduction plant in the United States was put in use at Buffalo, N. Y., in or about the year 1888, under United States patents granted in 1886 to Joseph Merz, of Bruen, Moravia. The Merz system was afterward modified by Charles W. Preston and F. G. Wiselogle. Merz patents were taken out in Europe as early as 1882. The patents covered the extraction of grease by use of the lighter hydrocarbons. Later the Arnold process was extensively used, and still later the Holthaus, Edson, and other processes. As a rule, all recent plants extract the grease by means of steam heat instead of by naphtha, which was used in the Merz process.

Consult Goodrich, *The Economic Disposal of Town's Refuse* (New York, 1901), id., *Refuse*

Disposal and Power Production (ib., 1904), id., *Modern Destructor Practice* (Philadelphia, 1912), Maxwell, *The Removal and Disposal of Town Refuse* (London, 1898), Waring, *Street Cleaning and the Disposal of a City's Wastes* (New York, 1897), Baker, *Notes on British Refuse Destructors* (1905), Parsons, *The Disposal of Municipal Refuse* (New York, 1906), Venable, *Garbage Crematories in America* (ib., 1906), Morse, *The Collection and Disposal of Municipal Waste* (ib., 1908).

GARBE, gar'be, RICHARD KARL (1857—). A German Orientalist, born at Bredow, Pomerania. He studied at Tübingen, became in 1880 professor at Königsberg, and in 1895 at Tübingen. In 1885–87 the Prussian government defrayed his expenses for travel and residence in India. *Indische Reise-skizzen* (1880) chronicles some of his impressions at that time. His further publications include an edition (1878) and translation (1878) of the *Vaitāna Sūtra*, *The Gāta Sūtra of Apastamba* (1882–85), *The Sāmkhya Sūtra Vṛtti* (1888, Eng. trans. 1892), *Die Sāmkhya-Philosophie* (Leipzig, 1894), *Philosophy of Ancient India* (1897), *Beiträge zur indischen Kulturgeschichte* (1903), a translation of the *Bhagavadgītā* (1905), an edition of *Bohlingk's Sanskrit-Chrestomathie* (1909), and *Kaiser Akbar von Indien, ein Lebens- und Kulturbild aus dem sechzehnten Jahrhundert* (1909).

GARBER, DANIEL (1880—). An American landscape painter. He was born at North Manchester, Ind., and studied under Nowotny at the Cincinnati Art Academy and under Thomas Anschutz at the Pennsylvania Academy, Philadelphia. A trip to Europe did much towards overcoming a somewhat dry quality in his earlier work and gave him French ideas of the painting of sunlight—afterward his main interest. Among his numerous awards were the first Hallgarten prize of the National Academy (1909), the Lippincott prize, Pennsylvania Academy (1911), and the Palmer prize and gold medal, Art Institute, Chicago. He was elected an Associate of the National Academy. He is represented in the Corcoran Art Gallery, Washington, the Cincinnati Museum, the Chicago Art Institute, and the Metropolitan Museum, New York. In 1909 he became an instructor at the Pennsylvania Academy of Fine Arts.

GARBO, gar'bō, RAFFAELINO DEL. See RAFFAELINO DEL GARBO.

GARBORG, gar'börg, ARNE (1851—). A Norwegian novelist and publicist, born in the parish of Time, in the District of Jæderen. In 1877 he founded the *Fædreheimen*, a journal in the *Landsmaal*, or popular idiom, and his novels and dramas are written in the same language. Among these, nearly all translated into Danish, Swedish, German, French, Finnish, etc., are the following: *A Free Thinker* (1881), *Students from the Country* (1883), *Stories and Traditions* (1884), *Men* (1886), *The Irreconcilables* (1888), *Kolbotn-Letters* (1890), *With Mother* (1890), *Tired Men* (1891), *Peace* (1892), *The Hill-Goblins* (1895), *Jonas Lie* (1893), *The Lost Father* (1899), *The Teacher* (1896), *In Helheim* (1901), *Mountain-Air* (1903), *Knudsker-Letters* (1904), *Jesus Messias* (1906), *Son Returned Home* (1908). He also wrote *The New Norwegian Language and the National Movement* (1877); *Free Discussion* (1888), *Our Struggle for Independence* (1894), *Our Language Evolution* (1897). Col-

lected Works appeared (1909 et seq.)—His wife, HULDA GARBERG (1862–), wrote the dramas *Mothers* (1897), *Rational Dairry Practice* (1897), and also *The Woman Created of the Man* (1904). In 1902 she visited the Faroe Islands, and in 1913 traveled through the United States lecturing.

GARÇÃO, gar-soun', PEDRO ANTONIO CORREA (1724–72). A Portuguese poet, born in Lisbon. He was educated at a Jesuit college in Lisbon and the University of Coimbra. He aided in the founding of the celebrated "Arcadia" of Lisbon and endeavored to create a better taste in literature by means of his poetry. The *Cantata de Dido*, and his satire on the life of Lisbon, the play entitled *Assemblea*, are splendid examples of eighteenth-century Portuguese verse. He is called "the Portuguese Horace." His *Obras poéticas* have gone through several editions, the best, that of Azevedo Castro (Rome, 1888), contains an excellent biography.

GARCÍA, gar-sē'a, DIEGO (1471–1529). A Portuguese navigator, born at Lisbon. After the discovery of the Straits of Magellan, three ships were fitted out at La Coruña for exploring South America and were placed under the command of García. Sailing in 1526, he arrived at São Vicente, Brazil, on Jan. 11, 1527. By exploring the Uruguay and Paraná rivers he gained a knowledge of the Indian tribes of this region. He aided the expedition of Sebastian Cabot, which was besieged by natives on the lower Paraná, and in 1528 returned to Spain. The account of this voyage is given in the *Memoria de Diego García sobre el viaje que hizo en 1526 y 27*, published in the *Revista de la Biblioteca pública de Buenos Aires*, vol. 1 (Buenos Aires, 1879). The island of Diego García, in the Indian Ocean, is said to be named from him.

GARCÍA, gar-thē'a, MANUEL (1805–1906). A famous singing teacher, born in Madrid, March 17, 1805. He studied singing with his father, Manuel del Pópolo (qv), and composition with Fétis. His voice, however, was not remarkable, and after a few years he definitely retired from the stage (1829) and settled in Paris, devoting his entire attention to teaching and original scientific investigation of the mechanism of the voice. In 1855 he invented the laryngoscope (qv), which made him famous and induced the University of Königsberg to confer upon him the degree of M.D. In 1840 he submitted to the French Academy his *Mémoire sur la voix humaine*, a work that attracted considerable attention, so that in 1847 a professorship of singing at the Paris Conservatory was offered to him. He then wrote his famous *Traté complet du chant*, which appeared in 1847, and in the same year also in a German translation. In 1850 he accepted the professorship of singing at the Royal Academy of Music in London. For almost half a century he retained this post, and when he resigned in 1895, still in the full possession of all his faculties, he yet continued teaching privately until his very death, which occurred on July 1, 1906, in London. Among his pupils were Jenny Lind, Henrietta Nissen, and the great German singing master Stockhausen. Consult S. Mackinlay, *Garcia the Centenarian and his Time* (London, 1908).

GARCÍA, MANUEL DEL PÓPOLO VICENTE (1775–1832). A famous Spanish tenor singer

and teacher of singing, born at Seville. At six years of age he was a chorister in the cathedral there. His teachers were Ripa and Almarcha, whose thorough training, combined with his own great talent, brought him distinction when but 17 in the triple rôles of singer, composer, and conductor. After winning an established reputation as a singer in Cadiz and Madrid, he went to Paris (1808) and achieved instantaneous success at the Italian opera. In 1811 he proceeded to Italy, meeting with great popular manifestations of public favor. The next five years were spent in study, and on his return to Paris, in 1816, disagreement with Catalani, the manageress of the Théâtre Italien, ended in his going to London (1817), where he was enthusiastically received. He visited England, South America, the United States, and Mexico, meeting everywhere with unqualified success. His compositions included 43 operas, written either in Spanish, French, or Italian. His fame as a teacher is enduring, his theories, proven by successful results, forming the groundwork of the best modern teaching. Among his pupils the most famous were his own children—a son, Manuel (qv), and two daughters, Marie Malibran (qv) and Pauline Viardot (qv).

GARCÍA, PAULINE VIARDOT. See VIARDOT GARCÍA.

GARCÍA DE LA HUERTA, VICENTE. See HUERTA, V G DE LA.

GARCÍA-GUTIÉRREZ, gar-thē'a-gōō-tyā'-rāth, ANTONIO (1813–84). A Spanish dramatist, born at Chiclana. As a youth, he studied medicine at Cadiz, but his bent was always towards literature. In 1833 he went to Madrid, where he wrote several plays, but all were failures. In 1837 his play *El trovador* was produced and achieved a brilliant success. Verdi afterward took this drama as a subject for his opera *Il trovatore*. His other works were not so well received, although several of them were finer, especially *Juan Lorenzo* (1865). He was made a member of the Spanish Academy in 1862. His poetry was published under the title *Luz y tinieblas* (2 vols., 1842, 1861). This volume also includes some pretty comedies. His plays were published by himself, as *Obras escogidas* (Madrid, 1856).

GARCÍA ÍÑIGUEZ, gar-sē'ā ē'nyē-gās, CALIXTO (1836–98). A Cuban patriot and soldier, born at Holguin, Santiago Province. He began the practice of law, but in 1868 became associated with Donato Mármol as a leader in the Ten Years' War, and soon attained the rank of brigadier general. Subsequently, upon the removal of Gen. Máximo Gómez by the provisional government, he was appointed commander in chief of the revolutionary forces in Oriente. At San Antonio, with a band of 20, he was surrounded by 500 Spaniards, and to avoid capture shot himself through the face, but, having recovered, was deported to Spain and there imprisoned. In 1880 he fought with José Maceo in the six months' rebellion known as the "Little War," again was captured, and for 15 years was held in Spain under police surveillance. Upon the outbreak of the final insurrection against Spain he escaped in 1895 to Paris and thence went to the United States, where he was active as a filibuster. An expedition fitted out under his direction, and embarked on the *J W Hawkins*, failed through the wreck of the vessel, and \$200,000 worth of arms and ammunition was

lost. Afterward he succeeded in reaching Cuba on the *Bermuda*, with six field guns and other supplies. During the insurrection, as commander of the troops in Camaguey and the Oriente, he won several brilliant victories, and in the Spanish-American War led a Cuban force of 4000 at El Caney (July 1, 1898). He died while in Washington as the head of a commission sent by the Assembly of the provisional government to discuss Cuban affairs with President McKinley.

GARCÍA MORENO, gar-sē'a mō-rā'nō, GABRIEL (1821-75). A politician of Ecuador, born at Guayaquil. He was educated at the University of Quito and became a professor of chemistry. Exiled in 1854, he went to Europe, where he studied political conditions. Returning to Ecuador in 1856, he was made mayor and rector of the University of Quito. In 1860 he was chosen head of the provisional government, and in 1861 President. Though his administration was marked by cruelty and concessions to the ecclesiastical power, yet he organized the finances, regulated abuses, and supplanted militarism with a civil régime. In 1865 he declared himself Dictator. In 1869, and again in 1875, he was reelected President, but previous to his inauguration in the latter year was assassinated. Consult Adolf von Berlichingen, S. J., *Don Gabriel García Moreno, Président der Republik Ecuador* (Essen-Ruhr, s. a.), A. Z. de Cancio, *Vida del Excmo Sr D Gabriel García Moreno* (Madrid, 1889).

GARCILASO DE LA VEGA (EL INCA). See LASO DE LA VEGA (EL INCA), GARCÍ.

GARCIN DE TASSY, gar'sān' de ta'sē', JOSEPH HÉLÉODORE SAGESSE VERTU (1794-1878). A noted French Orientalist. He was born in Marseilles, studied Oriental languages in Paris as a pupil of the distinguished Silvestre de Sacy, and in 1828 was appointed to the chair of Hindustani especially founded for him at the Ecole des Langues Orientales, which he occupied until his death. In 1838 he was elected to succeed Talleyrand in the Académie des Inscriptions et Belles-Lettres. Subsequently he became president of the Société Asiatique and an administrator of the Ecole. Originally known as a student of Mohammedanism and a translator from the Arabic, he was later recognized as the foremost European savant in the undeveloped and difficult field of the Hindustani language and literature. His annual review, *La langue et la littérature hindoustanes* (1872-77), was authoritative, not only throughout Europe, but as well among native Indian scholars. Among his publications, which include many translations, are the following: *Les oiseaux et les fleurs* (1821), Arabic text, with translation; *Relation de la prise de Constantinople*, translated from Turkish (1826), *Les aventures de Kamrup*, Hindustani text (1834), *Les œuvres de Wālī*, with text, translation, and notes (1836), *La poésie philosophique et religieuse chez les Persans* (1857), his chief work, a *Histoire de la langue et de la littérature hindoues et hindoustanes* (2d ed., 3 vols., 1871), *Rhétorique et Prosodie des langues de l'Orient musulman* (2d ed., 1873), *L'Islamisme selon le Coran* (1874). He also prepared a French edition (1845) of Sir William Jones's *Grammar of the Persian Language* (1771).

GARCIN'IA. See MANGOSTEEN.

GARD, gār. A department of France, in Languedoc, bounded on the east by the river

Rhone, and reaching into the Mediterranean, in a headland having a coast line of 10 miles (Map France, S., J. 4). Area, 2270 square miles. Pop., 1901, 420,836, 1911, 413,458. A considerable part of the surface is occupied by forests, plantations, and vineyards. On the coast there are extensive and unhealthy marshes. It is watered mainly by the Rhone and its tributaries—the Gard, the ancient Vaido (from which the department has its name), and the Cèze. The northwest is occupied by a branch of the Cévennes Mountains, the remainder slopes towards the Rhone and the Mediterranean. The soil is in general dry, the best lands occurring in the river valleys. Coal, iron, lead, and zinc are found in several places, and salt is manufactured in the south. The vine, the olive, and the mulberry are extensively cultivated. The silk industry is important and the department produces more silkworms than any other in France. Lignite is worked in the north-eastern part of the department. Wine is largely exported. The department is divided into the four arrondissements of Nîmes, Alais, Uzès, and Le Vigan. Capital, Nîmes.

GARDA, gar'dā (Lat. *Lacus Benacus*). The largest lake in Italy, 216 feet above sea level. It is 34 miles long, from 3 to 11 miles broad, 189 square miles in area, and its greatest known depth is 1916 feet (Map Italy, C. 2). Its northern extremity is in Tirol, and Peschiera, at its southern extremity, is 16 miles west of Verona and 77 miles east of Milan. There is a communication by steamboat once or twice daily between different points on the lake. The principal fish are salmon trout, trout, pike, and eels. The water is often rough, especially when there is a storm from the north (Consult Vergil, *Georgics*, II, 160). The southern shores are low and flat, but, as the lake narrows towards the north, the spurs of the Alps rise boldly from the water's edge. The chief tributary is the Sarca from the glaciers of Adamello, and the only outlet is the Mincio, which descends from Peschiera to Mantua and discharges into the Po.

The most fashionable resort is Gardone-Riviera, but dearest to the poet and to the antiquarian is Sirmione, a narrow promontory that extends 2½ miles out into the lake. The view from it is magnificent, and there are the ruins of Roman baths and of a building said to be the villa of the poet Catullus. Salò, a small town with terraces of lemon groves, has a church containing several interesting paintings; Maderno has a basilica of the eighth century. Malcesine is the place where Goethe was arrested by the Venetian officials. To the beautiful little village of Garda the lake owes its name. Riva, at the north end of the lake, in Austrian territory, is popular with tourists, on account of its hotels, ruins, and climate in summer. It is the starting point for numerous excursions over the mountains. Consult R. Bagot, *The Lakes of Northern Italy* (New York, 1907), W. D. McCrackan, *The Spell of the Italian Lakes* (Boston, 1913).

GARDAIA, gar-dī'a, or **GHARDAYA** (locally, Faghardet). An important trading point of the Sahara, and the chief town of the Mزاب District in Algeria, situated on a hill in the oasis of Gardaia, amid rocky mountains, 312 miles in a direct line south-southeast of Algiers (Map Africa, E. 1). It is fortified by a wall surmounted with towers and pierced by gates; possesses several mosques, one remarkable for

its size, and has a flourishing caravan trade with Tunis, Algiers, Fez, Morocco, Sudan, and Timbuktu, in slaves, barley, dates, pottery, provisions, oil, wool, cotton, indigo, leather, gold dust, ivory, and all the varied raw products of central and northern Africa. Its trade is for the most part in the hands of Jews, who inhabit a separate quarter. The population consists chiefly of the Beni Mzab, who speak a Berber dialect modified by Arabic. Gardania is surrounded by date-palm orchards containing over 64,000 trees and is irrigated by artesian wells. In the vicinity are the ruins of a Roman tower and the foundations of a temple dedicated to Isis were uncovered in 1910. The Mzab Confederation, formerly independent, has acknowledged the sovereignty of France since 1850. In 1857 Gardania, its capital, was surrendered to the French and was made a military station. Pop, 1901, 9315, 1911, 8551, of the oasis about 36,000.

GARDANE, gar'dan', CLAUDE MATTHIEU, COUNT (1766-1818). A French general and diplomat. He became a captain in 1793, a brigadier general in 1799, and aid-de-camp to Napoleon in 1805. In 1807 he was sent by the Emperor on a diplomatic mission to Persia to strengthen a Franco-Persian alliance with the view of a future invasion of India. Returning to France in 1809, he was created Count of the Empire and was sent to join Massena's army in Portugal, where he came into disfavor as a result of his conduct during the retreat from Santarém to Almeida. Consult P. A. L. de Driault, *La politique orientale de Napoléon. Sébastien et Gardane* (Paris, 1904).

GARD'ANT, Fr. pron gar'dan' (Fr, gazing, pres p of *garder*, to look). In heraldry (qv), a term used of an animal in fess and represented full-faced.

GARDE, gar'dē, THOMAS WILLIAM (1859-) A Danish naval officer, distinguished for his explorations in Greenland. With Holm (qv) he thoroughly explored the coast of southeast Greenland in 1883-85, by boat journeys from Cape Farewell. Garde explored Lindenøvs Fiord, 62° 15' N, where have been found the Scandinavian ruins on the east coast. Wintering at Nanortalik, he discovered between that place and Cape Farewell 200 live glaciers, of which 70 had a sea face more than a mile wide. During his surveys of the Julianahaab district, southwest of Greenland, in 1893, he made a long journey over the Greenland ice cap, which proved to be of unsuspected height. In his trip of 13 days he traveled 180 miles across the ice and reached an elevation of more than 8000 feet. He was awarded the Roquette medal by the Société de Géographie of Paris. He became a commander in the Royal navy, chief of staff, and from 1908 to 1911 was Assistant to the Minister of the Navy. Garde's narratives of his explorations appeared in *Meddelelser om Grønland*, ix, xvi.

GARDEN, ALEXANDER (1730-91). An American physician and naturalist, born in Charleston, S. C., and educated in Scotland. He was a professor in King's College (now Columbia University) in 1754 and in 1755 settled as a physician in Charleston. At the time of the Revolutionary War he sided with Great Britain and in 1783 emigrated to London, where he lived until his death. He wrote a number of papers on zoological and botanical subjects. The genus *Gardenia* was named in his honor.

GARDEN, ALEXANDER (1757-1829). An American soldier and writer, born in Charleston, S. C., and educated at Westminster and at Glasgow, Scotland. On the outbreak of the Revolutionary War he joined the patriot party, and he served in Lee's Legion, and was volunteer aid-de-camp to General Greene. He received the confiscated estates of his father, the botanist and Loyalist (see preceding title). He is known chiefly as the author of *Anecdotes of the Revolutionary War, with Sketches of the Character of Persons Most Distinguished in the Southern States for Civil and Military Services* (1822-28, last ed., 3 vols, 1868).

GARDEN, MARY (1877-) An American dramatic soprano. She was born at Aberdeen, Scotland, but at a very early age went with her parents to Chicago. Her love for music found its earliest expression through the violin, which she began to study in her sixth year. At the age of 12 she took up the piano. In 1893 she placed herself under the instruction of Miss Duff, of Bangor, Me., with the intention of becoming a singer. After two years of earnest work she went to Paris, where she continued her vocal studies under Trabadello and Fugère. Her début was made, in 1900, at the Paris Opéra Comique in Charpentier's "Louise." She immediately became a great favorite with the French public, and in 1902 was chosen to create the part of Mélisande in Debussy's opera. From the time of her first appearance in the United States (1908) at the Manhattan Opera House she was a prime favorite with American opera goers. From 1910 to May, 1914, she was a member of the Chicago Opera Company. Although her repertoire is rather limited, being restricted almost exclusively to modern French operas, she is an artist of compelling power. Her vocalism may not be above criticism, but for subtle delineation, plastic pose, spontaneity, and minutest attention to detail she is unsurpassed.

GARDE NATIONALE, gard na'syō'nal' See NATIONAL GUARD.

GARDEN CITY. A popular name for Chicago, from its numerous parks and gardens.

GARDEN CITY. A city and the county seat of Finney Co., Kans., 50 miles west by north of Dodge City, on the Atchison, Topeka, and Santa Fe Railroad (Map Kansas, B 7). It contains a public library, and has municipal water works and electric-light plant. The city is in an agricultural and stock-raising region. It has extensive irrigating works, being the centre of the irrigation system of southwestern Kansas and of a beet-sugar industry. A trade is also carried on in alfalfa and dairy products. The commission form of government became operative in Garden City in 1914. Pop, 1900, 1590, 1910, 3171.

GARDEN CITY. A village in Nassau Co., N. Y., 20 miles from New York, on the Long Island Railroad (Map New York, B 2). It was projected by A. T. Stewart as a model suburban village, and is the seat of the Protestant Episcopal Bishop of Long Island, with the cathedral schools of St Paul's and St Mary's. The Cathedral of the Incarnation is a fine specimen of Gothic architecture, erected by Mrs Stewart in honor of her husband. It has a magnificent organ, one of the largest in the world, costing \$100,000. A large publishing house is the chief industrial establishment. Pop, 1914 (local est.), 1000.

"THE GARDEN OF THE GODS"
CATHEDRAL SPIRES (UPPER)
THE SEAL AND BEAR (LOWER)

GARDENER, LION See GARDINER

GARDENER BIRD See BOWER BIRD

GARDE'NIA (Neo-Lat., from Alexander Garden) A genus of trees and shrubs of the family Rubiaceæ, natives of tropical and sub-tropical countries, many of which are now favorites in greenhouses and hothouses, on account of their beautiful and fragrant flowers. Some of them are hardy enough to endure the open air in summer. The corolla is funnel-shaped, or approaching to salver-shaped, the tube much longer than the calyx, the fruit, a berry, crowned with the calyx. The name Cape jasmine is given to *Gardenia jasminoides*, now known as *Gardenia florida*, a Chinese species well known in America. The fruit, which is about the size of a pigeon's egg and orange colored, is sold in the shops of China and Japan for dyeing silks yellow. A beautiful yellow resin exudes from wounds in the bark of *Gardenia gummiifera*, an East Indian species. The wood of *Gardenia thunbergii* and *Gardenia rothmannia* is very hard, and is used for agricultural implements, wheel axles, etc., at the Cape of Good Hope. Both of these species are grown in American hothouses. See JASMINE.

GARDENING See HORTICULTURE

GARDEN ISLAND An island of Western Australia, measuring 6 miles by 1, and situated near the mouth of Swan River, in lat 30° 10' S and long 115° 40' E. It shelters from the open ocean the deep and spacious anchorage of Cockburn Sound, thus contributing to make Fremantle the most important port of western Australia.

GARDEN OF ENGLAND Worcestershire so named because of its fertility.

GARDEN OF EUROPE A frequent designation for Italy, from its fertility, climate, and scenery.

GARDEN OF FRANCE A name sometimes used of the ancient Province of Touraine.

GARDEN OF ITALY A popular designation of Sicily, because of its fertility and scenery.

GARDEN OF THE GODS The name given to a region in Colorado, near Colorado Springs, covering about 500 acres and remarkable for the strange forms of the rocks with which it is covered. The red and white sandstone here assumes grotesque shapes to which various names have been given. The Gateway is formed by two huge masses of rock, of a bright red color, and 330 feet high, between which the road passes.

GARDEN OF THE HESPERIDES. See HESPERIDES.

GARDEN SNAIL. The British name of the large, brightly colored land snail (*Helix aspersa*), common and sometimes troublesome in gardens throughout Europe. It is edible when well cooked, but not so often eaten as another species (*Helix pomatia*), known and cultivated as the "edible" snail. Some interesting folklore attaches to this species in the rural districts of England and Scotland. See SNAIL, with accompanying Colored Plate of NORTH AMERICAN SNAILS.

GARDENS OF ADONIS See ADONIS

GARDENS OF CÆSAR. See CÆSAR, GARDENS OF

GARDENS OF LUCUL'LUS. See LUCUL'LUS, GARDENS OF

GARDENS OF MÆCENAS. See MÆCENAS, GARDENS OF

GARDENS OF SALLUST. See SALLUST, GARDENS OF

GARDEN VEGETABLES See VEGETABLES, and separate articles on individual crops, e.g., BEAN, CABBAGE, LETTUCE, PEA, ETC.

GARDEN WARBLER. An English name of a small brownish warbler (*Sylvia borin*, or *hortensis*) of Southern Europe, called in England "greater pettichaps," familiar about gardens, and noted for its sweet and varied song, whence the Germans call it "false nightingale." It is often caged under the French name *fauvette*, but does not endure captivity well. This is the bird known to the Italians as *beccafico* (qv), because it punctures the ripening figs, as illustrated in the article FIG.

GARDE SUISSE, gard swēs See SWISS GUARD

GARDIE, gar'dē', MAGNUS GABRIEL DE LA (1622-86). A Swedish statesman, born in Reval. He studied at the University of Upsala, was a great favorite of Christina, in 1646 was special Ambassador to France, and subsequently commanded the Swedish army in Livonia. During the minority of Charles XI he was Lord Chancellor, a member of the council of regency, and leader of the war party and the subsidy policy which made Sweden an ally of France. In 1682 he retired after the unfavorable report of a special commission on the conduct of the regency. He founded (1667) the Upsala College of Antiquities and gave to the University of Upsala the famous Codex Argenteus (See ULRICHAS). His collection of manuscripts was acquired in 1848 by the library of the University of Lund.

GARDINER, gard'nēr A city in Kennebec Co., Me., 6 miles south of Augusta, on the Kennebec River, on the Maine Central railroad, and on the line of the Eastern Steamship Company (Map Maine, C 4). Naturally endowed with excellent water power, it has saw, paper, and pulp mills, a sash and blind factory, foundries and machine shops, shoe factories, and manufactures of electric-railroad supplies. Lumber and ice are largely exported. There is a public library. Settled in 1760, Gardiner was part of Pittston until 1803, when it was incorporated as a town. It was chartered as a city in 1849. Gardiner adopted the commission form of government, which became operative in 1912. The city owns its water works. Pop., 1900, 5501, 1910, 5311. Consult Hanson, *History of Gardiner, Pittston, and West Gardiner* (Gardiner, 1882).

GARDINER, FREDERIC (1822-89). An American Episcopalian scholar. He was born at Gardiner, Me., Sept. 11, 1822, graduated at Bowdoin College, 1842, entered the Protestant Episcopal ministry, was professor in the Berkeley Divinity School at Middletown, Conn., from 1868 to his death, July 17, 1889. He was one of the best Bible students of his day, and his publications include commentaries upon Leviticus, 2 Samuel, Ezekiel, and Jude, a harmony of the Gospels in Greek and in English (1871), *The Principles of Textual Criticism* (1876), *The Old and New Testaments in their Mutual Relation* (1885), *Aids to Scripture Study* (1890).

GARDINER, HARRY NORMAN (1855-). An American professor of philosophy. He was born at Norwich, England, went to the United States in 1874, graduated from Amherst College in 1878; and also studied at Union Theological Seminary, Gottingen, Leipzig, and Heidelberg. He taught at Glens Falls (N. Y.)

Academy in 1878-79, was instructor in psychology at Amherst in 1891-92, and served as instructor at Smith College from 1884 to 1888, when he became professor of philosophy. In 1907 he was president of the American Philosophical Association. He published *Outlines of Modern Philosophy* (1892), and edited *Jonathan Edwards—A Retrospect* (1901) and *Selected Sermons of Jonathan Edwards* (1904).

GARDINER, JAMES (1688-1745). A daring Scottish soldier, famous for his remarkable religious experience. He was born at Carriden, Linlithgowshire, Scotland. When only 14 he obtained a commission in a Scottish regiment in the Dutch service. In 1702 he entered the English army, and fought with distinction in the campaigns of Marlborough. He was promoted to the rank of major in 1718. Up to this time his life had been extremely dissolute. But in 1719, while bent upon pleasure, he happened to take up a religious book, and while reading it saw what he considered a vision of Jesus Christ. He was immediately converted and thenceforth lived a pious and excellent Christian life. He became colonel in 1743, and two years later was mortally wounded in the battle of Prestonpans. Consult Doddridge, *Some Remarkable Passages in the Life of Col J Gardiner* (London, 1747, many later editions), and Carlyle, *Autobiography*, edited by Burton (Edinburgh, 1860).

GARDINER, JOHN (1731-93). An American lawyer, the son of Dr Sylvester Gardiner. He was born in Boston, studied law, and practiced his profession for a time in London and in Wales. A friend of John Wilkes, he appeared as junior counsel of the latter in 1764. In the Massachusetts Legislature he procured the abolition of the law of primogeniture in Massachusetts and the prohibition of special pleading, and worked for the repeal of the antitheatrical laws. He was one of the leaders of the original Unitarian movement in Boston.

GARDINER, JOHN STANLEY (1872-). An English zoologist, born in Belfast. He was educated at Marlborough College and at Gonville and Caius College, Cambridge, of which he became fellow in 1898 and was dean in 1903-09. He was university lecturer on zoology and professor of zoology and comparative anatomy. He took part in several scientific expeditions—to Funafuti (1896), Maldives and Laccadives (1899-1901), Indian Ocean (1905), and Seychelles (1908), wrote on the Indian Ocean and the Seychelles for different reviews, especially the *Geographical Journal*, and edited *Fauna and Geography of the Maldives and Laccadive Archipelagoes* (1902-06).

GARDINER, or GARDENER, LION (1599-1663). An English settler in America. He was a military engineer, and saw service in the Netherlands under the Prince of Orange. In 1635 he arrived at Boston under contract to serve for four years a company which had the patent of a tract of land at the mouth of the Connecticut River. There he built a fort which he called Saybrook, and remained in command until 1639, when he bought from the Indians the island called by him the Isle of Wight, now known as Gardiner's Island, the first English settlement within the present limits of the State of New York. To his little domain of 9 miles in length by 1½ miles in width he gained proprietary rights as lord of the manor. In 1653 he removed to Easthampton, Long Island, with others who had bought 30,000 acres there

in 1649. His *Relation of the Pequot Warres*, written in 1660, was edited by Carlton (Hartford, 1901) with valuable notes. Consult also C C Gardiner, *Papers and Biography of Lion Gardiner* (St Louis, 1883), and the same author's *Lion Gardiner and his Descendants* (ib, 1890).

GARDINER, SAMUEL RAWSON (1829-1902). An English historian. He was a descendant of Cromwell and Ireton, was born at Ropley, near Alresford in Hampshire, March 4, 1829, and was educated at Winchester and at Christ Church, Oxford, where he was awarded a first class in *literæ humaniores*. In 1884 he was elected a research fellow of All Souls, and in 1892 he was awarded a similar fellowship at Merton. From 1877 to 1885 he was professor of modern history at King's College, London, and was examiner in history at Oxford University, 1886-89. On the death of Froude, in 1894, he was offered, but declined, the regius professorship of modern history at Oxford. On Aug 16, 1882, he was granted a Civil List pension of £150. He was the recipient of several honorary degrees—LL.D. (1881) from Edinburgh, D.C.L. (1895) from Oxford, and Litt.D. (1899) from Cambridge. Gardiner's first important work was his *History of England from the Accession of James I to the Disgrace of Chief Justice Coke, 1603-1616* (2 vols, 1863). Subsequent installments appeared at various intervals until 1881, when they were reissued in a revised collective edition, the earlier volumes much altered, under the title *History of England from the Accession of James I to the Outbreak of the Great Civil War, 1603-1642* (10 vols, 1883-84). The *History of the Great Civil War* appeared in 3 vols (1886-91), and was reissued in a slightly revised form for the collective edition in 4 vols (1893). The third and last installment of the great combined work, under the title *History of the Commonwealth and Protectorate*, of which three volumes, including the year 1656, appeared in 1894-1901, was arrested by Mr Gardiner's death, which occurred Feb 23, 1902. He was the first English writer to treat this controversial period in detail from a non-partisan standpoint. His work rests upon the most laborious and exhaustive study of all the sources of the period which has been attempted. In this his efforts were lightened for the earlier part of the work by the various *Calendars of State Papers* still in process of publication. He was also greatly favored by numerous discoveries of new material, among which the most important are that of the great collection known as the Clarke manuscripts in the library of Worcester College, Oxford, the Verney manuscripts, the "Paston Letters" of the seventeenth century, the "Nicholas Papers," the "Hamilton Papers," and the secret correspondence of the papal agent Rossetti in England with Cardinal Barberini. In the history of the Long Parliament Mr Gardiner explains adequately for the first time the rise of the Cavalier party, and the division, growing into the Civil War, which arose from differences of opinion in matters of religion. Besides his great work, Mr. Gardiner edited numerous volumes for the Camden Society, and contributed many articles and reviews to the *English Historical Review*, of which he was editor from 1891 to 1901. He summarized the results of his labors in the following recent works: *Cromwell's Place in History* (1897), *Oliver Cromwell*, a biography first published in

an elaborately illustrated volume (1899) and afterward in a cheaper form without the illustrations (1901). Other works are *Constitutional Documents of the Puritan Revolution* (1889, 2d ed., 1899), *What the Gunpowder Plot Was* (1897), *The Thirty Years' War, 1618-1648* (1874), *The First Two Stuarts, and the Puritan Revolution, 1603-1660* (1876). The following are textbooks: *A Student's History of England* (3 vols., 1890-92), with Mullinger, *Introduction to the Study of English History* (1881, 3d ed., 1894). Consult Shaw, *Bibliography of the Historical Works of Dr Creighton, Dr Stubbs, Dr S R Gardiner* (London, 1903).

GARDINER, STEPHEN (1483-1555). An English prelate and statesman, born between 1483 and 1493. He was the son of John Gardiner, a prosperous cloth worker at Bury St. Edmunds, and studied at Trinity Hall, Cambridge, where he distinguished himself in classics. In 1520 he became doctor of civil law, next year of canon law, and in both branches speedily attained eminence. In 1524 he was appointed Rede lecturer in the university, and the same year became tutor to a son of the Duke of Norfolk. That nobleman introduced him to Cardinal Wolsey, who made him his secretary. In this capacity he gained the confidence of Henry VIII, and in 1527 he and Sir Thomas More were the English commissioners for negotiating with the French ambassadors regarding the maintenance of an army in Italy to oppose the Emperor. The year following he was sent with Edward Fox to negotiate with the Pope for the King's divorce from Catharine of Aragon. His arguments were unavailing, but on his return he was appointed the King's secretary. In 1531 he was appointed Archdeacon of Leicester, and the same year was installed Bishop of Winchester, vacant by Wolsey's death. A determined opponent of the Reformation and a staunch Catholic, he nevertheless wrote *De Vera Obedientia* (1535) in support of the King's supremacy. Various embassies to France and Germany were now intrusted to him, and after the execution of Thomas Cromwell, Earl of Essex, whose downfall was due mainly to him, he acquired great power. The tale of his impeachment of Catharine Parr and subsequent disgrace by Henry VIII is doubtful, but on the accession of Edward VI he was imprisoned for his opposition to the Reformation and deprived of his bishopric. When Mary came to the throne in 1553 she restored him to his see, and made him Lord Chancellor and Prime Minister. He officiated at the Queen's coronation, and at her nuptials with Philip of Spain. How far he was responsible for the persecution of Protestants during her reign is a debated question. He was a man of great erudition, and a friend of learning in every form. His writings consist of a number of tracts on theological and literary subjects, and include his interesting letters to Sir John Cheke against the Anglicizing of Greek pronunciation. Although a worldly-minded ecclesiast, he was a devoted and zealous worker, and conspicuous for religious consistency. He died Nov. 12, 1555. Consult Cassan, *Lives of the Bishops of Winchester*, 2 vols. (London, 1827); Cooper, *Athenæ Cantabrigienses*, vol. II (Cambridge, 1858), for his writings, Gairdner, *Letters and Papers . . . of the Reign of Henry VIII* (15 vols., London, 1862-96), Brewer, *Reign of Henry VIII* (2 vols., London, 1884); Maitland, *Essays on the Reformation in*

England (London, 1849), Dixon, *History of the Church of England* (4 vols., London, 1878-91); Froude, *History of England* (12 vols., New York, 1870).

GARDINER, SYLVESTER (1707-86). An American physician. He was born in South Kingston, R. I., studied medicine in Paris and London, and began practice in Boston. He was instrumental in colonizing that part of the "Plymouth Purchase" lying along the Kennebec River, and in settling the town of Pittston, Me., from which the present city of Gardiner, named in his honor, was subsequently set off. He established a church and library there, and was a leading member of King's Chapel, in Boston. On the outbreak of the Revolutionary War he joined the Loyalist element in Boston, and in 1776 removed to Halifax, N. S., whence he subsequently removed to England, his name having meanwhile been included in the proscription and banishment act of 1778. In 1785 he returned to this country, and settled at Newport, where he died.

GARDINER'S ISLAND. A portion of Suffolk Co., N. Y., lying 5 miles off Long Island on the south side of the east entrance of Long Island Sound, in the bay formed by the two arms of Long Island (Map New York, C 2). It has an area of 3300 acres. It has been the property of the Gardiner family since it was bought from the Indians by Lion Gardiner in 1639. It was on this island that the noted pirate (or privateer) Captain Kidd secreted some of his treasure, which was afterward discovered and appropriated.

GARDNER. A town in Worcester Co., Mass. (Map Massachusetts, D 2), including the villages of Gardner Centre, South Gardner, and West Gardner, 27 miles northwest of Worcester, on the Boston and Maine Railroad. It has the Henry Heywood Memorial Library and Museum, the Henry Heywood Memorial Hospital, a State colony for the insane, an almshouse, and a home for the aged, and Dunn and Crystal Lake parks. It is the seat of an extensive chair-manufacturing industry and has also manufactories of go-carts, oil stoves, silverware, furniture, harness, steam heaters, machinery, concrete blocks and bricks, tinware, time recorders, etc. The government is administered by town meetings, convened whenever necessary. Gardner was incorporated as a town in 1785, its population then being about 375. The water works are owned by the municipality. Pop., 1900, 10,813; 1910, 14,690, 1914 (U. S. est.), 16,353, 1920, 16,971.

GARDNER, EDMUND GARRATT (1869-). An English writer on Italian literature. He was born in London, was educated at Gonville and Caius College, Cambridge, and studied medicine, but devoted himself to the study of Dante, Italian history and literature, and mysticism. He wrote *Dante's Ten Heavens* (1898), *A Dante Primer* (1900), *The Story of Florence* (1900), *The Story of Siena and San Gimignano* (1902), *Dukes and Poets in Ferrara* (1904), *The King of Court Poets* (1906), *St Catherine of Siena* (1907), *The Painters of the School of Ferrara* (1911), *Dante and the Mystics* (1913).

GARDNER, ELIZABETH JANE (MME W. A. BOUGUEREAU) (1842-). An American figure painter, born at Exeter, N. H. She studied in Paris under Merle, Lefebvre, and finally under Bouguereau, whom she afterward married, and whose manner she adopted so successfully that some of her work might be mistaken for his.

Like him she excels in graceful draftsmanship and tender sentiment, but is deficient in color, truthfulness, and vitality. Among the best of her works are "Cinderella," "Cornelia and Her Jewels," "Corinne," "Fortune Teller," "Maud Muller," "Daphne and Chloe," "Ruth and Naomi," "The Farmer's Daughter," "The Breton Wedding," and some portraits.

GARDNER, ERNEST ARTHUR (1862-). An English classical archaeologist, born in London. He was educated at the City of London School, and at Gonville and Caius College, Cambridge, of which he was fellow 1885-94. After 1884 he devoted himself to archaeological work, and was director of the British School of Archaeology at Athens (1887-95). He became Yates professor of archaeology in University College, London, and public orator of the University of London (1910). He conducted the excavations at Naucratis in Egypt (1885-86), and carried on explorations in Cyprus, in Samos, at Megalopolis, and on many other sites in Greece. His publications include *Catalogue of Vases in the Fitzwilliam Museum* (1897), *Ancient Athens* (1902), *Introduction to Greek Epigraphy*, with E. S. Roberts (1905), *Six Greek Sculptors* (1910). He was a frequent contributor to archaeological journals, and in 1897 became coeditor of the *Journal of Hellenic Studies*.

GARDNER, GEORGE (1812-49). A Scottish botanist, born in Glasgow. He studied at the University of Glasgow, qualified as a surgeon, turned his attention from medicine to botany, and, assisted by subscriptions obtained in great part through the influence of his instructor, Sir W. J. Hooker, explored Brazil from May, 1836, to the close of 1840. During his absence he forwarded to England 60,000 specimens divided among 3000 different species. His total number of specimens represented more than 6000 different species. In 1842 he was elected a member of the Linnæan Society of London, in 1844 was appointed superintendent of the botanical garden of Ceylon, and in 1845 visited India for botanizing purposes, and became an associate editor of the *Calcutta Journal of Natural History*. He aided H. B. Fielding in the writing of *Sertum Plantarum* (1844), published *Travels in the Interior of Brazil* (1846), and many papers in the *London Journal of Botany* and other periodicals.

GARDNER, HENRY BRAYTON (1863-). An American political economist and educator, born in Providence, R. I. He graduated in 1884 at Brown University, studied at Johns Hopkins University, and in 1898 was appointed professor of political economy at Brown. In 1897-98 he was vice president of the American Economic Association, and in 1912 became a vice president of the American Statistical Association. His publications include *Statistics of Municipal Finance* (1889, in new series, No. 2, of the American Statistical Association's publications), and a second monograph under the same title in new series, No. 2 (1899), of the publications of the American Economic Association.

GARDNER, PERCY (1846-). An English classical archaeologist, born at Hackney and educated at the City of London School and at Christ's College, Cambridge. He was professor of archaeology at Cambridge (1880-87); and thereafter professor of classical archaeology at Oxford. Professor Gardner is best known for his publications on ancient numismatics. Among his works are: *Types of Greek Coins* (1883), with Imhof-

Blumer, "A Numismatic Commentary on Pausanias," in *Journal of Hellenic Studies*, vi-viii (1885-87), *New Chapters in Greek History* (1892), with Jevons, a *Manual of Greek Antiquities* (1895, 2d ed., 1898), *Sculptured Tombs of Hellas* (1896), *An Historic View of the New Testament* (1901), *A Grammar of Greek Art* (1905), *Growth of Christianity* (1907), *The Principles of Greek Art* (1914).

GARDNER GUN. A machine gun consisting of one, two, or five simple breech-loading rifle barrels, placed parallel, about 14 inches apart, in a case or compartment. The barrels are loaded, fired, and relieved of shells by one revolution of the hand crank. These guns, of 45-inch calibre, are no longer used in the United States service, but have been replaced by the *automatic machine rifle*, calibre 30, a single-barrel, portable gun, capable of great rapidity of fire. The inventor of the Gardner gun was Captain Gardner of the United States army. See *MACHINE GUN*.

GARDONE-RIVIERA, gar-dō'nā rē've-ā'ia. A winter resort consisting of eight villages on the west shore of Lake Garda (qv), in north Italy. It is sheltered by the mountains from all raw winds, and, in winter, has little rain, much sunshine, and an even temperature. Beautiful villas have been built along its lake promenades and mountain gorges since 1885, when it became popular with Austrians and Germans. It is now visited by invalids and tourists from all parts of the world. Pop. (commune), 1901, 1987, 1911, 2230.

GARDTHAUSEN, gardt-hou'zen, VICTOR (EMIL) (1843-). A German historian and palaeographer. He was born in Copenhagen, was educated at the universities of Kiel and Bonn, and at the University of Leipzig was librarian for many years (down to 1907) and, after 1877, professor of ancient history. He published *Collectanea Ammianea* (1869), *Die geographische Quellen Ammians* (1873), and an edition of Ammianus Marcellinus (1875), standard works on this author until the publication of Clark's edition (1910), the important *Augustus und seine Zeit* (2 vols., 1891-1904), and a valuable *Griechische Palaeographie* (1879, 2d ed., 1911-13).

GAREFOWL, or **GAIRFOWL**, gār'foul' (Icel. *gærufugl*, Swed. *garfögel*, Dan. *gærufugl*, Eng. *gerfalcon*, connected with OHG *gîr*, Ger. *Geier*, vulture, OHG *ger*, *gîr*, greedy + *fugl*, AS *fugol*, Ger. *Vogel*, fowl). The great auk (*Plautus impennis*) once frequently seen in the Hebrides, but now extinct. It was the largest of its race, standing about 29 inches high, and resembling a big razorbill. It was black above and white beneath in winter, the head changing to snuff brown in summer. Its small wings were useless for flying, and it waddled about with great difficulty on land. Its defenselessness and stupidity made it easy to kill, even with clubs, and at first it was slaughtered and its rookeries robbed of eggs for food or amusement. Later the demand for its feathers caused its rapid destruction, and the last bird was killed about 1844. See *AUK*.

GARETH, SIR. The youngest son of King Lot and Morgaine in the Arthurian legends. He entered the court of his uncle, King Arthur, concealing his identity at the request of his mother, and received from Sir Kay the nickname Beaumains. At the expiration of a year he received knighthood and, at the request of Lancelot, liberated her sister Liones, who was imprisoned

in Castle Perilous, and whom he afterward wedded Tennyson's "Gareth and Lynette" has some variations

GARFIELD A borough in Bergen Co., N. J., 10 miles northwest of New York City, on the Erie Railroad and on the Passaic River, opposite Passaic. It has woolen mills, knitting mills, embroidery works, stone works, a machine shop, and manufactures of clothing, wax paper, perfumes, chemicals, rubber goods, cigars, jewelry cases, paper boxes, etc. Incorporated in 1898, it is governed by a mayor and a unicameral council. The water works are owned by the borough. Pop., 1900, 3504, 1910, 10,213; 1914 (U. S. est.), 13,071, 1920, 19,381.

GARFIELD, HARRY AUGUSTUS (1863-1917). An American college president, son of James A. Garfield. He was born at Hiram, Portage Co., Ohio. Graduating from Williams College in 1885, he taught at Concord, N. H., in 1885-86, practiced law at Cleveland, Ohio, from 1888 to 1903, was professor of contracts at the Western Reserve University Law School in 1891-97, and served as professor of politics at Princeton University from 1903 to 1908. In the latter year he was chosen president of Williams. In 1896 he organized and later he was president of the Cleveland Municipal Association, and he was also president of the Cleveland Chamber of Commerce in 1898-99.

GARFIELD, JAMES ABRAM (1831-81). Twentieth President of the United States. He was born in a log cabin at Orange, Cuyahoga Co., Ohio, Nov. 19, 1831, was left fatherless when two years of age, and his youth was spent in alternate periods of study at school and hard manual work for his own support. He worked on a farm until his seventeenth year, when he left home and was engaged to drive horses and mules on the towpath of the Ohio Canal, later he was engaged as a deck hand. Returning home, he entered the Geauga Seminary at Chester, Ohio, in his eighteenth year, and began the study of Latin, Greek, and algebra. In 1851 he entered the Western Reserve Eclectic Institute (now Hiram College) at Hiram, Ohio, and in 1854 entered Williams College, Mass., where he graduated with high honor in 1856. The same year he became teacher of Latin and Greek in the institute at Hiram, Ohio, and a year later he was elected president of that institution. Before entering college, he had united with the Disciples Church, in which he had been brought up, and, according to the usage of that denomination, though never formally ordained to the ministry, he often preached. In 1858 he entered his name as a student with a law firm in Cleveland, Ohio, and, though his study was carried on by himself at Hiram, he was admitted to the bar in 1861. Having taken some part as a Republican in the campaign of 1856, he was in 1859 elected to represent the counties of Portage and Summit in the State Senate. In August, 1861, he was appointed lieutenant colonel of volunteers, and in September colonel. In December he reported for duty to General Buell at Louisville, Ky., and was ordered in command of a brigade of four regiments of infantry, to repel the Confederates under General Marshall from the valley of the Big Sandy River. He accomplished the task in January, 1862, defeating Marshall in the battle of Middle Creek, and forcing him to retreat from the State. He was commissioned brigadier general, was placed in command of the Twentieth Brigade, and was

ordered to join General Buell. He reached, with his brigade, the field of Shiloh on the second day of the battle, and aided in the final repulse of the enemy, and next day, at the front with Sherman, took part in the attack on the enemy's rear guard. He participated in the siege of Corinth, and, after its evacuation, was detailed to rebuild the railroad to Decatur. In October, 1862, he served on a court of inquiry, and in November on the court-martial which tried General Fitz John Porter. In February, 1863, he joined the Army of the Cumberland under Rosecrans, just after the battle of Stone River, and was appointed chief of staff. In the discussion with regard to a forward movement, Garfield, as chief of staff, collated the written opinions of the seventeen corps, division, and cavalry generals, and summarized their substance with cogent arguments of his own. This report induced Rosecrans to move forward, contrary to the opinions of most of his generals, in the Tullahoma campaign, opening the way for the advance on Chattanooga. In the battle of Chickamauga, September 19 and 20, Garfield issued the orders, as chief of staff, and after the retreat of the right of the army rode under fire across country and took word to Thomas, commanding the left wing, of the necessities of the situation, and, under Thomas, assisted in retrieving the disaster. Garfield was sent to Washington with dispatches, and was promoted to the rank of major general for his heroism and splendid services in the battle.

Having been elected a Representative in Congress, he yielded to the solicitation of Lincoln, resigned his commission Dec. 5, 1863, and took his seat in the House of Representatives, where he joined the radical wing of the Republican party and served as member of the Military Committee until the close of the war. Largely through his efforts and arguments, the commutation clause of the Enrollment Act was repealed, and the draft enforced at a time when otherwise the army would have been fatally depleted. He was in New York studying the subject of finance when the news of Lincoln's assassination was received, and he stilled an excited and angry crowd in Wall Street with the memorable words "Fellow Citizens, God reigns, and the government at Washington still lives!" On March 16, 1866, as a member of the Committee of Ways and Means, he made an elaborate speech on the public debt and specie payments. In 1867-68, as also later, he took strong ground against the improper inflation of the currency. In December, 1867, he returned to the Military Committee as chairman, and held that place during the discussions on the reconstruction of the Southern States, delivering a speech Jan. 17, 1868, on the power of Congress in this relation, in which he severely criticized the action of the President, and the course of Major General Hancock in his celebrated "Order No. 40." He also sustained the motion to impeach the President. Later he was chairman of the Committee on Banking and Currency, and of a special committee to investigate the cause of the gold panic in September, 1869, which culminated in the crisis of "Black Friday." He also drafted a bill for the taking of the census of 1870, which was rejected by Congress, but was made the basis of the law passed ten years later for the census of 1880. In 1871-75 he served as chairman of the Committee on Appropriations, and in this capacity introduced

many important reforms. In 1873 charges of corruption were made against him in relation to the *Crédit Mobilier* (qv). These attracted attention throughout the country, and especially in his own congressional district. After earnest discussion he was renominated by the three-fourths vote of the convention, and was reelected by a large majority. The charges were renewed two years later, but were met with greater strength. In 1876 there was no opposition in the convention, and in 1878 he was reelected by a large majority. In the Forty-fourth Congress (1875-77) the Democratic party was in the majority. Garfield became a member of the Committee of Ways and Means. He was a frequent and careful speaker on important measures, and was recognized as one of the leaders of the minority. After the presidential election of 1876, he was one of the prominent Republicans requested to witness the counting of votes in Louisiana, and one of two Republican members appointed by the House of Representatives to sit in the Electoral Commission (qv). In December, 1876, he was nominated by his party for Speaker of the House of Representatives, and received the same nomination on two subsequent occasions. In the Forty-fifth Congress (1877-79) he earnestly advocated the resumption of specie payments, and spoke against the Bland Silver Bill. In January, 1880, he was elected by the Ohio Legislature to the United States Senate.

In the Republican National Convention at Chicago, June, 1880, he was an earnest advocate of the nomination of John Sherman of Ohio. The convention was divided between the advocates of General Grant and the opposition favoring James G. Blaine, John Sherman, and others. Garfield was not at first considered a candidate, but after more than thirty ballots without a choice, and earnest discussion in which, as well as in the advocacy of his favorite candidate, he won the admiration of delegates from all sections, he received the nomination. In November he received 214 electoral votes as against 155 for his opponent on the Democratic ticket, Gen. Winfield S. Hancock, and was inaugurated on March 4, 1881. With the single exception of Robert T. Lincoln, Secretary of War, his cabinet, headed by James G. Blaine, as Secretary of State, was drawn from that wing of the Republican party of which Garfield himself was a member, and which antagonized the so-called "Stalwarts" (qv), among whom the Vice President, Arthur, ranked himself. Both in public and in private, however, Garfield had signified his earnest desire to unite all factions in support of his administration, and the people in general were disposed to trust in his promises. On March 23 the President sent in the name of William H. Robertson as his appointee to the office of collector of the port of New York. As Mr. Robertson was known to be a political enemy of Senator Conkling, the leading spirit among the "Stalwarts," Conkling looked upon the nomination as an affront to himself, and when he found that he could not prevent the Senate from confirming it, he and his colleague, Thomas C. Platt, resigned their offices (May 16) and returned to New York to seek vindication by reelection. The New York Legislature, however, refused to reelect either one, and after a long and tedious struggle Messrs. Lapham and Warner Miller were chosen in their stead. Meanwhile the President's nomination had been confirmed in the Senate, and the breach between

the Stalwarts and the administration was hopelessly widened. On July 2 Charles J. Guiteau, a man whose vanity had been offended by the refusal of an office, and whose unbalanced brain had been excited by the dissensions in the Republican party, shot Garfield in the railway station at Washington. The crime excited the horror and execration of all parties alike, and foreign nations joined in the universal sorrow and indignation. For eighty days Garfield lingered between life and death. Towards the end of August his medical attendants felt that his last chance of recovery depended on his removal from the malarious climate of Washington, and on September 6 he was taken by train to Elberon, N. J., where he died thirteen days later, on the 19th. The assassin Guiteau was convicted after a protracted trial in which the only defense offered was that of insanity, and was hanged in the jail at Washington on June 30, 1882.

There is no satisfactory biography of Garfield. His writings were collected and edited by B. A. Hinsdale (Boston, 1882). There are numerous accounts of his life which were written for campaign purposes or immediately after his death, among them Conwell, *Life, Speeches, and Public Services of Gen. James A. Garfield* (Boston, 1880), Green, *A Royal Life, or the Eventful History of James A. Garfield* (Chicago, 1882), Lossing, *A Biography of James A. Garfield* (New York, 1882), Ridpath, *The Life and Work of James A. Garfield* (Cincinnati, 1882). Consult also Pedder, *Garfield's Place in History* (New York, 1882). Hinsdale, *President Garfield and Education* (Boston, 1882), Stoddard, *Hayes, Garfield and Arthur* (New York, 1889). Dodge, *Biography of James G. Blaine* (New York, 1895), is valuable for its Garfield-Blaine correspondence.

GARFIELD, JAMES RUDOLPH (1865-). An American lawyer and government official, the son of President Garfield. He was born at Hiram, Ohio, graduated at Williams College in 1885, and after studying law at the Columbia Law School was admitted to the bar in 1888. He served in the Upper House of the Ohio Legislature in 1896-99, and in 1903 became Commissioner of the Bureau of Corporations in the Federal Department of Commerce and Labor. During 1905 and 1906 he investigated the methods of the western beef packers and of the Standard Oil Company. President Roosevelt appointed him Secretary of the Interior in 1907, and before his retirement in 1909 he had completely reorganized the department. He was especially active in the land-office reforms. He took a prominent part in the organization of the Progressive party in 1912.

GARFIELD MONUMENT. A monument at Cleveland, Ohio, in memory of the martyred President, dedicated May 30, 1890. Its cost, \$135,000, was defrayed by popular subscription. The monument is a round tower, 50 feet in diameter and 148 feet high, containing a marble statue of Garfield.

GARFISH. See **GAR**.

GAR/GANEY. A European teal duck (*Querquedula circa* or *Anas querquedula*) resembling the American blue-winged teal (see **TEAL**), which never ranges far north of central Europe, but is known eastward to China. It is also called "summer teal."

GARGANO, gar-ga'nō (Lat. *Garganus*). A peninsula on the east coast of south Italy ex-

tending into the Adriatic, containing both Monte Gargano and Monte Sant' Angelo (Map Italy, C 2), separated from the rest of the Apennines by the broad valley of the Candelaio. Although now quite treeless, it was renowned for its oaks during Roman times. It is 54 miles long, 27 miles broad, and in Mount Calvo rises to the height of 3465 feet.

GARGAN'TUA, *Fr* pron gar'gan'tu'a' A leading character in Rabelais's satire, *The Grand and Inestimable Chronicles of the Grand and Enormous Giant Gargantua* (1531). He appears also in another *Gargantua* (1535), the first part of the work now known as *Gargantua and Pantagruel* (1532-64). See RABELAIS.

GARGA'PHIA The name of a valley near Plataea in Greece, the place where Actæon (qv) was torn to pieces by his own hounds (Ovid, *Met*, III, 156).

GAR/GARA, or **GAR/GARUS** See IDA.

GAR/GERY, JOE A simple, open-hearted blacksmith, in Dickens's *Great Expectations*.

GARGET, gar'gèt See MAMMIS.

GARGET ROOT. See PHYTOLACCA.

GARGLE, or **GAR/GARISM** (OF *gargouille*, throat, from Lat *gurgulio*, gullet). One of a group of medicines intended to be ejected from the mouth after having been churned about in the back part of the mouth and throat, to cleanse parts affected with discharges from ulcers, or to act as astringents (qv) or stimulants (qv) in sore throat. The best gargles are composed of boric acid solution, or alcohol and water, of chlorine water or solution of permanganate of potash, in putrescent cases, of alum or capsicum, when a stimulating effect is required, of tannin or oak-bark decoction with alum or borax, in case a pure astringent is needed. Gargles should never contain any drug that would act as a poison if swallowed, nor substances that would injure the teeth.

GAR/GOYLE (OF *gargouille*, *gargouille*, F1 *gargouille*, throat, connected with Lat *gurgulio*, throat). A projecting spout, discharging the

gutter outlets of Greek and Etruscan temples carved in marble or terra cotta into the form of lions' or other heads or grotesque faces. But it is more commonly understood to designate the long and grotesquely carved spouts characteristic of Gothic architecture, with heads of men, beasts, or birds in preposterous combinations with bodies, wings, and paws of monsters. Some of them are famous, notably those of Notre Dame in Paris. In late castellated buildings they frequently assume the form of small cannons projecting from the parapet. In modern times the use of metal pipes to convey the water from roofs has almost entirely superseded the use of gargoyles.

GARIBALDI (so called from its color, red having been worn by adherents of Garibaldi). A name in California for the red perch (*Hypsops rubicunda*).

GARIBALDI, ga'rè-bal'dé, GIUSEPPE (1807-82). An Italian patriot and liberator, born at Nice, July 4, 1807. He was a sailor's son and adopted the sea as his own calling and as early as 1830 was in command of a lug. It was about this time that he became interested in the Italian national movement, which afterward became the great passion of his life. He made the acquaintance of Mazzini and other leaders of Young Italy in 1833 and became imbued with an unquenchable hatred of despotism. He was compromised by his participation in the futile outbreak at Genoa in 1834 and fled to French territory, while his condemnation to death was published in Italy. He resumed his seafaring life and sailed to South America, where he took an active part in the struggle of the new Republic of Uruguay, against the Argentine Dictator, Manuel Rosas. He distinguished himself as an intrepid partisan leader on sea and land and contracted a romantic marriage with Anita, the remarkable woman who for several years shared his campaigns. Upon receiving news of the rising of northern Italy against Austria in 1848, Garibaldi hastened to Europe to share in the struggles of his countrymen. He bore an effective part in the whole of the Sardinian campaign as the commander of a volunteer corps. He then joined the revolutionary government at Rome and distinguished himself by his defense of the city against the French forces under Oudinot in June and July, 1849. After a retreat of unparalleled difficulty through districts occupied by Austrian forces, Garibaldi, accompanied by his heroic wife, set sail in a small fishing craft towards Venice, but being pursued by Austrian vessels, they were compelled to land where they could, and, not far from the shore, his wife, exhausted by the dangers and terrible exertions of their flight, expired in the arms of her husband. Garibaldi at length reached Genoa in safety and thence embarked for Tunis. He afterward lived on Staten Island, N Y, supporting himself by making candles in a factory, revisited South America, and commanded an American trading-vessel on the Pacific coast.

Returning to Europe in 1854, Garibaldi accepted the Sardinian monarchy as the hope of Italy, in the years preceding the War of 1859. As the head of an irregular auxiliary force of the Piedmontese army on the commencement of hostilities in 1859, his services were brilliant and effective, notwithstanding the limited scope assigned for his operations. In 1860 he undertook the most momentous enterprise of his career. After the disappointing

GARGOYLES

Decorating the sacristy of the cathedral of Notre Dame at Paris

water from the roof gutters of buildings. Gargoyles of various forms have been used in almost all styles of architecture. Early examples are found in the temples of Edfu and Denderah in Egypt. The name is sometimes applied to the

Peace of Villafranca had defeated the hope of liberation from the Austrian yoke just when it seemed to be approaching realization, the Italian people resumed the revolutionary operations which had been temporarily suspended in the hope that Italian unity would be accomplished through the efforts of Sardinia. In Sicily, early in 1860, disturbances broke out, and Francesco Crispi (q.v.) obtained from Garibaldi a promise of assistance. In fulfillment of this promise Garibaldi assembled at Genoa a volunteer force of 1070 patriots, and on May 5 set sail for the island of Sicily. On the 11th his two small transport steamers reached Marsala in safety, and the landing of his followers was successfully effected in sight and partially under the fire of the Neapolitan fleet. On the 15th, in the battle of Calatafimi, 3600 Neapolitan troops were routed by Garibaldi's small force, and this opening victory cleared the way to Palermo. On the 27th of the same month Garibaldi and his little army occupied the heights which commanded Palermo, and after a desperate conflict with the Royalist troops fought their way into the city, which for several subsequent days had to sustain a ruthless bombardment from the united fire of the Neapolitan garrison and fleet. The intervention of the British fleet, however, and the isolated and destitute condition of the garrison shut up in the forts, induced the Neapolitan general to capitulate (June 6), and on his departure with his troops Garibaldi remained in undisputed possession of the city and strongholds of Palermo. He issued a proclamation as Dictator in the name of Italy and Victor Emmanuel, armed the citizens, and on July 20, at the head of 2500 men, he gave battle at Milazzo to 7000 Neapolitans, who were completely defeated and compelled to evacuate that fortress. On the 25th the Neapolitans were driven back into Messina, into which Garibaldi made his triumphal entry on the 27th.

On August 19 Garibaldi crossed over into Calabria and was immediately joined by large bodies of volunteers from all directions, by whom he was accompanied on his memorable and eventful march to Naples. On September 5 his army, which then amounted to 25,000 or 30,000 men, occupied Salerno on the withdrawal of the Royalists, and on the 7th, amid the frenzied enthusiasm of the inhabitants, Garibaldi entered Naples, with only one or two friends, to prove to Europe that his advent was that of a welcome liberator and not of a conqueror. On the previous day the capital had sullenly witnessed the withdrawal of the King, Francis II, to the fortress of Gaeta. On the 1st of October the Royalist troops, numbering 15,000 men, advanced from Capua and attacked the whole line of Garibaldians spread along the Volturno. Finally the Royalists were driven back to Capua in disorder. Victor Emmanuel, at the head of the Sardinian army, now crossed the papal frontier, routed the troops under Lamoricière, and passed on into the Kingdom of Naples, where Garibaldi relinquished into his sovereign's hands the unconditional disposal of his army and absolute sway over the Neapolitan provinces. Francis II was now besieged by the Sardinian forces in his stronghold of Gaeta, where on Feb. 13, 1861, he was compelled to surrender to Victor Emmanuel. Garibaldi retired to Caprera, but in June, 1862, he raised a force of volunteers at Palermo, invaded Calabria, and marched upon Rome, which he be-

lieved must be wrested from the Pope before the unity of Italy could be accomplished. Victor Emmanuel, fearing that Garibaldi's attempt on Rome would bring about foreign intervention with disastrous consequences to Italy, dispatched an army to check his progress. Garibaldi was defeated by the Italian troops at Aspromonte (August 29) and taken prisoner, but was pardoned in October.

During the campaign of 1866 Garibaldi took the field and was engaged in operations against the Austrians in the Tirol. The year 1867 was disastrous for him. Impatient of the long delays in completing the unification of Italy and bitterly opposed to the papal power, he organized an open invasion of the Papal States, which the Italian government could not countenance. France came to the aid of the Pope, the Garibaldians were defeated at Mentana (November 3), and their leader was made a prisoner, but was afterwards allowed to return to Caprera, in the neighborhood of which a man-of-war was stationed to prevent his escape. He left Caprera to fight for the French Republic in 1870 and was nominated to the command of the irregular forces in the region of Burgundy. In 1871 he was returned a deputy to the French National Assembly which met at Bordeaux, but encountered such bitter criticism of his conduct during the war that he returned to Caprera. He entered the Italian Parliament in 1874. After much hesitation he accepted from the Parliament an annual pension of 10,000 lire. In 1880 Garibaldi was inveigled into an unhappy marriage with the Countess Raimondi, which was annulled in 1879, when he married Francesca, a peasant, who had been in his family's household for many years. He died at Caprera, June 2, 1882. Garibaldi's novels, *Clelia* and *Cantoni il volontario*, have little literary value. Of his two sons by his first wife the elder one, Menotti (1845-1903), fought with credit by his father's side, the younger, Ricciotta (1847-), was for some time deputy.

Bibliography. The first work in importance is naturally Garibaldi's own *Memoirs*, translated into English by Werner, and published under the title, *Autobiography of Giuseppe Garibaldi* (London, 1889). This authorized edition contains a supplement by Jessie White Mario and embodies all that Garibaldi wished to have published. Much is omitted which Garibaldi preferred not to discuss, and there are many minor errors, as the memoirs were written entirely from memory, without verification of dates and other facts. The volumes are, nevertheless, of great value. Dwight, *Life of General Garibaldi*, *Translated from his Private Papers* (New York, new ed., 1903), is also autobiographical. Consult also Bent, *The Life of Giuseppe Garibaldi* (London, 1881); G. Guérzon, *Garibaldi* (2 vols., Florence, 1882); Marriott, *The Makers of Modern Italy* (New York, 1889), which includes an Oxford lecture on Garibaldi; Stiafelli, *Garibaldi nella letteratura italiana* (Rome, 1901); F. Bidischini, *Garibaldi nella vita intima* (ib., 1907); R. Thurston, *Garibaldi and his Friends* (New York, 1907); Trevelyan, *Garibaldi's Defence of the Roman Republic* (ib., 1907); H. N. Gay, *Lincoln's Offer of a Command to Garibaldi* (ib., 1907); R. S. Holland, *Builders of Modern Italy* (ib., 1908); Trevelyan, *Garibaldi and the Thousand* (ib., 1909); A. V. Vecchi, *La vita e le geste di G. Garibaldi* (Bologna, 1910); Trevelyan, *Garibaldi and*

the *Making of Italy* (New York, 1911). See ITALY

GARIEP' RIVER See ORANGE RIVER

GARIGLIANO, ga're-ly'a'no (Lat *Liris*, earlier *Clanis*) A river of south Italy, 92 miles long, which rises in the Abruzzi as the Liri. It receives the waters of the Sacco, the Melsa (at this point changing its name to Garigliano), and the Rapido, and then flows sluggishly through marshes, past the ruins of Minturnæ, into the Gulf of Gaeta, 10 miles east of Gaeta. In the marshy swamps near the river Marius found concealment when pursued by Sulla. On its banks in 1503 the Spaniards, under Cordova, won a famous victory over the French. On Nov. 3, 1860, the Neapolitan troops north of the river were defeated by the Sardinians, and as a result the investiture of Gaeta began.

GARIGUE, ga'rég' (Fr, uncultivated land, Cat *garriga*, from *garreg*, oak) A term applied to the barren and rocky desert-like areas of the Mediterranean region, where neither shrubs nor trees give tone to the landscape.

GARLAND, AUGUSTUS HILL (1832-99) An American politician. He was born in Tipton Co., Tenn., but when less than a year old was taken by his parents to Arkansas. He was educated at St. Mary's College, Lebanon, Ky., and at St. Joseph's College, Bardstown, Ky., studied law, and was admitted to the Arkansas bar in 1853. He was a Whig, and opposed secession in the State Convention of 1861, but finally went with his State. He was elected to the provisional Congress of the Confederate States in 1861; was elected to the House of the Confederate Congress in 1862, and afterward was a member of the Confederate Senate until the close of the war. He then practiced law in Little Rock and carried to the Federal Supreme Court a case in which he got a decision against the "ironclad" oath that prevented those who had been in the service of the Confederacy from practicing in United States courts. In 1866 he was elected to the United States Senate, but was not seated. In the Brooks-Baxter "war" for the governorship of Arkansas, Garland aided Baxter. In 1874-77 he was Governor of Arkansas under the new constitution. He was a member of the United States Senate from 1877 to 1885 and in 1885-89 was Attorney-General of the United States in the cabinet of President Cleveland. From 1889 to 1899 he practiced law in Washington, D. C., and was stricken suddenly while pleading before the Supreme Court.

GARLAND, HAMLIN (1860-). An American poet and story writer, born at La Crosse, Wis. His youth was passed in various Western towns. He completed his school education at Cedar Valley Seminary, Osage, Iowa, in 1881, farmed and taught in Illinois and Dakota, went to Boston in 1884, and devoted himself to literature there till 1891, since when he has lived chiefly in the West. His first book was *Main-Traveled Roads* (1890), frankly realistic fiction. Somewhat similar in character are *A Spoil of Office* (1892), *Prairie Folks* (1893), *A Little Norsk* (1891), *Rose of Dutcher's Coolly* (1895). Other novels are *Jason Edwards* (1891), *A Member of the Third House* (1892), *Wayside Courtships* (1897), *Her Mountain Lover* (1901). He has also written a volume of criticism entitled *Crumbling Idols* (1894), *Prairie Songs* (1894), a volume of verse, *Ulysses Grant - His Life and Character* (1898), *The Eagle's Heart* (1900); *The Captain of the Gray*

Horse Troop (1902), *Hesper* (1903); *The Light of the Star* (1904), *The Tyranny of the Dark* (1905), *Victor Olney's Discipline* (1911), *Forester's Daughter* (1914). He became known for realistic work chiefly interesting for its local color.

GARLAND, LONDON CABELL (1810-95) An American educator, born in Nelson Co., Va. He graduated in 1829 at Hampden-Sidney College (Va.), in 1834 accepted the chair of physics in Randolph-Macon College (Va.), and from 1835 to 1847 was president of that institution. In 1847-53 he was professor of mathematics and astronomy in the University of Alabama, of which he was president from 1855 to 1866, after serving for two years as president of the Northeastern Southwestern Railroad, from 1866 to 1875 he was professor of physics and astronomy in the University of Mississippi, and in 1875 he became chancellor and professor of physics in Vanderbilt University. He resigned from the chancellorship in 1893. He published *Trigonometry, Plane and Spherical* (1841), one of a projected series of textbooks, the remaining manuscripts of which were destroyed by fire.

GARLIC (AS *gārlēac*, from *gār*, spear + *līac*, leek, so called from the shape of the leaves), *Allium sativum*. A bulbous-rooted plant, native of the East, cultivated from the earliest ages. The stem rises to the height of about 2 feet, is unbranched, and bears at the top an umbel of a few whitish flowers, mixed with many small bulbs. The leaves are grasslike, obscurely keeled, and not fistulous like those of the onion. The bulb, which is the part eaten, consists of about 12 to 15 ovate-oblong cloves or subordinate bulbs. It has a penetrating and powerful onion-like odor and taste. It is in general use as a condiment with other articles of food in southern Europe, but has only a limited use in the United States. Garlic, or its fresh juice, is also used in medicine. It owes its properties chiefly to oil of garlic. The cultivation of garlic is extremely easy, it is generally propagated by its cloves. Many species of the genus *Allium* are popularly called garlic, with some distinctive addition. *Allium oleraceum* is sometimes called wild garlic in England, and its young and tender leaves are used as a potherb. Its leaves are semicylindrical, and grooved on the upper side, and its stamens are all simple. In America wild garlic is *Allium vineale*, a perennial also known as field garlic and wild onion. This is a serious weed pest in pastures, hay and grain fields of the eastern United States from New York to South Carolina. When eaten by cattle, it imparts a very disagreeable odor and flavor to the milk, butter, cheese, and other dairy products. The species has hollow, thread-like leaves surrounding a slender scape, which bears an umbel of greenish-white or rose-colored flowers in midsummer, which are followed in early autumn by either seeds or bulblets. The easiest way to eradicate it in fields is to alternate heavy cropping with clean cultivation. See ALLIUM, ALLIACEOUS PLANT, Plate of ONIONS, etc.

GARLIC, OIL OF When cloves of garlic are distilled with water, about 0.2 per cent of a brown heavy oil, with an acrid taste and a strong disagreeable smell, passes over. By careful rectification from a salt-water bath, about two-thirds of the oil may be obtained in the form of a yellow liquid, which is lighter than water, and which, when treated with fused calcium chloride (in order to dry it), and subse-

quently distilled from fragments of potassium, passes over pure and colorless as allyl sulphide, an organic compound of very considerable interest, whose formula is $(C_3H_5)_2S$. The crude oil also contains a compound of allyl still richer in sulphur than the sulphide. Sulphide of allyl exists not only in oil of garlic, but also in the oils of onions, leeks, cress, alliarria, radishes, asafetida, etc. It is a light, clear, pale-yellow oil, with a penetrating odor of garlic, it boils at $140^\circ C$ and dissolves readily in alcohol and ether.

GARMAN, SAMUEL (1846-) An American zoologist, born in Indiana Co, Pa. He graduated in 1870 at the Illinois State Normal University, was principal of the Mississippi State Normal School in 1870-71, was a pupil of Louis Agassiz in special work in natural history (1872-73), and received appointment as assistant in the departments of herpetology and ichthyology at the Museum of Comparative Zoology, Cambridge. His writings include *Fishes and Reptiles from Lake Titicaca* (*Bulletin of the Museum*, vol. III, 1871-76, No 11); (joint author) *Exploration of Lake Titicaca* (ib, vol III, 1871-76, Nos 11, 12, 15, and 16); *On Certain Species of Chelonoidæ* (ib, vol VI, 1879-80, No 6); *New Specimens of Selachians in the Museum Collection* (ib, vol VI, 1879-80, No 11); *The Reptiles and Batrachians of North America* (*Memoirs of the Museum*, vol VIII, 1883, No 3); *Reptiles and Batrachians of the West Indies* (1887, printed in the *Bulletin of the Essex Institute* and in monograph form); *Deep Sea Fishes* (1899).

GARNEAU, gar'no', ALFRED (1836-1904). A Canadian poet. He was born in Quebec and was educated at the Quebec Seminary, after which he engaged in journalism. He later studied law and was called to the Lower Canada bar in 1860, but entered the civil service in 1861 and in 1873 was appointed chief French translator to the Dominion Senate. He wrote poems and sonnets distinguished by beauty of form and delicate feeling, they were collected and published in a volume two years after his death at Montreal. In 1882 he published a fourth edition of the *Histoire du Canada*, by his father, François Xavier Garneau (qv). He also published *Les seigneurs de Frontenac* (1866). He thrice declined election to the Royal Society of Canada—His son, HECTOR GARNEAU (1872-), born in Ottawa, studied law and was admitted to the bar, but left the legal profession for literature and journalism, contributed weekly *chroniques* to *Le Monde*, literary criticisms to *Les Nouvelles*, and published *Poésies d'Alfred Garneau* (1906), the collected poems and sonnets of his father.

GARNEAU, FRANÇOIS XAVIER (1809-66) A Canadian historian, born in Quebec. He was educated at the Quebec Seminary and was admitted in 1830 as a notary. In 1831 he visited France and England, and while in London the brilliant literary society into which he was admitted strongly influenced his aspirations to authorship. In 1833 he returned to Lower Canada, was appointed translator to the Legislative Assembly of that province, and from 1844 to 1864 was secretary of the city of Quebec. He published an *Histoire du Canada, depuis sa découverte* (1845-48; 2d ed, revised and corrected, 1852, 3d ed, 1859), of which an unsatisfactory English translation by A. Bell appeared at Montreal in 1860 (2d ed., 1862). He

also wrote *Voyage en Angleterre et en France* (printed in the *Journal de Québec* in 1855) and contributed to periodicals numerous poems, collected in part in Huston's *Recueil de littérature canadienne* (Montreal, 1848). Garneau's history contains an account of all the French colonies of North America from their origin to the Treaty of 1763, and from the latter date the narrative is confined to Canada proper. Notwithstanding the fact that Garneau had in part a controversial aim, his history remains a standard work. In October, 1912, a monument to Garneau, by the French sculptor Chevré, was unveiled in Quebec. Consult CASCIAN, *Biographie de F X Garneau* (Montreal, 1886). See CANADIAN LITERATURE.

GARNER, JAMES WILFORD (1871-) An American professor of political science, born in Pike Co, Miss. He graduated from the Mississippi Agricultural and Mechanical College in 1892 and studied at the University of Chicago (Ph M, 1900) and at Columbia University (Ph D, 1902), where he was a lecturer in history in 1902-03. He was an instructor in political science at the University of Pennsylvania in 1903-04 and afterward professor of the same subject at the University of Illinois. He served as collaborator for the French *Revue Politique et Parlementaire*, contributed to the NEW INTERNATIONAL ENCYCLOPÆDIA, and was editor in chief of the *American Journal of Criminal Law and Criminology* in 1910-11. He is author of *Reconstruction in Mississippi* (1901), *The History of the United States*, with Henry Cabot Lodge (4 vols, 1906), *Introduction to Political Science* (1910), *Government in the United States, National, State, and Local* (1911, 3d ed, 1914).

GARNET (ME. garnet, grenat, from OF *grenat*, It *granato*, from ML *granatus*, garnet, either on account of its crimson color, from ML *granata*, cochineal insect, supposed to be a seed or berry, or from Lat. *granatum*, pomegranate, as resembling in shape and color pomegranate seeds, in either case from Lat *granum*, grain). An orthosilicate of varying composition that crystallizes in the isometric system. Some varieties of garnet are not quite so hard as quartz, others are considerably harder. When crystallized, garnets have a vitreous to resinous lustre. They occur in schists and slates, and in gneiss, granite, and limestone, and sometimes in lava and serpentine, being usually of secondary origin. Garnets are divided by Dana into three groups, viz, aluminium garnets, iron garnets, and calcium-chromium garnets.

The first group includes *grossularite*, or calcium-aluminium garnet, *pyrope*, or magnesium-aluminium garnet; *almandite*, or iron-aluminium garnet, and *spessartite*, or manganese-aluminium garnet. *Grossularite*, sometimes called *essonite*, or *hessonite*, or *cinnamon stone*, varies in color from white to different shades of yellow and brown, and from pale green to emerald green. Gem varieties of the green grossularite are obtained in Siberia, and the brown-colored ones, or cinnamon stones, are found in Ceylon, where they are sometimes mis-called *hyacinth*. In the United States green varieties have been found at Brewster, N Y., and red and yellow varieties in Phippsburg, Me., and Warren, N H., also at various places along the Alleghany Range. A rose-red variety of grossularite, called *rose garnet*, from Xalostoc, Mexico, is used as an ornamental material when cut and polished. *Pyrope*,

which is called *precious* or *Oriental garnet*, is of a deep-red to black color. The best-known varieties are found at a number of places in Bohemia, excellent specimens are also obtained at the Kimberley mines in South Africa. In the United States the finest pyrope garnets come from Arizona, southern Colorado, and New Mexico, where they are often called *Arizona rubies*, while the varieties from South Africa are known as *Cape rubies*. Almandite, which is the common garnet, varies in color from deep red to black. The transparent scarlet and crimson varieties, when cut, are called *carbuncles*, these were highly prized by the ancients. According to the Talmud, the only light that Noah had in the Ark was furnished by carbuncles. The finest almandite garnets are from Siam, India, from Burke, Caldwell, and Catawba counties, N C, and from Idaho. The specimens found in the United States, although inferior to those from India, are generally of good enough quality to be used as watch jewels.

Spessartite is of a dark hyacinth-red to brownish-red color, it is found in the Ural Mountains and in Amelia Co, Va.

The second group comprises the garnets which have the general name of *andradite*. They range in color from light yellow through various shades of green to red, brown, and black, and according to their colors they have special names, among which are *demantoid* for the green variety and *melanite* for the black variety. They are found variously throughout the world, chiefly along mountain ranges.

The last group is formed by *uvarovite*, or calcium-chromium garnet, which is of an emerald-green color, and is found in Siberia as well as at various localities in Canada.

According to their transparency and richness of color, garnets are cut and used for gem purposes. Among the ancients garnets—especially the precious varieties—were cut and polished into various ornaments. Pliny describes a vessel formed from carbuncles, having the capacity of a pint. A number of fine ancient specimens of engraving on garnets are to be found in the larger collections. The common garnet is frequently ground and used for polishing and cutting other stones and also for the manufacture of sandpaper. About 4000 tons of garnets for abrasive purposes—chiefly in the shoe industry—are produced annually in the United States from mines principally situated in New York. Garnets of the gem variety have been made artificially in Paris by the fusion of their constituents. See GEMS, LEUCITE.

GARNET, or GARNETT, HENRY (1555-1606). An English Jesuit, educated at Winchester and in London. He joined the Society of Jesus in 1575 and became a superior of the order in England in 1587. He is chiefly remembered for his connection with the Gunpowder Plot. His participation in that conspiracy consisted of his concealment of knowledge of the intended crime, gained in the confessional—an offense punishable by life imprisonment and forfeiture of property. He was, however, convicted on the charge of high treason instead of misprision of treason and was executed. Considerable controversy resulted between Roman Catholic and Protestant writers, and disputes arose among Jesuits themselves as to Garnet's justification or blame in concealing the plot that had become known to him through the religious rite of the confession.

VOL. IX.—31

GARN'NET, HENRY HIGHLAND (1815-82). An Afro-American clergyman and orator, born a slave in New Market, Md. He was a pure-blooded negro of the Mendigo tribe. When he was 10 years old, his parents escaped from slavery and settled in New York City. He was educated at Canaan Academy, New Hampshire, and graduated at Oneida Institute, near Utica, N Y, in 1840. He studied theology, and in 1842 became pastor of a Presbyterian church in Troy. A leader of the Abolition movement, he published the *Clarion*, a weekly paper devoted to the cause and in 1850-53 lectured in Great Britain on slavery. He was a delegate to the Peace Congress at Frankfort in 1851 and in 1853-55 was a missionary of the United Presbyterian Church of Scotland in Jamaica. He was pastor of the Shiloh Presbyterian Church in New York City in 1855-81, except that in 1865-69 he had a charge in Washington, D C. President Garfield appointed him Minister Resident and Consul General for the United States in Liberia, but Garnet died a few months after taking charge of his new post.

GARN'NETT. A city and the county seat of Anderson Co, Kans, 85 miles southwest of Kansas City, Mo, on the Missouri Pacific and the Atchison, Topeka, and Santa Fe railroads (Map Kansas, G 6). It is in the gas and oil region, has considerable trade in agricultural products, and manufactures furniture, flour, lumber, etc. Garnett adopted the commission form of government in 1913. The water works are owned by the city. Pop, 1900, 2078, 1910, 2334.

GARNETT, JAMES MERCER (1840-1916). An American educator, born at Aldie, Va. He graduated at the University of Virginia in 1859, served in the Confederate army and rose to be captain of artillery, and in 1867 was appointed professor of Greek in the Louisiana State University. Subsequently he was instructor in ancient languages and mathematics at the Episcopal High School (near Alexandria, Va.). From 1870 to 1880 he was president of St John's College (Annapolis, Md.), and from 1882 to 1896 professor of English literature in the University of Virginia. He was elected president in 1890 of the American Dialect Society and in 1893 of the American Philological Association. He edited *Selections in English Prose* (1891) and published a *Translation of Beowulf* (1882, 6th ed, 1900), a literal version in metre resembling the original, *Elene and Other Anglo-Saxon Poems* (1889-1900), and a *History of the University of Virginia* (1901).

GARNETT, RICHARD (1835-1906). An English librarian and author, born in Lichfield. He entered the service of the British Museum under Panizzi when he was 16 years old, became superintendent of the reading room in 1875, and from 1890 to 1899, when he retired, was keeper of printed books. From 1881 until 1890 Dr Garnett had charge of the preparation and printing of the great catalogue of authors of the museum. He acted as president of the Library Association of the United Kingdom and of the Bibliographical Society. In his professional field he edited the series of manuals entitled the "Library Series," to which he contributed *Essays in Librarianship and Bibliography* (1899). He published several volumes of verse, including *Primula* (1858), *Io in Egypt* (1859), *Collected Poems* (1893), and *The Queen and Other Poems* (1901). To the "Great Writers Series"

he contributed lives of *Carlyle* (1887), *Emerson* (1888), and *Milton* (1890). Among his other works are *Relics of Shelley* (1862), *The Twilight of the Gods and Other Tales* (1888), *Age of Dryden* (1895), *A History of Italian Literature* (1898), *Essays of an ex-Librarian* (1901), *William Shakespeare, Pedagogue and Poacher* (1904). He was editor of the *International Library of Famous Literature*, and contributed to the *Dictionary of National Biography* and the *Encyclopædia Britannica*. With Edmund Gosse he published in 1903-04 an *English Literature*, elaborately illustrated.

GARNETT, ROBERT SELDEN (1819-61). An American soldier, born in Essex Co., Va. He graduated at West Point in 1841, in 1841-42 was on duty on the northern frontier during the Canadian border troubles, was instructor in infantry tactics at West Point (1843-44), took part in the military occupation of Texas (1845-46), and fought through the Mexican War. From 1846 to 1849 he was aid-de-camp to Major General Taylor and in 1847 was brevetted major for gallant and meritorious conduct at Buena Vista. In 1852-54 he was commandant at West Point, in 1855 he became major, and in 1861, resigning from the United States army, he was appointed a brigadier general in the Army of the Confederate States. In command of the forces in western Virginia, he fell back before the superior numbers under Major General McClellan, was pursued and overtaken at Carrick's Ford (q.v.), and was killed in the ensuing combat (July 13, 1861).

GARNHAM, DR. See GAYNHAM.

GARNIER, gar'nyá', CLÉMENT JOSEPH (1813-82). A French economist. He was born at Beul (Alpes Maritimes), studied at the Ecole du Commerce, and was appointed professor of mathematics and political economy in that institution. In 1842 he assisted in founding the French Society of Political Economy and in 1846 the French Free-Trade Association. From 1845 to 1855 and from 1866 until his death he was editor of the *Journal des Economistes*. He wrote a number of works which did much to popularize economic science in France, and which include an *Introduction à l'étude de l'économie politique* (1843), *Richard Cobden, les ligueurs et la ligue* (1846), *Etude sur les profits et les salaires* (1848), *Traité des finances* (1862).

GARNIER, (MARIE JOSEPH) FRANÇOIS (1839-73), usually called Francis Garnier. A French officer and explorer, born at Saint-Etienne. He served under Admiral Charner in the war with China (1860-62), and remained in Cochin-China as a civil officer. In 1866 he accompanied Captain Doudart de Lagrée's exploring expedition from the coast of Cambodia through Yunnan to Shanghai. On the death of the commander Garnier successfully brought the expedition along the Yang-tse-kiang to the coast. A remarkable account of the expedition is given in his *Voyage d'exploration en Indo-Chine* (1873). After taking part in the defense of Paris in 1870-71, which he described in his journal *Le siège de Paris* (1871), he again went to the East. Further explorations were followed by a commission from the Governor of Cochin-China to negotiate a treaty with the Viceroy of Tongking. The Viceroy, however, refused to negotiate, and Garnier, with 120 men, took Hanoi, the capital, and won further successes, but reinforcements were delayed, the

party fell into an ambushade, and Garnier was killed. Consult Yule *Ocean Highways* (1874), and Petit, *Francis Garnier* (Paris, 1885).

GARNIER, JEAN JACQUES (1729-1805). A French historian, born at Gorron (Mayenne). Having arrived at Paris on foot, he entered the Minorite Order and in 1760 became adjunct professor of Hebrew in the Collège de France, and in 1768 inspector there. In 1761 his *Traité de l'origine du gouvernement français* was crowned by the Academy of Inscriptions, to which he was elected as associate. He succeeded Claude Villaret as historiographe, and wrote a continuation (1765-85) of the *Histoire de France* of Velly and Villaret, an interesting work on *L'Homme de lettres* (1764), and a treatise, *De l'éducation civile* (1765).

GARNIER, JEAN LOUIS CHARLES (1825-98). A French architect, born in Paris. He studied under Léveil and Lebas at the Ecole des Beaux-Arts, and won the Prix de Rome for architecture in 1848. Afterward he traveled extensively in Greece, Turkey, and Italy. In 1859 he won the competitive prize for plans for the new Opera House in Paris, which was in process of building from 1861 to 1875. Although somewhat overornate in detail, this is a design of remarkable merit and has exercised a notable influence on French monumental façade composition. Its staircase is especially magnificent, and its foyer (see FOYER) the largest and most sumptuous in the world. Garnier also built the Conservatory at Nice, the Casino at Monte Carlo, designed the tombs of Offenbach, Bizet, and Victor Massé in Paris, and, with Debacq, built the De Luynes Mortuary Chapel at Dampierre. He wrote *Restauration des tombeaux des rois Angevins en Italie* (with 54 plates in folio), *A travers les arts* (1869), *Etude sur le théâtre* (1871), *Le nouvel Opéra de Paris* (1875-81), *Monographie de l'observatoire de Nice* (1892), *Histoire de l'habitation humaine* (1894), with Ammann. He was a member of every architectural society of importance in France and abroad, and in 1889 was made commander of the Legion of Honor.

GARNIER, ROBERT (c.1534-c.90). A French dramatic poet, born at La Ferté-Bernard. He studied law at Toulouse and held various positions under the state before he gave himself entirely to the writing of drama. His plays have little real action, and that little is clogged by the long speeches and interminable dialogues of the characters. Nevertheless, in his later works, when he was less under the influence of Seneca, there is a freshness and vigor that suggests Corneille, and he is the greatest French dramatic author of his century. His works include *Poince épouse de Brutus* (1568), a tragedy, and *Sédécus, ou les Juives* (1583). He wrote a volume of poems, *Les plaintes amoureuses* (1565), which is now lost. His collected works were published in four volumes by Foerster at Heilbronn in 1882-83. Consult Bernage, *Etude sur Robert Garnier* (Paris, 1880), Mysin, *Robert Garnier and the antique Tragedy* (Leipzig, 1891), Faguet, *La tragédie française au XVII^e siècle* (Paris, 1883).

GARNIER-PAGÈS, gar'nyá' pa'zhès', ETIENNE JOSEPH LOUIS (1801-41). A French politician, born in Marseilles. He was admitted to the bar, took part in the revolution of 1830, in 1831 became member for Isère in the Chamber of Deputies, and in 1832 was one of the Liberals associated with Odilon Barrot in the prepar-

tion of the famous *Compte rendu*, in protest against the attitude of the Conservative Ministry. He was not reelected in 1834, but was returned in 1835 and 1839.

GARNIER-PAGÈS, LOUIS ANTOINE (1803-78). A French statesman, born in Marseilles. He fought in the July revolution of 1830, was chosen to the Chamber of Deputies in 1841 to succeed his stepbrother, Etienne Joseph Louis, and took high rank as leader of the opposition and a promoter of reform agitation. In February, 1848, he became a member of the provisional government and mayor of Paris, and in March, Minister of Finance. Circumstances forced him to extreme measures, of which the most unpopular was the celebrated tax of "45 centimes." In May he was one of the executive committee of five appointed by the Assembly. In 1864 he was a member of the Corps Législatif, devoting himself as such especially to financial matters, and until the fall of the Empire had a part in the most important acts of the Republican opposition. Having been reelected in 1869, he vigorously opposed war with Prussia, but, though a member of the Government of National Defense, he played an unimportant rôle, and retired to private life in 1871. He published *Histoire de la Révolution de 1848* (8 vols, 1860-62), *Histoire de la commission exécutive* (1869-72), *L'Opposition et l'empire* (1872).

GARNISHMENT (from *garnish*, from OF *garnir*, *guarnir*, *warnu*, Fr *garnir*, from OHG *warnōn*, Gei *Warnen*, AS *wearnian*, Eng *warn*). A process by which chattels, rights, or credits belonging to the defendant in an action, but which are in the possession of a third person, are seized and applied to the plaintiff's claim. The peculiarity of the process is indicated by the etymology of the term, garnishment meaning a warning or notice given to the third person not to pay money or turn over property to the defendant. It has been called an equitable attachment of the claims or assets of a defendant in the hands of a third person. It is not a common-law process and is regulated by statute in the States where it exists. Such statutes are, as a rule, strictly construed, and their requirements must be fully and fairly complied with by a plaintiff who would take advantage of them. It is held that only such property in the hands of the third party—the garnishee—is liable to this process as is not incumbered with trusts, and such as may be handed over or paid by the officer executing the process, under the order of the court and free from incumbrances, which can be properly determined and adjusted only by equity tribunals. Garnishment proceedings reach only such debts as are owing to the defendant at the time the process is served. A judgment obtained in a Federal court cannot be garnished in an action in a State court. Such garnishment would operate to oust the Federal court of its proper control over its own judgments. Debts owing by a public corporation to the defendant are not garnishable. If they were, municipal authorities might be compelled to occupy their time over contests in which the public had no interest. It may be laid down as a general rule that a person deriving his authority from the law to receive and hold property cannot be garnished for the same while holding it in that capacity.

As soon as the process of garnishment is duly

served, the garnishee holds the property as a stakeholder or trustee. Accordingly garnishment is known in some States as 'trustee process.' Consult Rood, *Garnishment* (St Paul, 1896), and the authorities referred to under ATTACHMENT.

GARNSEY, ELMER ELLSWORTH (1862-) An American mural painter. He was born at Holmdel, Monmouth Co., N. J., and studied at Cooper Union in New York and under Maynard and Francis Lathrop. He made an important part of his work the arranging of color schemes for important mural decorations. Among the buildings to which he has thus contributed are the Library of Congress, the public libraries of Boston and St. Louis, and the library of Columbia University, Memorial Hall, Yale University, the State capitols at St. Paul, Minn., Des Moines, Iowa, and Madison, Wis., and the Custom House, New York. He was elected a member of the Society of Mural Painters and of the American Institute of Architects and received awards from the World's Fair, Chicago (1893), and the Paris Exposition (1900).

GARO (ga'rō) or **GARROW HILLS**. Mountains overhanging the valley of the Brahmaputra, which gave them name to a western district of the Hill Division of Assam (q.v.), 3350 square miles in area, and reach their highest altitude at 4650 feet. The region has deep and extensive valleys, well watered and very fertile. Dense forests containing valuable sal trees cover the hills, and coal is found in large quantities. Pop. (district), 1901, 138,300, 1910, 153,936. See GAROS.

GAROFALO, ga-rō'fa-lō, properly **BENVENUTO TISIO**, or **TISI** (c.1481-1559). A Ferrarese painter of the Renaissance. He was born at Garofalo, near Ferrara, studied under Panetta at Ferrara and under Boccaccino at Cremona and in 1499 went to Rome, where he became the pupil of Giovanni Baldini. After this he painted with Lorenzo Costa at Mantua. From 1509 to 1515 he was in Ferrara with Dosso Dosso and then returned to Rome. Here he was an ardent admirer of Raphael. He was then recalled to Ferrara, where he executed for the Duke Alphonso I some of his best paintings and was active until 1550, especially in fresco work, which has since been destroyed. For the last nine years of his life he was blind. His art is especially well represented at Ferrara. In the Museum are his "Massacre of the Innocents," "Resurrection of Lazarus" (1534), "Adoration of the Magi" (1544), and many other works, in the cathedral his "Virgin Enthroned" (1524) and fine frescoes of Saints Peter and Paul, and in San Francesco the "Kiss of Judas," with two fine portraits of donors. His works are also numerous at Rome in several of the palaces (including Borghese and the Vatican) and in the museum of the Capitol, at Naples, and in the Breia (Milan). Outside of Italy the largest collection of his works is at Dresden, which possesses seven examples, including a Bacchanale, he is also represented in the galleries of Berlin, London, St. Petersburg, and in the Metropolitan Museum, New York. His finest works were executed in the manner of the Ferrarese school, to which he afterward added a certain suavity, gained probably from his admiration of Raphael. His coloring is peculiarly vivid and attractive, often showing Venetian influence, and his pictures are most harmoniously composed.

GAROFALO, RAFFAELE, BARON (1852-) An Italian jurist and criminologist, born at Naples and educated in the university of that city. He served as president of the Civil Court of Ferrara, as justice of the Court of Appeals of Naples, and as professor of law and criminal procedure at the University of Naples. In 1892 he had charge of the preparatory work of editing a new code of penal procedure. Besides serving as a collaborator on the *Flegrea*, he is author of *Criminologia studio sul delitto e sulla teoria della repressione* (1885, 2d ed, 1891, Eng trans by Robert Wyness Millar, 1914) and *Riforma della procedura penale in Italia* (1889).

GARON BUSH See DAPHNE

GARONNE, ga'ŕün' (Lat *Garumna*). The principal river in the southwestern part of France, rising within the Spanish frontier in the Val d'Aran, at the base of Mount Maladetta, in the Pyrenees (Map France, S, F 5). About 26 miles from its source it enters France in the Department of Haute-Garonne, flows in a generally northeasterly course to Toulouse, then bends to the northwest and enters the Bay of Biscay at Point de Grave. It forms an estuary after uniting with the Dordogne, 20 miles below Bordeaux, which is called the Gironde. Ocean steamers ascend to Bordeaux, and the river is navigable beyond Toulouse, which is connected with the Mediterranean by the Canal du Midi (qv). Total length, nearly 400 miles. With its 32 tributaries the Garonne drains an area of about 38,000 square miles and forms a system of navigable waterways of over 1400 miles, which is greater than that of any other French river. The Garonne is subject to destructive overflows. During the inundation of 1875 more than 7000 houses were destroyed. Consult L. Barron, *Les fleuves de France La Garonne* (Paris, 1901).

GARONNE, HAUTE See HAUTE-GARONNE

GAROS, ga'rōz. A people inhabiting the region of the Garo Hills in western Assam, India. They are said to be related, physically and linguistically, to the Thai (Burmese, Siamese, etc.) stock, but have a considerable Aryan admixture, particularly in language. They have many interesting social customs, among them courtship by the woman, bridegroom capture, etc. Besides the article by Godwin-Austen on "The Garo Hill Tribes," in the *Journal of the Anthropological Institute* (London), for 1871, reference may be made to Dalton, *Descriptive Ethnology of Bengal* (Calcutta, 1872). A Bengali-Garo Dictionary was published by Ramkhe (Tuva, Assam, 1887). Consult Crooke, *Natives of India* (London, 1907).

GAR PIKE See GAR

GARRARD, gār'ard, JAMES (1749-1822). One of the early governors of Kentucky, born in Stafford Co., Va. He was a militia officer in the Revolutionary War and a member of the Virginia Legislature. In 1783 he removed with the early settlers to Kentucky, settling near the present Paris, for a time he was a Baptist minister and afterward a Unitarian. In 1791 he drew up a petition for a constitutional amendment forbidding slavery in Kentucky. He was a member of the convention which framed the first constitution for Kentucky and from 1796 until 1804 was Governor of the State. In 1798, in his message to the Legislature (November 7), he attacked the Alien Law in terms very like Jefferson's in the Kentucky Resolutions. A county in Ken-

tucky formed in 1796 bears his name. Consult Des Cognets, *Geoginor Garrard His Descendants* (Lexington, Ky, 1898).

GARRARD, KENNEDY (1828-79). An American soldier, born in Cincinnati, Ohio. He graduated at West Point in 1851, was on frontier duty and topographical duty for the most part until 1861, was captured in April, 1861, by Texan troops, and was exchanged in August, 1862. In 1861-62, while on parole, he was commandant at West Point. He became a colonel of volunteers in September, 1862, served in the Rappahannock campaign and the Pennsylvania campaign, at Fredericksburg, Chancellorsville, and Gettysburg, was promoted brigadier general of volunteers in July, 1863, and major in the regular (cavalry) service in November, served in the Rapidan campaign from October to December, 1863, and was in charge of the Cavalry Bureau at Washington. In 1864 he commanded the Second Cavalry Division of the Army of the Cumberland in the various operations about Chattanooga and in the invasion of Georgia, and from December, 1864, to July, 1865, the Second Division of the Sixteenth Army Corps in the battle of Nashville, the capture of Blakely, and the movement upon Montgomery. In December, 1864, he was brevetted major general of volunteers and brigadier general in the regular army, and on March 13, 1865, received the brevet of major general, U S A. He commanded the District of Mobile from August to September, 1865, was mustered out of the volunteer service in August, 1865, and acted as assistant inspector general of the Department of the Missouri from March to November, 1866, when he resigned from the service. He was a member of the Cincinnati Plotting Commission (1871-79) and of the City Sewage Commission (1875-79). He wrote *Molan's System for Training Cavalry Horses* (1862).

GAR/RAWAY'S COFFEEHOUSE. A famous London coffeehouse, in Exchange Alley, Cornhill, which existed for over 200 years. It was originally kept by one Garway, a dealer in coffee and tobacco. It is the scene of the first tea sales in London, also of the meetings of the shareholders of the South Sea Scheme.

GAR/RETSON, AUSTIN BRUCE (1856-) An American labor-union official. He was born at Winterset, Iowa, and was educated in the Osceola (Iowa) high school. He served as a conductor on various railroads until 1889, when he became vice president of the Order of Railway Conductors, in 1906 he was elected president of the order. He also became president of the mutual-benefit department of the order, editor in chief of the *Railway Conductor*, and a member of the executive committee of the National Civic Federation. In 1912 he was a member of the Federal Commission on Industrial Relations. He was one of the leaders in the threatened railroad strike of 1913, which was successfully arbitrated.

GARRETSON, FREEBORN (1752-1827). An American pioneer Methodist, born in Maryland. In 1775 he became an itinerant preacher for the Methodist denomination and in 1784 was elected presiding elder. He also served four years as a volunteer missionary in Nova Scotia, and with 12 young ministers he organized the evangelical work in western New England and in eastern New York.

GAR/RETT. A city in Dekalb Co., Ind., 18 miles north of Fort Wayne, on the Baltimore

and Ohio Railroad (Map Indiana, G 2) It is a railway division point and has machine shops, car shops, and a roundhouse The city contains also a Carnegie library and the Sacred Heart Hospital Under a charter of 1892 it is governed by a mayor and a unicameral council The water works and electric-light and heating plants are owned by the municipality Pop, 1900, 3910, 1910, 4149

GARRETT, ALEXANDER CHARLES (1832-1924) An American Protestant Episcopal bishop, born in Ireland He graduated at Trinity College, Dublin, in 1855, was curate of East Worldham, Hampshire (1856-59), and until 1869 served as a missionary in British Columbia In 1870 he became rector of St James's Church, San Francisco, and in 1872 dean of Trinity Cathedral, Omaha In 1874 he was appointed Missionary Bishop of northern Texas and retained the bishopric after the formation of the diocese of Dallas He wrote *A Charge to the Clergy and Laity of North Texas* (1875), *Historical Continuity* (1875), and the *Baldwin Lectures on the Philosophy of the Incarnation*

GARRETT, JOÃS DE ALMEIDA See **ALMEIDA-GARRETT**

GARRETT, JOHN WORK (1820-84) An American railroad president, born in Baltimore After pursuing a course of study in Lafayette College he entered, at the age of 19, upon business life in a firm with his father and brother—Robert Garrett and Sons He became identified with the Baltimore and Ohio Railroad as a director in 1857, and as president in 1858, and during the remainder of his life devoted his energies to the development of this system Under his administration the line became one of the most important means of communication between the seaboard and the interior During the Civil War the road, which followed the Potomac River along a great distance of its way, was crossed and recrossed by the contending armies and was frequently broken by the Confederate forces But the repairs were quickly made, and the road continued to be of the greatest service to the United States government in the transportation of troops and materials Mr Garrett was closely associated with Johns Hopkins (founder of the university and the hospital which bear his name) He was one of the original trustees of the Johns Hopkins Hospital and University and a liberal contributor to the Young Men's Christian Association, the Maryland Institute, and the Association for the Improvement of the Condition of the Poor His son Robert succeeded to the presidency of the Baltimore and Ohio Railroad in 1884 Consult Scharf's *History of Baltimore City and County* (Philadelphia, 1881)

GARRETT, THOMAS (1789-1871) An American merchant, distinguished as a philanthropist and reformer He was born in Upper Darby, Pa., of Quaker parentage, learned the trade of a cutler and scythe maker, and in 1820 removed to Wilmington, Del., where he became an iron and hardware merchant Here, also, he avowed his antislavery opinions without reserve and became widely known as the friend of the slaves and of negroes generally His name was familiar to the slaves of Delaware, Maryland, and Virginia, and during a period of 40 years there was a constant procession of fugitives seeking his protection and aid It is said that not less than 3000 of them were indebted to him for their freedom He was compelled to resort to many ingenious devices in his work, but he

made no secret of the fact that he was engaged in it, and such was his reputation for success that few slaveholders thought it worth while to pursue their runaways any farther after learning that they had fallen into his hands In 1848 he was prosecuted by James Bayard before Judge Taney (qv), was finally convicted on what appears to have been insufficient evidence of having abducted two slave children, and was fined so heavily as to render him penniless His business would have been utterly broken up at this time if his fellow citizens of Wilmington had not volunteered to furnish him all the capital he needed

GARRICK, DAVID (1717-79) A celebrated English actor, long manager of Drury Lane Theatre, and the author of numerous comedies Descended on his father's side from a family of Huguenot refugees named De la Garrigue, he was born at Hereford, Feb. 19, 1717, and educated at Lichfield, the home of his mother's family During his youth he went to live with an uncle, who was a wine merchant in Lisbon, but he soon returned to England and became a pupil of the famous Dr. Johnson A few months later, in 1736, master and pupil left Lichfield together in the hope of improving their fortunes in London Garrick attempted the study of law, then for a time he engaged in the wine business, his uncle having left him £1000, but the dramatic instincts which he had shown even as a school-boy proved too strong, and after some amateur acting and falling in love with the famous Peg Woffington, he made, under an assumed name, his debut on the stage at Ipswich (1741) in a play called *Oroonoko* He succeeded so well that on October 19 of the same year he appeared in London in the character of Richard III After being engaged for the following season at Drury Lane, Garrick went in the summer of 1742 to Dublin, where he excited the Hibernian enthusiasm to an extraordinary degree His success in London, however, was not without unpleasant incident, for a quarrel arose between him and his friend Macklin, which was taken up by their partisans, and on one occasion Garrick's performance had to be given up In 1747 he became one of the patentees of Drury Lane Two years later he married Mademoiselle Violette, an excellent danseuse from Vienna This seems to have alienated some of his company, especially of the feminine members, who went over to the opposition house, and in 1750 occurred the famous rivalry, when Drury Lane and Covent Garden were each playing *Romeo and Juliet*, Garrick and Mrs. Bellamy at the former and Spranger Barry (qv) and Mrs. Cibber at the latter, till after a dozen nights the town was tired and Covent Garden gave up the field In 1763 Garrick visited the Continent and made the acquaintance of Diderot and other noted people He conducted in 1769 the memorable jubilee at Stratford-on-Avon in honor of Shakespeare To Garrick seems to belong much of the credit of bringing back to the stage Shakespeare's plays in their original form, in place of the altered versions which had commonly been in use since the Restoration During his management also at Drury Lane he made an end of the old custom of admitting spectators upon the stage and introduced other improvements His own last appearance was on June 10, 1776, in *The Wonder*, when at the close of the play he made an affecting speech of farewell His health was failing, and he died less than three years later, in Lon-

don, Jan 20, 1779. He was buried beneath the Shakespeare monument in Westminster Abbey.

Garrick is regarded as the greatest of English actors. He exhibited a Shakespearean universality in the representation of character and was equally at home in the highest flights of tragedy and the lowest depths of farce. But the naturalness which so distinguished him upon the stage often forsook him in real life. He was extremely sensitive to ridicule and had a curious fashion of forestalling the malice of the critics by bringing out, on occasion, pamphlets of bantering attack upon himself. In his financial affairs he was considered close, though his generosity was many. He left a fortune of about £100,000. He was on terms of intimate friendship with Johnson, Goldsmith, Burke, and other men of letters, and was a member with them of the famous Literary Club. As an author, he does not rank very high, though some of his farces, like *The Lying Valet*, have been repeatedly published, and his prologues were often extremely ingenious. A collected (partial) edition of his dramatic works was brought out in London in 1768 and again in 1798. Many of his letters are preserved in the Forster collection at the South Kensington Museum. On his life, consult Knight (London, 1894); Fitzgerald (ib., 1868); Murphy (Dublin, 1801); Davies (London, 1780); "Mémoires de Garrick," in *Bibliothèque de mémoires relatifs à l'histoire de France pendant le XVIII^e siècle*, vol. vi (Paris, 1878), and Boaden (ed.), *The Private Correspondence of David Garrick*, with a biographical memoir (London, 1832); Paisons, *Garrick and his Circle* (Boston, 1907).

GARRICK CLUB. A famous club in London, named in honor of the great actor David Garrick. It was founded in 1831 for the promotion of letters and especially of the drama and in 1864 took up its present headquarters in Garrick Street. It possesses an important and valuable collection of portraits of celebrated English actors, which are shown to members' visitors on every Wednesday. Here occurred the controversy between Thackeray and Edmund Yates which brought about the estrangement between the former and Dickens.

GARRISON, LINDLEY MILLER (1864-) An American lawyer and cabinet officer, born at Camden, N. J. He was educated at the Protestant Episcopal Academy (Philadelphia), Phillips (Exeter) Academy, and Harvard University, and he studied law in Philadelphia. He was admitted to the Pennsylvania bar in 1886 and to the New Jersey bar in 1888, practicing in Philadelphia and in Camden, N. J., and, as a member of the law firm of Garrison, McManus, and Enright, in Jersey City, N. J., from 1899 to 1904. He served as vice chancellor of New Jersey from 1904 to 1913 and then became Secretary of War in President Wilson's cabinet.

GARRISON, WENDELL PHILLIPS (1840-1907) An American editor and author, born at Cambridgeport, Mass., a son of William Lloyd Garrison. He graduated at Harvard in 1861 and was literary editor of the *Nation*, of New York, from 1865 to 1906, having assisted E. L. Godkin (qv) in founding that paper. Henry Villard, who joined the *Nation* and the *Evening Post*, was Garrison's brother-in-law. Garrison contributed to periodicals, compiled *Bedside Poetry*, *A Parents' Assistant* (1887), and wrote *What Mr Darwin Saw on his Voyage around the World* (1879), with his brother, F. J. Garrison,

a life of their father, *William Lloyd Garrison* (4 vols., 1885-89), *Parables for School and Home* (1897), *The New Gulliver* (1898), a satire on Calvinism, and *Memoirs* (1904) of Henry Villard. Consult *Letters and Memorials of W. P. Garrison* (Cambridge, Mass., 1908), containing poems, editorials, and essays, and *The New Gulliver*.

GARRISON, WILLIAM LLOYD (1805-79) The leader of the radical Abolitionists in the antislavery struggle in the United States. He was born at Newburyport, Mass., Dec. 10, 1805. As an apprentice in the Newburyport *Herald* office (1818-25) he became an expert printer, and, while yet a boy, foreman, and contributor to that and other newspapers, and in 1826 was editor of the Newburyport *Free Press*. Soon afterward, as a journeyman in Boston, he met and was deeply influenced by Benjamin Lundy (qv), a pioneer Abolitionist. After a year spent in editing the *National Philanthropist*, a Boston temperance paper, and the *Journal of the Times*, at Bennington, Vt., he joined Lundy at Baltimore, in September, 1829, in conducting the *Genius of Universal Emancipation*. The views of the two associates differed widely, for Lundy favored gradual abolition and colonization, which Garrison opposed. This phase of activity was short-lived, for editorials urging immediate emancipation presently repelled subscribers. The public mind, however, long indifferent to the evils of slavery, began to be aroused, though the agitation found foes more readily than friends. In April, 1830, Garrison was convicted of libel. After seven weeks in jail his fine was paid by Arthur Tappan, of New York, and the reformer turned to lecturing in Northern cities with a vehemence and fire not previously brought to this task. From this time dates the birth of a public sentiment which was to make slow headway against difficulties and opposition and finally to triumph through a civil war.

In January, 1831, appeared in Boston the *Liberator*, a small sheet, soon to be enlarged and conducted weekly by Garrison till the end of 1865. The first number gave its keynote: "I will be as harsh as truth and as uncompromising as justice. On this subject I do not wish to think or speak or write with moderation." Such a tone compelled attention, and the editor was widely denounced as a "wild enthusiast," as a "fanatic," and as a "public enemy." Apathy gave place to excitement, in the North as well as in the South. Hundreds of letters threatened Garrison's life, in December, 1831, Georgia offered \$5000 for his arrest and prosecution, and on Oct. 21, 1835, a mob, led or incited by reputable Bostonians, broke up one of his meetings and dragged him through the streets until he was rescued with difficulty by the police, who placed him in jail to insure his safety. In January, 1832, Garrison, with 11 associates, founded the New England Anti-Slavery Society, the parent of similar organizations. In this year he published *Thoughts on African Colonization*, denouncing that futile scheme of the moderate opponents of slavery. In 1833 he went to England to confer with the British emancipators, and on his return supplied a platform for the American Anti-Slavery Society, founded in December of that year in Philadelphia. Of this he was president from 1843 to 1865. He visited England several times subsequently to 1833 on antislavery missions.

Meanwhile the American Abolitionists divided. The moderate wing, which favored political action and objected to participation of women in their meetings, parted from their former comrades in 1840 and contributed to form the Liberty and Free-Soil parties. The extremists, who obtained or soon gained control of the societies, were more logical in disregarding the distinction of sex no less than that of color and more "thorough" in disowning a government which acknowledged and protected "the sin" of human bondage. In 1840 Garrison denounced the United States Constitution, to the horror of most, as "a covenant with death and an agreement with hell." In 1854 he burned the Constitution at an open air celebration of the Abolitionists in Framingham, Mass. He hailed the secession of South Carolina and the guns fired on Fort Sumter as the end of "the proslavery Union." Many wrought with him in urging the President to recognize the situation as it was. With the Proclamation of Emancipation their triumph came, and with the end of the war their leader's occupation was gone. With other eminent guests of the government he saw the flag replaced over Sumter. No longer a lonely protagonist, his age was provided for in 1868 by a "national testimonial," through admirers of his altruistic labors, and his last years were spent in less arduous journalistic and reforming services, with honor at home and abroad. He died in New York, May 24, 1879. Of his *Sonnets and Other Poems* (1843), some had been penciled on the walls of his Baltimore cell in 1830. Selections from his writings and speeches appeared in 1852, and *The Words of Garrison, 1805-1905*, in 1905. Consult the biography by his sons, W. P. and F. J. Garrison, *William Lloyd Garrison, 1805-79. The Story of his Life Told by his Children* (4 vols., New York, 1885-89), Goldwin Smith, *The Moral Crusader, William Lloyd Garrison* (1b, 1892), Crosby, W. L. *Garrison, Non-Resistant and Abolitionist* (Chicago, 1905), and biographies by L. Swift (Philadelphia, 1911) and J. J. Chapman (New York, 1913).

GARROD, gār'rod, SIR ALFRED BARING (1819-1907). An English physician, born at Ipswich. He studied at University College and the University of London, was appointed assistant physician at University College Hospital in 1847 and in 1851 physician and professor of therapeutics and clinical medicine. In 1863 he was appointed physician, in 1874 consulting physician, to King's College Hospital, and in the former year also became a professor in the college. He was elected a fellow of the Royal College of Physicians in 1856 and its vice president in 1888. In 1858 he became a fellow of the Royal Society of Great Britain and in 1896 physician extraordinary to Queen Victoria. His researches have been connected principally with the pathology of gout and rheumatic gout, or rheumatoid arthritis, on whose nature and treatment he published in 1860 a valuable work. He introduced lithia as a remedy for gout. He wrote also *The Essentials of Materia Medica and Therapeutics* (1885; many subsequent editions), which became authoritative on the subject and has been much used for textbook purposes.

GARROD, ALFRED HENRY (1846-79). An English zoologist and physician, born in London, and educated there at University and King's Colleges. In 1871 he was elected prosecutor to

the Zoological Society of London and in 1873 a fellow of St John's, Cambridge. From 1874 until his death he was professor of comparative anatomy at King's College, London, in 1875 was appointed professor of physiology at the Royal Institution of Great Britain, and in 1876 was elected a fellow of the Royal Society. His zoological studies were of high value, in particular those connected with the anatomy of birds, in which department he was a recognized authority. His publications include an edition (1879) of a monograph by Johannes von Müller (qv), the physiologist of Berlin, on the vocal organs of passerine birds, and numerous papers collected and edited by W. H. Forbes (1881).

GARROT. The golden-eye duck (see GORDEN-EYE), a French name used in English books. Consult Newton, *Dictionary of Birds* (London, 1893-96).

GARROTE, gār-rōt' (Sp, stick). A mode of execution practiced in Spain and Portugal. Originally it consisted in simply placing a cord round the neck of a criminal, who was seated on a chair fixed to a post, and then twisting the cord by means of a stick inserted between the rope and the back of the neck till strangulation was produced. Later an iron collar was used, worked by a screw. To such condemned persons as recanted the inquisitors granted as a favor this mode of strangulation before they were burned. If the executioner was unskillful, however, the pain was sometimes very great. Garroting is also the name given to a species of robbery in which the highwaymen suddenly came behind their victim and, throwing a cord, or handkerchief, or something of the sort round his neck, produced temporary strangulation till their purpose was effected. This form of crime became common in England in the early sixties, but was checked by a Law of 1863 which added flogging to the usual penalty for one convicted of this crime. Consult William Andrews, *Bugone Punishments* (London, 1899).

GARROW HILLS. See GARO HILLS.

GARRUCCI, gar-rōo'ché, RAFFAELE (1812-85). An Italian archaeologist. He was born Jan. 23, 1812, became a Jesuit (1826), and after De Rossi was the greatest explorer of the catacombs of Rome. He died at Rome, May 5, 1885. Of his numerous writings the masterpiece is *Storia dell' arte cristiana nei primi otto secoli della chiesa* (1872-81). His life was published by Di Montescaglioso (Naples, 1885).

GARRUPA. A fish. See GROUPER.

GARSHIN, gar'shén. VSYEVOLOD MIKHAILOVITCH (1855-88). A Russian author, born in the Government of Yekaterinoslav. From his earliest childhood he was a voracious reader. At the age of nine he entered a St. Petersburg gymnasium. On graduation in 1874 he entered the School for Mining Engineers, but left it to enroll as a volunteer in the army sent to Turkey in 1877, where he distinguished himself in attacks upon the enemy until he was wounded and sent back to Russia. He based his powerful story *Four Days* on an incident that occurred after the first skirmish. The story itself, and the Turgeniev-like mastery of detail and narration, all combined to produce a sensation. A series of stories of about 25 to 50 pages followed, each increasing his popularity and fame, but in 1880 the mental malady which had already attacked him broke out anew, and nearly two years were spent in sanitariums and out-of-the-way villages to recuperate. In 1883 Garshin

again resumed his literary work, was appointed secretary to the Railroad Congress, and married a physician. His frail constitution needed all the care she bestowed on him. His health improved, but in 1888 he killed himself in a fit of insanity. In all his sketches there is a noticeable lack of the epic element, the outward description of his personages is utterly neglected in the exposition of the labyrinth of conflicting emotions and feelings. But, as psychological studies, his sketches, dealing mostly with moral and social questions in the manner of Tolstoy, are the nearest approach to the latter's mastery. Besides the sketch mentioned, *The Journal of Private Tsvánov* and *The Red Flower* are notable examples of his peculiar art. The latest edition of his works is that of 1910. Most of his work has been translated into French and German, and some of it into English.

GARSTANG, JOHN (1876-) An English archaeologist, born in Blackburn, the son of Walter Garstang, a physician and specialist on fisheries. He was educated at Jesus College, Oxford, and became reader in Egyptian archaeology at the University of Liverpool in 1902 and professor of archaeology there in 1907. He was engaged in excavations in Roman Britain, in Nubia, in northern Syria and Asia Minor (1907, 1908, 1911), and in Egypt, especially at Meroe (1909-14). He wrote *El Irábeh* (1902) and *A Short History of Ancient Egypt* (1904), both with P. E. Newberry, *The Land of the Hittites* (1910), *Meroe* (1911), *On Lucian's De Dea Syria* (1913).

GARSTON A town and port of Lancashire, England, on the Mersey estuary, $5\frac{1}{2}$ miles southeast of Liverpool (Map England, D 3). It has a large coal-shipping trade, its two docks belonging to the London and North Western Railway Company. The town maintains parks, recreation grounds, an isolation hospital, and has technical schools and a free library. Coal is the chief article of export. Pop., 1901, 17,300, 1911, 23,852.

GARTER, ORDER OF THE. The highest order of chivalry in Great Britain. The Order of the Garter was instituted by King Edward III and though not the most ancient is one of the most famous of the chivalrous orders of Europe. The original number of the knights of the Garter was 25, the Sovereign himself making the twenty-sixth. The story goes that the Countess of Salisbury let fall her garter while dancing with the King and that the King stooped quickly to pick it up. This occasioned some indelicate jokes which caused the Countess to withdraw. The King exclaimed angrily, *Honr soit qui mal y pense* (Shame to him who evil thinks), and added that he would make this blue ribbon so glorious that all the courtiers would desire it. This story has absolutely no foundation in fact. Edward had formed the plan for the order in 1344 and instituted it on April 23, 1349. Its patrons were Holy Trinity, the Virgin Mary, St. Edward the Confessor, and St. George, but the last, who had become the tutelary saint of England, was considered its special patron, and for this reason it has borne the title of "The Order of St. George" as well as of "the Garter." A list of the original knights or knights founders is given by Sir Harris Nicolas. The order was reorganized in 1831, when the number of knight companions was left at 25, but the membership extended to include the Prince of Wales and such descend-

ants of George I and foreign sovereigns as might be chosen. The emblem of the order is a dark blue ribbon edged with gold, bearing the motto *Honr soit qui mal y pense* in gold letters. It is worn on the left leg below the knee. The Grand Master is always the monarch of England. The number of members in 1906 was 55. The officers are the prelate (the Bishop of Winchester), the chancellor (the Bishop of Oxford), the registrar (the dean of Windsor), the herald (the Garter King-at-Arms) (qv), and the Gentleman Usher of the Black Rod. Consult Nicolas, *History of British Orders of Knighthood* (London, 1841-42), Ashmole, *Order of the Garter* (ib, 1672), Beltz, *Memorials of the Order of the Garter* (ib, 1841), Gallwey, *History of the George Worn on the Scaffold by King Charles I* (New York, 1908). See Plate II of ORDERS.

GARTER KING-AT-ARMS. An officer of the Order of the Garter (qv) and the chief heraldic authority in England. The office was instituted by Henry V, in 1417, with the advice and consent of the knight companions. The duties of the Garter are to attend upon the knights at their solemnities, to inform those chosen to the order of their election and to summon them to the installation, to marshal funeral processions, to assign lords to their places in Parliament, and to be the executive officer of the King for the order. The Garter is also the principal king-at-arms, taking precedence over the other two kings-at-arms in England. He is a member of the "Heralds' College," or "College of Arms," of which the Earl Marshal is the head. The Garter grants and confirms arms under the authority of the Earl Marshal, but as Garter King-at-Arms he is independent of him. See HERALDS' COLLEGE.

GARTER SNAKE (so called from its color stripes). An elastic name given in North America to any of various small snakes, but properly applied to striped species of the genus *Eutania*, which includes those most often seen of all our serpents. The genus is widespread and contains, according to Cope, 24 species north of the Isthmus of Panama. Other authors recognize from 12 to over 50. Several of these are very slender, mainly green with lighter stripes, and are popularly distinguished as ribbon snakes (qv). One Oregon species is black, and some semitropical species have the stripes broken so as to form series of spots or crossbars. The best-known species is the ordinary garter snake (*Eutania sirtalis*), which has the widest range of all species of the genus, being distributed over the whole of the United States, southern Canada, and Mexico. Throughout this large area it presents a wide series of variations which have been distinguished by Cope, *Annual Report of the United States National Museum* (Washington, 1898), as 11 subspecies. One recent author has reduced this number to five.

The length of the garter snake when fairly grown is about 3 feet, of which from one-fourth to one-fifth belongs to the tail. As a species, it is the most widely distributed and most numerous in individuals of all our serpents, except in the Western arid regions. This is due to its extreme fecundity, to its agility and ingenuity in pursuit of food or in escape from danger, and to its willingness to fight off assailants. It is to be found in all sorts of situations, but is partial to grassy meadows and to

the borders of streams, where the frogs, toads, fish, mice, and shrews upon which it mainly feeds are numerous, and it takes to water willingly and swims well. Some other species of the genus are almost habitually water snakes. All garter snakes are able to climb well, wriggling easily up a rough tree trunk, a wall of brick or of rough boards, and they search the bushes for eggs and young birds in the spring, but rarely climb high. They are bold in coming about gardens and village streets, but enter cellars, dairies, and chicken houses less often than do some larger serpents, such as the milk snake. All garter snakes retain the eggs in the oviduct of the mother until they hatch and the embryos have reached a length of $5\frac{1}{2}$ to 7 inches, when they are extruded, from 25 to 75 being produced (late in summer) by a single female, but when so many are born some will be small or even confined within the egg covering when pressed from the vent. These young are able at once to take care of themselves and will struggle vigorously for earthworms, etc. They remain together and are watched and protected by the mother, who will brave formidable perils in her anxiety for their welfare. It has been asserted repeatedly by credible witnesses that she receives them into her mouth and throat for temporary refuge from danger, whence they emerge as soon as possible. The courage and pugnacity of this snake are familiar facts, it is the only one of our common snakes that will ever come towards a man with threatening demeanor when attacked. Its bite is quite harmless so far as poison is concerned, but its strength and weasel-like courage make it a successful antagonist of many animals whose size would seem to give them immunity. It is itself, however, the favorite prey of the black snake, copperhead, and of many reptile-hunting birds and mammals. On the approach of cold weather these snakes seek some opening in the ground, creep as far in as practicable, and become dormant, emerging, however, rather earlier in the spring than most other serpents. In the West the burrows of ground squirrels, badgers, etc., are favorite hibernacula, and in these retreats great numbers of the snakes often gather and entangle themselves into a ball of sleeping serpents—a practice induced probably by sexual impulses as well as by a desire for mutual comfort.

In addition to the common and variable garter snake (*Eutæna sirtalis*) there occurs numerous in the eastern United States the ribbon snake (q.v.). Florida has a local species (*Eutæna sackeni*), and the Mississippi valley and plains region possess a local species (*Eutæna redra*), which is peculiar in its fondness for water and a fish diet. In the central region and on the Pacific coast is found another species (*Eutæna elegans*), which exhibits many variations of color and has habits similar to the eastern form. Finally, many species belong to Mexico and Central America. See SNAKE, and Plate of SNAKES, AMERICAN HARMLESS.

GARTH, SIR SAMUEL (1661–1719). An English physician and poet. He was born at Bowland Forest, Yorkshire, in 1661, was educated at Peterhouse, Cambridge, and studied medicine at Leyden. Obtaining the degree of M.D. from Cambridge in 1691, he settled in London, where he was elected a fellow of the Royal College of Physicians (1693) and was soon recognized as a wit and conversationalist. He was knighted

in 1714 and appointed physician in ordinary to George I and physician general to the army. He died Jan. 18, 1719. Garth gained deserved fame in his own time for a satirical poem entitled "The Dispensary" (1699), in which he ridiculed those physicians who opposed his plan for establishing a free dispensary for poor people. He also published "Clairemont" (1715), a descriptive poem in imitation of Denham's "Cooper's Hill," and two years later contributed to a translation of Ovid's *Metamorphoses*. He was much admired by Pope and others. His verse is smooth but monotonous. Consult the sketch of Garth in Johnson's *Lives of the Poets* (London, 1854), and Chalmers, *Works of the English Poets*, vol. ix (ib., 1810).

GARTNER, gärt'nër, FRIEDRICH VON (1792–1847). A distinguished German architect, born at Coblenz. The son of an architect, he studied first under his father at Munich, then in Paris under Percier (1812), and finally in Italy (1814–18). Two years later he was called to the chair of architecture in the Academy of Munich and began at the same time the practice of his art. He designed the Ludwigskirche, the Feldherrn Halle, the Library, University, and Wittelsbacher Palace (all in Munich), the royal palace at Athens, and other important buildings. In spite of the strongly classical bent of his early training most of his own work in Germany represents a consistent effort to revive mediæval Romanesque forms, and he was wisely intrusted with the restoration of the minsters of Speyer, Regensburg (Ratisbon), and Bamberg. He was made head inspector of buildings, and director of the Academy at Munich. In 1819 he published *Ansichten der am meisten erhaltenen Monumente Italiens*.

GARTNER, HEINRICH (1828–1910). A German landscape painter, born at Neustrelitz. He was a pupil of Ruscheweyh, of F. W. Schirmer in Berlin, and of Ludwig Richter in Dresden, whence he went to Rome to study the old masters, and there was also much influenced by Cornelius. He became favorably known after his return to Germany through several decorative cycles executed in private houses and villas and was commissioned to paint some of the mural decorations in the new Court Theatre at Dresden, and after that the encaustic paintings in the Hall of Sculptures in the Leipzig Museum (1879). Three great landscape compositions by him (1883–85) adorn the staircase of the Agricultural Museum in Berlin. Of his oil paintings there is a "Landscape with the Return of the Prodigal Son" in the Leipzig Museum, and one with "Adam, Eve, Cain, and Abel" in the Dresden Gallery.

GARTNER, JOSEPH (1732–91). A German botanist. He was born at Kalw (Wurttemberg), studied at Tübingen and Göttingen, and after extensive travel was, in 1761, appointed professor of anatomy at the former university. From 1768 to 1770 he was professor of natural history and director of the botanical garden and the natural-history collection at the University of St. Petersburg. His most important work is *De Fructibus et Semnibus Plantarum* (1788–91), which, by its minutely accurate descriptions, comprising a thousand and more species, introduced a new era in plant morphology. The scientific value of the book was much increased by the addition of 180 copper-plate engravings.

GARTSHERRIE A coal-mining district in Lanarkshire, Scotland, near Coatbridge (qv). A coal-cutting machine first used in the Baird pits here is known as the Gartscherrie coal-cutting machine.

GARUM'NA See GARONNE

GARVE, gar'və, CHRISTIAN (1742-98) A German philosopher. He was born at Breslau, studied at the universities of Frankfurt-on-the-Oder and Halle, in 1769 succeeded Gellert as professor of philosophy at Leipzig, but in 1772 was obliged by ill health to retire. His writings did much towards the popularization of philosophy in Germany. His work was highly valued by Kant and by Frederick II, who bestowed upon him a pension of 200 thalers and requested him to prepare a translation (1783, 6th ed., 1819) of Cicero's *De Officiis*. Garve eulogized the King in the *Fragmente zur Schilderung des Geistes, Charakters und der Regierung Friedrichs II* (1798). Among his further publications are a collection of essays, *Ueber verschiedene Gegenstände aus der Moral, der Litteratur und dem gesellschaftlichen Leben* (1792-1802), and translations (1798-1801, 1799-1802) of the *Ἠθικά* and *Πολιτικά* of Aristotle.

GARVIE, ALFRED ERNEST (1861-) A British Congregational theologian, born in Zyrardow, Russian Poland, the son of a Scottish flax merchant. He was educated at George Watson's College, Edinburgh, at the University of Glasgow, and at Oxford. For a few years he was in business in Glasgow, but after leaving Oxford in 1893 became minister of the Macduff Congregational Church and in 1895 of Montrose Congregational Church. In 1903-07 he was professor at Hackney and New colleges and then became principal of New College. In 1902 he was president of the Congregational Union of Scotland. He wrote *Ethics of Temperance* (1895), *Ritschlian Theology* (1899), *The Gospel for To-Day* (1904), *Religious Education* (1906), *Studies in the Inner Life of Jesus* (1908), *Handbook of Christian Apologetics* (1913), and commentaries on Romans and St Luke, and edited *The Westminster New Testament*.

GARY, gá'ri. A city in Lake Co., Ind., 29 miles southeast of Chicago, on the Indiana, Baltimore, and Ohio, the Chicago, Indiana, and Southern, the Elgin, Joliet, and Eastern, the Indiana Harbor Belt, and several other railroads (Map Indiana, C 1). It is situated at the head of Lake Michigan, midway between the vast iron-ore beds of the north and the great coal region of the south, and thus, together with its excellent railroad and water facilities, caused it to be chosen as the site for the main plant of the United States Steel Corporation, in April, 1906. Since then the growth of Gary has been rapid. The city is now the greatest steel-producing place in the world. Besides the Indiana Steel Company, its industrial establishments include the American Bridge Works, sheet and tin-plate works, a cement plant, locomotive works, a coke by-products factory, tube works, car and foundry works, etc. Gary contains a Carnegie library, a fine city hall, two fine hospitals, and public parks. It was named for F. H. Gary (qv). Pop., 1910, 16,802, 1920, 55,378.

GARY, ELBERT HENRY (1846-1927) An American corporation official, born at Wheaton, Ill. Educated at Wheaton College and at the University of Chicago (LL.B., 1867), he was admitted to the Illinois bar in 1867 and to the bar of the Supreme Court of the United States

in 1878. He was mayor of Wheaton for two terms, and county judge of Dupage County for two terms. For 25 years he practiced law in Chicago, serving as railroad and corporation counsel for various companies. He helped to organize, and became president of, the Federal Steel Company, and he was connected with the organization of the United States Steel Corporation, of whose board of directors and finance committee he later became chairman. As such, he was prominently in the public eye during the government prosecution of the Steel Corporation as a monopolistic trust. He was chosen a director in several Chicago and New York banks and other corporations. See GARY, IND.

GARY PLAN See SCHOOLS

GAS See GASES, GENERAL PROPERTIES OF

GAS, ILLUMINATING AND FUEL Gas for illuminating or heating purposes may consist of (1) a pure compound, such as acetylene, produced from calcium carbide, (2) air charged with volatile hydrocarbon vapor, such as naphtha and various mixtures of hydrogen, (3) hydrocarbon gases occurring as natural products and widely known as natural gas, (4) similar mixtures, with the addition of carbon monoxide, produced by the destructive distillation of bituminous coal, heavy hydrocarbon oils, and wood, also (5) a mixture of hydrogen and carbon monoxide produced by the decomposition of water in presence of incandescent carbon, enriched with oil gas, the whole popularly known as water gas. Of the above mentioned, coal gas, water gas, and natural gas are the most important and are handled on a large scale. The others are of service in isolated localities or on moving vehicles.

COAL GAS

Coal gas is the gas produced by the destructive distillation of bituminous coal.

History. The existence of inflammable gases issuing from the earth has been known from

FIG. 1. COAL-GAS RETORT, WITH DIRECT-FIRE FURNACE

very early times. In 1659 Thomas Shirley communicated to the Royal Society a paper describing experiments on a gas issuing from a well near Wigan in Lancashire and resulting, in his

opinion, from the decomposition of coal Dr John Clayton, in a paper presented to the same society in 1739, described the production of a

FIG 2 CROSS SECTION OF HYDRAULIC MAIN

similar gas from coal heated in a closed vessel. It was not, however, until 1792 that the practical value of coal gas as an illuminant was demonstrated by William Murdock, a Scotchman, who

in the Soho foundry. The experiment proved highly successful, and the plant was soon enlarged so as to give light to the principal shops in the vicinity. In 1805 Murdock introduced gas in the cotton mills in Manchester. Meanwhile Lebon had used coal gas in his home in Paris in 1799, and his experiments attracted the attention of Winsor, the 'father of modern gas lighting,' who, on his return to England soon after, urged the use of coal gas for general illumination. In consequence of his agitation various buildings in London were lighted by this means, but it was not until 1810 that he secured the incorporation of the Gas Light and Coke Company, and even then the royal charter was not granted until 1812. Westminster Bridge in London was first lighted by gas in 1813, and in 1815 Guildhall was similarly illuminated. As a street illuminant, gas was first introduced in St Margaret's parish in London. Paris was lighted in 1820, and thereafter the use of gas for street illumination was gradually extended throughout the Continent. In the United States the use of illuminating gas was agitated as early as 1812, it was successfully introduced in Baltimore in 1821, in Boston in 1822, in New York gradually between 1823 and 1827.

The Coal. A good gas coal should contain only a small percentage of ash and sulphur and should yield, upon distillation, a comparatively large percentage of volatile matter of good illuminating value, and a good coke amounting to from 60 to 65 per cent of the original weight of

FIG 3. GAS PLANT WITH INCLINED RETORTS

constructed apparatus by which he lighted his home and office in Redruth, Cornwall. In 1798 he moved to Soho and introduced the illuminant

the coal. A gas coal showing the following analysis by weight may be considered as the standard for the United States: volatile matter

33 to 35 per cent, fixed carbon, 55 to 60 per cent, ash, 4 to 6 per cent, sulphur, 0.4 to 0.6 per cent. A pound of such coal will yield, upon distillation, about 5 cubic feet of gas, possessing an illuminating value of from 15 to 17 candle power when burned in an Argand burner.

Good gas coals of practically the above composition are found in Pennsylvania, in the Pittsburgh fields, in the West Virginia and Kanawha fields, and also in Tennessee, Indian Territory, and Colorado, while others not so good are found in Alabama, Kansas, and Washington. In Europe the coal fields of England furnish the best gas coals, these English coals being of very nearly the composition given above, except that they contain less ash, but more sulphur.

Apparatus. The distillation of the coal is carried on in closed retorts, heated by suitable furnaces. Originally made of cast iron and circular in cross section, these retorts are now made of fire clay, are oval or D-shaped, and set horizontally or inclined. Vertical retorts are square in section, with rounded corners, and larger at the bottom than at the top. Horizontal retorts (see Fig 1) are of varying dimensions, a very common size for the United States being 16 inches \times 26 inches \times 9 feet inside, and are set in groups of from three to nine. The furnaces by which these groups are heated are of two kinds—direct fire and generator. In the former the carbon of the fuel is burned directly to carbon dioxide, while in the latter the combustion of the carbon is performed in two stages, the first taking place in the furnace proper and forming carbon monoxide, which is burned in the second stage to carbon dioxide, this secondary combustion taking place between the retorts. The use of generator furnaces results in greater economy of fuel and the attaining of a higher temperature in the retorts than is possible with direct-fire furnaces. These advantages are secured to a still greater degree by the use of recuperators, in which the heat of the outgoing products of combustion is transferred to the incoming air. The retorts are either set horizontally or at an angle of about 30° to the horizontal (see Fig 3). The object of this inclination is to permit the charging of the coal into, and the discharging of the coke from, the retorts to be performed by gravity instead of by manual labor or by machinery, as is necessary when they are set horizontally. In large gas works coal and coke handling machinery is employed, sometimes to such an extent that the coal is unloaded from the cars or vessels in which it is brought to the gas works, transported to the retort house, and charged into the retorts, and the coke drawn, carried to the yard, and stacked or loaded for sale without being touched by hand. Retorts of the size mentioned will take charges of from 250 to 350 pounds of coal, according to the degree to which they are heated.

To the open end of each of the retorts is bolted a cast-iron mouthpiece, of the same cross section as the retort, and from 14 to 16 inches deep. On the outer end of the mouthpiece is hinged, so that it can be readily opened and closed, a cast-iron or steel lid, which, when closed, makes a gas-tight joint with the face of the mouthpiece. At the mouthpiece a bell is provided, into which is inserted the lower end of the standpipe, or pipe through which the gas passes away from the retort. On the top of the standpipe is a bridge or arch pipe, from which

hangs a dip pipe, which is bolted to the hydraulic main (a large pipe generally U-shaped and made of steel, see Fig 2), and passing down into this main dips below the surface of the ammoniacal liquor, with which the main is partly filled, and by being thus trapped prevents the return of any gas to the retort when it is open for drawing and charging.

Vertical retorts are of two types, intermittent and continuous, both of larger capacity than older forms, since they run from 1500 to 2000 pounds of coal per charge. They are more economical of operation and are rapidly replaced

FIG 4 VERTICAL RETORT.

ing the other types. Fig 4 shows a vertical section of one of the latest forms.

It is significant that the gas produced during the coke-oven operation has at last come into use as a public illuminant, particularly in Germany and England.

From the hydraulic main the gas passes to the exhaust, a rotary pump employed to relieve the retorts of the pressure of the gas generated from the heated coal. The rotary pump also pushes the gas into a tar extractor, in which the gas is subjected to friction for the removal of such of the heavy tar as has not been condensed out in the hydraulic main. After the removal of the tar, which should be effected at a temperature not lower than 100° F., the gas passes to the condensers and is cooled to a temperature of about 50° to 60° F. These con-

condensers may be either atmospheric condensers or water condensers. The atmospheric condensers employ air, and have concentric steel shells forming an annular gas space exposed to air on both the inner and outer circumferences. They are used to perform the first part of the cooling, which is completed by the water condensers, these being somewhat similar in construction to a tubular boiler, the water passing through the tubes in one direction, while the gas passes outside of them in the opposite direction.

After cooling, the gas passes to the washers and scrubbers for the removal of the ammonia which it still contains. In the washer and scrubber the gas is caused to pass in thin streams over wetted surfaces, the object being to expose the gas to intimate contact with water. Scrubbers are of two general types—tower scrubbers, vertical cylinders filled with bundles of thin boards which are wet by water caused to flow over them by the force of gravity, and rotary scrubbers, fitted with bundles of wooden rods mounted on a horizontal shaft and kept wet by being rotated through the water or ammoniacal liquor with which the lower part of the scrubber is filled.

From the scrubber the gas passes to the purifiers. These are usually four in number, and the gas passes through three of them consecutively, while the fourth is cut out for cleaning and refilling. They are cast-iron boxes with open tops, which are closed by means of removable covers made of light steel plates. When in place over the boxes, the sides of these covers are sealed in water contained in "cups" cast on the sides of the boxes, and the escape of gas is thus prevented. The purifiers are filled with one or more layers of slaked lime or oxide of iron, the latter being the most commonly used in the United States.

From the purifiers the gas passes to the station meter, where it is measured by means of a drum divided into either three or four compartments. The meter is partly filled with water, and the inlets and outlets to the different compartments are so arranged in connection with this water that gas cannot simultaneously enter and leave a compartment. The pressure of the gas causes the drum, which is mounted on a shaft, to revolve so that each compartment is alternately filled and emptied, and since each is filled with a definite volume of gas, the volume of gas passing through the meter is accurately measured and is recorded by suitable mechanism.

After passing through the station meter the gas is conveyed to the gas holder, a cylindrical vessel open at the bottom, but closed on top, made of steel sheets. The lower edge of the gas holder is always kept sealed in water contained in a masonry or steel tank, in which the holder is free to rise and fall, being guided in the tank and by columns rising above the tank to prevent tilting. The guiding is performed by wheels attached at equal distances

around the top and bottom of the cylinder, and in the case of telescopic holders at the top and bottom of each of the sections working against rails or channel irons fastened to the inside of the tank wall and of the columns. All large gas holders are telescopic, i.e., are made with one or more outer sections, which are merely rings, in addition to the inner section closed on top. At the bottom of each of the sections, except the lowest, is a "cup" (see Fig 6). Gas is admitted to and drawn from the holder by pipes passing down on the outside of the tank under and through its foundation, and up on the inside to a point above the water level. When gas is admitted, it enters the space between the closed top, or crown, and the water in the tank. As it continues to enter, the pressure increases until it is sufficient to overcome the weight of the holder, which then begins to

FIG. 5 SECTION AND ELEVATION OF ROTARY GAS SCRUBBER

rise and continues to do so as long as gas is entering faster than it is passing out. When the inner section is completely filled with gas, the cup filled with water engages the grip of the next section and, as gas continues to flow into the holder, raises this section, the water in the cup forming a seal which prevents the escape of any gas. When the holder descends, the outer section lands on the bottom of the tank, and the inner section continuing to go down, the cup and grip separate. The columns, by which the holder is guided and prevented from tilting as it rises above the tank, are built up of structural steel and are connected together at the top and intermediate points by girders, and also by diagonal ties, so that the whole of the guide framing is bound together into what is practically a rigid cylinder. Originally built in very small sizes and with only a single lift, gas holders have been made larger and with more lifts, one at the East Greenwich Works in London consists of six lifts and contains, when full, 12,000,000 cubic feet of gas. The largest holder built in the United States, at the Astoria Works, New York City, has lifts 300 feet in diameter and 245 feet high, capacity 15,000,000 cubic feet. In some cases, usually those of comparatively small holders, the guide framing has been completely done away with, the guiding being performed by means of spiral guides fastened to

the inside of the tank wall and to the inner surfaces of the sections of the holder

Process of Manufacture When the coal is placed in the retort, the volatile matter is driven off by heat, rapidly at first and then more and more slowly. The reactions taking place in the retorts are complex. In general they consist of the decomposition of the coal into coke and heavy hydrocarbons, and the breaking down of the latter into lighter hydrocarbons, with the setting free of hydrogen and marsh gas and, when the breaking down is carried too far, of solid carbon, which is deposited on the interior of the retort. Reactions also occur between some of the nitrogen and hydrogen, the hydrogen and sulphur, and the carbon and nitrogen by which comparatively small amounts of ammonia, hydrogen sulphide, and cyanogen are formed. The coke which is left in the retort is composed almost entirely of carbon, with a percentage of ash dependent

this time. In England the length of charge is usually five to six hours.

The gas leaving the retort is a mixture of permanent gases, principally hydrogen, marsh gas, and carbon monoxide, with some carbon dioxide, nitrogen, hydrogen sulphide, ammonia, and cyanogen. Hydrocarbon vapors are the most important light-giving constituents. The problem to be solved in the cooling of the gas is to leave in it a sufficient quantity of the lighter vapors to saturate it fully at the minimum temperature and maximum pressure to which it is to be subjected in the future. After the gas has been cooled, it is necessary to remove the ammonia and hydrogen sulphide, and in some cases the carbon dioxide and cyanogen are also taken out.

The heaviest of the vapors condense in the hydraulic main, forming tar, which must not be allowed to rise to the level of the lower edges

FIG 6 SECTION THROUGH GAS HOLDER

upon the amount of ash in the coal. The extent to which the hydrocarbons are broken down increases with the temperature at which the retorts are maintained, the volume of the gas produced increases, and its illuminating value decreases. The product of illuminating value and quantity depends, therefore, upon the heat, and the retorts are usually heated to a temperature of about 2000° F. The gas produced is deteriorated in illuminating value if exposed to prolonged contact with the hot walls of the retort, and to reduce the extent of this contact to a minimum the volume of the charge of coal should be as large as possible in proportion to the size of the retort. The existence of a pressure in the retort also increases the contact between the gas and the walls, and it is to avoid this, as well as leakage of gas through minute cracks in the clay, that the pressure is taken off the retort by means of the exhaustor. In the United States the length of charge or time the coal is left in the retorts is usually four hours, the heat and the weight of charge being so proportioned that the gas is all driven off in

of the dip pipes, since if brought into intimate contact with the gas it will absorb the lighter hydrocarbon vapors. For this reason it is also necessary that the heavy tar that is not deposited in the hydraulic main should be removed from the gas before it is cooled, and this is done by the friction tar extractor. The lighter tar is then condensed by the cooling effected in the condensers. This cooling should be done very gradually to avoid the condensation of vapors that should be retained in the gas. As the gas cools, some of the water vapor with which it is saturated condenses and absorbs a portion of the ammonia, forming ammoniacal liquor. The tar and ammoniacal liquor thus formed in the hydraulic main and the condensers are run off through suitable drains into wells. The portion of the ammonia that still remains in the gas when it leaves the condensers is removed in the washer and scrubber. By using weak ammoniacal liquor as the washing liquid in the first stages of the scrubbing, the ammonia is made to combine with carbon dioxide and hydrogen sulphide, the resulting liquor being an aqueous

solution of carbonate, sulphide, and various other salts of ammonia.

The gas leaving the scrubbers contains as impurities carbon dioxide and hydrogen sulphide, as well as small quantities of other sulphur compounds and cyanogen. It is necessary to remove the hydrogen sulphide and reduce the sulphur compounds to an amount not to exceed 30 grains of sulphur per 100 cubic feet of gas, since these substances produce sulphurous oxide when burned, and thus give rise to disagreeable fumes if present in any quantity. The carbon dioxide is sometimes removed also, although, being harmless except as it affects the illuminating value, it is usual in the United States to allow it to remain in the gas. For its removal it is necessary to employ, in the purifiers, calcium hydroxide, which combines with it, forming carbonate of lime. Lime will also combine with hydrogen sulphide and was formerly the sole substance employed for its removal, which can, however, be effected much more economically by the use of hydrated sesquioxide of iron, either prepared artificially or in the shape of a natural bog ore, and this has largely superseded lime. The reaction between the oxide of iron and the hydrogen sulphide results in the formation of sulphide of iron, which is again changed to oxide when the fouled material is exposed to the air. The material can thus be used over and over

lene, a volatile hydrocarbon which, when chilled, condenses at once to the solid form in light flakes, and at times causes much trouble by stopping the small pipes of the distribution system.

It will be seen that in addition to the gas there are produced in the manufacture of coal gas coke, tar, and ammoniacal liquor, all of which are valuable—the coke as a fuel, the tar as a raw material for the manufacture of paving and roofing pitch, artificial dyestuffs, various drugs, etc (see COAL TAR), and the ammoniacal liquor as a raw material for the manufacture of

FIG 7 DOUBLE SUPERHEATER LOWE CARBURETED-GAS APPARATUS

again until it becomes so charged with the sulphur, deposited at each revivification, as to be rendered inactive. The oxide of iron also absorbs some of the cyanogen, and when spent is of value for the manufacture of cyanides. After passing the purifiers the gas is ready for distribution by means of the gas holders.

The scheme of condensation and purification outlined is the one usually employed, but it is becoming customary to scrub the gas with a solution of ferrous sulphate to remove the cyanogen completely and in a more merchantable form than is done in the purifiers. Scrubbing with tar oils is also used to remove naphtha-

ammonia in various forms. The products from 2000 pounds of gas coal will be, about, 1200 pounds of coke, 10,000 cubic feet of gas, 13 gallons of tar, 20 pounds ammonium sulphate, and 3.5 pounds potassium ferrocyanide.

CARBURETED WATER GAS

Carbureted water gas is made by decomposing steam in the presence of incandescent carbon so that the hydrogen is set free, and the oxygen unites with the carbon giving carbon monoxide. These two gases, with small amounts of methane, carbon dioxide, and nitrogen, form what is

called "water gas," which, while combustible, burns with a nonluminous flame. The gas is made luminous by mixing with gas made from oil.

History Although it was shown by Fontana, in 1780, that a combustible gas could be formed by the reaction between steam and incandescent carbon at high temperatures, which is the basis of all water-gas manufacture, and between 1823 and 1858 many patents were taken out aiming to take advantage of this reaction, the commercial development of the manufacture of water gas and carbureted water gas is of comparatively recent date. This development was made almost entirely in the United States, where both anthracite coal, a desirable source of carbon, and petroleum, for the manufacture of oil gas, were plentiful and cheap. In the earlier forms of apparatus the water gas was made from anthracite coal raised to incandescence in externally heated retorts, similar to coal-gas retorts, and the amount of fuel required proved too great for the success of the process. In 1871 Tessie du Motay erected in New York City an apparatus for the manufacture of "oxygen" gas, which, although it proved unsuccessful for this purpose, was later successfully developed into the generator-retort form of carbureted water-gas apparatus, and in 1873 Lowe erected, in Phoenixville, Pa., the first apparatus of the generator-superheated type, covered by his patent taken out in 1872. In 1875 Lowe took out, as a result of his experience in construction, another patent, the basic patent for apparatus of this class.

Apparatus and Process of Manufacture. In the generator-retort, or Tessie du Motay, process, water gas is made in a generator, a steel shell lined with fire brick. The generator is filled with anthracite coal, which after kindling is brought to incandescence by means of a forced blast of air. When the proper temperature is reached, the blast is shut off, the outlet for the escape of the products of combustion closed, and steam is admitted to the fire and is decomposed, forming water gas. The water gas is led from the generator into a small gas holder, called a relief holder. This is necessary, because the action of the generator is intermittent, and the production of water gas rapidly cools the fire below the gas-making temperature. The temperature must be brought back by again putting on the blast, while the gas must pass through the rest of the apparatus continuously and at a uniform rate. From the holder it is led above a series of steam-heated shelves, on which naphtha is vaporized, and the mixture of gas and vapor then passes through externally heated retorts, the vapor being converted by the heat into permanent gases. The crude carbureted water gas so formed is drawn from the retorts by an exhaustor and condensed and purified, without being scrubbed, in the manner described under the heading *Coal Gas*.

In the generator-superheater, or Lowe, type of apparatus (see Fig. 7) the water gas is made and carbureted in one operation. In its most common form it consists of three brick-lined steel cylindrical vessels connected and called the generator, the carburetor, and the superheater. The generator contains the coal, and the carburetor and superheater are filled with fire brick piled in a checkerwork. This checker brick is heated by the combustion of the producer gas formed in the generator while the coal is being

brought to incandescence by a forced blast. When the proper temperature has been reached in all the vessels, the blast is shut off, the stack valve on top of the superheater, through which the products of combustion escape during the heating-up period, or "blow," is closed, and steam is turned into the generator. As soon as the production of water gas begins, oil is admitted at the top of the carburetor, is vaporized by the heat of the checker brick, and is taken up by the water gas and carried through the checkerwork in the carburetor and superheater, being converted into a mixture of permanent gases by the exposure to heat to which it is thus subjected. After leaving the superheater the gas passes through a water seal and is then cooled by the condenser and run into a relief holder. An exhaustor draws the gas from this holder and forces it through the purifiers and station meter into the storage holder. The generator-superheater type is the one that is generally employed at present, having replaced all the earlier installations of the generator-retort type.

Carbureted water gas is a mixture of essentially the same gases as are found in coal gas, though in different proportions, the following being representative analyses of each gas after purification by oxide of iron.

	Coal gas	Carbureted water gas
	<i>Per cent</i>	<i>Per cent</i>
Carbon dioxide	12	3.8
Ethylene and benzene	32	11.4
Oxygen	4	2
Carbon monoxide	91	31.0
Methane	30.2	15.0
Hydrogen	48.5	32.9
Nitrogen	7.4	5.7

In the case of carbureted water gas, however, the crude gas contains no ammonia or cyanogen, and smaller amounts of sulphureted hydrogen and sulphur compounds than are found in crude coal gas. It is estimated that from 70 to 75 per cent of the total amount of illuminating gas sold in the United States is carbureted water gas, while English gas works at present send out 14 per cent of carbureted water gas.

DISTRIBUTION OF GAS

From the gas holder the gas is conveyed to the consumers by means of *main pipes*, laid under the surface of the streets, from which branch or *service pipes* are led to the houses. The pressure on the mains, which varies in ordinary practice from $1\frac{1}{2}$ to 4 inches of water ($\frac{1}{8}$ to $\frac{1}{2}$ pound per square inch), is furnished by the weight of the gas holder and is regulated to meet the variation in the demand for gas by men at the valves, or by a *governor* on the holder outlet. This governor consists of a valve fastened to an inverted bell sealed in water, the weight of the valve and bell being supported by the pressure of the gas in the mains. If this falls, the bell falls, opening the valve, and so, by allowing more gas to pass, brings the pressure back to the proper point. The amount of pressure can be varied by the use of removable weights to vary the total weight to be supported.

The main pipes vary in internal diameter from 3 to 72 inches. They are usually cast-iron bell and spigot pipes, made in lengths 12 feet long, which are connected together with lead or cement

joints, but wrought-iron pipe with screwed joints is sometimes used for the smaller sizes. The services are always made of wrought-iron pipe (See PIPES). The mains must be laid so as to drain to certain points, at which provision is made by means of "drips" for removing the water and such hydrocarbon vapors as condense from the gas, and the service pipes should drain into the mains.

In recent years the use of high pressure (10 to 20 pounds per square inch) has been advocated for the distribution of gas in localities having a scattered population, and several distribution systems using this pressure have been installed and are now being operated. In such systems wrought-iron pipe is used exclusively.

Meters. The amount of gas supplied to each consumer is measured by means of consumers' meters, which are now of the dry type only. A dry meter consists of a rectangular box, made of tin plate, divided into two main compartments by a horizontal partition. The lower of these compartments is also divided into two equal parts by a vertical partition. The measuring apparatus consists of two bellows, one in each of the divisions of the lower compartment, each formed by a circular metal disk, to the circumference of which is fastened one edge of a leather diaphragm having its other edge fastened to the central partition, the whole forming a gas-tight space. The alternate opening and closing of these bellows by the pressure of the gas as it is admitted, first into the spaces inside and then into the spaces outside of them, furnishes motion which by suitable mechanism is made to operate valves controlling the flow of gas into and out of the bellows and outer spaces in such a way that gas cannot pass simultaneously into and out of any given space, and also to work the train of gears which records the amount of gas passed through the meter. The mechanism also controls the extent to which the bellows can open and close, so that a fixed and definite volume of gas passes into and out of the meter each time one is filled and emptied. The house pipes, which are usually wrought iron, should drain to the meter, where any condensation can be run off if necessary. A tolerance of 1 or 2 per cent fast or slow at time of the installation of a meter is usually considered sufficiently accurate, as the meter can be adjusted within 1 per cent of correct without difficulty. If the meter, after having been in service for several years, is accurate within 2 or 3 per cent, the loss to either customer or company is considered negligible. Tests or retests are required by public-service authorities in many States, and the percentage of accuracy is being increased.

Burners. The principal forms of gas burners used for the development of light from the gas are the flat flame, the Argand, and the incandescent. The flat-flame burners are either "batwing," in which the gas issues from a narrow slit cut through the rounded top of the tip, or "fishtail," in which the gas issues from two circular holes in a flat tip, inclined in such a way that the jets of gas strike against each other and are spread out in a sheet of flame. The tips are usually made either of steatite or of a species of enamel. Although in their early forms these two types produced flames of different shapes, whence their names, as now made they produce flames that are practically identical. The Argand burner is circular in form and consists of a hollow steatite or metal ring, the

top of which is pierced with small holes, through which the gas issues. Air, drawn in by the draft produced by a glass chimney, is supplied to both the inner and outer circumferences of the flame. In the incandescent burner the gas is burned in an atmospheric burner giving a nonluminous flame, the heat of which is used to raise to incandescence a hood or mantle composed of oxides of rare earths, which are very refractory. The mantles most commonly employed are composed of approximately 99 per cent of thorium and 1 per cent of cerium. This combination has been found to yield the greatest amount of light, and the use of such mantles increases the amount of light obtainable from a foot of gas to four or five times what it can be made to yield in flat-flame or Argand burners. As the amount of light that may be obtained from gas when burned in incandescent burners depends largely upon the calorific value, and but slightly upon the illuminating value, as shown by the legal method of testing (for which see PHOTOMETRY), the increasing use of these burners has given rise to a discussion of the advisability of changing from the old illuminating-value standards by which the quality has been judged to a calorific-value standard. In some cities in Europe, where it is possible to make a gas of good calorific but low illuminating value much more cheaply than a gas with a higher illuminating value, the legal illuminating value has been reduced to 10 candles. In London the legal standard of the gas companies has been reduced to 14 candles.

Use of Illuminating Gas for Fuel Purposes. During recent years there has been a large development of the use of gas for cooking, for such heating as is not required to be continuous, and for industrial purposes where it is important to have a high and easily controllable temperature. A great number of gas companies have been very active in seeking for business along these lines, until in some cases the output of gas for fuel purposes is greater than that for illuminating purposes. This development of the sale of gas for fuel also affords an argument in favor of the adoption of a calorific-value standard, as mentioned above.

In 1912 the *Mineral Resources* of the United States Geological Survey reported that there had been sold for illuminating and fuel purposes 212,391,168,000 cubic feet, a figure which included a considerable decrease in the amount of gas used for illumination, but a great gain in its use for fuel.

The total quantity of gas reported as sold in the United States for lighting and heating during the year 1910 according to the thirteenth census, was 156,900,000,000 cubic feet, as compared with 68,265,000,000 reported for 1900, an increase of 130 per cent. Of the amount sold in 1909, about 15,791,220,000 was a by-product from the manufacture of coke and was sold to distributing companies for resale to consumers, the balance of the output was made by 1296 gas works, which number may be compared with 877 reported in 1899, 742 reported in 1889, and only 30 in 1850. The capital invested in the gas industry, according to the reports, increased from \$6,674,000 in 1850 to \$258,771,745 in 1889, \$567,000,506 in 1899, and \$915,536,762 in 1909. The total receipts for gas sold in 1909 were \$138,615,309, or \$0.92 per thousand cubic feet, which latter figure may be compared with \$1.03 per thousand in 1899 and \$1.42 per thousand in

1889 By-products sold in 1909, including tar, coke, and ammoniacal liquor (not separately reported), amounted to about \$21,155,672, which, with \$7,043,390 from rents and sales of appliances, brought the total revenues of the gas works up to \$166,814,371. The total output of English gas works in 1910 was about 206,510,000,000 cubic feet.

Sanitary Aspects. Towards the close of the nineteenth century the attention both of sanitarians and of those interested in gas manufacture was directed to the sanitary aspects of the use of illuminating gas. The importance of this phase of the subject had recently been increased by the frequent substitution of water gas for coal gas. In water gas the most poisonous agent—carbon monoxide—is increased, as compared with coal gas, from 6 or 7 per cent to about 30 per cent. This change, however, was not necessary to make illuminating gas an active poison to breathe. The danger in the use of illuminating gas arises from two sources: (1) from unburned gas which escapes into the atmosphere through defective pipes or fixtures, or through burners accidentally open, and (2) from vitiation of the atmosphere through the products of burning gas.

The National Board of Fire Underwriters has published a table of gas losses compiled from data furnished by 15 companies, which shows that over 14 per cent of the total product of gas plants leaks into the streets and houses of the cities supplied. The danger to houses from escaping gas is much greater in the winter time, when the street surface is frozen, and when houses, on account of their higher temperature, act as chimneys to draw in the ground air, and with it the gas which has leaked into the soil. Gas thus escaping may follow water or sewer pipes and enter even those houses which have no gas connections.

In order to remove the constant menace to life and property, through explosion and asphyxiation, which is afforded by leaky gas mains, the whole matter should be under the strictest surveillance and control by the public. The introduction in our large cities of subways for underground pipes and wires would remedy the evil by rendering gas mains easily accessible for constant inspection. In this way the slightest leak would be detected. The danger of deterioration of the mains through rust and of their breaking through settlement of the soil would also be removed.

While the consumption of gas does vitiate the atmosphere of a room to a certain extent, an ideal system of ventilation is possible, in which burning gas is not a hindrance, but an essential part. An example of such a system is the British Houses of Parliament, in which, by means of flues placed over the jets, the heat or surplus energy of the gas flame assists in producing a pure atmosphere. A similar system of ventilation could be carried on in an ordinary room with a 13-foot ceiling, in conjunction with the chimney in the room, and the combustion of one cubic foot of gas could be made, by a suitable flue, to change the atmosphere of a room 15 × 15 × 11 feet once per hour. In this event the three feet per hour consumed by an incandescent burner could be made abundantly to light and ventilate that space.

For cases of isolated lighting, air gas, oil gas, and acetylene are chiefly used. Among these the oldest method is air gas, popularly

known as "Naphtha Gas," which consists of air charged with naphtha or gasoline vapor, a petroleum distillate consisting mainly of pentane, hexane, and heptane. If the product is to be used exclusively for house lighting and heating, care must be taken that the mixture contains either less than 2 or more than 5 per cent of the hydrocarbon vapor, as it is between these figures that the mixture is explosive and only fit for use in the gasoline engine. Many kinds of apparatus have been used for producing mixtures of the first type. They consist essentially of a system for feeding measured quantities of air under slight pressure to a carburetor, or chamber, where the necessary amount of hydrocarbon is introduced in the form of a fine spray and regulated by a float operating a needle valve. These carburetors are familiar in connection with the "gasoline engine." It is essential that the air used be at constant temperature and the vaporization be regular, otherwise the absorption of heat by too rapid evaporation yields a product low in illuminating and heating power. With the use of gas mantles this difficulty has been partly obviated. Where the mixture consists of more than 5 per cent vapor, it must be mixed with air before combustion. Such mixtures are now used almost exclusively for heating purposes and are familiar in the painter's or brazier's torch and plumber's furnace. Either piece of apparatus consists of a strong brass cylinder provided with an air pump or heating coil and a burner tube filled with fibrous material, the outer end of which terminates in a needle valve for controlling the supply of heated gas, and an air-mixing chamber. Of the few types of apparatus of this order still used for house lighting, the simplest consist of a revolving air drum driven by weights and capable of forcing warm house air through a pipe to an underground tank, situated some distance from the building. This pipe enters the top of the tank, bends at a right angle, and continues nearly to the bottom. Another pipe for conveying the vapor-laden air leaves the top of the tank and returns to the building. A supply pipe for gasoline extends just above the ground line and is closed except when the tank requires filling. It is obvious that the house air, impelled by the drum, bubbles through the gasoline and becomes saturated with vapor. Special burners, filled with fibre and provided with an air-mixing device, are necessary. Many forms of air-gas machines are now operated by gasoline-engine power, the exhaust from which heats the air used in the operation, thus obtaining more constant results. A simple form of apparatus of the pressure type is quite largely used in small household stoves and differs not materially from the plumber's furnace, except that the air pump is absent, and vaporization of pure hydrocarbon is maintained by heat, conducted back into the reservoir by the burner tube or a copper rod. A small reservoir is provided under the burner. By filling this with gasoline or alcohol and igniting, sufficient heat is generated in the reservoir by the time it has burned out to partly vaporize the hydrocarbon and produce enough pressure to cause a flow of hot vapor. On opening the needle valve this vapor mixes with air and is burned at the tip of the burner. The burner tube maintains sufficient heat in the reservoir as long as the flame is alight. Kerosene may be burned in this

type of apparatus, which is familiarly known as the blue-flame stove. The vapor of denatured alcohol is utilized in similar apparatus, but the practice has not found much favor in the United States. Where light only is required, a mantle burner is employed.

Oil Gas Illuminating mixtures made by the destructive distillation of oil or fats antedate coal gas, but failed from high cost of the original material. With the production of cheap liquid hydrocarbons from various sources, the project revived and is now extensively employed either for enriching water gas or to be sold in a compressed form for isolated lighting—railway cars, boats, buoys, isolated dwellings, and street lamps.

This gas is best known as "Pintsch gas." The process of manufacture is conducted in iron retorts and is similar to the coal-gas process, except that the maximum temperature rarely passes 900° F. In the Young process the gas is washed by the oil flowing into the retort, and all condensable vapor removed.

Oil gas has the following composition

CONSTITUENTS	Per cent
Unsaturated hydrocarbons	33.16
Saturated hydrocarbons	45.15
Hydrogen	19.65
Carbon monoxide	50
Carbon dioxide	50
Oxygen	60
Nitrogen	44

Oil gas is compressed in steel cylinders at 90–100 pounds' pressure and when used must be attached to a special governor for reducing the pressure to 1–2 inches of water. Special flat-flame or ordinary mantle burners are used.

Blau Gas, invented by Hermann Blau, of Augsburg, is a special form of oil gas consisting of propane, butane, and pentanes with hydrogen and methane in solution under pressure. It has a higher illuminating and heating power than ordinary oil gas and is particularly recommended on account of its safety for use in dwellings, lighthouses, etc. Very high temperatures are obtained by burning the gas in combination with oxygen. In this manner it is used in burning steel beams in the demolition of buildings, ships, and similar structures.

Acetylene, C_2H_2 , is produced by adding water to calcium carbide, or vice versa. The gas is pure, requiring no further treatment, and the operation of making may be stopped at will. As the gas is generated under pressure, a strong well-made apparatus is necessary, and there is always the element of danger from excessive pressure. This form of lighting has been very popular, especially on a small scale, as in bicycle and automobile lamps, etc. The danger factor has led to the manufacture of the gas and storage under pressure in strong steel tanks filled with fibre and containing acetone, which dissolves the gas under pressure and releases it on removal. The high cost of this system limits its application for general use. Acetylene and oxygen, both under pressure, are extensively used in producing high temperatures for metal work, acetylene welding, and brazing. It is claimed that acetylene penetrates fog or mist better than the electric light, hence should receive the preference for buoys, ships, and railway signals. Acetylene burns best in the Y-shaped burner. The apertures are on the

inside of the Y arms near the top. The two opposing streams of gas impinging spread out in fan-shape flame. Acetylene is less poisonous than any other illuminating gas and if it escapes in any quantity may be recognized by its characteristic odor. See ACETYLENE.

Natural Gas issues from the earth in many localities and has been known from a very early date. As far back as history goes the "eternal fires of Baku" on the Caspian Sea are mentioned, and it is quite likely that a gas well existed in the temple of Diana at Ephesus. No application was made of this valuable product until recent times. Wherever soft coal or oil occurs, the deposits are more or less accompanied by gas. This fact has led to the belief that "natural gas" is one of the by-products in the formation of coal. With the exploitation of petroleum in the United States vast supplies of gas were accidentally tapped and many hundred million feet wasted before the excessive pressure of the wells could be brought under control. When means were devised for accomplishing this end, the product was piped many miles in some cases and utilized for heating and lighting on a large scale.

Natural gas consists largely of hydrogen and methane, consequently has low illuminating and high heating capacity. It is, moreover, frequently highly charged with impurities such as hydrogen sulphide, etc., and requires purification before it is suitable for house use. As there is no absolute certainty of the duration of the supply, any but the simplest means of handling and purification are usually out of the question. Natural gas is still very largely used for metallurgical purposes and street lighting. See GAS, NATURAL.

Bibliography Journals devoted to the subject of the manufacture and distribution of gas appear in all the leading languages, and of these the *Journal of Gas Lighting* (London) was first issued in 1849. Other journals of importance are the *American Gaslight Journal* (New York) and the *Gas Age* (ib). For a full description of the subject of gas lighting, consult Thorpe, *Dictionary of Applied Chemistry* (London, 1912). Newbigging, *Handbook for Gas Engineers* (ib, 1904); Lewes, *Carbonisation of Coal* (ib, 1912); O'Connor, *Gas Manufacture and Lighting* (ib, 1910); Bertelsmann, "Das Leuchtgas in den Städten," in Weyl's *Handbuch der Hygiene* (Leipzig, 1913); Strache, *Gas Beleuchtung und Gasindustrie* (Brunswick, 1913); *Legal Specifications for Illuminating Gas*, United States Bureau of Standards, Technologic Papers No. 14 (Government Printing Office, Washington, 1913); Hunt, *History of the Introduction of Gas Lighting* (London, 1907); Butterfield, *The Chemistry of Gas Manufacture* (ib, 1907); id., *Lectures on Chemistry in Gas Works* (ib, 1913).

See PUBLIC UTILITIES for discussion of organization and control of gas companies.

GAS, LAUGHING See ANÆSTHETIC; NITROGEN.

GAS, NATURAL A gaseous member of the paraffin series (see HYDROCARBONS), petroleum (q.v.) being a liquid member and asphalt (q.v.) a solid one.

Composition Natural gas is made up chiefly of marsh gas, or methane (CH_4), which usually forms over 90 per cent of the entire gas, the extremes of a number of analyses of United States samples being 98.30 (Ala.) and 14.33

(Dexter, Kans.). In this same series carbon dioxide ranges from 0.05 to 30.40 per cent, nitrogen from 82.70 to 0.60 per cent, and oxygen from a trace to 9 per cent. Other hydrocarbons are usually present in small amounts, but range from a few tenths per cent up to 20 or 30 per cent in exceptional cases. The rare element neon as well as helium has been found in Kansas gas. The accompanying analyses give the composition of natural gas from different American localities.

arrange themselves according to their specific gravities, the gas and oil being found at and near the crest, respectively, while on either flank there is often an abundance of water. At times little or no oil may be present.

This theory of gas accumulation is known as the "anticlinal theory" and was developed by Profs. E. Orton and I. C. White. The structure of the rocks at the surface is not necessarily the same as that of the oil-bearing formation, since the two series may not be conformable. It has

NATURAL GASES	1	2	3	4	5	6	7
Methane (CH ₄)	96.20	14.85	62.93	73.81	92.61	80.94	86.48
Ethane (C ₂ H ₆)	.78	.41				14.60	7.65
Olefine (C ₂ H ₄)	.00				.30		
Carbon dioxide (CO ₂)	.00	.00	.50	.81	.26		
Carbon monoxide (CO)	.11	.00	tr		.50	.40	.50
Oxygen (O)	tr	.20	.70	3.46	.34	.20	.30
Nitrogen (N)	2.46	82.70	24.36	21.92	3.61	3.46	4.87
Hydrogen (H)	.18	tr	11.51		2.18	tr	
Helium (He)	.27	1.84	undet	undet	undet	undet	undet
Hydrogen sulphide (H ₂ S)	.00				.20		

1. Buffalo, Kans., 2. Dexter, Kans., 3. Stockton, Cal., 4. Pittsfield, Ill., 5. Findlay, Ohio, 6. Big Injun Sand, Shinnston, W. Va., 7. Fifty Foot Sand, same locality.

Natural gas has a specific gravity of 0.6 to 0.65, it weighs from 47 to 49 pounds per 1000 cubic feet and has a calorific power ranging from about 920,000 to 1,250,000 B. T. U. per 1000 cubic feet.

Mode of Occurrence. Gas, as a rule, is found only in sedimentary formations, unbroken by faults and but little folded or otherwise disturbed. Exception to this is the occurrence of gas with salt domes in Louisiana and with faulted beds in California. The conditions favorable for accumulation are a porous rock to serve as a reservoir, a cap rock to hold it, and the proper structure to encourage concentration. The reservoir rock is generally sandstone, but sand, limestone, dolomite, and more rarely shale, may serve the same function. Natural gas is found in rocks of all geological ages and is often more or less closely associated with petroleum. The following classification, suggested by Clapp, indicates the types of structure with which gas may be associated:

- I Where anticlinal structure exists
 - (a) Strong anticlines standing alone
 - (b) Well-defined anticlines alternating with synclines
 - (c) Structural terraces
 - (d) Accumulations on monoclines due to thinning out or change in texture of the sand as it rises towards the nearest anticline
 - (e) Broad geanticlinal folds
- II Quaquaversal structures
 - (a) Anticlinal bulges
 - (b) Stratigraphic domes
 - (c) Saline domes.
- III Contact of sedimentary and crystalline rocks
- IV In joint cracks
- V Where there is no particular gas structure, but the gas is associated with adjacent oil pools.

While all these types of occurrence are known in the United States, the most common one is the association of the gas with some sort of anticlinal structure. Where this is true, and oil and saline water are associated with the gas, there will be a tendency for the three to

been noticed in many gas fields that when the reservoir is tapped the gas usually rushes out as though under great pressure, this being spoken of as rock pressure. Prof. E. Orton believed that this pressure was hydrostatic and due to the head of water in the rocks overlying the gas, the amount of pressure in the Ohio field being equal to a column of water whose height was equal to the elevation of Lake Erie above the gas-bearing stratum. While this theory may hold in some cases, still I. C. White has pointed out that in others the rock pressure is much greater than the artesian pressure in the same region, and furthermore that the exhaustion of the gas is not always followed by a flow of water. In such cases the rock pressure must be due to the expansive force of the gas. The original rock pressure varies in different fields and is not infrequently as high as 300 or 400 pounds per square inch at the mouth of the well and in some wells may exceed 1000 pounds per square inch. Several of the newer wells in West Virginia having a depth of from 2700 to 3200 feet showed a rock pressure ranging from 1000 pounds to 1300 pounds per square inch. A decrease in pressure is always likely to follow with time, as in the case of the first well opened at Findlay, Ohio, where the pressure fell from 450 pounds in 1886 to 170 pounds in 1890. In the early days of gas-well drilling the supply appeared so inexhaustible that the newly drilled wells were often allowed to blow off gas for several days or weeks before attempts were made to cap them.

Origin. Many theories have been advanced to explain the origin of natural gas, but they all fall into one of two groups, the inorganic and the organic. Those belonging to the former class usually assume that surface water has penetrated to the earth's interior, where it has acted chemically on carbide of iron at high temperature, producing hydrocarbons, or in other cases the natural gas is supposed to be a volcanic exhalation. The organic theories agree in believing the gas to have originated by the decomposition of organic matter buried in the rocks, but the points of difference shown by the advocates of this theory are whether the

gas has originated in situ or migrated from other formations, and whether it has been derived from animal or vegetable matter

Distribution. The natural gas fields of the United States, together with their estimated areas, are as follows

	Sq mi		Sq mi
Pennsylvania	2730	Arkansas	100
Indiana	2460	Colorado	80
West Virginia	1000	South Dakota	80
New York	550	Missouri	70
Oklahoma	1000	Washington	70
California	310	Illinois	50
Kentucky	290	Michigan	40
Ohio	275	Montana	40
Kansas	550	Utah	40
Texas	130	Alabama	40
Wyoming	120	Oregon	20
Louisiana	110		10,155

The areas of gas production and oil production correspond more or less geologically and geographically, but there are comparatively few important gas-producing regions. These are

(1) Appalachian region, including the fields of New York, Pennsylvania, southeastern Ohio, West Virginia, Kentucky, and Alabama, (2) Trenton rock region, or Ohio-Indiana field, (3) Clinton sand region, or central Ohio field, (4) Mid-Continent or Kansas-Oklahoma field; (5) Caddo field of northwestern Louisiana

In the Appalachian field, which extends from New York to Alabama, the gas occurs in formations ranging from the Ordovician to Carboniferous, but in the central part the wells do not penetrate deeper than the Devonian. No less than 30 gas sands are known in the Devonian and Carboniferous, and in West Virginia some producing wells reach a depth of 4000 feet. The Trenton rock region extends from northwestern Ohio into Indiana and is associated with a broad dome known as the Cincinnati anticline. This field is decreasing in output. The Clinton sand field extends from western Ontario southward nearly to the Ohio River, the large gas fields being found in the highest portion of the Clinton (Silurian) sand.

In the Kansas-Oklahoma field the gas is all obtained from carboniferous sandstones except an area in southern Oklahoma which yields Cretaceous gas. The structure is of the anticlinal type or a modification of it. The Caddo field of northwestern Louisiana is associated with the Sabine uplift, which is a broad anticline, carrying gas in the Cretaceous and Tertiary sandstones.

Mining and Uses. The methods used for drilling gas wells are the same as those employed for sinking oil wells. When the gas is first struck, the pressure has in rare cases been sufficiently great to blow out the string of drilling tools weighing over 1000 pounds. As soon as practicable the well is capped, and the supply is piped to the site of consumption or to storage tanks. As the gas is often required for use at some distance from the well, the construction of pipe lines has become an important feature of the natural-gas industry. With high rock pressure the gas may reach the market unaided, but with low pressure it is necessary to locate pumping stations at different points along the pipe. The pipes used vary in diameter from 2 inches to 3 feet and are made of wrought iron or steel. One of the first lines was

that laid in 1832 from Wilcox to Colegrove, Pa., a distance of 20 miles. Later, with the depletion of the gas fields around Pittsburgh, it became necessary to pipe the gas for that city from greater distances, and at the present time some of it is being piped from Doddridge Co., W. Va., a distance of over 100 miles. The pipe lines from Wetzel Co., W. Va., to Akron and Canton, Ohio, are over 150 miles long.

When first used, the price of natural gas was low and no attempt was made to measure it, as it appeared to be widely distributed and to exist in inexhaustible quantities, but the giving out of some of the districts and the rapid fall in rock pressure led to the use of meters and a rise in the value of the gas. On account of its cleanliness and excellent calorific power, natural gas has become an important source of light, heat, and power in many States, so that in 1912 it was supplied in 23 States to a total of 15,936 manufacturing establishments, including iron mills, steelworks, glass factories, brick factories, and lead and zinc smelters. In addition to this it was used in many hundred private houses for heating or illumination.

There has been considerable agitation in recent years against a reckless waste of natural gas. The causes of this waste are (1) free escape from natural-gas wells that have not been closed, (2) free escape of gas from oil wells, (3) abuse of gas by the use of its pressure to drive engines, (4) jetting of gas into oil wells for purpose of gas lift instead of air lift, (5) wasteful installation of gas burners and lights in oil-well drilling, (6) waste by selling at a flat rate, (7) waste from inefficient furnaces.

The consumption of natural gas in the United States in 1912 was 562,203,452,000 cubic feet, valued at \$84,563,957, an average price of 15.04 cents per thousand cubic feet. There were 30,779 producing wells at the end of 1912.

An interesting recent development is the separation of the more volatile grades of gasoline from natural gas issuing from oil wells, the gas from various regions yielding from 0 to 8 or 10 gallons of gasoline per thousand feet, with an average of 3 gallons. The total quantity of gasoline so produced in 1912 was 12,081,179 gallons, valued at \$1,157,476.

History. The use of natural gas in China and Persia is said to date back to a very remote period. In the United States General Washington is said to have visited a burning spring on the Great Kanawha River, near the present site of Charleston, W. Va., but the first recorded use of natural gas in this country was in 1821 at Fredonia, N. Y., where it was piped from a well for illuminating purposes. In 1841 it was used in the Great Kanawha valley for heating salt furnaces, but its extensive use did not begin until 1872, at Fairview, Pa. In 1875 it was first used for iron smelting at Etna Borough, near Pittsburgh, and in 1886 was brought to Pittsburgh from the Haymaker well near Murfreesville, 19 miles distant. Since then its use has steadily increased.

GAS CITY A city in Grant Co, Ind, 45 miles southeast of Logansport, on the Pittsburgh, Cincinnati, Chicago, and St Louis Railroad (Map: Indiana, F 4). The city contains a Carnegie library. It is in an agricultural region and has tin-plate works and glass factories, bottling works, and manufactories of paper boxes, rubber goods, gloves, and lumber. Under a charter of 1896 its government consists of a mayor and a unicameral council. The water works and electric-light plant are owned by the city. Pop., 1900, 3662, 1910, 3224

GASCOIGNE, gās-koin', GEORGE (c 1535-77) An English poet. He was born about 1535, the son of Sir John Gascoigne, of Cardington, Bedfordshire, and was educated at Trinity College, Cambridge, but left without a degree, entering, it is said, the Middle Temple before 1548. In 1555 he became a student of Gray's Inn, in 1557-59 he was member of Parliament; about 1566 he married and settled at Walthamstow. To escape his numerous creditors he went to Holland in 1572, where he served with distinction under William, Prince of Orange, but was captured by the Spaniards under the walls of Leyden and sent back to England after an imprisonment of four months. His *Poeses of G. Gascoigne* appeared in 1575. In the same year he accompanied Queen Elizabeth on her memorable visit to Kenilworth, and was commissioned by Leicester to write verses and masques for her entertainment. These appeared in *The Princelye Pleasures* (1576). Gascoigne is best known by his lyrics, such as "The Arraignment of a Lover" and "A Strange Passion of a Lover." But much of his other work is of very great historical interest. *The Supposes*, acted at Gray's Inn in 1566, an adaptation of Ariosto's *Gl' suppositi*, is the earliest extant comedy in English prose. Aided by Francis Kinwelmersh, he wrote *Jocasta* (1575), a free rendering of Euripides' *Phæmæssæ*. This is the second earliest English tragedy in blank verse. *The Steel Glas* (1576), written in blank verse, is our earliest regular verse satire. *Certaine Notes of Instruction Concerning the Making of Verse or Ryme in English* (1575) is the earliest English critical essay. An edition of Gascoigne's *Works* was published by Jeffes (London, 1887). His *Complete Poems* were edited by W. C. Hazlitt, Roxburghe Li-

brary (London, 1868-69). His principal poems were edited by Arber (London, 1868), and his *Complete Works*, ed. by John W. Cunliffe, appeared in the *Cambridge English Classics* (New York, 1907-10). Consult F. E. Schelling, *Life and Writings of George Gascoigne* (Philadelphia, 1893), and Sidney Lee's article in *Dictionary of National Biography* (London, 1889).

GASCOIGNE, SIR WILLIAM (c 1350-1419) An English judge during the reign of Henry IV and the first English judge of whom we have any personal anecdotes. He was made a sergeant at law in 1397 and in 1400 became Chief Justice of the King's Bench. In this high office he distinguished himself both by his integrity and ability. In July, 1403, he was joined with the Earl of Westmoreland in a commission for levying forces against the insurrection of Henry ("Hotspur") Percy. In popular, though unauthenticated, story he is chiefly celebrated for the fearlessness with which he defended the immunities of his judicial office from interference by the court. On one occasion, the legend runs, when one of the dissolute companions of young Prince Henry, afterward Henry V, was arraigned before Gascoigne for felony, the Prince demanded his release and, on being ordered out of the court room, rushed upon the judge and struck him. Gascoigne immediately committed the Prince to prison, and Henry, so the story goes, conscience-stricken, submitted. The King, on being informed of the occurrence, is said to have thanked God for having given him "both a judge who knew how to administer the laws and a son who respected their authority." Shakespeare, in *Henry IV, Part II*, represents the young Henry V as bidding Gascoigne retain, under a new king, the office whose honor he knew so well how to defend. Historically this is untrue, as Gascoigne seems to have resigned immediately after Henry V's accession. Consult Foss, *Biographia Juridica* (Boston, 1870); Campbell, *Lives of the Chief Justices* (London, 1874); Oman, *History of England from Accession of Richard II to Death of Richard III, 1377-1485* (ib, 1906).

GAS'CON A fish. See SAUREL.

GASCON, gā'skōn', **GASCONNADE**, gā'skō'nād'. Terms employed to denote respectively a boaster or biaggart and any extravagant boast or vaunting. The inhabitants of the district once known as Gascony have long been, and are still, regarded as notorious biaggarts.

GASCONADE (gās'kōn-ād') **RIVER** A right tributary of the Missouri, rising in the Ozark Mountains, in Wright Co, Mo (Map: Missouri, E 3). It flows north-northeast and empties into the Missouri at Gasconade after a course of about 300 miles. Its principal tributaries are the Prairie Fork, Osage Fork, Robidoux Creek, and Big and Little Piney. The stream is navigable for vessels of light draft to Arlington, 107 miles above its mouth, and is an important medium of commerce and transportation throughout this distance.

GAS'CONY (Fr *Gascogne*, Lat *Vasconia*, from *Vascones*, the Basques). An ancient duchy in the southwest of France. Its boundaries were normally the Bay of Biscay, the river Garonne, and the western Pyrenees. The modern departments of Landes, Gers, Basses-Pyrénées, Hautes-Pyrénées, and the southern portions of Haute-Garonne, Tarn-et-Garonne, and Lot-et-Garonne are embraced within its ancient boundaries. It derived its name from the Basques, or Vasques,

who, driven by the Visigoths from their own territories on the southern slope of the western Pyrenees, crossed to the northern side of that mountain range in the middle of the sixth century and settled in the former Roman District of Aquitania Tertia, or Novempopulana. In 602, after an obstinate resistance, the Basques were forced to submit to the Franks. They passed under the sovereignty of the dukes of Aquitania, who for a time were independent of the crown, but were afterward conquered by Pepin and later by Charles the Great. Subsequently the district became incorporated with Aquitania (qv). Consult Monlezun, *Histoire de la Gascogne* (6 vols, Auch, 1846-50), Jaurgain, *La Vasconie, étude historique et critique* (2 vols, Paris, 1898-1902), Lot, *Etudes sur le règne de Hugues Capet* (ib, 1903), Marsh, *English Rule in Gascony, 1199-1259* (Ann Arbor, 1912).

GASCOYNE-CECIL See SALISBURY, third MARQUIS OF

GAS ENGINE A form of prime mover which renders available the energy released in the form of heat when a combustion takes place under the following conditions (1) when such combustion takes place within the motor cylinder itself, (2) when the fuel elements enter the cylinder in the form of gas. The pressure developed by heating the air supplied for proper combustion and the products of such combustion in a confined space is exerted directly to drive the piston. A better and more inclusive term to meet requirement (1) is the title *internal-combustion engine* (qv), because the combustion is internal to the cylinder, instead of external as in the *hot-air engine* (qv) or in the *steam engine* (qv), which has a *steam boiler* externally heated, and in many cases the operation and functioning of the motor will be identical if the fuel is supplied under the second requirement mentioned above, in liquid form, and made into a fog or mist or a true vapor by an atomizing process. Such fuel fog behaves exactly like a gas when the division is fine enough. A true gas is supplied to an internal-combustion motor only in very large installations, where it will pay to make the gas in a producer or gas-making plant, and near the iron-making blast furnace, where a fuel gas is a by-product of the plant and process, or in districts where natural gas is available (See FUEL). The construction, functioning, and uses of the internal-combustion motor, whether using gas or an atomized liquid fuel, will be discussed under INTERNAL-COMBUSTION ENGINE.

Historical Development In 1678 the Abbé d'Hautefeuille invented an engine for employing the explosive power of gunpowder to drive a piston working in a cylinder. This was the prototype of the modern gas engine. In 1680 the eminent Dutch physicist, Christian Huygens, devised a similar gunpowder engine. The next development of the internal-combustion engine was in 1791, when John Barber, an Englishman, specified in a patent the use of a mixture of a hydrocarbon gas and air and its explosion in a vessel, which he called an exploder. Some years later John Street, also an Englishman, took out a patent for the production of an explosive vapor by means of a liquid and air, ignited by a flame, in a suitable cylinder so as to drive machinery. In 1799 Philip Lebon, a Frenchman, took out a patent describing the construction and principle of operation of an engine using coal gas as the

fuel, and two years later he secured a second patent on an improved form of the same engine. Several other inventors followed Lebon, but nothing practical was devised until 1860.

In 1860 Lenoir, a Frenchman, invented the first practical gas engine. This engine resembled in external appearance a single-cylinder, horizontal steam engine and was double acting. Gas was drawn into the cylinder during the first half of the forward stroke and exploded by an electric spark from a Ruhmkorff coil when the piston was commencing the second half of the forward stroke. The burnt gases were forced out during the return stroke, at which time an explosion was taking place on the other side of the piston. The cylinder was water-jacketed and the engine ran smoothly and regularly, thus raising high hopes that a successful substitute for the steam engine had been found. As the charge was exploded without its being compressed, the engine was very wasteful in its consumption of gas. Because of this and other defects, it soon went out of use.

The principal good accomplished by Lenoir's work was to attract attention to the gas engine. As a result of this, in 1862, M. Beau de Rochas took out a patent for the working principles of an internal-combustion motor which were set forth as follows. During the forward stroke of the piston the explosive mixture was to be drawn into the cylinder, and during the return stroke this volume of gas was to be compressed, at the beginning of the second forward stroke the combustion was to take place, driving the piston forward, the burnt gases to be expelled during the second return stroke. As will be observed, the invention called for an engine with a cycle of four distinct operations for each impulse. No engine was built by Beau de Rochas, and for 16 years the existence of his invention remained practically unnoticed. Meanwhile, in 1867, two Germans, Otto and Langen, patented an engine in which the explosion of gases in the cylinder served to impel a free piston so that the volume behind it at the end of its traverse was not filled by the volume of the gases at atmospheric pressure. Hence there was a partial vacuum under the piston, which was therefore forced down by the atmospheric pressure above it. Although very crude mechanically, this engine consumed only about one-half the gas consumed by the Lenoir engine and was the first atmospheric engine to attain commercial importance.

In 1878 Dr. Otto brought out his gas engine, in which he reinvented the Beau de Rochas cycle and applied it in the construction of an actual engine. In this engine the cylinder was continued back beyond the stroke of the piston to form a compression chamber, and the mixture, or charge, was compressed to a pressure of from 45 to 60 pounds per square inch. The ignition was effected by a flame being brought into contact with the compressed mixture, and this produced a pressure of about 150 pounds per square inch, with a temperature of about 1500° Centigrade. The cycle was identical with that of Beau de Rochas, but, to increase the efficiency and to simplify practical working, Otto permitted the dilution of the fresh charge by a portion of the burnt gases from the previous stroke. This made the gases burn more slowly and caused a less violent explosion. As the piston received an impulse only once in every four strokes, or every two revolutions,

regularity of motion had to be secured by heavy fly wheels. Overheating of the cylinder was prevented by a water jacket. Otto's engine consumed only about 915 liters of gas per horse power per hour as compared with 1380 liters consumed by the Otto and Langen engine and 2700 liters by the Lenoir engine.

Many inventors tried to make a gas engine which gave an impulse every two strokes, or once in each revolution, and among them Dugald-Clerk was the first to be successful. He built an engine having two cylinders of equal diameter placed side by side, of which one was the power cylinder in which the explosion took place, the other being used to draw in and to compress the charge and also to furnish a blast of fresh air to clear out the power cylinder after the explosion. This engine could be run with lighter flywheels than the Otto, because of the impulse at every revolution, but owing to high dilution with burnt gases from a previous stroke, it was less efficient. Engines of the Clerk principle are called "two-cycle," or more properly "two-stroke cycle," engines and will be discussed under INTERNAL-COMBUSTION ENGINE.

suction producer. The latter has the advantages that the draft, being dependent on the engine, automatically controls the fire, and, the gas pressure being below atmospheric, there is no tendency for it to leak out. This is important because the gas is poisonous. On account of the large saving in the cost of power, producer-gas engines are being used extensively. A light form of producer has been used with a gas engine to propel a vessel, but the majority of boats driven by internal combustion motors use liquid fuel, either as gasoline, or, in the case of the larger vessels, the heavier oils, such as crude petroleum or distillate. See INTERNAL-COMBUSTION ENGINE, where bibliography is given.

GASES, ANALYSIS OF See ANALYSIS, CHEMICAL.

GASES, GENERAL PROPERTIES OF The study of the nature and properties of gases has yielded many of the most important results of modern science. Practically the entire structure of modern chemistry rests on our knowledge of gases. The birth of the science, as already explained in the article CHEMISTRY, followed almost immediately the discovery of the common

LONGITUDINAL SECTION OF OTTO-CROSSLEY GAS ENGINE

Gas engines using illuminating gas from the mains of cities and towns will usually be very small on account of the cost of fuel so distributed, but in certain high-pressure pumping stations, as in Philadelphia, they have been found very serviceable for fire purposes, being available instantly and responding at once, so that the independent fire mains may be put under pressure. Of course here with infrequent use cost is a secondary consideration, even for a large station.

Producer Gas Engines. The greatest recent advance in true gas engine practice has been the development of engines using producer gas. (See FUEL.) By this method it is comparatively easy to get a horse-power hour per pound of anthracite coal, and during tests some of these engines have produced a horse-power hour on about three-quarters of a pound of anthracite coal. Another decided advantage is that the small sizes of anthracite coal, which are the cheapest, can be used in a gas producer. The producer may be operated on either of two systems. In one a blower is used to furnish a draft for the fire, thus putting the gas under pressure, this is called a pressure producer. In the other system the suction of the engine furnishes the draft, the pressure of the gas being consequently less than atmospheric, this is a

gases. The fruitful theories of modern organic chemistry are based entirely on the general properties of gases, and in the latter part of the nineteenth century general theoretical chemistry received a powerful impulse by the extension of the laws of gases to dilute solutions. (See SOLUTION.) On the other hand, the physicist has been led, by the study of gases, to a clear and simple explanation of the phenomena of heat and of many other general phenomena forming important chapters in modern physics. And, of course, through chemistry and physics the applied and natural sciences, too, owe a great deal to our knowledge of gases. All this importance of gases is due to the comparative simplicity of the laws followed by them. The simplicity of the laws is, in turn, readily explained from the standpoint of the molecular conception. Molecules are minute particles of matter. When they are very near to one another, there must naturally come into play between them forces whose effects are practically nothing when the molecules are widely separated. Under ordinary pressures a substance occupies a much greater volume in the gaseous than in the liquid or solid state. Thus, an amount of water occupying, at 0° C., one cubic centimeter if liquid, would, if vaporized at the same temperature and under ordinary atmos-

2. OTTO GAS-ENGINE.

3. WESTINGHOUSE 3-CYLINDER VERTICAL GAS-ENGINE Operating Direct Current Engine Type Generator.

pheric pressure, occupy over 773 cubic centimeters. Evidently the molecules of a gaseous substance must be very far apart, and their mutual influence very slight. In other words, the number of causes determining the properties of gases must be smaller, and hence the properties themselves must be less complex, than those of liquids or solids. Of course, as the volume within which a gas is compressed is made smaller and smaller, the relative simplicity of properties gradually disappears. (See MOLECULES—MOLECULAR WEIGHTS.) Under certain conditions of pressure and temperature the properties of a substance in the gaseous and liquid states even become identical. (See CRITICAL POINT.) This shows that simplicity of properties, while generally found in the gaseous state, is not strictly characteristic of it. Other characteristics may be found mentioned under AGGREGATION, STATES OF.

It is explained in the articles on HYDROSTATICS and HYDRODYNAMICS how liquids and gases have certain properties in common, viz., all those which depend upon fluid pressure, which is defined as the force per unit area. It is shown in those articles

1. The pressure at any point in a gas is the same in all directions, and its value is $\rho gh + P$, where ρ is the average density of the gas above the point, g is the acceleration due to gravity of a freely falling body, h is the vertical distance from the point to the top of the gas (if it is inclosed in a reservoir), and P is a pressure uniform throughout the gas, due to the reaction of the walls of the reservoir against the outward expansive force of the gas. In all ordinary cases of gases h is not large, and so ρgh may be neglected, because ρ is extremely small, and P is the principal term. In the case of the atmosphere, however, P is zero and h large.

2. The pressure of the gas against the containing walls or against any solid immersed in it is perpendicular to the solid, if the gas is not flowing.

3. Archimides' principle applies to gases, viz., if a solid or a drop of liquid is immersed in the gas, it is buoyed up with a force equal to the weight of the displaced gas.

4. If a gas escapes from a reservoir through a small opening in a thin wall, its velocity of "efflux" is given by the formula $v = \sqrt{\frac{2p}{\rho}}$, where p

is the difference in pressure of the gas inside the reservoir and outside. (This is not the total pressure, but the partial pressure due to this particular gas. See Dalton's Law, below.)

5. If a gas is flowing steadily but slowly through a tube of irregular cross section, the pressure is greatest where the velocity is least, and vice versa. This is the principle of the "atomizer," the "injector" for steam boilers, etc.

The densities of gases at 0° C and standard pressure are as follows: air, 0.001293, carbon dioxide, 0.001974, hydrogen, 0.0000896, oxygen, 0.001430. The special properties of gases have been stated in the form of laws.

Dalton's Law If several gases are contained in the same reservoir, they are distributed uniformly through it, so that the mixture is everywhere the same, and the total pressure on the walls is the sum of the partial pressures, by "partial" pressure is meant that pressure which each gas by itself would exert on the walls if the other gases were removed. This law of

pressures has been shown recently to be not perfectly exact.

Boyle's Law If the temperature of a gas is kept constant, and its volume changes, the resulting pressure and density are such that one is proportional to the other. In symbols,

$$p = k\rho, \text{ or writing } \frac{m}{v} \text{ for } \rho, pv = km, \text{ where}$$

m is the mass and v is the volume. This law, too, is only approximate, for as the pressure on the gas is increased, the product $p v$ does not remain a constant quantity, but first decreases and then increases. (For hydrogen gas the product $p v$ increases without any preliminary decrease.) This means that at high pressures gases are less compressible than they would be if Boyle's law were obeyed exactly. This law, $p v = \text{constant}$ at constant temperatures, was first stated by Robert Boyle in 1662 as the result of careful experiments on air, 14 years afterward it was published by Mariotte.

It is a consequence of Boyle's law that the elasticity of a gas at constant temperature numerically equals the pressure. If a gas is compressed rapidly, its temperature rises, and so the pressure is increased, the elasticity for a sudden compression or rarefaction equals γp , where γ is the ratio of the two specific heats for the gas and for ordinary gases has the value 1.4. (See ELASTICITY.) An instrument for measuring high pressures in a fluid is made, called a closed "manometer," the principle of which depends upon Boyle's law. It consists of a device to trap a definite mass of gas in a closed tube by means of some liquid, such as mercury, and to have the column of mercury compress the gas as the pressure to be measured is increased, the volume of the gas varies inversely as the pressure on it.

If a gas is allowed to expand freely, doing no external work—e.g., take two reservoirs connected by a tube with a stopcock, compress the gas in one and rarely it in the other, then let the stopcock be opened—it is observed that there is practically no energy required to produce the expansion. This shows that any forces of attraction between the molecules must be extremely small. (See HEAT.) It is found by experiment that if the pressure on a gas is kept constant, but the temperature changed, the volume changes at the rate given by the formula

$$v = v_0(1 + \beta t),$$

where v is the volume at $t^\circ \text{C}$, v_0 , that at 0° ; β is a constant, the same for all gases approximately. Similarly, if the volume is kept constant, and the temperature changed, the pressure will change according to the law

$$p = p_0(1 + \beta t),$$

where p is the pressure at $t^\circ \text{C}$, p_0 , that at 0° . β is a constant, the same for all gases and the same as in the above formula for the change of volume. The value of this "coefficient of expansion" is almost exactly $\frac{1}{273}$ or 0.003662. This law for the change in pressure or volume of a gas as the temperature is altered, viz., that β is the same for all gases, was discovered almost simultaneously by Charles, Dalton, and Gay-Lussac.

Another law, known as the "law of combining volumes," may be found explained under CHEMISTRY.

The experimental laws for gases may be deduced theoretically for a mechanical system of perfectly elastic spheres thrown at random into

a space bounded by rigid walls. If the number of spheres is great enough to allow the application of the principle of statistics, it can be shown that the pressure on the walls owing to the impact of the spheres is $p = \frac{1}{2} mn\bar{u}^2$, where m is the mass of each sphere, n is the number of spheres per cubic centimeter, \bar{u}^2 is the mean value of the squared velocities of the spheres. The density is then mn , and the formula may be written $p = \frac{1}{2} \rho \bar{u}^2$.

It may also be shown that the mean kinetic energy of translation of the spheres— $\frac{1}{2} m\bar{u}^2$ —has properties identical with those of the temperature of a gas, consequently the above value of the pressure satisfies Boyle's law. The law for the expansion with temperature may also be derived, viz that β is the same for all gases.

Again, if there are several sets of spheres inclosed in the same space,

$p = \frac{1}{2} (m_1 n_1 \bar{u}_1^2 + m_2 n_2 \bar{u}_2^2 + \text{etc.})$,
which is Dalton's law. And if there is equilibrium of temperature,

$$\frac{1}{2} m_1 \bar{u}_1^2 = \frac{1}{2} m_2 \bar{u}_2^2 = \text{etc.},$$

and therefore

$$p = \frac{1}{2} m \bar{u}^2 (n_1 + n_2 + \text{etc.}),$$

which states that for a given value of $\frac{1}{2} m \bar{u}^2$ (i.e., temperature) the pressure depends simply on the number of the spheres per cubic centimeter, not on their masses. This is equivalent to Avogadro's rule ($q\ v$), another of the general principles concerning gases. Looked at in a different way. If there are two sets of spheres in different reservoirs at the same pressure, $m_1 n_1 \bar{u}_1^2 = m_2 n_2 \bar{u}_2^2$, if, further, their values of $m \bar{u}^2$ are the same (i.e., their temperatures), $m_2 \bar{u}_2^2 = m_1 \bar{u}_1^2$. Hence $n_1 = n_2$, or they have the same number of spheres per cubic centimeter. The densities of the two are $\rho_1 = m_1 n_1$, $\rho_2 = m_2 n_2$, so, if the pressures and "temperatures" are the same,

$$\frac{m_1}{m_2} = \frac{\rho_1}{\rho_2},$$

which is the formula used in determining the "molecular weights" of gases. See MOLECULES—MOLECULAR WEIGHTS.

It can be shown, further, that the greatest possible value of γ , the ratio of the specific heats, is 1.67, but if the molecules are complex, so that there is internal energy in them, γ must be less. It is interesting to note that for helium, argon, and mercury vapor $\gamma = 1.67$, as found by direct experiment.

The properties of the pressure due to the atmosphere around the earth are discussed in the article ATMOSPHERE. Only a few points need be mentioned here. The pressure is measured by a barometer ($q\ v$) and is found nearly to equal that of 76 centimeters of mercury at sea level and at 45° latitude, i.e., $76 \times 13.6 \times 980$, or 1,013,300 dynes per square centimeter. The barometer was invented by Torricelli, a pupil of Galileo, and the first instrument was made and used by Viviani in 1643. Pascal in 1648 showed that the height of the barometer varied with different heights above the earth and proved that the pressure of the atmosphere obeyed the laws of liquid pressure. Von Guericke invented the air pump ($q\ v$) in 1650 and without knowing of Torricelli's work discovered the properties of atmospheric pressure. He did not publish an account of his work, however, until 1672. Boyle published in 1660 an account of his experiments with an air pump illustrating the properties of the pressure due to the air.

The action of lift pumps, siphons, etc., depends

upon atmospheric pressure. Air pumps are instruments designed to exhaust the gas from a closed space, such as a glass bulb.

GASKELL, MRS. ELIZABETH CIEGHORN (1810-65). An English novelist, born in Chelsea, Sept. 29, 1810, the daughter of William Stevenson. When she was only a few weeks old, her mother died, and she was brought up by her aunt at Knutsford in Cheshire—the village afterward described in *Cranford*. She was sent to school at Stafford-on-Avon, where she learned Latin, French, and Italian. In 1832 she married Rev. William Gaskell, a Unitarian minister of Manchester. Her first novel, *Mary Barton*, appeared anonymously in 1848. It was followed by *Ruth* (1853), *Cranford* (1853), *North and South* (1855), *Lizzie Leigh* (1855), *Sylvia's Lovers* (1863), *Cousin Phillis* (1865), *Wives and Daughters* (1865), and many short tales. Mrs. Gaskell's usual aim was to combine instruction with pleasure. Her first novel and several others depict the habits, thoughts, privations, and struggles of the industrial poor, as she herself had observed them in Manchester. Her classic, however, is the delightfully and delicately humorous *Cranford*, with its inimitable sketches of a quaint town and its spinners. Mrs. Gaskell wrote an admirable biography, *The Life of Charlotte Brontë* (1857). The Knutsford edition (8 vols., London, 1906) of her works, with its full and excellent introductions, is the most satisfactory edition. Consult C. K. Shorter, *Mrs. Gaskell* (London, 1904), and E. A. Chadwick, *Mrs. Gaskell's Haunts, Homes, and Stories* (New York, 1911).

GASKELL, WALTER HOLBROOK (1847-1914). An English physiologist. He was born at Naples, Italy, was educated at Trinity College, Cambridge, studied medicine at University Hospital and Leipzig University, and in 1883 was appointed university lecturer in physiology at Cambridge. In 1889 he became fellow of Trinity Hall and in the same year received the gold medal of the Royal Society for his investigations regarding the sympathetic nervous system. His name is identified with the theory that the central nervous system in vertebrates has resulted from the coalescence of the alimentary canal and the central nervous system of some crustacean-like ancestral form. In 1896 he was elected president of the physiological section of the British Association for the Advancement of Science and in 1905 honorable fellow of the Medico-Chirurgical Society.

GASOLINE A distillate from petroleum ($q\ v$) used extensively as a fuel for internal-combustion engines ($q\ v$), especially those of motor vehicles ($q\ v$). It is chiefly produced by the fractional distillation of "refinably crude" petroleum containing a large proportion of

paraffin hydrocarbons, but is also obtained by the so-called "cracking" process, by the condensation of natural gas, and from oil-bearing shales. Strictly speaking, gasoline is the fraction intermediate between petroleum ether and naphtha, but the name is applied to various mixtures of the lighter distillates, so that its specific gravity may range from 80° Baumé to 62° Baumé and its boiling point from 90° F to 200° F. The commercial term "gasoline" includes naphthas and the lighter petroleum products. In the "straight" distilling process the benzine distillate, or light or crude naphtha, is the first product, and this when redistilled yields in the order named cymogene, ihigolene, gasoline, C naphtha (benzine), B naphtha, and A naphtha (petroleum naphtha). From 100 barrels (42 gallons each) of crude oil five to seven barrels of commercial gasoline are yielded by this process. The more efficient "cracking" process involves destructive distillation where the heavier vapors, becoming condensed, are superheated and decomposed, as they fall back upon the hot oil in the still, securing a more complete separation of the fractions. The Burton "cracking" process of the Standard Oil Company in 1916 produced more than 3,000,000 barrels of gasoline from certain low-grade petroleum distillate, or the equivalent of the ordinary recovery of gasoline from 18,000,000 barrels of crude oil containing 17 per cent of gasoline. Up to 1916 this process had not been used for kerosene, heavy residuum oils, and asphaltic crude oils. On the other hand, in the process developed in the United States Bureau of Mines by W. F. Rittman in 1915, gasoline can be produced from crude oil, kerosene, or any low-grade distillate in increased yield by control of the temperatures and pressures of the decompositions.

Gasoline also may be extracted from natural gas by compression. With over 3,000,000 motor vehicles in the United States in 1917 the question of gasoline is a vital one. A production of 6,680,000 barrels in 1899 had increased to 41,600,000 barrels in 1915, of which 6,500,000 barrels were exported. The price of gasoline, which increased from 13 cents a gallon to 21 cents between Jan. 1, 1915, and Jan. 1, 1916, varies with the price of crude oil, but not always proportionately.

GASOLINE-ELECTRIC CARS. See **ELECTRIC RAILWAYS**, *Electric Locomotives*.

GASOMETER. See **GAS**, **ILLUMINATING AND FUEL**.

GASPARIN, ga'spa'rân', AGÉNOR ETIENNE, COUNT DE (1810-71). A French statesman and author, born at Orange. He was a department chief under his father (then Minister of Interior), master of requests in the Council of State, and Deputy from Bastia (Corsica) in 1842-46. As religious reformer he was associated with Frédéric Monod (qv). From 1849 he lived in Geneva. Gasparin made early scientific experiments on table tipping and wrote on it (1854). He published also many monographs on the separation of church and state, the abolition of slavery, the reform of home life, and the Franco-Prussian War. Consult biographies by Naville (Geneva, 1871) and Borel (2d ed., Paris, 1879). See **GASPARIN**, VALÉRIE.

GASPARIN, VALÉRIE BOISSIER, COUNTESS DE (1813-94). A French woman of letters, wife of the above. Born at Geneva, she lived mostly in Canton Vaud, Switzerland. Besides translations, travel books, and novels, she published *Le mariage de point de vue chrétien* (1842) and *Il y a des pauvres à Paris et ailleurs* (1846),

each of which won the Montyon prize of the French Academy, *Les horizons prochains* (1859) and *Les horizons célestes* (1859), translated into English as *The Near and the Heavenly Horizons* (1862), *Les tristesses humaines* (1863), attacks on various social evils. Consult biography by Barbey-Boussier (Paris, 1902).

GASPARINO DA BARZIZZA, ga'spa-rē'nō da bar-tsé'tsa (c 1359-1431). An Italian humanist, born at Barzizza, Bergamo. He taught at Venice and Padua and in 1418 established a school at Pavia. He laid stress on Latin epistolography and especially the letters of Cicero. His *Works* were published at Rome in 1723.

GASPARY, gas'pa-ré, ADOLF (1849-92). A German Romance philologist, born in Berlin. He became lecturer at Berlin University (1879), professor at Breslau (1883), and accepted (1891) but never occupied a chair at Göttingen. He ranks among the foremost German Italian scholars of half a century. The incomplete *Geschichte der italienischen Litteratur* (1885-88), his chief work, and *Die sizilianische Dichterschule des dreizehnten Jahrhunderts* (1878) have been translated into Italian.

GASPÉ, gas'pi'. The most easterly district in the Province of Quebec, Canada, consisting of the counties of Gaspé and Bonaventure, chiefly a peninsula projecting into the Gulf of St. Lawrence, between the estuary of the same name on the north and the Bay of Chaleurs on the south (Map: Quebec, B 2). It consists of an elevated plateau traversed by the Schickshock or Notre Dame Mountains, ranging from 3500 to 3800 feet in height and terminating in Cape Gaspé, a bold headland of sandstone 690 feet high. Area, 8015 square miles. Pop., 1901, 55,178, 1911, 63,111, the greater number of the inhabitants being of French descent. Lumbering and fishing are the chief occupations of the country.

GASPÉ. A village in the Province of Quebec, Canada, which gives its name to the district (qv) and the bay on which it stands (Map: Quebec, C 2). It is the commercial centre of the extensive fishing industries of the region and is a favorite summer resort for sportsmen attracted thither by fine angling and the varied scenery. The United States is represented by a consul and a vice consul. It was here that Jacques Cartier landed in 1534 and took formal possession of the country for the King of France. It was the scene of the destruction of a French fleet in 1627, in 1760 it was captured by the English. Pop., 1901, 454, 1911, 606.

GASPÉ, PHILIP IGNATIUS (1714-87). A French-Canadian soldier. He accompanied De Longueuil on the expedition against the Chicacha and Natchez Indians (1739) and subsequently led troops from Mackinac in attacks on the English colonists. In 1750-52 he was in command of a fort on the St. John River and in 1758 led the Canadian militia in the defense of Fort Carillon (better known under its English name of Ticonderoga), when 3600 troops under Montcalm repulsed an English army about four times as numerous under Abercromby. After the surrender of Quebec in 1759 he commanded the grenadiers of De Lévis.

GAS POISONING. See **CHEMICAL WARFARE**, and **SURGERY**, **MILITARY**.

GASQUET, gas'ká', FRANCIS AIDAN, CARDINAL (1846-). An English Catholic prelate and historian, born in London. He was educated at Downside College and in 1878-84 was

superior of the Benedictine monastery and college of St. Gregory at Downside. He afterward became abbot president of the English Benedictines, president of the International Commission for the Revision of the Vulgate, and (1914) Cardinal. Among his important publications are *Henry VIII and the English Monasteries* (1888-89, 2d ed., 1906), *Edward VI and the Book of Common Prayer* (1890), *The Last Abbot of Glastonbury* (1895, 2d ed., 1908), *A Sketch of Monastic Constitutional History* (1896), *The Old English Bible* (1897, new ed., 1908), *The Eve of the Reformation* (1900), *A Short History of the Catholic Church in England* (1903), *Vita antiquissima B. Gregorii Magni* (1903), *Collectio Anglo-Premonstratensis* (1904 et seq.), *English Monastic Life* (1904), *Henry III and the Church* (1905), *Lord Acton and his Circle* (1906), *Parish Life in Mediæval England* (1906), *The Greater Abbeys of England* (1908), *The Black Death of 1348 and 1349* (2d ed., 1908), *England under the Old Religion* (1912), *Breaking with the Past* (1914).

GASS, gas, WILHELM (1813-89). A German Protestant theologian, born in Breslau. He studied at Breslau, Halle, and Berlin, became a lecturer in theology at Breslau in 1839 and in 1846 was appointed professor, was professor at Greifswald from 1847 to 1862, at Giessen in 1862-68, and from 1868 at Heidelberg. His chief work is *Geschichte der protestantischen Dogmatik* (4 vols., 1854-67). His other publications include *Gennadius und Pletho, Aristotelismus und Platonismus in der griechischen Kirche* (1844), *Die Mystik des Nikolaus Kabasilas vom Leben in Christo* (1849), *Geschichte der christlichen Ethik* (2 vols., 1881-87). He was an associate editor of the *Zeitschrift für Kirchengeschichte* (after 1876) and of the *Theologischer Jahresbericht*.

GASSENDI, ga'san'de', or **GASSEND**, gas'san', PIERRE (1592-1655). An eminent French philosopher and mathematician. He was born at Champiercier, a little village of Provence, in the Department of Basses-Alpes. His unusual powers of mind showed themselves at an early age, and at the age of 16 he became instructor of rhetoric, then professor of theology, at Aix, and in 1616 professor of philosophy. He meanwhile applied himself with zeal to the study of the natural sciences that were taught in his day and was especially interested in astronomy and anatomy. In philosophy he became disgusted with scholasticism and undertook to maintain certain theses against the Aristotelians. His polemic appeared at Grenoble in 1624 and was entitled *Exercitationes Paradoxicæ adversus Aristoteles*. He drew a distinction between the Church and the scholastic philosophy, denying that the former must stand or fall by the latter. In 1623 he was appointed provost of the cathedral at Digne, an office which enabled him to pursue without distraction his astronomical and philosophical studies. At the recommendation of the Archbishop of Lyons, a brother of Cardinal Richelieu, Gassendi was appointed in 1645 professor of mathematics in the Collège Royal de France, at Paris, where he died, Oct. 14, 1655. As a philosopher, Gassendi revived and maintained, with great learning and ingenuity, the doctrines of Epicurus, as he found the atomistic philosophy most easily brought into harmony with his own scientific acquirements and modes of thought. His Epicureanism, however, was not allowed to interfere with

his loyalty to the Catholic faith. He reconciled the two views by holding that God is the First Cause, who created matter in the form of atoms and endowed these with motion, which thus becomes their indefeasible characteristic. His great philosophical opponent was Descartes (q.v.). His philosophy was in such repute that the savants of that time were divided into Cartesians and Gassendists. The two chiefs themselves always entertained the highest respect for each other and were at one time on the friendliest terms. Gassendi ranked Kepler and Galileo among his friends, and was himself the instructor of Molière. He published *De Vita, Moribus, et Placitis Epicuri* (1647) and *Philosophiæ Epicuri Syntagma* (1649). They contain a complete view of the system of Epicurus. His *Institutio Astronomica* (1647) is a clear and connected representation of the state of the science in his own day, in a later work he gave the biography of Tycho Brahe, Copernicus, and other astronomers, and a history of astronomy down to his own time. But his principal philosophical work is *Syntagma philosophicum* in three parts, dealing respectively with logic, physics, and ethics. This work appears as the first two volumes of his collected writings in six volumes, published at Leyden (1658). Another edition of his collected works was published at Florence (1727). Consult Thomas, *La philosophie de Gassendi* (Paris, 1889), Martin, *Histoire de la vie et des écrits de Gassendi* (Paris, 1853), Kiehl, *Gassendus Erkenntnistheorie und seine Stellung zum Materialismus* (Fulda, 1893), Bielt, *Philosophy of Gassendi* (London, 1908).

GASSER, gas'er, HANS (1817-68). An Austrian sculptor, born at Eisentratten, Carinthia. He studied in Vienna under Klieber and Kahssmann and afterward in Munich with Schwanthaler. He began as a portraitist, and his statuette of Jenny Lind and busts of Rahl and Stefan Szechenyi show considerable power. Although he inclined to realism, he was too prolific to be careful in execution or profound in conception. His other works include the statue of Adam Smith at Oxford, allegorical statues for the arsenal and other public buildings of Vienna, the not very successful monument to Wieland at Weimar, the statues of Maria Theresa in Wiener-Neustadt and of the Empress Elizabeth at the Elizabeth Railroad Station. He is at his best, however, in the "Donauweibchen" (Danube Maiden), in the Vienna Stadtpark, and the charming "Twelve Months" in the Belvedere.

GASSER VON VALHORN, gas'sër fön fal'hörn, JOSEPH (1816-1900). An Austrian sculptor, brother of Hans Gasser. He was born at Pragrat, Tirol, and studied at the Vienna Academy under Schaller, Klieber, and Kahssmann, and from 1845 to 1849 in Rome. After his return he executed for the portal of the cathedral of Speier five statues of heroic size. Among the numerous works intrusted to him subsequently in Vienna, where he had settled in 1852, the best are the statues of Emperor Maximilian I., Frederick the Warlike, and Leopold of Hapsburg, in the Arsenal, busts of the Emperor and Empress of Mexico, the marble statues of the "Seven Liberal Arts" in the staircase of the opera house, 24 statues in St. Stephen's Cathedral, and especially the sculptures for the Votivkirche, including the large bas-reliefs on the three main portals. He was

professor at the Academy from 1865 to 1873 and received a title of nobility in 1879

GASSION, ga'syōn', JEAN DE (1609-47). A French general, born at Pau. He fought under the Prince of Piedmont in 1625 and under the Duke de Rohan in 1628. In 1629 he joined a troop of French volunteers and entered the service of Gustavus Adolphus. With him he fought at Leipzig (1631) and saved his life afterward at the siege of Ingolstadt. As a reward, the King gave him command of a regiment. He further distinguished himself at Nuremberg and Lutzen. After the King's death he returned to France and fought bravely in the battles of Charnes and Neuchâtel and at the sieges of Dole, Hesdin, and Landrecies. He was made *maréchal de camp* (1638) and materially assisted in the French victory of Rocroi (1643). He received the baton of a marshal of France in 1643. He died from a wound received under the walls of Lens.

GASSNER, gas'nēr, JOHANN JOSEPH (1727-79). A priest who gained renown as an exorcist. He was born at Bratz, near Bludenz, in the Tirol, and became a Catholic priest at Klosterle, in the diocese of Chur (1758). The accounts of demoniacs in the New Testament, with the writings of celebrated magicians, brought him to the conviction that most diseases are attributable to evil spirits, whose power can be destroyed only by conjuration and prayer. He began to practice on some of his parishioners and succeeded in healing many. He was convinced that he had recovered his own health, which had begun to fail, by exorcism. The Bishop of Constance called him to his residence, but, having come to the conviction that he was a charlatan, advised him to return to his parsonage. Gassner betook himself, however, to other prelates of the Empire, some of whom believed that his cures were miraculous. He gained influential supporters and was sustained by the ecclesiastical authorities, although innumerable attacks were made upon his methods and the genuineness of his cures. Consult his life by Zimmermann (Kempten, 1878).

GAST, gast, FREDERICK AUGUSTUS (1835-) An American clergyman of the Reformed church in the United States, born at Lancaster, Pa. He graduated in 1856 at Franklin and Marshall College (Lancaster), studied at the Mercersburg Theological Seminary (now at Lancaster), and in 1859-65 was pastor at New Holland, Pa. In 1865 he was chaplain of the Forty-fifth Pennsylvania Volunteers, in 1865-67 pastor at London and St Thomas, Pa., and in 1867-71 principal of the academy connected with Franklin and Marshall College. In 1871 and 1872 he was assistant professor in the college, from 1871 to 1873 a tutor and from 1873 to 1909 professor of Hebrew and Old Testament theology in the Lancaster Theological Seminary.

GAS TAR. See COAL TAR.

GASTEIN, ga'stēn. A valley in the Austrian Duchy of Salzburg, celebrated for its mineral springs (Map Austria-Hungary, C 3). It is a side valley of the upper Salzach valley, and is about 25 miles long and 1¼ miles broad, with an elevation of between 3000 and 3500 feet. It is traversed by the river Ache, which forms near Wildbad-Gastein two magnificent waterfalls—the upper, the Kesselfall, 200 feet, and the lower, the Barenfall, 280 feet in height—and by the Tauern Railway, which goes to Mallnitz. The principal villages are Bock-

stein, Hof-Gastein, and Wildbad-Gastein. Hof-Gastein, with a number of deserted gold and silver mines in the vicinity, contains a military hospital, and in the open platz there is a bust of the Emperor Francis I, who in 1828 caused a conduit of upward of 5 miles in length to be constructed for the purpose of conveying the mineral waters thither from Wildbad. Wildbad, the principal watering place, is a fashionable health resort and contains a number of hotels and villas. The water of the springs is considered efficacious in the case of nervous and skin diseases.

GASTEIN, CONVENTION OF. A treaty concluded at Wildbad-Gastein, Aug. 14, 1865, between Austria and Prussia, regulating the relations of these two powers with respect to the duchies of Schleswig-Holstein (qv) and Lauenburg, which they had taken from Denmark and occupied in common. Schleswig was placed under Prussian administration, and Holstein under Austrian, while Lauenburg was annexed to Prussia, Austria ceding its share for 2,500,000 rix thalers. This convention postponed for a short time only the outbreak of the war between the two countries. See GERMANY.

GASTER, MOSES (1856-) A Semitic scholar, born in Bucharest and educated there, at Leipzig, and at Breslau. In 1881-85 he was a lecturer on Rumanian language and literature in the University of Bucharest and then was exiled because he labored in behalf of the persecuted Rumanian Jews. He settled in England, became chief rabbi of the Sephardic communities in England (1887), was principal of the Montefiore College in Ramsgate (1890-96), and was Ilchester lecturer at Oxford in 1886 and 1891. He wrote on folklore, gypsies, Rumanian language and literature, and Biblical questions for special reviews, and published *Literatura populara româna* (1883), *Chrestomathie roumaine* (1891), "Geschichte der rumänischen Literatur," in Groeber's *Grundriss der romanischen Philologie* (1899), *Sephardic Prayer Book* (1901-06), *The Samaritan Book of Joshua* (1908), *The Hebrew Divorce* (1911).

GASTEROMYCE'TES (Neo-Lat. nom. pl., from Gk γαστήρ, *gastēr*, stomach + μύκης, *mykēs*, mushroom). One of the great groups of Basidiomycetes (qv). It contains the most highly organized of the fungi, their complexity appearing in the structure of the fructification. The most familiar forms are the puffballs. The name refers to the fact that the spore-producing cells are inclosed within the fruitlike body. This body is of various forms and structures, but the globular puffball is the best illustration.

GASTINE, ga'stēn', CRVQUE (1793-1822). A West Indian reformer and author, born at Fort de France in the island of Martinique. He was educated in New Orleans (1803-09) and in Philadelphia, where he studied law, but in 1813 had to make his escape to Paris because he had written and spoken too boldly in favor of the negro. In 1815 he began to publish a journal, *L'Ami du Noir*, whose utterances often subjected him to imprisonment or fines. Finally, upon the publication of his *De la nécessité de faire un traité de commerce avec Haïti* (1821), he was banished. He proceeded to Haïti, where he was granted an annual pension of 5000 francs and appointed Secretary of Foreign Relations. He wrote *Histoire de la république de Haïti* (1819), *L'Esclavage aux États-Unis* (1819), and an *Histoire de l'esclavage dans la Louisiane* (1820).

GASTINEAU, ga'stê'nô', BENJAMIN (1823-1904) A French author, born at Montreuil-Bellay. He was at first a printer, but first attracted attention by a series of articles in *L'Ami du Peuple* in 1851, which led to his arrest and deportation to Algeria. He returned to France in 1854, but his connection with the *Guetteur de Saint-Quentin*, which he edited in 1856-58, brought upon him the displeasure of the government, and he was again deported. After the insurrection of March, 1871, he was placed in charge of the Mazarin Library by the Communists. For this he was in the following year again sentenced to deportation (in his absence), but returned to France after the general amnesty. In addition to frequent contributions to the reviews, he published a large number of books, mostly political or historical, including *Lutte du catholicisme et de la philosophie* (1844), *Le bonheur sur terre* (1844), *La guerre des Jésuites* (1845), *L'Orpheline de Waterloo* (1847), *Le régime de Satan, ou les riches et les pauvres* (1848), *Les femmes et les mœurs de l'Algérie* (1852), *Histoire de la folie humaine* (1862), *Les femmes des Césars* (1863), *Les génies de la liberté* (1865), *Les socialistes* (1865), *Les drames du mariage* (1865), *Les victimes d'Isabelle II* (1868), *L'Impératrice du Bas-Empire* (1870), *Le centenaire de Voltaire* (1878), *Les femmes et les prêtres* (1888), *Les crimes des prêtres de l'église*.

GASTON, ga'stôn', MARIE. A nom de plume of Alphonse Daudet.

GASTON, WILLIAM (1778-1844). An American orator and jurist, born in Newbern, N. C., of a Huguenot family which for several generations had lived in Ireland. He graduated at Princeton in 1796, studied law with F. X. Martin, was admitted to the bar in 1798, and in 1800 was elected to the North Carolina Senate, in which he served also in 1812-13 and 1818-20. He was a presidential elector in 1808, and from 1813 to 1817 a Federalist member of Congress, where he achieved a reputation as an orator by an able speech in opposition to the Loan Bill in 1815. In 1808-10, 1827-29, and 1831-32 he was a member of the State Assembly, where he drafted the act regulating the descent of inheritances and the act establishing the present Supreme Court of the State. He served as a judge of this court from 1834 until his death, was a member of the Constitutional convention of 1835, and in 1840 refused the nomination as United States Senator. After the disappearance of the Federal party he became a Whig and zealously opposed the South Carolina nullification doctrine.

GASTON DE FOIX, de fwa, Duc DE NE-MOURS. See FOIX.

GASTONIA. A city and the county seat of Gaston Co. N. C., 23 miles west of Charlotte, on the Southern, the Piedmont and Northern, and the Carolina and Northwestern railroads (Map North Carolina, A 2). It is a manufacturing centre, having a number of cotton mills, oil works, and manufactures of wood fibre, cotton-mill machinery, brooms, mattresses, cement, etc. Under an amended charter of 1898, it is governed by a mayor and a unicameral council. The water works and electric-light plant are owned by the city. Pop., 1900, 4610; 1910, 5759, 1920, 12,871.

GASTORNIS (from *Gast-on* Planté, the discoverer of the bird + Gk *ὄρνις*, *ornis*, bird). A

genus, or perhaps a family (Gastornithidæ), of extinct gigantic birds, larger than and related to the ostriches, whose bones are found in the Lower Eocene of France and England, and which is represented in coeval formations in the United States by the genus *Diatryma*. 'In the European gastornis the component bones of the skull remained separate throughout life, and there may have been a tooth on each side of the upper jaw.' See BRONTORNIS.

GASTRÆA THEORY (Neo-Lat., from Gk *γαστήρ* *gaster*, stomach). A theory propounded by E. Haeckel, according to which the gastrula stage in the development of animals (see EMBRYOLOGY) is a recapitulation of a hypothetical common ancestor—the gastræa, for just as the two-layered gastrula stage, although sometimes disguised by the presence of much yolk, is common in the embryological development of the Metazoa, so in their phylogenetic development there was a primitive type that was the starting point from which all the various metazoan types have developed along diverging lines. The gastrula is the type which seems to be the common one in the embryological development of the Metazoa. The hypothetical phylogenetic type, the starting point of the Metazoa, Haeckel named "gastræa". The Gastræidæ were supposed to be of world-wide distribution and of many families and genera. The outer and inner layers of the gastrula and the gastræa Haeckel homologized with the ectoderm and endoderm of the Metazoa. This theory, however, should not be wholly ascribed to Haeckel, for the homologies of the germ layers had already been pointed out by Kowalewsky, Von Baer, Remak, and others. Kowalewsky concluded from his embryological researches that the nervous layers and the ectoderm of insects and vertebrates are homologous, and that the germinal layers of *Amphioxus* and vertebrates correspond with those of ascidians and worms. Kowalewsky, indeed, believed "that the homologies of the general layers in the different types afford a scientific basis for comparative anatomy and embryology, and must be recognized as the starting point for the proper understanding of the relationships of the types." The generalizations of Haeckel, although based largely on such work as Kowalewsky's, are much bolder than those just quoted.

The simplest and probably the most primitive gastrula seen in vertebrate development is that of *Amphioxus*. The blastula, or stage that is antecedent to the gastrula in *Amphioxus*, is composed of a single layer of cylindrical cells closely joined in the shape of a hollow sphere. At one place in this sphere, called the vegetative pole, the cells are larger and contain more yolk granules than the cells of the rest of the circumference. The vegetative surface begins to flatten and then to push towards the inside of the sphere. This pushing is termed "invagination." As the cavity formed by invagination grows larger, the original cleavage cavity in the sphere grows smaller, until finally it is wholly obliterated. The resulting individual is two-layered and cup-shaped, with one large opening to the exterior, the primitive mouth or blastopore. This double-layered, cup-shaped individual is the gastrula, and its inner cavity is the primitive intestine. Neither this mouth nor the intestine is homologous with the mouth or the intestine of the adult animal. The two primary germ layers of the gastrula are known

as ectoderm and entoderm. The outer, or ectoderm, is the sensitive layer, and the inner is the nutritive layer. C. E. von Baer calls them, in view of their function, the two primitive organs of the animal body. By the separation and differentiation of cells from one or the other, or both of these layers, all subsequent development and differentiation of the body is brought about. Embryonic stages quite like this of the *Amphioxus* are known to exist in the *Cælen-terata*, some *Scolecida*, *Echinodermata*, and some *Annelida*, in addition to those of the higher vertebrates.

As Huxley has pointed out, the *Porifera* and *Celenterata* very nearly approach the conditions of the *gastrea*. The fresh-water hydra and the microhydra, e.g., are two-layered animals with a central digestive cavity surrounded by both layers and opening to the exterior at a point about the margins of which the two layers are continuous. This permanent mouth is the terminal aperture of the *gastrea* and serves both for the ingestion and extrusion of materials, while in the *Porifera* it serves as the permanent egestive opening only.

GASTRALGIA, or **GASTRODYNIA**. See INDIGESTION.

GASTRIC FEVER. See TYPHOID FEVER.

GASTRIC JUICE. See DIGESTION, ORGANS OF, FOOD, GASTRITIS.

GASTRITIS, *gäs-tri'tis* (Neo-Lat., from Gk *γαστήρ*, *gastēr*, stomach) A disease in which the mucous membrane of the stomach is the seat of disordered action accompanied by inflammation. Acute gastritis may be of three forms. 1. *Acute catarrhal gastritis*, in which there is a feeling of fullness, production of gas in the stomach, nausea, slight pain, severe headache, often rise of temperature, possibly vomiting, diarrhoea or constipation, with furied tongue. It is caused by errors in diet, such as excessive quantities of food, ice-cold drinks, spiced or fermented food, or alcoholic beverages. It is very common and, except in the aged, has a favorable prognosis. Emptying the stomach by washing with a tube or pump is good treatment in some instances. Some aperient is generally very desirable, and abstinence from food should be practiced for two or three days. 2. *Toxic gastritis* is caused by alcohol, phosphorus, arsenic, corrosive sublimate, chlorate of potash, mineral acids, caustic alkalies, etc. The symptoms are as given for acute catarrhal gastritis, with vomiting of blood, torturing thirst, small pulse, cyanosis, cold perspiration, and even coma and death in grave cases. The treatment consists in antidoting the poison taken, and in some cases washing the stomach. 3. *Purulent* or *phlegmonous gastritis*, in which variety small abscesses form in the submucous or muscular layer of the stomach walls. After dyspeptic symptoms for several days, burning pain, thirst, revulsion against food, fever reaching 103° to 105° F., small, irregular pulse, vomiting of mucus and bile, and generally diarrhoea follow. Death generally supervenes in from four days to two weeks.

In *chronic gastritis* the symptoms are as in the acute catarrhal form, persisting permanently, with constipation alternating with diarrhoea, pyrosis, scanty urine, cold hands and feet, irregular and capricious appetite, sallow skin, coated tongue. There is generally a decrease in the secretion of gastric juice, and low acidity, as learned from a test meal. This form of gas-

tritis is common in men in middle life and is the result of abuse of the stomach by eating rich, highly seasoned foods and indulgence in alcohol and tobacco to excess. Chronic affections of the heart, liver or kidneys often coexist. Diet and hygiene, occasional lavage, certain mineral waters, and very little drugging help many cases to enjoy life for years. Outdoor exercise, spinal douches, faradization, and massage are useful adjuncts to the treatment.

Pathology In acute catarrhal gastritis the mucous membrane of the stomach is swollen and red, and coated with an increased amount of mucus, although the secretion of gastric juice is less than normal. The cells of the mucous membrane, both mucous and peptic, are swollen and granular, and there may be considerable infiltration of the intertubular tissue with serum and leucocytes. In the acute gastritis due to the taking of irritant poisons, such as strong acids, caustic alkalies, corrosive sublimate, etc., the changes in the stomach are directly proportioned to the quantity and strength of the poison taken. Thus, strong acid in large quantities may not only destroy the entire mucous membrane of the stomach, but may cause extensive destruction of the deeper coats, even causing perforation. Smaller quantities destroy portions of the mucous membrane and underlying tissue, with consequent sloughing and cicatrization. In chronic gastritis the stomach may be of normal size, small, or enlarged. The mucous membrane may be thickened or thinner than normal and is usually coated with thick tenacious mucus. It may be red and congested or of a dull gray color. There are atrophy of the gastric tubules and an increase in the tubular connective tissue. The stomach walls are sometimes greatly thickened from the formation of new fibrous tissue, and the capacity of the organ is thus greatly diminished. A form of gastritis characterized by the formation of a false membrane is known as croupous, membranous, or diphtheritic gastritis. In connection with suppurative processes in other parts of the body, there may be suppurative with abscess formation in the walls of the stomach, this condition constituting what is known as suppurative or purulent gastritis.

GASTROCHÆNA, *gäs'trô-kē'nä* (Neo-Lat., from Gk *γαστήρ*, *gastēr*, stomach + *χαίειν*, *chaíein*, to gape) A genus of lamellibranchiate mollusks, having a delicate shell of two equal valves, gaping very much in front. The animal sometimes takes possession of an already existing cavity, which it often coats with a calcareous lining, so as to form a tube, to which the valves of its shell are cemented, sometimes burrows for itself in sand, coral, or calcareous rocks, and lines its hole with a shelly layer. One species (*Gastrochæna modiolina*), common in the Mediterranean, perforates shells and limestone, making holes about 2 inches deep and ½ inch in diameter. The tubes of some of the tropical species which live in sand are very curious. See WATERING-POT SHELL.

GASTROCNEMIUS (*gäs'trôk-nē'mi-ŭs*) **MUSCLE** (Neo-Lat., from Gk *γαστροκνήμια*, *gastroknēmia*, calf of the leg, from *γαστήρ*, *gastēr*, stomach + *κνήμη*, *knēmē*, knee) The muscle which forms the greater part of the calf of the leg. It rises by two heads from the two condyles of the femur, or thigh bone, and is inserted through the tendo Achillis into the posterior part of the heel bone. In man this muscle possesses great power and is constantly called

into use in standing, walking, leaping, etc. In walking it raises the heel, and with it the entire body from the ground, and, the body being thus supported on the raised foot, the other leg is carried forward. From its close association with the erect position, it is much more developed in man than in other mammals.

GASTROENTERITIS (Neo-Lat., from Gk γαστήρ, *gastēr*, stomach + ἐντέρον, *enteion*, intestine). An inflammatory disease of the stomach and small intestine resulting in disordered function, vomiting, and diarrhoea. In children the disease is called *cholera infantum* (qv). It is the "summer diarrhoea" which proves fatal to so many infants fed on cow's milk from unclean bottles. In children it is ushered in by slight fever, fretfulness, diarrhoea, coated tongue, and loss of appetite. In a few days the diarrhoea becomes worse, the stools are thin, green, yellow, or brown, and contain undigested food and mucus, and their odor is very offensive. The infant becomes pale and rapidly emaciates. It may improve from this point and recover in a week, or it may suddenly suffer from a rise of temperature to 103° or 105° F., cry much, evince great thirst, and exhibit a weak pulse. Stupor, sunken eyes, general relaxation, and even convulsions may follow. Vomiting supervenes on taking any food or water, and death results from exhaustion. The treatment consists in administering a purgative (calomel or castor oil preferably), withholding all food for 12 hours or more, allaying thirst with small quantities of barley water, followed by nursing every four hours, for two or three minutes at a time, washing out the stomach in the worst cases, and irrigating the large intestine by means of a tube. A normal salt solution at 80° F. is best for this purpose. Subnitrate or subgalate of bismuth, salol, hydrochloric acid, with small doses of opium in selected cases, and stimulants such as brandy where collapse threatens, are all of value. City children are benefited by removal to the country or the seashore.

Gastroenteritis of adults is discussed in **CHOLERA**. See also **ENTERITIS**.

GASTROENTERITIS, IN CATTLE The chief symptoms of this disease in cattle are dullness, dry skin, fullness of the left flank, and staring coat—the hair standing on end. The pulse is weak, the gait staggering, and the bowels constipated. The animal grunts with each breath, especially when lying down, and dies in convulsions. The more common causes of the trouble are too long intervals between feeding, sudden changes of diet, sudden checking of perspiration, and violent exercise immediately after eating.

When the disease is supposed to originate from imperfectly digested food, one pint of castor oil should be given, followed by liberal doses of linseed tea, to which carbonate of magnesia has been added. This may be administered three or four times daily along with 10 drops of tincture of aconite.

GASTROMANCY See **SUPERSTITION**.

GASTROPODA (Neo-Lat. nom. pl., from Gk γαστήρ, *gastēr*, stomach + πούς, *pous*, foot). A class of mollusks characterized by having a distinct head, usually bearing eyes and tentacles, and moving by a large creeping disk, or "foot." The head and foot are bilateral, but the rest of the body (except in *Patella*, etc.) is unsymmetrical. The animal is usually protected by

a single or univalve shell, which is more or less spirally coiled, inclosing the visceral mass, i.e., heart, stomach, liver, and reproductive glands. Moreover, these mollusks have, besides two pharyngeal horny teeth, a rasplike lingual ribbon (radula) forming a part of the odontophore situated in the mouth, or buccal cavity. There are, in the typical forms, two plumelike gills (ctenidia) inclosed in a mantle cavity, but there may be only one, while in the air-breathing forms (*Pulmonata*, or land snails) the animal breathes the air through the wall of the mantle cavity itself, which forms the pulmonary sac, or lung. The "foot" is a broad creeping disk, situated behind the head, and it is usually seen from beneath to be broad and flat. See illustration under **FIG SHELL**.

Structure A heart contained in its pericardial sac is always present, except in the parasitic *Entoconcha*, while in some genera, as *Neritina* (periwinkle) and *Haliotis* (abalone), it, as in the clam, is perforated by the intestine. In a few genera there are two auricles to the heart, but, as a rule, only one is present. A ventricle is always present. There is but a single kidney (nephridium). The digestive canal is doubled on itself, the vent opening on one side of the mouth. In certain opisthobranchs the stomach is lined with series of teeth, sometimes sharp and chitinous. In some nudibranch gastropods (see **NUDIBRANCHIATA**) the intestine has numerous lateral offshoots, or gastrophatic branches, which resemble similar structures in the planarian and nematode worms.

The nervous system varies in the number of ganglia, but is usually represented by the "brain," a pair of supracæophageal ganglia, with connecting threads (commissures) passing around the gullet to the infracæophageal or pedal ganglia, thus forming the cæophageal nerve ring; there are also a pair of buccal ganglia, while the visceral and abdominal ganglia, all connected by commissures, are situated at a varying distance from the head. The ears, or "otocysts," are usually near the pedal ganglia, but are always innervated from the cerebral ganglion, or "brain."

The animal in certain forms is bisexual or hermaphroditic, in others the sexual glands exist in separate individuals. The eggs are laid in capsules of various sizes and shapes, usually attached to seaweeds or rocks, or deposited freely in the sand. Land snails lay their eggs loose under stones or leaves in damp places. The embryo on hatching passes through a well-

A YOUNG GASTROPOD

| 4 TIGER COWRY - CYPRAEA TIGRIS | 8 CONUS AURATUS |
| 5 | 9 RANELLA CRUMENA |

NATURAL SIZE

to form, the foot grows larger, the eyes and tentacles appear, when the young sinks by gravity to the bottom and gradually assumes the snail condition of maturity. The eyes may be absent in those marine forms which actively burrow in the sand, though the single pair of tentacles persists. In the land snails there are two pairs of tentacles, the upper and longer pair containing both the eyes and the optic nerve with the olfactory nerve, which ends in groups of cells.

A distinctive feature in gastropods is the "odontophore," an apparatus of muscles bearing the radula, or "lingual ribbon," a solid flattened ribbon-like or rasplike plate armed with transverse rows of sharp siliceous teeth. This rasp is drawn back and forth over a tendon like a pulley. By means of this rasp the land or pond snail cuts slits into leaves, swallowing the pieces, or the marine forms, such as the *Sycotypus* (see CONCH) or the "drill," files a hole into the clam or oyster, so as to get at the flesh within the tightly closed shell of its victim.

Certain forms as the *Murex* (qv) of the Mediterranean, secrete the Tyrian dye of the ancients, and a similar fluid is secreted by the com-

branchia, containing the sea hares (*Aplysia*), pelagic pteropods, etc., and Pulmonata, containing the land and fresh-water air-breathing snails and slugs.

Fossil Gastropods. Gastropod shells are found in all the geological formations from those of lowest Cambrian age to those of recent time, and they occur usually in abundance in those formations above the Cambrian. The earliest forms are limpet-like shells (*Scenella*) and a capulid (*Stenotheca*) in the *Olenellus* zone of the Lower Cambrian system. Very soon, in the Upper Cambrian a few turreted gastropods appear (*Raphistoma* and *Straparollina*). These true gastropods are in the Cambrian associated with a host of slender conical shells, the hyolithids, which are often classed with the pteropods, but which should more properly be placed with the tubicolar worms.

In the Ordovician the gastropods are widely differentiated and are represented by numerous genera and abundant individuals, with such well-known forms as *Pleurotomaria*, *Bellerophon*, *Raphistoma*, *Murchisonia*, *Maclurea*, *Euomphalus*, and others. In the Silurian a further evolution has taken place, manifested principally in the increased ornamentation of genera that come up from the Ordovician, and in the creation of new genera from those already existing. Some of the important forms are *Loxonema*, *Murchisonia*, *Platystoma*, *Pleurotomaria*, *Bucania*, *Trematonotus*, *Euomphalus*. The Devonian formations are still richer in species and are characterized by such forms as *Loxonema*, *Turbo*, *Euomphalus*, *Platystoma*, *Platyceras*, *Acroculia*, *Macrocheilus*. In the Carboniferous the same genera are present, with the addition of *Naticopsis*, *Vermetus*, and *Acteonina*. The Permian gastropod fauna is about the same as that of the Carboniferous. The majority of the Paleozoic gastropods belong to the more primitive, less specialized subclass of the Streptoneura, and especially to the order Aspidobranchia, and it is worthy of note also that the Paleozoic genera are, as a rule, holostomatous, i.e., they have shells with nonsiphonate apertures.

The Triassic formations at the beginning of the Mesozoic show important changes in the gastropod fauna. The Paleozoic pteropods have dropped out, the Bellerophonitidae, the Devonian Platyceridae and Platystomidae have disappeared, and the euomphalids have become less abundant, and a new type of shell, the siphonostomatous, appears with the families Cerithiidae and Melanidae, in which the siphon is, however, shorter than in the later members of these families. The important genera are *Chemnitzia*, *Loxonema*, *Rissoa*, *Eulima*, *Trochus*, *Turbo*, *Pleurotomaria*, *Cerithium*, *Helcion*. In the Jurassic the Valvatidae, Viviparidae, Melanidae, Aporrhaidae, Strombidae, Columbelloide, Cypræidae, begin their existence, and the fauna is strongly siphonostomatous. One Jurassic family, the Nerineidae, which began in the Trias and continued into the Cretaceous, is a very characteristic Mesozoic shell, that may be recognized by its slender turreted spire, resembling that of its allies the Cerithiidae, and by the peculiar longitudinal septa that project from the columella and walls of the whorls into the central cavity of the shell.

The Cretaceous ushers in another lot of families Solaridae, Cassidae, Dohidae, Tritonidae, Buccinidae, Muricidae, Purpuridae, Volutidae, Olividae, Cancellaridae, Pleurotomidae, Conidae, in

STRUCTURE OF A GASTROPOD

1 Diagram of the structure of a gastropod (the common whelk). *f*, muscular "foot", *op*, operculum, *t*, one of the tentacles or feelers, *e*, eye stalk, at the base of the tentacle, *p*, proboscis, retracted, with the mouth at its extremity, *oe*, gullet, *g*, stomach, *i*, intestine, terminating in the anus, *n*, *n*, salivary glands, *l*, liver and ovary, *oe*, oviduct, *h*, heart, *bc*, gill, contained in a hood of the mantle, *s*, breathing tube or siphon, *c*, *c*, main nerve ganglia. 2 Shell, with animal removed, *a*, spire whorls, separated by sutures, *b*, body whorl, *m*, outer lip of "mouth", *n*, notch for the siphon at the base of columella. 3 Egg capsules of the whelk.

mon *Purpura* of our coast. This fluid is formed in a peculiar "adrectal gland" situated at the side of the rectum. It is colorless, but turns purple on exposure to the air.

The shell of different gastropods varies greatly in shape. In the limpets (*Patella*) it is low and conical, in most of the species it is spiral, made up of whorls. The greater number of shells are "dextral," i.e., the spire turns to the right, in a few cases they are sinistral or turn to the left.

Over 22,000 species are known, of which about 7000 species are fossil, there are about 6500 species of land snails alone.

Classification. Gastropods are divided into two subclasses (1) Streptoneura, "in which the visceral commissures are twisted into a figure of 8 and in which the sexes are distinct", and (2) Euthyneura, in which the visceral commissures are not so twisted, and in which the sexes are united. The former contains the order Aspidobranchia, which includes the limpets, ear shells, top shells, turban shells, etc.; and the order Pectinibranchia, which contains the bulk of the other marine shell-bearing forms. The latter subclass also has two orders Opistho-

fact, all the more specialized families of the Ctenobranchiata, including more pronounced siphonate forms. The gastropods hold third rank among the Cretaceous mollusks, being excelled by the clams and cephalopods. In the Tertiary the gastropods rise to first rank. Among the few new families appearing in the Tertiary the more important are the Harpidæ and Ovulidæ. The siphonostomate shells attain here their highest development and are more prominent than any others. All the Tertiary forms are closely allied to modern forms, indeed, the majority of the Pliocene fossils and a small per cent of the Miocene species are still living in the modern ocean. At the present day the gastropods are enjoying rapid progressive evolution.

The history of terrestrial and fresh-water gastropods is interesting. The earliest form known is *Pupa*, found in the Devonian beds of St John, New Brunswick, while a *Pupa* and a *Zonites*, remarkably close to the existing species, have been found in the coal measures of the Carboniferous. In the Mesozoic are found numerous fluviatile genera, such as *Planorbis*, *Melania*, *Hydrobia*, *Valvata*, *Physa*, *Lamnaea*, *Amnicola*, and *Carychium*. In the Cretaceous appear, in addition to those already cited in the Jurassic, *Vivipara*, *Glandina*, *Bulmus*, *Goniobasis*, *Liopax*, *Pleuroceras*, and in the Tertiary deposits the land and fresh-water snails are quite as abundant as they are at the present time.

Some interesting evolutionary series have been worked out among fossil gastropods. Neumayr has shown how *Vivipara* of the Miocene beds of Slavonia starts in the lower layers as smooth shells with rounded whorls, and changes, or evolves, through the succeeding overlying beds by successive intermediate stages into a more elevated shell, with concave whorls and nodose surfaces, that occurs only in the highest beds. Hilgendorf, and afterward Hyatt, showed the peculiar transformations of *Planorbis* in the fresh-water Miocene beds of Steinheim, Wurttemberg. Other similar evolutionary series have been worked out for the Melanidæ, Cerithidæ, Volutidæ, Mitridæ, and Turritellidæ.

Bibliography. For general information and anatomy, consult Parker and Haswell, *Text-Book of Zoology*, vol 1 (New York, 1910); Fischer, *Manuel de conchylogie et de paléontologie conchyologique* (Paris, 1897); Tryon and Pilsbry, *Manual of Conchology* (16 vols, Philadelphia, 1879-96); Pelseener, *Introduction à l'étude des mollusques* (Brussels, 1894); Lang, *Text-Book of Comparative Anatomy*, translated by Bernard, vol 11 (New York, 1896), which contains an excellent bibliography of gastropod anatomy and physiology; Walther, "Die Lebensweise der Meeresthiere," in *Einleitung in die Geologie*, part 11 (Jena, 1893); Gould, *Invertebrates of Massachusetts*, edited by Binney (Boston, 1870); Cooke, *Molluscs*, vol 111, *Cambridge Natural History* (New York, 1895); Pelseener, *Mollusca*, vol v, Lankester's *Treatise on Zoology* (London, 1906). For fossil gastropods, see Von Zittel and Eastman, *Text-Book of Paleontology*, vol 1 (New York, 1900), where a good bibliography of fossil gastropods is given, see also Ulrich and Scofield, "The Lower Silurian Gastropoda of Minnesota," in *Minnesota Geological and Natural History Survey, Paleontology*, vol 11, part 11 (Minneapolis, 1897); Lindstrom, "On the Silurian Gastropods and Pteropods of Gotland," in *Kongliga Svenska Vetenskaps-*

Akademiens Handlingar, vol xix, No 6 (Stockholm, 1884), and Dall, "Contributions to the Tertiary Fauna of Florida," in *Transactions of the Wagner Free Institute of Science*, vols 111 and 114 (Philadelphia, 1895-97). See articles on MOLLUSCA, and on the various families and genera of gastropods.

GASTROPTOSIS, gäs'tröp-tō'sis. Prolapse of the stomach below its usual site in the abdomen. It is commonly part of a general relaxation of the ligamentous supports of all the abdominal organs (Visceroptosis, Glenard's disease or splanchnoptosis, enteroptosis is prolapse of the intestines). This condition may result from general malnutrition, loss of the elasticity of the abdominal muscles from the pressure of improper clothing, and from chronic intestinal poisoning. The symptoms are those of dyspepsia, lack of appetite and constipation, together with such nervous symptoms as headache and insomnia. The treatment consists in applying an abdominal support, and the use of hygienic measures designed to strengthen the abdominal muscles. Where a single organ is affected operation is sometimes necessary.

GASTROTOMY (from Gk γαστήρ, gaster, stomach + στόμα, stoma, mouth). An operation which is performed for the relief of stricture of the gullet. Its object is to relieve the patient from the imminent risk of starvation, by introducing food directly into the stomach through an external opening. The well-known case of Alexis St Martin, and numerous experiments on the lower animals, first led to the introduction of the operation as a practical surgical procedure.

GASTROTOMY (from Gk γαστήρ gaster, stomach + τομή, tomē, a cutting, from τέμνω, temnō, to cut). An incision into the cavity of the stomach for the purpose of removing some diseased structure or foreign body.

GASTRULA. See EMBRYOLOGY, GASTRÆA THEORY.

GASZYŃSKI, gā-shin'ské, KONSTANTY (1809-66). A Polish poet, born at Malawies. He fought in the insurrection of 1830-31 and afterward went to France and settled at Aix in Provence. During this exile he wrote much verse and prose, which has frequently been translated into French. A collection of his stories was published in Paris in 1833 under the title *Poém pielgrzymy*. His sonnets are particularly elegant. His works include *Poezye* (1856), *Sielanka młodości* (1855), *Reszty pamiętniku Macieja Rogowskiego* (1847), *Kontuszowe pogadanki* (1851), *Listy z podróży po Włoszech* (1853), and *Pan Dezydery Boczek* (1846). He also contributed to magazines and newspapers. His complete works were published in 1870-74.

GATA, gā'ta, CAPE DE. See CAPE DE GATA.

GATACRE, gāt'ā'kēr, SIR WILLIAM FORBES (1843-1906). An English soldier, born near Stirling, and educated at Sandhurst. He entered the army in 1862, passed at the Staff College in 1875, and from 1875 to 1879 was instructor in surveying at the Royal Military College. In 1889-90 he served in Burma, in 1895, as brigadier general, distinguished himself in the Chitral expedition, and in 1898 went to the Sudan, where he led the British division in the battles of Atbara and Omdurman. In the Boer War he was placed at the head of a division with the rank of lieutenant general, was defeated at Stormberg Junction, Dec 10, 1899, and in April, 1900, was ordered home for failing to

relieve a beleaguered British force at Reddersburg. He retired in 1904. Gatacre's men "called him General 'Backacher,' and loved him" though he worked them so hard. Consult the *Life* by Lady Gatacre (London, 1910).

GAT'AKER, THOMAS (1574-1654). A Puritan clergyman, critic, and author, born in London. He was educated at St John's College, Cambridge, and in 1596 became one of the earliest fellows of Sidney Sussex College. In 1601 he was appointed lecturer to the society of Lincoln's Inn, and from 1611 he was rector of Rotherhithe (Surrey). He declined the mastership of Trinity College, Cambridge, and in 1643 was appointed a member of the Westminster Assembly of Divines. In 1645 he was elected one of seven to draft a confession of faith. He was a scholar of unusual acquirements in Hebrew and the classics. Hallam called Gataker's *Marcus Antoninus* (1652), the Greek text with a version and commentary in Latin, "the earliest edition of any classical writer published in England with original annotations", it was repeatedly reprinted. Commentaries on Isaiah, Jeremiah, and Lamentations he prepared for the Assembly's *Annotations* (1645, 1651). His *Opera Critica*, including a *De Novi Instrumenti Stylo Dissertatio* (1648), were edited by Witsius (Utrecht, 1698). His *Of the Nature and Use of Lots* (1619, 2d ed, 1627) defended the use of lots (not for divination) and brought him into dispute with some. He wrote several controversial works and published a collection of sermons (1637). Consult the autobiographical matter in his *Adversaria Miscellanea Posthuma* (London, 1659), and Brook, *The Lives of the Puritans* (London, 1813).

GATCHINA, ga'ché-na. A town of Russia in the Government of St Petersburg, situated about 28 miles south-southwest of the capital on a small lake formed by the Izhora (Map Russia, C 3). It is especially worthy of mention for its Imperial palace, constructed in 1770, which contains 600 rooms, a theatre, and art collections. It is surrounded by a magnificent park. It originally belonged to Prince Orloff, who received it from Catharine II. After his death it reverted to the crown and became the favorite summer residence of Czar Paul I, who bestowed municipal rights upon the town in 1797. Gatchina is a very popular summer resort with the residents of the capital. Pop, 1897, 14,735.

GATE CITY. A popular name for Keokuk, Iowa, from its situation at the head of navigation on the Mississippi, and for Atlanta, Ga., which was so named by Jefferson Davis on account of the importance of its position.

GATE HOUSE PRISON. A prison in Westminster, London, from which, on Oct 29, 1618, Sir Walter Raleigh was led to the scaffold in Old Palace Yard.

GATE OF THE LIONS. See LION GATE.

GATE OF THE MEDITERRANEAN. The Strait of Gibraltar, as the passage between the Atlantic and the Mediterranean.

GATES, CALLEB FRANK (1857-) An American Congregational missionary and college president. He was born in Chicago, and graduated from Beloit (Wis.) College in 1877 and from the Chicago Theological Seminary in 1881. Ordained to the Congregational ministry, he was sent under the auspices of the American Board of Commissioners for Foreign Missions as a missionary to Mardin, Turkey, Asia Minor, in 1881. From 1894 to 1902 he was president of

Euphrates College at Harpoot, Turkey, and after 1903 president of Robert College in Constantinople. He is author of *A Christian Business Man* (1893).

GATES, ELEANOR (1875-) An American playwright, born at Shakopee, Minn. She was educated at Stanford University and the University of California. While still a student she was on the staffs of the *Examiner*, *Call*, and *Chronicle* of San Francisco, and the *Enguiner* of Oakland, Cal. In 1901 she married Richard Walton Tully, the playwright, but was divorced in 1914. She is author of *The Biography of a Prairie Girl* (1902), *The Plow-Woman* (1906), *Good Night* (1907), *Cupid, the Cow-Punch* (1907), *The Justice of Gideon* (1910), and of the play *The Poor Little Rich Girl*, the production of which in 1913 was an unusual popular and artistic success.

GATES, FREDERICK TAYLOR (1853-) An American Baptist clergyman and educator. He was born at Maine, Broome Co., N. Y., and graduated from the University of Rochester in 1877 and from Rochester Theological Seminary in 1880. He was pastor of the Central Church, Minneapolis, Minn., from 1880 to 1888, and as corresponding secretary of the American Baptist Education Society in 1888-93 was instrumental in establishing the University of Chicago. In 1893 John D. Rockefeller chose him as his business and benevolent representative, he became chairman of the General Education Board and also of the Rockefeller Institute for Medical Research.

GATES, GEORGE AUGUSTUS (1851-1912). An American educator, born at Topsham, Vt. After graduating from Dartmouth College in 1873 he studied in Germany and at Andover Theological Seminary. Ordained to the Congregational ministry, he held a pastorate at Upper Montclair, N. J., from 1880 to 1887, when he became president of Iowa College. This position he left in 1901 to become pastor of the First Church of Cheyenne, Wyo. He was president of Pomona College from 1902 to 1909, and thereafter president of Fisk University for negro students at Nashville, Tenn. His book, *A Foe to American Schools* (1897), an exposure of school-book trust methods, attracted much attention.

GATES, HORATIO (1728-1806). An American soldier, prominent in the Revolutionary War. He was born at Maldon, Essex Co., England, his parents being servants in the household of the Duke of Leeds. He entered the army when very young, went to America in 1755, and, as major, served under Braddock (qv) and was severely wounded at the defeat of the latter on July 9 of the same year near Fort Duquesne (Pittsburgh). In 1760 he was stationed, as brigade major, under General Monckton, at Fort Pitt (Pittsburgh), and in 1762 was Monckton's aid at the capture of Martinique. Buying a farm in Berkeley Co., Va., in 1763, he lived there in retirement until July, 1775, when Congress appointed him adjutant general in the regular army, with the rank of brigadier. In 1776 he was appointed to the command of the army which had lately retreated from Canada, and immediately began intriguing to supplant General Schuyler as the commander of the Northern Department. In this he was successful through the influence of the New England delegates in Congress, on Aug 2, 1777. The army under his command, after fighting the battles of Stillwater and Saratoga, forced Burgoyne to surrender on

October 17 (See *SARATOGA, BATTLES OF*) Gates received nearly all of the credit, though Schuyler, Arnold, and Morgan had done most of the work, and he had been conspicuous chiefly for incapacity and for an apparent lack of personal courage. Soon afterward he entered into the schemes of the Conway Cabal (qv), whose object was to have him appointed, in Washington's stead, as commander in chief. For a time he was president of the newly organized board of war, but was detected in several falsehoods, became discredited, and withdrew in 1778 to his farm in Virginia, where he remained until 1780, when he was put in command of the Army of the South. Owing chiefly to his wretched generalship, his forces were totally defeated near Camden, S. C. (qv), on August 16 by Lord Cornwallis, and on December 2 he was superseded by General Greene. A court of inquiry, appointed to investigate his conduct, sat until 1782, and finally acquitted him. He then again retired to his Virginia farm and lived there until 1790, when, after freeing his slaves, he removed to New York City, where he remained until his death, April 10, 1806. Personally, he was handsome, affable, and courteous, and in society was a general favorite. For his part in the Saratoga campaign, consult Stone, *Campaign of Lieutenant-General Burgoyne* (Albany, 1877).

GATES, LEWIS EDWARDS (1860-) An American critic, born at Warsaw, N. Y. A graduate of Harvard, he became connected with that institution in the departments of English and comparative literature. He won a reputation as a subtle critic, especially by his essays on Cardinal Newman, Francis Jeffrey, and Matthew Arnold prefixed to volumes of selections from their writings edited for use in colleges. In 1900 appeared his *Studies and Appreciations*.

GATES, MERRILL EDWARDS (1848-1922) An American educator. He was born at Warsaw, N. Y., the son of Seth Merrill Gates, graduated at the University of Rochester in 1870, and from 1870 to 1882 was principal of the Albany Academy. From 1882 to 1890 he was president of Rutgers College, and from 1890 to 1899 president of Amherst. He promoted civil-service reform and ballot reform, and in 1884 became a member of the United States Board of Indian Commissioners, of which he was chairman in 1890-99, and then secretary. For several years he was president of the Lake Mohonk Indian Conferences. He received the degree of LL.D. from a number of universities. Among his publications are *Land and Law as Agents in Educating the Indians* (1885), *Sidney Lanier, Poet and Artist* (1887), *International Arbitration* (1897), *The Highest Use of Wealth* (1901).

GATES, SETH MERRILL (1800-77). An American lawyer, born at Winfield (Herkimer Co.), N. Y. He was admitted to the bar in 1827, and in 1832 was a member of the State Assembly. In 1838 he became editor and proprietor of the *Le Roy Gazette*. He was an antislavery Whig member of Congress from 1839 to 1843, the year in which he drafted the protest signed by the Whigs in Congress against the annexation of Texas. In 1848 he was the unsuccessful candidate on the Free-Soil ticket for Lieutenant Governor of New York. So pronounced was his hostility to slavery that a Southern planter offered a reward of \$500 for his apprehension.

GATES, SIR THOMAS (c.1559-c.1621) The first sole Governor of Virginia under the Virginia Company. He was born probably at Coly-

ford, Devonshire, England, entered the military service, accompanied Sir Francis Drake on his voyage to America in 1585-96, and published in 1589 the account of this voyage written by Captain Bigges. For his conduct at Cadiz Essex knighted him in June, 1596. In 1598 he entered Gray's Inn and in the following year was engaged in public service at Plymouth, but soon afterward he enlisted, together with Sir Thomas Dale (qv), in the service of the Netherlands. He was one of the first petitioners for royal license to colonize Virginia and was one of the incorporators of the first Virginia charter of 1606. Having obtained a leave of absence from the States-General, he was chosen the first sole and absolute Governor of Virginia, and was placed in command, with Sir George Somers and Captain Newport, of the fleet of nine vessels, carrying 500 colonists, which sailed for America in 1609. The *Sea Venture*, carrying Gates, Somers, and Newport, was wrecked on the Bermudas, where, within the next nine months, two new vessels were constructed. The story of the wreck is supposed to be one of the sources for Shakespeare's *The Tempest*. Leaving the Bermudas on May 10, 1610, Gates arrived at Jamestown in May, near the close of the "starving time," and was installed with great ceremony as Deputy Governor, replacing George Percy, the retiring president of the King's Council. The famished colonists clamoring to be taken from Virginia, Gates crowded them upon four small vessels and started with them for England, but was met at the mouth of the James River and turned back by Lord De La Warr (qv), who took office as Governor. Gates was sent to England for a new supply of cattle, returned to Jamestown in 1611 with six ships and 300 colonists, and remained as Lieutenant Governor until March, 1614. He afterward served on one of the committees of the Virginia Company, and in 1620 was appointed by James I one of "the first moderne and present Council established at Plymouth, in the County of Devon, for the planting, ruling, and governing of New England in America." For an account of the administration of affairs in Virginia by Gates, consult Brown, *The First Republic in America* (Boston, 1898).

GATESHEAD. A large manufacturing town in Durham Co., England, on the south bank of the Tyne, opposite Newcastle, of which it is practically a suburb, and with which it is connected by three bridges, one 1337 feet long (Map England, E 2). The community finds employment almost entirely in the neighboring coal mines, in the Gateshead Fell quarries celebrated for "Newcastle grindstone," in the locomotive works of the Northeastern Railway, in shipbuilding yards, iron foundries, cable and wire-rope factories, tanneries, breweries, and in chemical, soap, candle, brick, cement, and glass works. Here also are the works of the Newcastle and Gateshead Gas Company. At Gateshead a large portion of the first Atlantic cable was manufactured. The town's history dates from the Roman occupation. The chief architectural features are the town hall, free library, mechanics' institute, various denominational churches, and the restored parish church of St. Mary, established in the eleventh century, and in 1080 the scene of Bishop Walcher's murder by an avenging English mob. Daniel Defoe's dwelling, where he wrote *Robinson Crusoe*, is in the Hillgate district. The town owns a

profitable corporation quay, and maintains baths, washhouses, cemeteries, public parks, recreation grounds, and public libraries. Gateshead sends a member to Parliament. Pop., 1901, 109,888, 1911, 116,907. Consult Welford, *History of Newcastle and Gateshead* (Newcastle-on-Tyne, 1884-85).

GATESVILLE A city and the county seat of Coryell Co., Tex., 45 miles west of Waco, on the Leon River and on the St. Louis Southwestern Railroad (Map Texas, D 4). It is the seat of the State Juvenile Training School. The city ships cotton, grain, and live stock, and has cotton gins and compress, flour, oil, and planing mills, etc. Pop., 1900, 1865, 1910, 1929.

GATEWAY. The passage or opening in which a gate or large door is hung. This may be either a mere opening in a wall or a covered way vaulted or roofed over. It differs from a doorway in that it does not open directly into a building. A monumental gateway and doorway are often both called a *portal* (qv). From the earliest ages the gateway has been considered a feature of the utmost importance, not only because of its strategic value in city walls and fortifications, necessitating its protection and defense by towers and drawbridges and other devices, but also because of its architectural significance and the opportunities it offers for impressive architectural effect. In very ancient times the "gate"—i.e., the chamber or passage between the outer and inner gates of a gateway in a city wall—was the place where proclamations were made, and where kings or elders administered justice. This was especially the case in the Orient, where all kinds of business were transacted in the gateway. Hence the modern term "The Sublime Porte" (i.e., Lofty Gate) used of the Turkish government. Such gateways are often mentioned in the Old Testament, and the great Assyro-Babylonian city gates, especially those of Sargon's city, at Khorsabad (qv), illustrate the texts. Many of the Moorish gates of cities and fortified palaces (e.g., of the Alhambra, qv) in Spain still exist, bearing significant names like "Gate of Pardon," "Gate of Justice," etc. The Greek and Roman gates were frequently of great magnificence. The Propylæa at Athens is a beautiful example, and the triumphal arches of the Romans were often identical with their city gates. The Lion Gateway at Mycenæ and the city gates of Segni and Alatri in Italy are good examples of early Cyclopean structures before the seventh century B.C. Those at Ferentino, Viterbo, and Falerii show the pre-Roman arched style, those of Volterra and Perugia the later Roman-Etruscan type. The Roman gates at Verona, the Golden Gateway at Jerusalem, the gates at Spalato and Benevento, and others in Gaul, Syria, Asia Minor, and North Africa show every variety of design and number of openings. In the Middle Ages the city gateways were often crowned by towers of imposing architecture, especially in north Germany, as in Lübeck and Nuremberg, and the same was the case with the gateways of bridges, as at Prague, and of secular buildings, such as those of Oxford and Cambridge. The castle gateways, of which many remain, have seldom any decorative character, being for defense, with flanking turrets, drawbridge (see BRIDGE), and portcullis (qv), but the monastic doorways, leading into the great enclosed courts, were often architecturally beautiful, as in the Cistercian monastery at Casamari

in Italy, with its double porch, porter's lodge, and living rooms. The abbey gates of Canterbury and Bury St. Edmunds are well known. All *close*s, whether of abbeys, colleges, law courts, guilds, fraternities, or the like, had architectural gateways. The city gates of Verona, designed by Sanmichele (qv) in the sixteenth century, are dignified examples of the Italian Renaissance type after the disappearance of the mediæval form with its flanking turrets, while the gate of the Certosa at Pavia with its mosaics and the elegant gateways of many villas illustrate various nonmilitary types frequently imitated in modern work. A type peculiar to modern architecture (at least since 1750) is that consisting of masonry piers, more or less decorated, between which are hung elaborate gates of wrought iron or bronze. Parks, private grounds, and avenues are often entered through such gates.

GATH (Heb., wine press). One of the five cities of the Philistines. It was probably situated at the modern Tell el-Safiyeh (the white hill), though the Crusaders identified it with Yebna, the ancient Jamnia, and some modern scholars have adopted this view. The first mention of Gath is in the list of Palestinian towns conquered by Thothmes III, where it is referred to as Kntu (Kintu). In the Amarna letters it occurs several times as Gmt. and Ginti, there being an Egyptian governor in this city in the time of Amenhotep IV. Its position on the borders of Judæan territory made it of great importance in the wars with the Philistines. The Philistine champion Goliath (qv) came from Gath (1 Sam. xvii 4). David took refuge with Achish, King of Gath (1b xxii 10), and probably also obtained a wife in Gath. It is possible that Gath was in the hands of the Israelites in the time of David. Whether Solomon and Rehoboam were able to keep it cannot be determined in view of the probable late date of the statements. During the wars with Assyria Gath seems to have formed a part of Ashdodite territory. Sargon mentions in the Khorsabad inscription that he besieged and conquered Gintu, probably in the year 711 B.C. The absence of Gath in many passages where the other Philistine cities are mentioned may be accounted for by its being regarded as a dependency of Ashdod. In the days of Eusebius and Jerome the city still existed, and the description of the site in the *Onomasticon* seems to point to Tell el-Safiyeh. At this place the *Blanca Guardia* was erected by Foulques of Anjou in 1144. The fortress was taken by Saladin in 1191, and recaptured and fortified by Richard in 1192. Situated on a hill 300 feet above the plain with steep walls upon three sides, it was at all times a difficult place to capture and an important stronghold. There is to-day a small village on the top of the hill. Consult Smith, *Historical Geography of the Holy Land* (London, 1895), and Huntington, *Palestine and its Transformation* (Boston, 1911).

GĀTHĀS, ga'thaz (Av. *gāṭha*, Skt., *Pañi gāthā*, song). The name applied to certain metrical compositions, both in the Avesta and in Sanskrit Brahmanic and Buddhist literature. The Gāthas of the Avesta comprise 17 hymns (Yasna 28-34, 43-51, 53), which contain 232 stanzas, besides three in Yasna 27, 13-14 and Yasna 54. They are composed in five metres, which are reckoned by the number of feet, not by their quality, as in Greek and Latin. These metrical schemes, which are of great antiquity,

are composed respectively of three-line stanzas of $7 + 9$ (or sometimes 8) syllables (Ahunavarti), five-line stanzas of $4 + 7$ syllables (Ushtavarti), four-line stanzas of $4 + 7$ syllables (Spentamainyu), three-line stanzas of $7 + 7$ syllables (Vohukhshathra), and four-line stanzas, whose first two lines have $7 + 5$, and the last two $7 + 7 + 5$ syllables (Vahishtoishiti). The dialect in which these hymns are written differs considerably from the ordinary Avesta, and is more archaic in character. If we may reason on the analogy of the Gathas of the Buddhist Jatakas (qv), where verse alternates with prose, it might be plausibly suggested that the Avesta Gathas represent but a small part of the original content of this portion of the Zoroastrian Scriptures. There may have been a large amount of prose between the stanzas which has been lost. The Iranian tradition ascribes the authorship of the Gathas to Zoroaster (qv) himself. They are of peculiar difficulty, owing in part to the inflectional system of the Gatha-Avesta dialect, and in part to the numerous words which occur but once in them and have no representatives, so far as known, in any other Indo-Iranian or even Indo-Germanic language. Their interpretation is aided, however, to a large degree, by a Pahlavi version with glosses, which was translated into Sanskrit by a Parsi priest, Neryosangh, probably about 1200 A.D. These versions, while important, are not altogether trustworthy, mainly on account of the decay of grammatical knowledge of the Avesta language. They are, notwithstanding, indispensable in interpreting the Gathas, and mainly through their aid the meaning of the hymns is now for the most part tolerably certain.

In India the term "Gatha" was employed in the Brahmanas (qv) to denote verses of religious content which did not belong to any of the four Vedas (See VEDA). It became wider in its scope in the Buddhist literature, and denoted especially that part of the sacred canon which comprised the Dhammapada, Theragatha, Therigatha, and the pure verse sections of the Suttanipata, and also to the verses in the Jatakas. It is most commonly applied, however, to the North Buddhist Lalita-Vistara (qv), composed in verse mingled with prose. This work is in a dialect, probably artificial, of Prakrit words with Sanskrit terminations, and on account of this peculiarity the language of the Lalita-Vistara is often called the Gatha dialect, although prose works were sometimes written in it. Consult Bartholomae, *Die Gāthā's und heiligen Gebete des altiranischen Volkes* (2d ed., Halle, 1897), id., *Die Gāthas des Avesta* (Strassburg, 1905), Mills, *A Study of the Five Zarathushtrian [Zoroastrian] Gāthās* (Oxford, 1892-94), id., *A Dictionary of the Gāthā Language of the Zend Avesta* (Leipzig, 1902-13), id., *The Gāthās of Zarathustra [Zoroaster] in Metre and Rhythm* (Oxford, 1900), Muller, "Der Dialekt der Gāthās des Lahtavistara," in *Beiträge zur vergleichenden Sprachforschung*, vol. VIII (Berlin, 1876), Jackson, *A Hymn of Zoroaster, Yasna 31* (Stuttgart, 1888), Kanza, *The Gāthās, Transliterated and Translated into Gujarati* (2d ed., Bombay, 1902), Bulsara, *God in the Gāthās* (ib., 1906), Macdonell, *History of Sanskrit Literature* (London, 1913). See AVESTA, LALITA-VISTARA, ZOROASTER.

GATHORNE-HARDY, G. See CRANBROOK.

GATINEAU, ga'té'nō' A large river of Que-

bec, Canada, rising in a connected chain of large lakes immediately north of the 48th parallel of latitude (Map Quebec, C 4). It flows first south-southwest, and then almost due south, and falls into the Ottawa one mile below Ottawa City. The length of the river is estimated at 400 miles, it receives a number of tributaries, and is extensively used for floating down the lumber of the upper region.

GATLING, RICHARD JORDAN (1818-1903) An American inventor. He was born in Hertford Co., N. C., and during his boyhood he acquired considerable skill and mechanical acumen working as his father's assistant in the perfection of a machine for sowing cottonseed. His principal invention, and the one by which he became famous, was the revolving machine gun, since known by its inventor's name. In 1886 he invented a new gun metal of steel and aluminum. Congress afterwards voted him \$40,000 to experiment on a new method of casting cannon. Among his other inventions may be noted a hemp-breaking machine and a steam plow. Although a graduate of the Ohio Medical College (1850), he never practiced medicine. See MACHINE GUN, ORDNANCE.

GATSCHET, ga'shà', ALBERT SAMUEL (1832-1907) An American philologist and ethnologist, born at St. Beatenberg, Bern, Switzerland. He studied at the universities of Bern and Berlin, made investigations regarding the Swiss dialects, and published *Orts-etymologische Forschungen als Beiträge zu einer Toponomastik der Schweiz* (1865-67) and *Promenade onomatologique sur les bords du Lac Léman* (1867). In 1868 he removed to the United States, where until 1877 he was connected with the staffs of various German newspapers, and in that year was appointed ethnologist of the government Geological Survey. He became linguist to the Bureau of American Ethnology in 1879. From 1874 he made extensive study of the languages of the North American Indians, in particular those of the Tonkawa, Yuma, Chumeto, Hitchiti, Creek, and Timucua tribes. Among the many valuable treatises published by him, in both English and German, are *Zwölf Sprachen aus dem südwesten Nordamerikas* (1876), *Analytical Report upon Indian Dialects Spoken in Southern California, Nevada, and on the Lower Colorado River* (1876), "Classification of Western Indian Dialects," in vol. VII of the *Report of the Geological Survey West of the 100th Meridian* (1879), *Volk und Sprache der Timucua* (1881), *Indian Languages of the Pacific States and Territories and of the Pueblos of New Mexico* (1882), "A Migration Legend of the Creek Indians," in No. 4 of Brinton, *Library of Aboriginal American Literature* (Philadelphia, 1884-88), and "The Indians of Southwestern Oregon," in *Contributions to North American Ethnology*, vol. II (Washington, 1890). For a further list of titles, consult Pilling, *Bibliography of North American Languages* (ib., 1885).

GATSCHINA, ga'chè-na See GATCHINA.

GATTEAUX, ga'tō', JACQUES EDOUARD (1788-1881) A French sculptor and engraver, born in Paris. He was the pupil of his father, Nicholas Marie Gatteaux, and of Moitte, and won the Prix de Rome (1809) for medallage. He was one of the founders of the "Galerie Numismatique des Illustrations Françaises" in Paris. He was employed by the French government to strike a medal commemorating the establishment of the School of Architecture. Others of

his famous medals are those for the "Holy Alliance" and the Peace of 1814. He was elected to the Institute in 1845, and left his art collection to the Ecole des Beaux-Arts and the Louvre. His busts include those of Michelangelo, and of Rabelais, at Versailles. His statue of Aimé de Beaujeu is in the Luxembourg Gardens.

GATTERER, gat'ēr-ēr, JOHANN CHRISTOPH (1727-99). A German historian, born at Lichtenau. He studied at the University of Altdorf, and in 1759 became professor of history at Göttingen, where from 1767 he was also director of the historical institute established by himself in 1764. He was the first to introduce into the historical courses of German universities geography, diplomacy, heraldry, and other auxiliary studies. The most important of his works are *Die Weltgeschichte in ihrem ganzen Umfange* (2 vols., 1785-87) and the *Versuch einer allgemeinen Weltgeschichte bis zur Entdeckung von Amerika* (1792). Consult *Elogium Gattereri*, by Heyne (Göttingen, 1800), also Wesendonck, *Die Begründung der neuern deutschen Geschichtsschreibung durch Gatterer und Schlozer* (Leipzig, 1876).

GATTI, gat'té, BERNARDINO (c.1495-1575), called "il Sojaro" (the Cooper). An Italian painter, born at Parma. He was the pupil of Correggio and so like him in his manner that his pictures have been mistaken for that master's. He also imitated Pordenone and was selected to complete the frescoes left unfinished by him in the Santa Maria di Campagna, Piacenza. Gatti's works are well represented in Parma Cathedral and in the church of St Peter at Cremona. His masterpiece is an altarpiece, "Madonna with Donors" (1531), in the cathedral of Pavia.

GATTI-CASAZZA, gat'té-ka-zat'sa, GIULIO (1869-). An operatic manager, born at Udine, Italy, Feb 3, 1869. He was educated at the universities of Ferrara and Bologna and completed the course in engineering at the Naval School of Engineering at Genoa. As his father had been the director of the municipal theatre of Ferrara, the young man grew up in a musical atmosphere and always manifested a keen interest in theatrical affairs, so that, when his father in 1893 accepted a position in Rome, the son abandoned the proposed career of an engineer and assumed the directorship at Ferrara, which he held for five years. In 1895 he was chosen director of La Scala in Milan. During the 10 years of his incumbency he raised that institution to the rank of the foremost opera house of Italy. In 1908 he became the general manager of the Metropolitan Opera House of New York. Here he found the widest field for the display of his extraordinary administrative ability. Under his régime the already famous institution entered upon the period of its greatest prosperity, financial and artistic. The achievements in every department approach almost ideal standards. From the very beginning of his administration Mr Gatti-Casazza followed the policy of encouraging native singers and of producing every year one new opera by an American composer. In 1910 he took the entire Metropolitan company to Paris, where it created a veritable furore because of its perfect ensemble. He married, in 1910, Frances Alda (qv), one of the prima donnas of his company.

GATTY, MRS. MARGARET (1809-73). An

English novelist. She was born in 1809 and in 1839 married a clergyman and passed most of her life after marriage at Ecclesfield in Yorkshire, becoming widely known by *The Fairy Godmothers* (1851) and *Parables from Nature* (five series, 1855-71), translated into the leading languages of Europe. In 1866 she started a monthly periodical for young people, called *Aunt Judy's Magazine*, which after her death, in 1873, was continued by her daughters till 1885. Here first appeared nearly all the stories of her daughter, Mrs Juliana H. Ewing (qv). Consult *Parables from Nature* (New York, 1912), which contains a memoir by her daughter, Juliana H. Ewing.

GATUN. See DAMS AND RESERVOIRS, PANAMA CANAL.

GAU, gou (Ger, district). In the earliest German times used for 1000 men, then transferred to the territory occupied by them. Later used indefinitely for a district, frequently it was identical in the Middle Ages with a county, or Grafschaft, but sometimes with a portion of a county. In the early period of the migrations the ruler of a gau was frequently designated as king. Consult Schroder, *Lehnbuch der deutschen Rechtsgeschichte* (Leipzig, 1907).

GAUBIL, gô'bêl, ANTOINE (1689-1759). A French Jesuit missionary to China, born at Gaillac. He became a Jesuit at the age of 15 and in 1723 was sent to China, where he learned Chinese and Manchu with wonderful facility. His scholarship won him a place at court, in spite of the Emperor's aversion to the missionaries, and his influence kept the Jesuits from being disturbed. He was made interpreter and carried on diplomatic correspondence with Russia, besides being head of the Imperial Colleges under Kien Lung when he succeeded Yung Ching. He was a correspondent of the Paris Academy of Sciences and a member of the Academy of St Petersburg. Père Gaubil died in Peking. He wrote *Histoire de Gentchiscan et de toute la dynastie des Manchoux* (1739), *Traité de chronologie chinoise* (1814), and a translation of *Le Chou King* (1771), besides many letters and sketches published in *Lettres édifiantes* and in Rémusat, *Nouveaux mélanges asiatiques*.

GAUCHOS, gou'chôz (countrymen). Pastoral nomads of the Chaco, in the Argentine Republic, South America, offspring of whites and Indians of the pampas. They are tall and handsome, with a proud and dissolute expression of countenance. They wear mustaches and have long black hair hanging down their backs. Their costume is brightly colored. They are very polite and possess high ideas of their own equality and dignity. These hybrids can scarcely be traced to their original Guaycuru Indian components, but since the white infusion has ceased, the people are reverting to the Indian type, thus showing a most interesting example of the formation of a new race. The free, wild life of the pampas has developed the Gauchos into an alert, vigorous people, expert horsemen and cattlemen, who wield the lariat with great skill. The bolas (qv) is also employed in the chase and in warfare.

The Gauchos eat meat exclusively for months together, and with it a large proportion of fat. It has been observed that they dislike dry meat. Curiously enough, they do not eat salt. The men are proficient in leather working, and the women weave belts and dress skins. Consult Sir Edmond Temple, *Travels in Various Parts of*

Peru (London, 1830), and W H Koebel, *Mod-ern Argentina* (Boston, 1912)

GAU'DEAMUS (Lat, Let us rejoice) The first word and the title of a well-known Latin student song popular in Germany and America. It is based partly on a Latin song dating from 1267 and existed in the eighteenth century in a somewhat obscene form, with German as well as Latin verses. The present version dates from 1781.

GAUDEN, gā'den, JOHN (1605-62) An English prelate and author. He was born at Mayland, Essex, where his father was vicar. After education at Bury St Edmunds, he entered St John's College, Cambridge, and obtained the degrees of B A and M A. While a tutor at Oxford he took the degree of B D at Wadham College in 1635 and D D in 1641. His pupil, Sir Francis Russell, presented him with the living of Chippenham in 1640, and the same year he was the appointed preacher to the House of Commons. After the Restoration, in 1660, he was appointed Bishop of Exeter and in 1662 was translated to the bishopric of Worcester. He died four months later (Sept 20, 1662). His publications number some 13 or more books, which appeared between 1642 and 1660. At first he was inclined to the Parliamentary cause, but in the end he strongly opposed the Puritan excesses. Among his more forcible writings may be mentioned *Cromwell's Bloody Slaughter House*, or, *His Damnable Designs in Contriving the Murder of His Sacred Majesty King Charles I Discovered* (1660). He is best known on account of the controversies which have raged over the authorship of *Eikon Basilike*, a book attributed to Charles I himself. It was published immediately after the execution of the King, and, according to Malcolm Laing, "had it appeared a week sooner, it might have saved the King's life." The Bishop claimed its authorship in correspondence with Chancellor Hyde, Lord Clarendon (1660-62), and Clarendon admitted it. Burnet in 1674 stated that the Duke of York told him that Dr Gauden was the author, and in November, 1686, at the sale of the Marquis of Anglesey's choice library of books, the "famous memorandum" was found in the peer's copy of the *Eikon Basilike*—"King Charles II and the Duke of York have both assured me that this work was none of the King's compiling, but made by Dr Gauden, Bishop of Chester (?), which I here insert for the undeceiving of others in this point, by attesting so much, under my hand." A sharp controversy arose, which has been revived on various occasions up to as late as 1880. In *Who Wrote Eikon Basilike?* (3 vols, 1824-28), Dr Christopher Wordsworth "proves" that the King did. Sir James Mackintosh, reviewing Wordsworth's book in the *Edinburgh Review* (xlv), "proves" that Gauden wrote it. Macaulay, Guizot, and other historians sustain Gauden's claim. Consult Almach, *Bibliography of the King's Book* (London, 1896). See *EIKON BASILIKE*.

GAUDRY, gō'drē', ALBERT (1827-1908) A French paleontologist, born at Saint-Germain-en-Laye. In 1853 he traveled in the Orient and from 1855 to 1860 in Greece, where he was occupied with paleontological researches. He was then appointed assistant naturalist in the Museum of Natural History in Paris, where in 1872 he became professor. In 1882 he was elected a member of the French Academy of Sciences. His works include *Recherches scien-*

tifiques en l'Orient (1855), *Animaux fossiles et géologue de l'Attique* (2 vols, 1862-67), *Animaux fossiles du Mont-Lébéron*, with Fischer and Tournouer (1873), *Enchaînements du monde animal dans les temps géologiques* (1878).

GAUDY, gou'dé, FRANZ BERNHARD HEINRICH WILHELM, BARON VON (1800-40) A German author, born in Frankfort-on-the-Oder. In 1818 he entered the Prussian army, but resigned from the service in 1833 to follow a wholly literary career, and at Berlin was a friend of Chamisso, with whom he edited the *Deutscher Musenalmanach* for 1839. His best-known work is his humorous and frequently epigrammatic verse, especially his *Kaiserhede* (1835) in honor of Napoleon. Some of his poems became widely popular. Of his prose writings, *Tagebuch eines wandernden Schneidergesellen* (1836), *Venezianische Novellen* (1838), *Der Katzenraffael*, and *Jugendliebe* are still read in Germany. His complete works appeared in 1853 (8 vols, ed. by Arthur Müller).

GAUERMANN, gou'ër-man, FRIEDRICH (1807-62) An Austrian genre, landscape, and animal painter. He was born at Miesenbach, Lower Austria, Sept 20, 1807, a son of the landscape painter Jakob Gauermann. He was a pupil of his father at Vienna, and in copying the old masters he acquired the technique of the Dutch school, modified by the smooth, delicate handling of the Viennese. In summer he made studies of the landscapes and peasants of the Austrian and Styrian Alps. His landscape motives are poetic in conception, his representations of wild animal life dramatic and spirited, and his rough idyls of the mountaineers show keen observation of local peculiarities. He first attracted attention at the Vienna Exhibition in 1824. "The Storm" (1829) assured his reputation, and the "Field Laborer" (Vienna Gallery) was one of the sensations in the Exhibition of 1834. The Vienna Academy possesses a series of charming studies of animals and four paintings, including "Peasants Resting." Among the most important of his other works are "Vultures Hovering over a Wounded Deer," "Husbandmen Ploughing"; "Cows, Sheep, a Horse" (Leipzig Museum), "Rural Smithy"; and "Well in the Tyrol" (Berlin National Gallery). He was made member of the Munich Academy in 1836. Gauermann left at his death, which occurred at Vienna, July 7, 1862, more than 1000 oil paintings, about 565 drawings, and 15 unfinished pictures.

GAUGE, gā (from OF. *gauge*, *jauge*, connected with ML *gaugatum*, gauging of a wine cask, *jalagium*, right to gauge wine casks, and probably with *jalea*, gallon, OF, Fr. *jale*, bowl). In mechanics, an instrument for determining the dimensions, quantity, force, capacity, etc., of anything. Gauges are of various forms and are employed for numerous purposes in engineering and the arts. Gauges to secure precision in the dimensions and forms of manufactured articles are made of hardened steel, or of case-hardened wrought iron, formed to the exact outline to be secured and accurately dimensioned. Such gauges are extensively used in machinery manufacture where interchangeability of corresponding parts is sought. Wire gauges are circular disks of hardened steel, having round the edge a series of notches of different sizes of openings corresponding to the standard wire sizes of the Birmingham or other gauges, such as the American or Brown and Sharpe. In the Birmingham

wire gauges the sizes run from No 1, denoting a wire diameter of 0.3 inch, to No 34, denoting a wire diameter of 0.004 inch. Similar gauges are used for measuring the thickness of metal plates, and in the United States a standard gauge for sheet and plate iron and steel was established by Act of Congress in 1893, the corresponding numbers being defined both in metric measure and fractions of inches. The modern tendency in design in many large manufacturing works is to state the actual dimensions in thousandths of an inch or in millimeters rather than by gauge.

Pressure gauges for measuring the pressure of steam or other gas inside a closed vessel are familiar to all. In the most usual form the pressure of the gas acts to cause a pointer to move around a graduated dial. The steam-boiler gauge is a familiar example of such devices. Wind gauges are arrangements by which the wind blowing against a plate diaphragm actuates a recording device which records the pressure. (See ANEMOMETER.) Water gauges consist of a strong glass tube with metal fixtures at its ends, which connect the tube with the interior of a steam boiler. The lower end of the tube connects with the boiler below the lowest water line, and the upper end connects with it above the highest water line, and the level of the water between the two points is observable by the height at which it stands in the glass.

Screw gauges consist of a U-shaped frame of steel, at the end of one arm of which is a steel plug pointing towards the opposite arm, through whose end runs a finely threaded thumbscrew with a graduated head. To measure with this device the end of the plug is brought into contact with one side of the object, and the screw run out into it touches the other side, a reading of the graduated head shows the distance apart of the end of the plug and the end of the screw, and therefore the thickness of the object. See CALIPERS, RAILWAYS.

GAUGER. A United States customhouse officer whose duty is to gauge or measure casks and other hollow vessels containing liquids liable to duty. Local officers are to be found in many States also, whose duties are of a similar nature. These are often known as sealers of weights and measures.

GAUGUA, gou'gwa. See GUAGUA.

GAUGUIN, gô'gân', PAUL (1848-1903). A French figure and landscape painter, one of the pioneers of the post-Impressionist movement. He was born at Paris, June 17, 1848, the son of a journalist of Orléans (not Breton) descent and of a Peruvian mother. The lad was brought up at Lima and in the house of his grandfather at Orléans. In 1865 he went to sea, returning in 1871. He then took up successfully a banking career and was married to a cultivated and sympathetic Danish lady. Painting was for him a hobby to occupy leisure evenings and Sundays. Forming the acquaintance and acquiring the friendship of Pissarro, he worked with the Impressionist group, becoming the most radical of them all. He soon achieved a reputation with his simple and forceful presentation of rocky Breton landscape and became founder of the school of Pont Aven. He then passed considerable time with Van Gogh (qv) in southern France, painting the landscape and figures of that country. Among his notable paintings of this period are his well-known portrait of himself and the curious "Yellow Christ," so called from

the prevailing tone of the painting. Disgusted with the civilization of Europe, he went in 1891 to Tahiti, where he lived like a native until 1893. While there, he painted a remarkable series of Tahitian subjects, which, exhibited with Maori titles, caused quite a sensation in Paris. The most remarkable of them were brown nudes in bright tropical landscapes, such as "Te Arii Vahine," also called the "Maori Venus," and "The Spirit of the Dead." There were also fine portraits, like the two "Maori Women," besides interesting still life and sculptures—"A Maori Woman" in stone and his own characteristic head in wood. He was well represented in the International Exhibition held at New York in 1913. The Luxembourg Museum possesses a "Still Life" by him, the Copenhagen Museum, his "Jardin de Paris." In 1895 he returned to Tahiti, and died on May 9, 1903, in the Isle of Dominique. Gauguin rejected all dogma in art and claimed the liberty for every one to interpret nature according to his own temperament. Although, according to the accepted standards, his art lacks beauty both in line and in color, it has an indisputable decorative quality of its own. He also produced some good lithographs and water colors, and in conjunction with Charles Morice he published an interesting booklet entitled *Noa Noa* (1897). Consult De Ronchamp, *Paul Gauguin* (Weimar, 1906).

GAUL, gal (Lat. *Gallia*). The name given by the Romans to that portion of western Europe which is in the main identical with France, although extending beyond the bounds of the modern state. In the earliest times this region, bounded by the Atlantic, the Rhine, the Alps, the Mediterranean, and the Pyrenees, was inhabited by the Gauls, who had overrun the territory and had brought under control the earlier peoples, such as the Ligurians, along the southern coast line, and the Iberians, who had subjugated the southwestern section and are represented by the Basques of modern days. (See IBERIANS, LIGURIA, LIGURIAN, BASQUE, BASQUE RACE.) The Greeks founded Massilia (Marseilles), a Phœcean colony, about 600 B.C. They called the people *Kέλται*, either, as Thierry suggests, extending the name of one tribe to the entire race, or using a generic term to indicate the collective Celtic people. Later the Greeks named the country *Γαλατία*, and the Romans spoke of the Galli and of Gallia. These words are cognate with the native title *Gaeltachd*, which means 'the land of the Gauls,' and which designated the territory above defined, but did not include the two islands known as Albion (qv) or Albin, the White Island, and Erin (*Eri* or *Iar* = the West), the Isle of the West, which were inhabited by the same race.

Julius Cæsar is the first writer who enlightens us in regard to this people. He speaks of Gaul as being divided among three peoples—the Belgæ, the Aquitani, and the Galli (or, "as they are known in their own tongue," Celtæ). The Belgæ dwelt on the north, with the Seine as their southern boundary, the Aquitani lived in the south, between the Garonne and the Pyrenees, the Celtæ dwelt between the Belgæ and the Aquitani. They differed in language, customs, and laws. This description is substantially correct, although Cæsar does not mention all the races of Gaul, nor does he recognize the fact that the Aquitani were really distinct in race from the Belgæ and the Celtæ, who were closely related to each other. The Aquitani were Iberian in

stock, and this racial difference was indicated by marked differences in temperament and physical characteristics. The Gauls were tall, of light complexion, sociable in disposition, given to fighting in large numbers, while the Aquitani were dark, reserved in disposition, and fond of fighting in small bands—traits which are found among the Basques to-day.

Cæsar mentions numerous tribes belonging to the three nations distinguished by him. Such were, in Celtic territory, the Helvetii, the Sequani, and the Ædui along the Rhône and the Saône, and the Arverni (modern Auvergne) among the mountains (Cevennes), along the Loire were the Namnetes, the Senones, and the Carnutes, and between the Loire and the Seine the Armorican or maritime tribes, such as the Veneti. The Bellovaci, Suessiones, Nervii, and Morini were tribes of the Belgæ.

The part the Gauls played in the ethnic distribution of the early peoples of Europe was remarkable. In their nomadic history they wandered far and wide throughout Europe, Asia, and Africa. From their home in western Europe they spread to Britain, invaded Spain, swarmed over the Alps into Italy, and, extending their conquests to the Tiber, burned Rome (390 B.C., see ALLIA; BRENNUS, I, CAMILLUS, ROME, *History*). For later invasions of Italy by the Gauls, see MARIUS, CIMBRI. Other tribes of Gaul traversed eastern Europe and Asia Minor, ravaged Macedonia and Thessaly, passed through Thermopylæ, and pillaged Delphi. In 241 B.C., meeting with Attalus, King of Pergamus, they were driven back into the mountain district near the Halys River, and there they established the independent principality of Galatia (q.v.), or Gallo-Græcia, which became a power among the peoples of Asia. This represents the first period of their history. The second is the history of their settlements in various parts of the world and the development of their peculiar institutions, influenced as they were by environment and modified by the introduction of foreign elements. Thus, in Phrygian Galatia the Gallic civilization was combined with those of Greece and Phrygia, and in Italy their manners and customs were affected by their contact with the Romans. Finally, in the struggle to maintain their freedom, they met the Romans on every side. As Thierry says "The Gauls and Romans followed each other over the earth to decide the old quarrel of the Capitol." It was the long conflict between a ferociously active but undisciplined people and the sturdy, disciplined prowess of the Romans. The northern part of Italy, because of the early invasion of the Gauls, was termed by the Romans Gallia Cisalpina, i.e., "Gaul this side of the Alps," as viewed from Rome. (For these invasions, see ROME, *History*, under the heading *From the Abolition of the Decemvirate to the Defeat of the Samnites*, etc., subdivision 2, *External History*.) This territory was also known as Gallia Citerior, to distinguish it from Gallia Transalpina or Gallia Ulterior. Here the contest was waged for centuries, the Romans gradually pushing their sway up to the Alps and establishing colonies in the Gallic towns. Julius Cæsar gave its inhabitants Roman citizenship (49 B.C.), in 42 Gallia Cisalpina was definitely merged with Italy. In this territory were born VERGIL, CATULLUS, LIVY, PLINY THE ELDER, and PLINY THE YOUNGER.

Then the Romans passed over the Alps, invited by the people of Massilia, who sought

assistance against their neighbors, but the invaders did not cease to interfere with the affairs of southern Gaul until the entire region from the Alps to the Pyrenees became a Roman province. This was known as Gallia Provincia (Provence), and Narbo became the capital city. The wars of Julius Cæsar, which ended with the eighth campaign, in 50 B.C., in the conquest of Gaul, resulted in the formation of a new province, Aquitania. To this province was given the name Gallia Comata, or Long-haired Gaul, just as Cisalpine Gaul had been termed Gallia Togata, and the old province Gallia Biaccata, from the word *bracca*, meaning the trousers (breeches) worn by the people. The third period in the history of Gaul dates from the time of Augustus, for in 27 B.C. Augustus organized the peoples of Gaul in four provinces—Gallia Narbonensis, the old province, Aquitania, with the Liger (Loire) as the northern boundary (larger by 14 tribes than the Aquitania of Cæsar), Gallia Lugdunensis, named from the town of Lugdunum (Lyons), between the Loire, the Seine, and the Saône, and Gallia Belgica, between the Seine and the Rhine, with the North Sea as the northern boundary. This division was not changed until the fourth century, when Gaul was divided into two great dioceses, the *Diocesis Galliarum* and the *Diocesis Viennensis*. The former was subdivided into eight provinces and the latter into seven provinces. The Emperor Claudius did much towards the complete Romanization of Gaul, and later emperors completed what Augustus had begun. In the history of the Imperial period the Gauls had an important part, their fortunes rose and fell with the fortunes of the Roman people. See ALESIA, AQUITANIA, ARLES, AUTUN, BELGÆ, NÎMES, CÆSAR, GAIVS JULIVS, HELVETII, CELTIC LANGUAGES, CELTIC PEOPLES, ITIVS PORTVS, ORANGE, DRUID.

In the many contests of later Imperial times their land was the scene of fierce conflicts, and when the races of the north and east fought and overcame those of the south, their land was traversed again and again by great migrations of the Burgundians, the Goths, and the Franks, until out of the ruin there arose a new empire, and the history of mediæval and modern Europe began. See FRANCE.

VII (Stuttgart, 1912), the article "Gallia" in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914).

GAUL, ALFRED ROBERT (1837-1913) An English organist and composer, born at Norwich. He studied under Zechariah Buck, organist of Norwich Cathedral, from 1854 to 1859 was or-

ganist at Fakenham (Norfolk), and in 1859 was appointed organist of St Augustine's (Edgebaston), Birmingham. His works include an oratorio, *Hezekiah* (1860), two sacred cantatas, *Ruth* (1881) and *The Holy City* (1882), the latter of which has been very popular in the United States, a *Passion Service* (1882), an historical cantata, *Joan of Arc* (1887), *The Ten Virgins* (1890), *Israel in the Wilderness* (1892), *Una* (1893), and anthems and part songs.

GAUL, GILBERT WILLIAM (1855-1919) An American historical and genre painter, born at Jersey City, N. J. He studied under J. G. Brown and was a pupil of the National Academy of Design, of which he became a member in 1882. He painted many genre pictures, such as "Indian Girl" (1880), "Old Beau" (1881), but is at his best in his battle pictures of the Civil War, which are characterized by clever coloring, notable dash and spirit, and great truthfulness of detail. Among the best are "Charging the Battery," "Saving the Colors," "Battery H in Action" (Toledo Museum), "Exchange of Prisoners" (Democratic Club, New York). Among his more recent paintings are "Golden Prospects" (1910), "Sioux Indian" and "Loot" (1911), "Ration Day" and the "Peace Conference" (1912).

GAULEY (ga'lé) **MOUNTAIN** A ridge in Randolph and Pocahontas counties, W. Va., having a maximum altitude of about 4000 feet. The name is also applied to a lower ridge (1500 to 2000 feet) in Fayette Co., W. Va., between the Gauley and New rivers, forks of the Kanawha River.

GAULEY RIVER. A river rising in the Gauley Mountains, Pocahontas Co., W. Va. After a southwest course it unites with New River at Gauley Bridge, to form the Great Kanawha, a tributary of the Ohio.

GAULIN, gô'lin' (West Indian name) In Jamaica and the West Indies, a heron.

GAULS See **GAUL**.

GAULT A division of the Cretaceous system of England separating the Lower and Upper Greensands. It consists of a dark, plastic clay, sometimes sandy or marly, and attains a thickness of from 100 to 300 feet. It is exposed along the southeastern coast of England, one of the best sections being near Folkestone.

GAULTHERIA (Neo-Lat. nom. pl., from *Gaulther*, a Canadian physician) A genus of low or trailing shrubs, belonging to the family Ericaceae, a number of species of which occur in North and South America, Asia, Australia, and Tasmania. Among the best-known is *Gaultheria procumbens* (wintergreen, q.v., or checkerberry), a common plant in evergreen woods from Canada to Georgia, especially in the mountainous districts at the south. It is also called teaberry, deerberry, boxberry, partridge berry, and mountain tea. The stems are

trailing, with ascending tips, which bear the dark-green, smooth leaves and the scarlet berries. The foliage has the same flavor as that which characterizes the sweet birch (*Betula lenta*). The whole plant contains a volatile oil, oil of wintergreen, which is obtained by distillation. This oil is used to some extent in medicine as a stimulant, antiseptic, and diuretic, but its chief use is as a flavor. Other species, especially the Asiatic, are used as a source of the flavor. *Gaultheria shallon*, found from Alaska to California, is a shrub 2 or 3 feet high. It is known as "salal," and its black berries are edible. The fruits of wax cluster (*Gaultheria hirsuta*) and *Gaultheria antipoda* of Tasmania are edible, those of the latter being considered the better.

GAULUS See **GOZO**.

GAUNT, JOHN OF See **JOHN OF GAUNT**.

GAUNTLET, or **GANTLET**, gant'lét (OF *gantelet*, dim. of *gant*, glove, from ML *uanteus*, glove, from Dutch *want*, OSwed *wante*, glove, mitten). In medieval armor, a glove usually of leather covered with iron, which formed part of the equipment of knights and men at arms. The back of the hand was covered with scale-work of plates joined together, so as to permit the hand to close. Gauntlets were introduced about the middle of the thirteenth century. They were often thrown down by way of challenge, like gloves. They were frequently used in heraldry, the fact of their being for the right or left hand being expressed by the words "dexter" or "sinister." Consult Demmin, *Arms and Armour* (London, 1877).

GAUPP, goup, ERNST (1865-1917) A German anatomist, born in Beuthen, Upper Silesia, and educated at Jena, Königsberg, and Breslau. At Breslau in 1889-95 he was an assistant in the university and taught anatomy in the art school. He then went to Freiburg and in 1897 to Königsberg, where he became professor and (in 1912) director of the Anatomical Institute. He revised Ecker's *Anatomie des Frosches* (1896-1904), wrote "Entwicklung des Kopf-skelets" (1905), in Hertwig's *Handbuch der Entwicklungslehre*, and contributed the chapter "Morphologie der Wirbeltiere," in *Kultur der Gegenwart*.

GAUR, gour, or **GOUR**. The medieval capital of Bengal, situated on the arm of the Ganges called the Bhagirathi, in lat 24° 52' N and long 88° 10' E. According to tradition, the city was founded in the twelfth century by Lakshmanasena of the Vaidya dynasty of Bengal, who called it, after his own name, Lakshmanavati, or, in the vernacular, Lakhnauti. Lakhnauti continued for the most part to be the seat of rulers who governed Bengal and Behar, sometimes as confessed delegates to the Delhi sovereigns, sometimes as practically independent kings. It was conquered by the Mohammedans in 1198, and from the year 1338, with the waning power of the Delhi dynasties, the Kingdom of Bengal acquired a substantial independence which it retained for more than two centuries. One of the earliest of the kings during this period, by name Ilyas Shah, transferred the seat of government (c. 1350) to Panduah, a place about 16 miles north by east of Gaur. After some occasional oscillation the residence was again (c. 1446) transferred to Gaur by Nasr ud-Din Mahmud Shah I, by which name the city is generally known thenceforward, that of Lakhnauti disappearing from history. On account

GAULTHERIA

of its somewhat unhealthy situation Sulman Kīramī (1564-65) abandoned Gauī for Tandah, a place somewhat nearer the Ganges. Mu'ūmin Khan, a general of Akbar, when reducing these provinces in 1575, was attracted by the old site and resolved to readopt it as the seat of local government. But a great pestilence (probably cholera) broke out at Gaur and swept away thousands, the general in chief being himself among the victims. Gaur cannot have been entirely deserted, for the Nawab Shīya ud-Dīn, who governed Bengal 1725-39, built a new gate to the citadel. The city is now in ruins, its remains being scattered over a vast area. Consult Ravenshaw, *Gaur Its Ruins and Inscriptions* (London, 1878), Ferguson, *History of Indian and Eastern Architecture* (ib, 1876, 2d ed, 1910), *Reports of the Archaeological Survey* (Bengal, 1900-04), Havell, *Indian Architecture* (New York, 1913).

GAUR, gar or gour (Hind, from Skt *gāura*, white). A wild ox (*Bos gaurus*) of India, probably the largest existing species of wild cattle, and the one hunted by Indian sportsmen under the misnomer "Indian bison." An old bull may stand 6 feet high at the withers, and specimens have been recorded whose horns measured 39 inches and had a basal circumference of 19 inches, but the average is less than this, the cow is in every way smaller. The animal is massively built, with regularly upward-curving yellowish horns decidedly flattened at their base, and has a distinct ridge above the shoulders produced by great upstanding spines of the vertebrae. The ears are very large, the dewlap inconspicuous, and the tail comparatively short. In color, old bulls are dark brown, sometimes nearly black, with the crown of the head and the muzzle gray, and the lower parts of the legs pure white. The hair is fine and glossy. This grand animal is to be found in small bands throughout all the forested parts of India (except Ceylon) to the foothills of the Himalayas, and thence through the hilly districts of Assam and Burma down into the Malay Peninsula, where there are two forms—one called *sladong*, and the other *sapo*, in *Proceedings of the Zoological Society of London* (London, 1899). It roams widely, but keeps to the jungle and is so alert and cunning in escape, and so formidable when brought to bay, that its chase is justly regarded as among the finest sports with a rifle in the world, and among the most dangerous, as it must always be pursued on foot. An old bull makes an even match for the tiger himself. Nevertheless, it is not pugnacious and rarely or never attacks human beings except when wounded or brought to bay, but shyly retreats from man whenever possible. These cattle have not been domesticated, except partially by some semiwild hill tribes east of the Ganges in company with their gayals, who keep them as food. Consult books of natural history and sport in India and Burma, especially Sanderson, *Thirteen Years among the Wild Beasts of India* (London, 1893), noting that most of these writers call the animal "bison", also Blandford, *Fauna of British India Mammals* (2 vols, ib, 1888-91), id, "On the Gaur and its Allies," in *Proceedings of the Zoological Society of London* (ib, 1890). Cf GAYAL, and see **PLATE OF CATTLE, WILD**.

GAURISANKAR, gou'ri-sān'kēr, MOUNT. See EVEREST, MOUNT.

GAUSS, gous, KARL FRIEDRICH (1777-1855)

A German mathematician, one of the most brilliant mathematicians of modern times. He was born at Brunswick, the son of a day laborer. After three years (1792-95) in the Carolinum at Brunswick, he went to the University of Göttingen, where he remained from 1795 to 1798, devoting all of his attention to mathematics. When at Göttingen, he was already in possession of the idea of least squares (see **LEAST SQUARES, METHOD OF**), and in March, 1796, he discovered the proposition that a circle can be divided into 17 equal arcs by means of elementary geometry, the first extension of the ancient Greek knowledge in this particular. During his university career at Göttingen he also worked upon his *Disquisitiones Arithmeticae* (1801, 2d ed, 1889) a treatise which soon brought him into prominence before the scientific world. The German astronomers being unable to locate the planet Ceres, discovered by Piazzi at Palermo, Jan 1, 1801, Gauss invented a new method for calculating the position of heavenly bodies, and thus enabled Zach (Dec 3, 1801) and Olbers (Dec 4, 1801) to rediscover the planet. His *Theoria Motus Corporum Coelestium* (1809), vol vii of his *Werke* (1871, Göttingen by Haase, Hanover, 1865), completely established his reputation, so that Laplace recognized him as the first mathematician in Europe. The latter part of his life was devoted largely to two branches of applied mathematics, geodesy and electricity, he measured the meridian from Altona to Göttingen (1821-24), and he may be considered as the founder of the mathematical theory of electricity. With Weber he established telegraphic connection between the magnetic and the astronomical observatories at Göttingen (1833) and published the *Resultate aus den Beobachtungen des magnetischen Vereins* (6 vols, 1838-43) and the *Atlas des Erdmagnetismus* (1840). He also wrote on the theory of surfaces, least squares, and other subjects of mathematics, physics, and astronomy. His collected works were published by the Göttingen Academy (vols i-vi, Göttingen, 1862-74, vol vii, Göttingen, 1871, 2d ed, 8 vols, Göttingen, 1870-1900). For his life, consult Schering (ib, 1887).

GAUSSEN, go'san', LOUIS (1790-1863). A Swiss Protestant theologian. He was born in Geneva and in 1816 became pastor of Satigny, near that city. He held strongly to the old Calvinistic teachings and refused to use a new and revised catechism which had been substituted for Calvin's. For this he was censured by the majority of the Geneva ministers and in 1832 was deposed by the consistory. In the same year, with Meile d'Aubigné and Galland, he formed the "evangelical society" for the circulation of Bibles and tracts. In 1836 he became professor of theology in the new evangelical school at Geneva. He held to the verbal inspiration of the Scriptures in its most extreme form. Among his works translated into English are *Theopneustics* (1841), his most widely known work, *It is Written* (1856), *Lessons for the Young on the Six Days of Creation* (1860), *Canon of Scripture* (1862).

GAUTAMA, gou'ta-ma. The name of a family, the Sākya of Kāpilavastu, and of several individuals known in connection with the early Vedic literature of India. This appellative is a patronymic from Gotama and was borne also by Buddha. (See **GOTAMA**.) It was especially preserved also as the name of an early

Hindu teacher or lawgiver, the author of a work known as the *Institutes of Gautama*. These legal aphorisms, like the institutes of Apastamba, Baudāyana, and Vasiṣṭha (qv), are important in connection with early Hindu law. For a translation, consult "Sacred Laws of the Aryans," in Muller, *Sacred Books of the East*, vol. II (2d ed., Oxford, 1897), and Macdonell, *History of Sanskrit Literature* (London, 1913).

GAUTAMA BUDDHA, *gou'ta-ma bood'a*. The great religious teacher and reformer of early India. His name is variously given. Its form as Gautama (qv) was a common appellation in ancient Sanskrit and appears in Pali as Gotama. It was a family designation, and for this reason the title "Gautama Buddha" is sometimes given in English as "Buddha the Gotamid, or of the Gautama family." Often he is called Sākya-muni (Sage of the Sākya Clan), as he was descended from this tribe, and frequently he is styled Siddhārtha, or, in Pali, Siddhartha (the one who successfully attains his aim). The designation "Buddha" is an epithet and signifies the "Enlightened One." Similarly Bodhisatva, or Pali Bodhisatta, means "one who possesses the verity of knowledge," and it is an attribute applied to each of a long line of Buddhas who have reached or will attain to perfect enlightenment and wisdom.

Buddha was born in the sixth century before the Christian era, but the precise date is not known. His home was in the region of India to the northeast of Benares, and the town where he was born was Kapilavastu, modern Kohāna, not far from the borders of Nepal. Tradition states that he was born in a garden sacred to the goddess Lumbini, and it is likely that the very place which the faith at least hallowed as his birthplace was discovered in 1897 by Alois Fuhrer, but so many inaccuracies were connected with his identification of the column of Asoka, which marked the spot, that some discredit has been thrown on the authenticity of the identification.

The name of Buddha's father is given in the sacred texts as Suddhodana, a chief of the Sākyas, and his mother is known as Māyā in the Buddha-vamsa. It is generally thought that he was a prince of the royal blood, but this statement is not found in the oldest documents. For that reason doubt has, perhaps wrongly, been raised on this particular point. However that may be, the consensus of opinion is agreed that Siddhārtha's mother died when he was but seven days old, and that he was intrusted to the care of her sister, Mahā-Prajāpati, of the Gotamid family, who was also a wife of Suddhodana. We know little that is authentic regarding his youth and education, but later tradition has woven a garland of legend about his youthful attainments and achievements, his talents and his virtues. A reflex of these Oriental descriptions may be gained from Sir Edwin Arnold's romantic poem *The Light of Asia*.

Prince Siddhārtha, if so we may style him before he attained to Buddhahood, was very early married to his cousin, the daughter of the Rajah of Koli, and had a son named Rāhula, born some 10 years after his marriage. It was shortly after the birth of this son, in his thirtieth year, when he had fulfilled the obligation which the Hindu creed required to be discharged to one's ancestors, that he left his wife, child, home, and kingdom, and wandered forth to take up the life of an ascetic. This was the method

of procedure that the Brahman faith authorized, this was the manner of seeking the path of salvation. Finding his way to Rājagṛha, he devoted himself to such rigorous and excessive asceticism that he nearly lost his life. Discovering that all this was idle and futile for him, he gave himself up solely to thought and meditation, which gradually led him to evolve his religious and philosophic theory of the general existence of evil, its origin and its eradication. The place where the light dawned upon his soul is still pointed out. He was seated beneath a pipal tree near the village that is now known as Buddh-gaya, to the southeast of Benares. The tree has ever since been sacred as the Bo tree (qv). The emancipation of his spirit found expression in rhythmical stanzas, and he enjoyed at that moment, even while alive, the perfect peace of Nirvāṇa. To his enlightened eyes the cause of misery and sorrow was desire; the only relief was to pluck from the heart this lust, and to achieve this he pointed out the Eightfold Path of truth and right. See BUDDHISM.

After attaining the Buddhahip he proceeded to find the five ascetics with whom he had been associated in his recluse life near Benares. He wished to impart first to them the newly won joy and the solution of life's problems, after that to his family, kinsmen, countrymen, and to all mankind. Wandering up and down the Ganges region, the Holy Land of India, he continued to preach, and, in parable, precept, and practice, to impart the tenets of redemption. The purity of his life, the gentleness of his manner, the earnestness of his teaching, and the firmness of his conviction, won thousands upon thousands to accept his simple creed and "take refuge in Buddha." Even during his lifetime his doctrines spread widely through India, and they became established in Ceylon hardly less than two centuries after his death. There is even a tradition, though not generally accepted, that Buddha himself twice visited the island. See BO TREE, CEYLON.

Much of Buddha's time was spent in founding monastic orders and in developing lines along which the religion was destined in the future to grow. His life was a long one, 80 years, more than twoscore of which were devoted to his ministry. The time of his death is believed to have been about 480 B.C., but some latitude must be allowed for inaccuracy in the deductions. The place where he died was near Kusinagara, some 80 miles to the east of his birthplace, and about 120 miles to the northeast of Benares. A detailed account of the death scene, even naming the disciples who were present, especially the beloved Ananda, is given in the Buddhist scriptures. Abundant incidents regarding Buddha's teaching and preaching may be gathered from the same sources. As to precise biography, in the strict sense of the term, there is none that is ancient, but the material may be collected from the Pali texts. The introduction to the Jātakas (qv), or book of birth stories, gives an account of the previous existences of the Buddha, and a sketch of his life down to his thirty-sixth year. The two Sanskrit metrical works entitled *Buddhacarita* and *Lalitā-Vistāra* (qv) contain biographical accounts, but they are not earlier than the first and the second centuries of our era, while the Pali poem *Jīna Carita* (Story of the Victorious One), written in Ceylon, is as late as the twelfth

century A.D., and the *Malalankara Watthu* is of uncertain date. But the continued publication of Pali texts, Tibetan writings, Chinese records, and Ceylonese accounts, is adding new information each year regarding the history of Buddha, of whose historical existence there is no longer any question, and fresh archaeological discoveries and researches are contributing extensively to the knowledge already gained. Consult Rhys Davids, *Buddhism* (new ed., London, 1903), and Bigandet, *Life or Legend of Gautama, the Buddha of the Burmese* (4th ed., ib., 1911-12). See BUDDHISM.

GAUTIER, go'tyá', EMILE THÉODORE LEON (1832-97). A French paleographer and historian of literature, born at Havre. He was educated at Laval and at the Collège Sainte-Barbe, Paris, entered the Ecole des Chartes in 1855, and became archivist in the national archives at Paris in 1859, and professor of paleography in the Ecole des Chartes in 1871. He was made chief secretary of the national archives in 1886 and was elected to the Institute in 1887. He was one of the greatest authorities on mediæval European literature, his works on early French literature being especially valuable. He wrote *Quelques mots sur l'étude de la paléographie et de la diplomatie* (1858, 3d ed., 1864), *Scenes et nouvelles catholiques* (1861), *Benoît II* (1863), *Études historiques pour la défense de l'église* (1864), *Études littéraires pour la défense de l'église* (1865), *Épopées françaises* (3 vols., 1866-67, 2d ed., 1878-97), *Portraits littéraires* (1868), *La chanson de Roland* (1872), an edition which won the Guizot prize in 1878 and was repeatedly reissued, *Vingt nouveaux portraits* (1878), *La chevalerie* (1884), *Histoire de la poésie religieuse dans les cloîtres, des IX^e et XI^e siècles* (1887), *Portraits du XVIII^e siècle* (1888), *Études et tableaux historiques* (1890); *Bibliographie des chansons de geste* (1897).

GAUTIER, JUDITH (1850-1918). A French poet and historical novelist, the daughter of Théophile Gautier and the noted singer Carlotta Grisi. She was married to Catulle Mendès, but soon separated from him and married Pierre Loti, the famous novelist, in 1913, with whom she had collaborated in a play, *La fille du ciel* (1912, English, "The Daughter of Heaven"), translated and produced under their personal supervision at the Century Theatre, New York City. She is an Oriental scholar, and her works deal mainly with Chinese and Japanese themes. Among them are *Le dragon impérial* (1869), *L'Usurpateur* (1875), *Les princesses d'amours* (Paris, 1900), *Le collier des jours* (ib., 1902). Consult R. de Gourmont, *Promenades littéraires* (ib., 1905).

GAUTIER, (CHARLES) LUCIEN (1850-). A Swiss theologian, born at Cologny, near Geneva, and educated at Geneva, Leipzig, and Tübingen. In 1877-98 he was professor of Hebrew and Old Testament exegesis at Lausanne, and thereafter honorary professor. He was president of the synod of the Vaudois église libre in 1885, 1886, 1891, and 1892. He traveled in Palestine in 1893-94 and 1899, and wrote *Au delà du Jourdain* (1895, 2d ed., 1896), *Souvenirs de Terre-Sainte* (1898), *Autour de la Mer Morte* (1901). In addition he translated Ghazali's *Ad-Dourra el-Fâkhira* (1878) and wrote *Le sacerdoce dans l'Ancien Testament* (1874), *La mission du prophète Eséchiel* (1891), *Vocations de prophètes* (1901, in Ger-

man, 1903), *Introduction à l'Ancien Testament* (1906), *La loi dans l'Ancienne Alliance* (1908), *L'Evangéliste de l'Écrit* (1911).

GAUTIER, MARGUERITE. The name of an idealized courtesan, who is the heroine of *La dame aux camélias*, by the younger Dumas. By a quaint translation of sound rather than sense the name has been changed to "Camille" in the English adaptation.

GAUTIER, THÉOPHILE (1811-72). A noted French poet, critic, and novelist. Born at Tarbes, Aug. 31, 1811, he went as a child to Paris and was educated there. He showed special interest in the Latin of the Decadence and the French of the Renaissance, being attracted less by the normal than by the primitive or the overrefined. He became a painter, then a "flamboyant" Romanticist, joining as a leader in the "Battle of Hernani" (see HUGO), defying conventionality by his flowing hair and far-famed scarlet waistcoat. His poems of this period, *Premières poésies* (1830) and *Albertus* (1832), show a highly developed technique and a minute power of description. Then followed *Les Jeunes-France* (1832), stories of nonchalant irony, mocking alike romantic liberty and classic restraint. Gautier's next book, *Mademoiselle de Maupin* (1835), a curious attempt at self-analysis, was a frank expression of hedonism. Its art is fascinating, but it treats the fundamental postulates of morality with a contempt that closed the Academy to him for life. *Fortunio* (1837) is also frankly pagan. In 1836 Gautier put on the harness of journalistic criticism, embracing art and the drama, and his later works were, perforce, less offensive to the moralists. The best of the short stories printed in 1845, *La morte amoureuse*, bears the date of 1836. The deadening effect of this hack work wore off in the fifties. He produced during this decade the masterful short stories, *Arra Marcella*, *Jettatura*, and *Avatar*, and the curiously antiquarian *Roman de la momie*. But none of these approaches in interest *Le capitaine Fracasse*, which had been announced in 1836 and appeared in 1861 and 1863 (2 vols.), as "a bill drawn in my youth and redeemed in middle life." It is a true classic of romanticism, illustrating a minute knowledge of the epoch of Louis XIII such as Gautier had already been showing in a series of literary studies, *Les grotesques* (1844).

In literary criticism Gautier's most significant works are his *Histoire du romantisme* (1854), his essays on Baudelaire and Lamartine, and his *Rapport sur le progrès de la poésie depuis 1830* (1868). An important event in his life was his change from the staff of *La Presse* (1836-54) to the *Moniteur* (later the official journal of the Second Empire). Until his death he was a critic of authority in Paris and exceptional for the charm of his paragraphs. These articles were assembled in *Histoire de l'art dramatique en France* (6 vols., Paris, 1858-59). In these he inveighed against the classic and the bourgeois drama. Gautier was a great traveler for his time and described his journeys in many books—*Voyage en Espagne* (1843), *Italia* (1852), *Constantinople* (1854), *La Russie* (1866), etc., some of which are still widely read, owing to his graceful, limpid language, and his fondness for discovering artistic effects.

His particular claim to fame, however, lies in his unique gifts as a poet as represented by his masterpiece, *Emaux et camées*—a rather small

collection of poems written between about 1850 and 1865. They are nearly all in geometrical stanzas of four lines and eight feet and are distinguished for their impeccable daintiness, exhibiting Gautier's love of miniature effects and his adoration for the sculptural and for the color white. This volume shows how concretely Gautier, a former leader of the Romantic school, helped to shape the ideals of the Parnassian school, which was to abandon the exaggerated ego of the Romanticists for the more polished and impersonal technique of the Classicists. In this connection it may be said that he was the originator of the art for art's sake theory in France and the prime inspiration of *Beauclaire*. In its pages there is no flesh and blood, life appears merely as plastic form and picturesque hue. The *Poésies* may be thought of perhaps as a French pendant to the little poems of Heine and quite as exquisite in their way. Likely the most famous of them, and certainly as characteristic as any, is the one entitled *Symphonie en blanc majeur*. It celebrates the author's worship of the white, cold divinity of the passionless nude, which forever torments him with its mute, sphinxlike messages of inert beauty.

Gautier was a great genius in his own narrow limits, rather unmindful than void of ideas and sentiments, uniting in his pages the pictorial exotic with the pagan plastic, in accordance with his celebrated saying "I am one for whom the visible world exists." In treating his soulless images he employed with the accuracy of a true artist a vocabulary famed for its rich resources and a style remarkable for its faultlessness. For 40 years he was one of the interesting and conspicuous figures of the Paris literary and art world. A somewhat grotesque personality, he wore by preference the mask of a grave stoic in a sort of relaxed hopeless attitude towards his impecunious destiny. When he spoke, it was to give utterance to some memorable remark or resigned witicism, or to indulge in a droll monologue composed of the sublime and the absurd. He was a cosmopolitan, remarkably open for a Frenchman to foreign influences. He died in Paris, Oct 23, 1872.

Consult the *Works* of Gautier as edited in English by Sumichrast (24 vols, Boston, 1900 et seq.), the monographs by Baudelaire (Paris, 1859), Feydeau (ib, 1874), Bergerat (ib, 1878), Du Camp (ib, 1890), also Sainte-Beuve, *Nouveaux lundis* (ib, 1863-72), Spoelberch de Lovenjoul, Brunetière, *Evolution de la poésie lyrique* (ib, 1894), Faguet, *XIXe siècle* (ib, 1894), Deschamps, *La vie et les livres* (ib, 1900), J G Huneker, *The Pathos of Distance* (New York, 1913), E Henriot, "Théophile Gautier, poète," in *Annales Romantiques* (1912).

GAUTIER DE COSTES, gô'tyá' de kôst. See LA CALPRENÈDE

GAUTING, gou'ting, EREMIT VON. See HALLBERG-BROICH, THEODOR M. H.

GAUTSCH VON FRANKENTHURN, gouch fôn frank'en-tôörn, PAUL, BARON VON (1851-). An Austrian statesman, born and educated in Vienna. In 1874 he entered the Department of Education and in 1885-93 was Minister of Education in the Taaffe cabinet. Minister of Education again under Badeni (1895-97), he succeeded Badeni and was Minister of the Interior and head of the cabinet for three months in 1897-98 and then became Presi-

dent of the Supreme Court of Accounts. On Dec 31, 1904, he succeeded Koerber as Premier, but, on the failure of his scheme for the establishment of universal suffrage, resigned in May, 1906. In 1911, from June 26 to October 31, he was again Premier.

GAUZE (Fr *gaze*, ML *gazzatum*, probably of Eastern origin, cf Pers *gazi*, thin, coarse cotton cloth, less probably from the Syrian city of *Gaza*). A light transparent fabric, originally made of silk. The openness of texture is obtained by crossing the warp threads between the threads of the weft, so that the weft passes through a succession of loops in the warp, and the threads are thus kept apart, without the liability to sliding from their places, which would take place if simple weaving were left so loose and open. Large quantities of medicated and antiseptic cotton gauze are used by surgeons. *Bolting cloth* is a gauze made of unsized silk for separating the products of a flour mill. (See FLOUR.) Fine wire cloth is called *wire gauze*. The term is also applied to light woven fabrics of silk, linen, or cotton, such as are used in the manufacture of summer underwear.

GAVAGE, ga'vazh' (Fr, from *gaver*, to gorge). A method of feeding infants, and sometimes adults, when, by reason of weakness or disinclination, the individual is unable to take food in the ordinary way. It is of great value in rearing premature infants and in those so weak that they are unable to suck or swallow, and among adults in certain types of insanity. The apparatus consists of a soft rubber catheter, connected by a short glass tube, and about 18 inches of rubber tubing, to a glass funnel, which holds from 4 to 6 ounces. The catheter is introduced either through the nostril or the mouth, passed through the œsophagus and into the stomach, and, after waiting a few moments to allow the gas to escape, the food is simply poured into the funnel. When the latter is emptied, the tube is compressed between the fingers and quickly withdrawn.

GAVARNI, ga'var'né' (1804-66). A noted French caricaturist and illustrator of great originality and verve, an historical satirist of inexhaustible inventive power who portrayed types of French character, and in particular the various phases of Parisian life. His real name was Guillaume Sulpice Chevallier, and he was born in Paris, Jan 13, 1804. When a mere boy, he was placed with an architect, then at the age of 13 was apprenticed to a maker of mathematical instruments, and two or three years later studied mechanical drawing at the Conservatoire des Arts et Métiers. This was all the artistic training he ever received. In 1824 he took up etching in the employ of Jean Adam, who sent him to draw and engrave the bridge at Bordeaux, for which he was to receive 1200 francs a year, but, finding the employment uncongenial, he threw it up before the year was out and wandered about for some months, apparently without aim. By a lucky chance he found a benefactor at Tarbes in M Leleu, the superintendent of the cadastre in the Pyrenees, who gave him employment and made him at home in his family, until an offer of regular work took him back to Paris in 1828. Here he taught himself to draw the human form, and gradually acquired the mastery of technique which so preeminently distinguished him. In 1829 he adopted his nom de guerre, derived from

the beautiful valley of Gavarnie in the Pyrenees. In 1830 he made the acquaintance of Emile de Girardin, who invited him to make the designs of costumes for *La Mode*, and it was in its office that he met Balzac, who shortly after asked him to illustrate his *Peau de chagrin*. Other papers also had the aid of his pen and pencil, and theatrical tailors and costumers found in him a valuable assistant, but his greatest success was as a satirist of the dandyism of the day. With the year 1832 the period of uncertainty came to an end, and from that date he could count upon an appreciative and faithful public. Two years later he founded the *Journal des Gens du Monde*, of which he was at once editor and illustrator, and to which he contributed verse and prose, illustrating both with charming drawings. The undertaking proved unprofitable, and after struggling through six months of existence landed its parent in the debtor's prison at Cliehy. While, restored to liberty, he was hesitating as to his future course, he received a liberal offer from the proprietor of the *Charivari*. Modifying the publisher's idea, the artist produced the series of drawings known as *Les fourberies de femmes en matière de sentiment* (The Tricks of Women in Matters of Sentiment), which was soon followed by *La boîte aux lettres* (The Letter Box). Illustrating the Bohemian world in which he lived, series after series flowed from his pencil, all instinct with vivacity and force, and drawn mostly from the shady side of Paris life, like *Les lorettes* (The Ladies of Easy Virtue), *Les coulisses* (Behind the Scenes), *Le carnaval*, *Les étudiants* (The Students), *Les débardeurs*, etc., while later he embodied in other series his studies in superior strata of society, as in the well-known *Les enfants terribles*, and in *La politique des femmes* (Female Politics), *Impressions de ménage* (Household Impressions), *Nuances et sentiments*, and others.

In 1844 he married Jeanne de Bonabry, but the union did not prove happy, and three years later he went to London. He returned in 1852, so deeply impressed by the scenes of degradation and wretchedness he had witnessed that it seemed to color all his future work, and it is said that he never laughed again nor made others laugh. He continued the practice of his art, but his tone was sterner, and his satire became more biting. Some of the series of this last period exhibit his tendency to be a moralist, as may be noticed in *Les partageuses* (The Partners), *Les lorettes vieilles* (Ladies of Easy Virtue Grown Old), and *Les propos de Thomas Virelogue* (The Sayings of Thomas Virelogue). Among his best illustrations for books are those of Eugene Sue's *Wandering Jew*, Hitzel's *Le diable à Paris*, Balzac's *Paris marié*, and *Gulliver's Travels*. Gavarni had great literary ability and was a brilliant water-color painter, fine examples of his work in this medium are in the Louvre and many private collections. He also essayed painting in oils, but without much success. During his last years he inclined more and more towards scientific pursuits and passed most of his time in his garden at Auteuil with his two boys. He died there, Nov. 24, 1866.

The *Catalogue raisonné de l'œuvre de Gavarni*, issued by Mahéruault and Bocher (Paris, 1873), conveys an adequate idea of the extraordinary amount of work performed by this unique prince of the pencil. In the Bibliothèque Nationale, Paris, his drawings fill 15 folio volumes, but

they represent little more than half of his work, which numbers about 8000 drawings, water colors, and lithographs. For his biography, consult Duplessis (Paris, 1876), Goncourt (ib., 1879), and Forgues in *Les artistes célèbres* (ib., 1888), also Mirecourt, *Les contemporains* (ib., 1886), Blanc, *Les artistes de mon temps* (ib., 1876), Beraldi, *Les graveurs du XIX^{ème} siècle* (ib., 1885-92), Curtis, *Masters of Lithography* (New York, 1897), and the biographical notes on Daumier and Gavarni by Frantz and Uzanne, published as a separate volume of the *Studio* (1904).

GAVARNIE, ga'var'ne'. A frontier village in the Department of Hautes-Pyrénées, France, on the Gave-de-Pau, 34 miles south of Tarbes. The village originated in a hospital of Knights Templars, and is famous for the Cirque de Gavarnie, 3 miles to the south, a natural amphitheatre, nearly 9 miles in circumference, surrounded by three ranges of limestone mountains, rising respectively to an altitude of 6900, 8500, and 9000 feet, the intermediate slopes being covered with glaciers. Thirteen cascades fall into the Cirque, the principal one, the Cascade de Gavarnie, fed by the Gave-de-Pau, having a drop of 1385 feet. Pop., 1901, 269, 1911, 298.

GAVAZZI, ga-vat'sé, ALESSANDRO (1809-89). A popular Italian preacher and reformer. He was born at Bologna, became a monk of the Barnabite Order in 1825, and in 1829 professor of rhetoric at Naples. He entered the priesthood and acquired great reputation as an orator and advocate of liberal ideas. In 1840 he was transferred to Rome. He was one of the foremost supporters of the liberal policy that marked the beginning of the pontificate of Pius IX and was prominent in the patriotic movements of the time. When Rome was captured by the French (July, 1849), he escaped to England and lectured in that country and in Scotland. He also visited the United States and Canada, where his reception was not always favorable. In 1850 he renounced Catholicism and became pastor of an Italian church in London. In 1860, having returned to Italy, he accompanied Garibaldi in the campaign of that year. After the battle of Mentana (1867) he devoted himself entirely to the Free church of Italy, which he organized in 1870. He established a theological school of the church at Rome in 1875 and became its professor of dogmatics, apologetics, and polemics. He made his last visit to America in 1881. He died in 1889. He published *Orations* (London, 1851), *Recollections of the Last Four Popes* (ib., 1859), *Records of Two Years' Christian Work in Italy* (ib., 1868). For his life, consult King (ib., 1860), and *Lectures in New York*, with life by Campanella and Nicolini, corrected by himself (New York, 1853).

GAVELKIND, gav'el-kind (Ir *gabhair-cine*, from *gabhair*, tenure + *cine*, family). An ancient form of tenure in England, which antedated the Conquest, and which, in the County of Kent and in some parts of Northumberland and Wales, survived the coming and the disappearance of the feudal system. Its principal characteristic was the fact that the lands so held passed by descent to all of the sons of the tenant equally, instead of going, under the feudal rule of primogeniture, to the eldest son alone. Though Blackstone, probably with reason, ascribes a Celtic origin to this tenure, it seems to be the general opinion of English legal writers that it prevailed over the whole kingdom

in Anglo-Saxon times, and that in Kent and elsewhere it was among the "liberties" which the people were permitted to retain at the Conquest. In Wales gavelkind obtained universally till the time of Henry VIII (34 and 35 Hen VIII, c 26), and in some parts of England it is not yet abolished. In Kent all lands that have not been disgavelled by act of Parliament are held to be gavelkind. In addition to the characteristics of this tenure already noticed, Blackstone mentions the following: 1 The tenant is of age sufficient to alien his estate by feoffment at the age of 15. 2 The estate does not escheat in case of an attainder for felony, their maxim being, "the father to the bough, the son to the plow." 3 In most places the tenant had a power of devising lands by will before the statute authorizing the devise of lands generally was made. See TENURE, and consult Blackstone, *Commentaries* (Chicago, 1899), and the authorities cited under TENURE.

GAVERE, ga'vr'. A small town in the Province of East Flanders, Belgium, near Ghent. Pop., 1900, 1893, 1910, 1942. In 1453 it was the scene of a crushing defeat of the citizens of Ghent by Philip the Good, Duke of Burgundy.

GAVERNITZ, G VON SCHULZE. See SCHULZE-GAVERNITZ.

GAVESTON, PIERS, EARL OF CORNWALL (?-1312). The favorite of Edward II, King of England. His father was a Gascon knight attached to the royal household of Edward I. Here, from an early age, Piers was a companion of the heir apparent, who, on his accession to the crown, created him Earl of Cornwall. He was witty and clever, but unscrupulous in the pursuit of his ambitious designs. Presuming on the King's regard for him, his attitude towards the English barons was of such a nature as to excite their enmity. His nomination as Regent of the kingdom during the royal absence in France in the early months of 1308, and the honors conferred upon him at the coronation in the same year, aroused the open hostility of the barons, in compliance with whose demands the King was forced to send Gaveston out of the kingdom, making him, however, Lord Lieutenant of Ireland. In July, 1309, he was recalled and, firm in the King's favor, grew more insolent than ever. This led Parliament to insist upon his banishment in October, 1311. In less than two months, however, he returned and was reinstated in royal favor, whereupon the barons rose in arms, besieged Gaveston in Scarborough Castle, captured him, and beheaded him on Blacklow Hill, near Warwick, on June 10, 1312. In Marlowe's *Tragedy of Edward II* Gaveston plays a prominent part. Consult Stubbs, *Constitutional History*, vol. II (Oxford, 1896), and Dodge, *Piers Gaveston* (London, 1899).

GA'VIAL, or **GHARIAL** (from Hind *ghariyāl*, fish eater). A fish-eating crocodile of northern India (*Gavialis gangeticus*), differing from true crocodiles and from alligators in the great length and slenderness of the muzzle, and the cartilaginous swelling at its extremity (in old males) around the orifice of the nostrils by which it may be largely inflated. The teeth are very numerous, about 120; the longest of the lower jaw are received into notches in the upper, as in the true crocodiles. The head is broad, the narrow muzzle begins abruptly, and in it the branches of the bone of the lower jaw are united and prolonged as one. There are two

great perforations in the bones of the skull behind the eyes, externally marked by depressions. The plates which cover the back and the nape of the neck are united. The crest of the tail is much elevated, the feet are webbed to the extremity of the toes. Its habits are as aquatic as those of the crocodile of the Nile. It attains a great size, but, owing to the slenderness of its muzzle, is esteemed less dangerous than a true crocodile of smaller size. The genus dates from the Upper Chalk period. See CROCODILE.

GAVINIÉS, ga've'nyä', PIERRE (1726-1800). A French violinist and composer. He was born at Bordeaux and was practically a self-taught musician. When only 15, he made his début at a "concert spirituel," an enterprise which he in part projected. His success was immediate, Viotti, hearing him play, remarked that he was *le Tartini de la France*. From 1795 until his death he was professor of the violin at the Paris Conservatory. His style is said to have been formed upon that of the old Italian masters and was remarkable for its expressive and sympathetic qualities. He was of greatest importance in the development of violin technique in France, where he is considered the founder of the modern school of violin playing. His compositions for the violin are for the most part very difficult and comprise *Les vingt-quatre matinales*, six violin concertos, and nine violin sonatas. He also composed a three-act comic opera, *Le prétendu* (1760), which met with considerable success. He died at Paris.

GAV'IO'TA (Neo-Lat., from Lat *gavia*, sort of bird, probably a sea mew). A species of gull (*Larus cirrocephalus*), very familiar about the harbor of Buenos Aires and neighboring parts of South America. Consult *Proceedings of the Zoological Society of London* (London, 1871).

GA'VOTTE, ga-vôt'. A French dance, whose name is derived from the *Gavots*, a people inhabiting the Pays-de-Gap, in Dauphiné. Originally a peasant dance, it was introduced at court in the sixteenth century and was largely remodeled in the seventeenth and eighteenth centuries. Its distinctive feature consisted of the performers raising their feet clear of the ground, instead of shuffling along, as was usual in dances of this character. Kissing and merry-making played a great part in the old gavotte, but subsequently it became almost as stiff and formal as the minuet. As a theatrical dance, the gavotte was effective and popular, Gluck and Grétry in particular having written famous ones. The music is in alla-breve time; in two parts—the first of four, the second of eight bars—and each part is repeated. As each phrase begins with an up beat, the fundamental rhythm of the gavotte is

by which the second bar has a remarkable *cæsura*. Some of Bach's suites contain excellent examples of the gavotte. It generally commences on the third beat of the bar, though this rule is not without its exceptions. See SUITE.

GA'VRE, PRINCE OF. See EGMONT, LAMORAL. **GA'VROCHE**, ga'vrösh'. A street urchin in Victor Hugo's *Les Misérables*.

GAWAIN, ga'wän, SIR. One of the knights of the Round Table. He is the nephew of King Arthur (qv) and his ally in the war

with Launcelot. He tries in vain to pull the magic sword from the magic stone, fails in the quest of the Holy Grail (qv), and dies from wounds received in a fight with Launcelot. Consult *Sir Gawain and the Green Knight* (New York, 1910), retold in modern prose, with introduction and notes, by J. L. Weston, *Gawayne and the Green Knight* (New Haven, 1913), ed. by C. M. Lewis, Malory, *Morte d'Arthur*, Tennyson, *Idylls of the King*. The name is also given to a knight in *Amadis of Gaul*.

GAY, GÄ, CLAUDE (1800-73). A French traveler and naturalist, born at Draguignan, France. He pursued scientific studies primarily in Paris and, after a few months' travel in Greece and Asia Minor, sailed, in 1828, to Chile with the intention of making an extensive study of the flora of the South American continent. With the exception of a short period in 1832-33, which he spent in Paris supervising the construction of some scientific instruments of his own invention, Gay remained in South America until 1843, making extensive researches in Chile and parts of Peru and collecting a great mass of material, not only in regard to the flora of the country, but its physical characteristics and political history as well. In 1843 he returned to Paris, where, by means of financial aid furnished by the Chilean government, he was enabled to publish (in Spanish) his monumental *Historia física y política de Chile* (24 vols., 1843-51, with an atlas in 2 vols.). Gay spent 1856-58 in travel in Russia and the Orient and in 1858 was commissioned by the Academy of Sciences, of which he had been elected a member, to study mining in the United States, the results of his investigations being incorporated in an interesting work entitled *Rapport à l'Académie des Sciences sur les mines des États-Unis* (1861). Among his other publications were *Consideraciones sobre las minas de mercurio de Andacolla é Illapel con su posición geológica* (1837), *Origine de la pomme de terre* (1851), *Triple variation de l'anguille aimantée dans les parties ouest de l'Amérique* (1854), *Carte générale du Chile* (1855).

GAY, DELPHINE, MADAME DE GIRARDIN (1804-55). A French novelist and miscellaneous writer, nicknamed the *Muse de la Patrie*. She was born at Aix-la-Chapelle, the daughter of Sophie Gay (qv), and in 1831 became the wife of Emile de Girardin (qv). Her great beauty and charming wit made her salon the most brilliant of her period. While she collaborated with such great authors as Sandeau and Théophile Gautier and contributed rather cleverly to the *Lettres parisiennes* (1836-48) under the pseudonym of De Launay, she can hardly be ranked as a great literary light. Of her numerous but ephemeral productions a comedy, *La joie fait peur*, and a novel, *Le lorgnon* (1831), are sufficiently typical. Consult Imbert de Saint-Amand, *Madame de Girardin* (Paris, 1875, 1888), F. de Baudiss, *Chow de lettres parisiennes* (London, 1906), L. Séche, *Les Muses romantiques* (Paris, 1910), Jean Balde, *Mme de Girardin* (ib, 1913).

GAY, EDWARD (1837-) An American landscape painter. He was born in Dublin, Ireland, but came to America in 1848 and studied at Albany, N. Y., and in Karlsruhe, Germany, under Schirmer and Lessing. His landscape "Broad Acres" received a prize of \$2000 from the American Art Association and was given by

it to the Metropolitan Museum of Art in 1887. His mural painting "Taormina" is in the Mount Vernon (N. Y.) Public Library. Among other noteworthy paintings are "Washed by the Sea" (Layton Museum, Milwaukee), "Waving Grain" (Minneapolis Gallery), "The Hill Side" (National Gallery, Washington), "The Month of May" (Chicago Art Institute), "Pines of South Carolina" (1904), "The House on the Moor" (1912), "Low Tide" (1913). Gay received the Shaw prize in 1903, the Inness gold medal in 1905, and was elected a member of the National Academy of Design in 1907. With a simple and unaffected art he paints by preference the large sunny aspects of nature, distinguished for fine atmospheric effects.

GAY, JOHN (1685-1732). An English poet and dramatist, born in 1685 at Barnstable, Devonshire, of an ancient but impoverished family. After attending the free grammar school he was apprenticed to a London mercer, but, dissatisfied with the occupation, he soon abandoned it. In 1712 he was appointed secretary to the Duchess of Monmouth. He had already written "Wine" (1708), a poem in blank verse, and a pamphlet entitled *The Present State of Wit* (1711), which gives an account of the current periodical literature. In 1713 he published a poem descriptive of country life, called "Rural Sports." It was dedicated to Pope, whose acquaintance Gay had made two years before. Now under Pope's influence, he produced *The Fan* (1714) and *The Shepherd's Week* (1714), a series of pastorals aimed against Ambrose Philips. Appointed secretary to Lord Clarendon, Envoy to Hanover, he was abroad in the summer of 1714. Returning to England in September, he addressed an epistle to the newly arrived Princess of Wales (October). His next production was a farce in ridicule of popular tragedies, entitled *What-d'-ye-Call-It* (1715). It contains the famous song, "'Twas when the seas were roaring." Next came *Trivia* (1716), descriptive of outdoor life in London. This was followed by an unsuccessful comedy, *Three Hours after Marriage* (1717). Three years later he published a collection of his poems with additions, by which he cleared £1000. Here first appeared his finest ballad, "Sweet William's Farewell to Black-Ey'd Susan." His poems appeared in 1720, and in the same year, entering into the South Sea speculations, he lost everything and became dependent on his friends, the kindest of whom were the Duke and Duchess of Queensberry. In 1724 he produced for Drury Lane Theatre the tragedy of *The Captives*, which met with some success. Three years later came the popular verse tales entitled *Fables*, the best of their kind in English. Gay was yet to gain his great fame. His Newgate pastoral, *The Beggar's Opera*, was first performed at Lincoln's Inn Fields, Jan. 29, 1728. It ran for 63 days, was revived the next season, and performed in all the great English towns. Gay wrote a sequel entitled *Polly*, which was prohibited, but it succeeded remarkably in book form. A fully illustrated edition of *The Beggar's Opera*, containing also *Polly Peachum*, appeared in New York, 1913. Gay died Dec. 4, 1732. A second series of *Fables* appeared posthumously (1738). The *Fables*, with memoir, were edited by Dobson (London, 1882), and the *Poetical Works* by Underhill (ib, 1893). Consult Johnson, *Lives of the Poets* (ib, 1854), and Thackeray, *English Humorists* (ib, 1853).

GAY, MARIA (c 1880—) A Spanish dramatic mezzo-soprano, born at Barcelona. Originally she studied sculpture, which art she pursued eagerly until her sixteenth year. Then she began to study the piano and soon showed that she possessed remarkable talent. When Pugno (qv) on one of his tours through Spain heard her sing, he was so struck with the natural beauty and power of her voice, which at that time had not yet been cultivated, that he immediately engaged her for some of his own concerts. At Brussels the director of the Opera heard her in a concert with Ysaye and asked her to study the rôle of Carmen. Incredible as it may sound, five days later she not only made her début in that difficult rôle at the famous De la Monnaie (1902), but also through the sheer force of her natural gifts scored a veritable triumph. This very success convinced her of the necessity of serious study, and she at once went to Paris, where she worked indefatigably for one year with Madame Adiny. In 1903 she reappeared as a finished artist and began her triumphant tours of Europe and South America. During the season of 1908-09 she sang at the Metropolitan Opera House in New York.

GAY, gâ, SOPHIE NICHOLT DE LAVELETTE (1776-1852). A French novelist, born in Paris, July 1, 1776. Her novel *Laure d'Estel* (1802) has a sort of biographical interest, for it was written to indicate how much the author liked Madame de Stael and disliked Madame de Genlis. Although a prolific writer, she is better known as the mother of the famous Delphine Gay and for her literary salon, most celebrated during the reign of Louis Philippe.

GAY, SYDNEY HOWARD (1814-88). An American journalist and historian. He was born in Hingham, Mass., studied for a time at Harvard, then traveled, worked in a counting house in Boston, and afterward studied law, but became an Abolitionist, and was precluded from practicing by his refusal to take the oath to support the Constitution. He became a lecturing agent for the American Anti-Slavery Society in 1842, and the editor of the *National Anti-Slavery Standard*, the official organ of the society, in 1844. He accepted a position as an editorial writer on the *New York Tribune* in 1857 and from 1862 to 1866 was its managing editor. Subsequently he was managing editor of the *Chicago Tribune* from 1868 to 1871 and an editorial writer on the *New York Evening Post* from 1872 to 1874. Though nominally only a collaborator, he actually wrote nearly the whole of Bryant and Gay's *Popular History of the United States* (1876-80), a work whose comprehensiveness, clearness, and accuracy soon gave it a high rank among compendiums of American history. He also wrote a *Life of Madison* (1884) for the "American Statesmen's Series", the chapter on Amerigo Vespucci in Winsor, *Narrative and Critical History of America* (1886-89), and many articles on historical subjects for the magazines.

GAY, WALTER (1856—) An American interior painter. He was born at Hingham, Mass., and went in 1876 to Paris, where he studied under Bonnat. He first became known for his clever and frankly truthful genre pictures, such as the celebrated "Bénédicté" "The Blessing" (1888), now in the Amiens Gallery, "The Cigarette Makers," in the Luxembourg (Paris), and "The Spinners," in the Metropoli-

tan Museum, New York—all of which are characterized by skillful handling of light and harmony of tone. In his later work he devoted himself to rich interiors without figures, painted with great delicacy, charm, and precision, but never cold or overfinished. Good examples are "Gold and White," "The Medallions," and "Interior," in the Luxembourg, "Interior of the Palazzo Barbaro" (Boston Museum), "Interior of the Petit Trianon" (School of Design, Providence), and "Green Salon" (Metropolitan Museum, New York). He is also represented in the museums of Pittsburgh, Chicago, Philadelphia, Brussels, Munich, and in the Tate Gallery, London. He made Paris his residence, exhibited constantly at the Salon after 1879, and sold more pictures in France than any other stranger. He became a chevalier of the Legion of Honor in 1894, and officer in 1906, and received gold medals at Vienna (1894), Berlin (1896), Munich (1897), and Paris.

GAY, WINCKWORTH ALLAN (1821-1910). An American landscape painter, born at West Hingham, Mass. He studied under Robert Weir at West Point and Troyon in Paris, and traveled extensively in Europe and the Orient. He was one of the first to break away from the dry, thin manner of the early American landscape school, and his paintings, which are simple and sincere, have not been properly appreciated outside of Boston, where his art life in America centred, and where most of his work is preserved. He painted American, French, Dutch, Italian, Egyptian, and Japanese scenes, among the best being "Mackerel Fleet off Beverly Coast," "Harbor Day at Cape Ann," "Windmills of Delfthaven, Holland," "Forest Sanctuary," "Nimich on the Nile," "Scene in the White Mountains" (Boston Athenæum), "Scene in Japan" (Somerset Club, Boston).

GAYA, gî'a, or GYA. The capital of the district of Gaya, in the Presidency of Bengal British India, on the Phalgu, an affluent of the Ganges, 57 miles south of Patna by rail (Map India, E 4). A place of great sanctity, it is annually visited by thousands of pilgrims. It consists of the old town, Gaya proper, and Sahibganj, the modern European and trading quarter. Of its many shrines and temples the most important is the temple of Vishnu, crowned by an octagonal pyramid over 100 feet high. Its public institutions include a well-attended high school and a hospital with a branch for women. Pop, 1901, 71,288, 1911, 49,921. The manufactures of the town, largely carried on by prison labor, include oil, metal work, woven ware, bamboo baskets, cotton rope, mats, and jute twine. Buddha Gaya, 7 miles to the south, the ancient dwelling place of Gautama Buddha, is the seat of a famous temple, which dates from 543 B.C. and has a pipal tree, the descendant of the one under which the saint attained Nirvana. Population of district, 2,225,000.

GAYAL, gâ'al, Hind ga-yal' (probably from Skt *gaya*, household), or **MITHAN**. A species of native cattle (*Bos frontalis*), closely related to the gaur, which has long been more or less domesticated among the hill tribes of northeastern India, and thence eastward through Assam to the Chinese borders, where it is known as *mithan*. It was formerly considered a race of the gaur (qv), but is now known to be a distinct species, which Blanford asserts to exist wild in Tenasserim. It resembles the gaur, but is of less size, has proportionately shorter limbs,

less of a ridge on the back, and the horns shorter and less compressed at the base. The head is very broad and flat at the upper part, suddenly contracted towards the nose, with a very wide space between the horns. The prevailing color is brown, generally dark, but in some of the herds particolored and white ones are frequently seen. The Keskis, of Tipperah, and other eastern hill tribes keep herds of gayals, which they permit to roam at large during the day in the forests, but which return home at night of their own accord. Their milk is extremely rich, but not abundant, the natives, however, do not use the milk, but rear these cattle entirely for their flesh and skins. They are never used in agricultural labor nor as beasts of burden and, though occasionally interbred with captive gaurs, have given rise to no domestic race. Beyond the fact that it is, like the gau, an inhabitant of the forests, and is surprisingly agile among rocky hills, nothing is known of the habits of the gayal in a wild state. See Plate of CATTLE, WILD.

GAYANGOS Y ARCE, ga-an'gós e ar'tha, PASCUAL DE (1809-97). A Spanish historian. He studied at Madrid and later in France, held office under the Spanish government (1833-36), then lived for a time in London, where he translated into English Al Makkari's *History of the Mohammedan Dynasties* (1840-43). He became professor of Arabic at the University of Madrid and in 1881 Director of Public Instruction. Resigning soon afterward, he spent much of his time in London. The historian Prescott, in his preface to *Ferdinand and Isabella*, acknowledges the valuable services of Señor de Gayangos, and he repeats these acknowledgments in his *Philip II*. He refers particularly to the remarkable facility of Gayangos "in deciphering the mysterious handwriting of the sixteenth century," with which "he combined such a thorough acquaintance with the history of his country as enabled him to detect, amid the ocean of manuscripts which he inspected, such portions as were essential to my purpose." His works, as editor, include a Spanish edition of Ticknor, *History of Spanish Literature* (1851-56), *Cartas y Relaciones de Hernán Cortés al Emperador Carlos V* (1866), *Fifth Letter of Hernán Cortés* (1868), *Calendar of Letters, Despatches, and State Papers. England and Spain, 1525-1529*, vol. III (1873-77), two volumes in the *Biblioteca de Autores Españoles*—vol. XI, *Libros de Caballerías* (1874), and vol. II, *Escritores en prosa anteriores al siglo XV* (1884). His best original work is his *Discurso preliminar* to the edition of the *Libros de Caballerías*. He also prepared a *Catalogue of Manuscripts in the Spanish Language in the British Museum* (1875).

GAYARRÉ, gā-ar-rā', CHARLES ETIENNE ARTHUR (1805-95). An American historian. He was born at New Orleans, La., Jan. 9, 1805, was educated in the College of New Orleans, studied law in Philadelphia, and was admitted to the bar in 1829. Returning to New Orleans, he was soon made a member of the Legislature, Deputy Attorney-General of the State, and presiding judge of the New Orleans City Court. In 1835 he was chosen United States Senator, but on account of ill health did not serve and spent the next eight years in Europe. After his return he was twice again elected to the Legislature and was for seven years (1846-53) Secretary of State for Louisiana, doing much for

the State library and for local historical studies. He was in favor of secession and advocated the emancipation and arming of the slaves. But although a prominent figure of the public life of Louisiana, his main bent was literary, and in the course of his long life he published many volumes, including some romances and dramas. He is best known, however, as the historian of his State. He died in New Orleans, Feb. 11, 1895. Among his books we may cite *Histoire de la Louisiane* (1847), *Romance of the History of Louisiana* (1848), *Louisiana Its Colonial History and Romance* (1848-52), *Louisiana, Its History as a French Colony* (1851), *History of the Spanish Domination in Louisiana* (1854), *Philip II of Spain* (1866). The complete *History of Louisiana* appeared, in 1866, in four volumes. His romance *Fernando de Lemos* gives an interesting picture of old New Orleans.

GAYER, gī'er, JOHANN KARL (1822-1907). A German forester, born at Speier. In 1855 he was appointed professor of forestry at Aschaffenburg, whence he was in 1878 called in the same capacity to the University of Munich. In his work entitled *Der Waldbau* (2 vols., 1878-80, 3d ed., 1889, 4th ed., 1898), he introduced a new method of instruction in forestry, based upon a stricter adherence to natural laws. His manual of forestry, entitled *Die Forstbenutzung* (1863, 10th ed., 1909), is the authority on that subject in Germany. Other works by the same author are *Wald im Wechsel der Zeiten* (1889) and *Der Femelschlagbetrieb in Bayern* (1895).

GAY HEAD. See MARTHA'S VINEYARD.

GAYLEY, CHARLES MILLS (1858-). An American author. He was born at Shanghai, China, where his parents were missionaries, and was educated in England, at the University of Michigan (1878), and at Giessen and Halle, Germany. At the University of Michigan he taught Latin from 1880 to 1887 and English in 1887-89 and then became professor of English in the University of California. His publications, the more important of which deal with the history and criticism of the English drama, include *Classic Myths in English Literature* (1893), *A Guide to the Literature of Aesthetics*, with F. N. Scott (1890), *Methods and Materials of Literary Criticism*, with F. N. Scott (1899), *Representative English Comedies* (5 vols., vol. I, 1903, vol. II, 1913), a valuable collection of texts and notes by various scholars, *The Star of Bethlehem* (1904), *Songs of California* (ed.) (1905), *Plays of our Forefathers* (1907), *Idols of Education* (1910), *English Poetry Its Principles and Progress*, with C. C. Young (1911), *Baumont the Dramatist* (1914).

GAYLEY, JAMES (1855-1920). An American inventor and corporation official, born at Lock Haven, Pa. He graduated as a mining engineer from Lafayette College in 1876. Between 1877 and 1885 he was chemist successively of the Crane Iron Works at Catasauqua, Pa., the Missouri Furnace Company at St. Louis, Mo., and the E. & G. Brooke Iron Company at Birdsboro, Pa. He then served as superintendent of the blast furnaces, and later as manager, of the Edgar Thompson Steel Works, and finally as managing director of the Carnegie Steel Company. From 1901 to 1909 he was first vice president of the United States Steel Corporation, and as such had full charge of the shipping and transportation. Gayley in-

vented a bronze cooling plate for the walls of blast furnaces, and an auxiliary casting stand for Bessemer steel plants, and he was the first to use the compound condensing blowing engines with the blast furnace. For inventing the dry-air blast (see IRON AND STEEL), he received the Elliott Cresson medal of the Franklin Institute of Philadelphia. In 1904-05 he was president of the American Institute of Mining Engineers and from 1905 to 1911 president of the board of directors.

GAY-LUSSAC, gā'lu'sāk', JOSEPH LOUIS (1778-1850). One of the most distinguished chemists and physicists of the nineteenth century. He was born at Saint-Leonard le Noblat (Haute-Vienne). In 1794 he was sent to Paris and was admitted to the Ecole Polytechnique in 1797. After three years' study Berthollet, who was then professor of chemistry in the Ecole Polytechnique, selected him as his assistant at Arcueil, where the government chemical works were situated. In 1801 the young chemist published his first memoir, which treated of the dilatation of gases with rising temperature, and which was speedily followed by others, on the improvement of thermometers and barometers, on vapor pressures and the determination of vapor densities, and on capillary action. In association with Biot, he was commissioned by the Institute of France to employ a balloon for observations, with the view to ascertaining whether magnetic force existed at considerable heights above the surface of the earth or only on the surface, as had been asserted by some physicists, and made two important ascents. Alexander von Humboldt investigated with him the properties of air brought down from a height of more than 23,000 feet, and their joint memoir to the Academy of Sciences (read on Oct. 1, 1804) contained the first announcement of the fact that oxygen and hydrogen unite to form water in the simple proportion of one volume of the former to two volumes of the latter. The simplicity of the ratio in which these gases stood to each other in their combining proportions induced Gay-Lussac to study the combining volumes of other gases and thus led him to the important discovery of the law of volumes, which was announced in 1808 and is one of the most general and important laws in the whole domain of chemistry. In 1809 he was made professor of chemistry at the Ecole Polytechnique. Davy's discoveries of potassium and sodium, by the decomposing action of the electric current, having excited much attention in France, Napoleon directed Gay-Lussac and Thénard to pursue this class of researches. The results of their investigations appeared in two volumes, under the title *Recherches physico-chimiques*, in 1811. Among the most important of the discoveries announced in these volumes were a new chemical process which yielded potassium much more abundantly than the electrolytic method, the isolation of boron, and new and improved methods of analyzing organic compounds. Gay-Lussac was also the first to obtain hydriodic and iodic acids and cyanogen. He, further, investigated the manufacture of hydrated sulphuric acid, bleaching chlorides, alcohols, and alkalies employed in commerce. In 1805 he was chosen a member of the Committee of Arts and Manufactures, established by the Minister of Commerce. In 1818 he was appointed to superintend the government manufactory of gunpowder and saltpetre, and in 1829

he received the lucrative office of chief assayer to the mint, where he introduced several important improvements. In 1831 he became a member of the Chamber of Deputies, in 1832 professor of chemistry at the Jardin des Plantes, and in 1839 he was made a peer of France. He never took an active part in politics and was diligently engaged in scientific research until his last illness. From 1816 he was coeditor of the *Annales de chimie et de physique*, in which many of his original memoirs were published. He also wrote *Cours de physique* (1827), *Leçons de chimie* (2 vols., 1828), and other works. Consult *American Journal of Science* (New Haven, 1850), and Biot and Gaideur le Brun, *Notices biographiques sur Gay-Lussac* (Châlons, 1850). See CHEMISTRY, AVOGADRO'S RULE.

GAY-LUSSACIA. A genus of shrubs of the family Ericaceæ (q v), named after the French chemist J. L. Gay-Lussac. The species, of which about 40 are natives of North and South America, bear alternate serrate or entire leaves, racemes of red, white, or reddish-green flowers, and black or blue, generally edible fruits. Some species are deciduous, some evergreen. The former, though hardy, are not markedly ornamental, the latter are nearly all attractive in both foliage and flower, but little cultivated in cold countries, on account of their tenderness. Like their close relatives, the species of *Vaccinium*, they thrive in peaty or sandy soils and in partial shade. In northeastern United States four species occur, three of which are called huckleberries.

GAYN'HAM, or **GARN'HAM**, DR. One of the most lax of the degraded clergymen who, while confined as prisoners in the Fleet, performed secret marriages in the eighteenth century. He claimed in court to have lent himself to 2000 such marriages.

GAY'NOR, WILLIAM JAY (1851-1913). An American jurist and public official. He was born at Whitestown, Oneida Co., N. Y., was educated at the Assumption and Whitestown academics, and studied theology for three years at the Christian Brothers College, St. Louis, Mo. After spending some time in travel and in teaching school at Boston he moved to Brooklyn in 1873 to study law, meanwhile supporting himself as a newspaper reporter. Admitted to the bar in 1875, he moved to Flatbush, then a suburb of Brooklyn, and there fought the corrupt politicians, effected the election of a reform ticket, and was himself for a time police commissioner of that village. Moving to Brooklyn proper in 1885, he carried on the same reform work, successfully opposed the attempt of Hugh McLaughlin to sell to the city for \$1,500,000, a property that he had bought for \$185,000, and compelled the Elevated Railroad of Brooklyn to pay more than \$1,000,000 in back taxes. For frauds committed when he was elected judge of the Supreme Court of New York for the term 1893-1907, Gaynor obtained the conviction of John Y. McKane and 16 of his henchmen, he was reelected judge in 1907. In 1894 he had declined the nomination for Governor of New York and in 1896 for mayor of Brooklyn, and he was an unsuccessful candidate for the Democratic nomination for mayor of New York City in 1903 and for the same party's nomination for Governor in 1904. With the support of Tammany Hall he was elected mayor of New York City in 1909 by a large plurality, although the rest of the Democratic

ticket was badly defeated. He quickly put the city administration on an efficient business basis and thereby incurred the bitter hostility of the Tammany politicians. On Aug. 9, 1910, he was shot as he was boarding an ocean liner, and, though he resumed the duties of office, he never fully recovered from the effects of the wound. In 1913 he was a candidate for reelection on an independent ticket, but died before election day, while on a sea voyage. He acquired considerable renown through his unusual letters, which frequently were reported by newspapers. *Some of Mayor Gaynor's Letters and Speeches* appeared in New York (1913).

GAY SABER, gā sa'bār. A small association, or committee, originally known as "the very gay company of the seven troubadours of Toulouse," which met first in 1324 at Toulouse. Its object was the restoration of the Provençal language and customs, and the rules which it adopted are still in force in the annual floral games held at Toulouse on May 1.

GAZA, ga'za. A city in Syria, the modern Ghazze, 3 miles from the Mediterranean coast and about 50 miles southwest of Jerusalem. It was once the most important member of the Philistine Pentapolis and a flourishing centre of Hellenistic culture and is still an emporium of trade and a place of considerable size, with a population of about 35,000. Gaza is mentioned as Gazatu in a list of places in Palestine captured by Thothmes III (1501-1447 B.C.). It is referred to in the Amarna correspondence under the form Khazati. In the time of Rameses II it was still an Egyptian possession. But the Philisti, or Philistines, seem to have secured the city when they were repelled in their attack upon Egypt in the reign of Rameses III. Probably the city was not captured by the tribe of Judah at the time of the Hebrew invasion, as stated in Judg. 1:18, since the editorial gloss contradicts the context. In the narrative of Samson (q.v.), Gaza figures prominently, and he is said to have carried away the gates of this city (Judg. xvi:3). The Assyrian inscriptions do not mention the city until the reign of Tiglath-pileser IV (745-728 B.C.), when "Chanun, King of Gaza," resisted his attacks, was defeated, and fled to Miluhha in 734 B.C. In 720 B.C. this King again offered resistance, aided by Sibe, King of Muzri. Sargon defeated him at Raphia and carried him and 9000 of his people away into captivity. Gaza seems to have taken no part in the rebellion of Ashdod in 713-711 B.C., or in that of Hezekiah of Judah in 701 B.C., and its King Sil Bel was therefore presented with a part of Hezekiah's territory. Sil Bel is mentioned as a faithful vassal of Asurbanipal (668-625 B.C.), and even in the time of Nabunaid of Babylonia (556-539 B.C.) the vassals of Gaza are mentioned. During the Achæmenian period the city must have been of great importance. Herodotus (ii, 159), who calls it Kadytis, says that it seemed to him not inferior to Sardis. In 332 B.C. it was taken by Alexander only after a siege of two months, the Persian General Bates, with the aid of Arabian mercenaries, offering a stout resistance. Gaza was destroyed in 96 B.C. by Alexander Jannæus, the Nabatæan King Aretas failing to send aid. The ruined city is referred to in Acts viii:26 and also in a Greek geographer as ἐρήμος, erēmos, 'desert'. The port grew up into a new Gaza, later called Majuma Gaze, or Constantia. Under the Roman administration Gaza was rebuilt

and attained to a significance that it had scarcely possessed before. Hellenic culture made it a rival of Antioch, Alexandria, and Athens. In its temples Greek gods were worshiped, Greek art flourished among its wealthy citizens, from its schools went forth famous rhetoricians, philosophers, and poets. Representatives of Neoplatonism, such as Proclus, Olympianus, and Isidor, taught in Gaza in the fifth and sixth centuries, the last of them even after the closing of the school of Athens in 529. Christianity also found here philosophically educated defenders, such as Procopius, Choricus, and Johannes. But both the native faith, the worship of the god Marna (our lord), and the Greek cults continued in Gaza longer than in any other great Syrian city. Omai captured the city in 634. The Crusaders found it in ruins. In 1149 Baldwin II built a citadel, which he left to the Templars to defend. Saladin plundered the city in 1170, but could not take the citadel until 1187. Napoleon took it in 1799. Consult Clermont-Ganneau, *Archæological Researches in Palestine* (London, 1896); Stark, *Gaza und die philistäische Küste* (Jena, 1852); Smith, *Historical Geography of the Holy Land* (London, 1895); Gatt, in *Zeitschrift des deutschen Palästina Vereins*, vol. 1 (1888); Martin A. Meyer, *A History of Gaza* (New York, 1907); Schurer, *Geschichte des jüdischen Volkes* (4th ed., Leipzig, 1907).

GAZA, THEODORUS (c.1398-c.1475). A famous teacher of the Greek language and literature in the West, the successor of Emmanuel Chrysoloras. He was born in Thessalonica and came to Italy between the years 1435 and 1440, apparently from Constantinople. The Latin language he learned under Vittorino da Feltre at Mantua, he studied it so assiduously that in three years he was a master of the tongue. Soon after 1441 he was appointed professor of Greek in the newly established school at Ferrara. About 1450 Pope Nicholas V invited him, along with other learned Greeks, to Rome, where he was appointed to the chair of philosophy. At this time he made a Latin translation of Aristotle's *Problemata* in mechanics and of his *History of Animals*. Later he made translations of many other Greek works. After the death of Pope Nicholas, King Alfonso gave him an invitation to remove to Naples in 1455, but the death of this monarch in 1458 necessitated his return to Rome, where he found a patron in Cardinal Bessarion, who obtained for him a small benefice in southern Italy, in Calabria. But the learned Greek longed for Rome, to which he returned for a time under the Popes Paul II and Sixtus IV. He died in Calabria about 1475. Gaza has been warmly praised by subsequent scholars, such as Politian, Erasmus, Scaliger, and Melancthon. His principal writings are his *Introductio Grammatica, Libri IV* (a work on the elements of Greek grammar, first published by Aldus Manutius at Venice, 1495 A.D., and long held in high repute), a number of epistles to different persons on various literary subjects, and a variety of important translations into Latin—portions of Aristotle, Ælian, Theophrastus, St. Chrysostom, Hippocrates, and other Greek writers. Consult Hodijs, *De Græcis Illustribus* (London, 1742); Voigt, *Wiederbelebung des klassischen Altertums*, vol. 1 (Berlin, 1893); Gercke, *Theodoros Gazæ* (Griefswald, 1903); Sandys, *A History of Classical Scholarship*, vol. 11 (Cambridge, 1908).

GAZELLES AND SMALL ANTELOPES

1. KLIPSPRINGER (*Oreotragus saltator*).
2. NAKONG (*Tragelaphus spekei*).
3. COMMON or DORCAS GAZELLE (*Gazella dorcas*).
4. SPRINGBOK (*Antidorcas euchores*).

5. GUIB (*Tragelaphus scriptus*).
6. ISABELLE ANTELOPE (*Gazella isabella*).
7. CHOUSINGA (*Tetracerus quadricornis*).
8. BLACKBUCK (*Antelope cervicapra*).

GAZALAND, ga'za-länd A district in southwestern Portuguese East Africa. It marches with the Transvaal on the west and is traversed by the Limpopo River. Gazaland is fertile and well watered. Here are recruited many negroes for the Transvaal mines. Portugal first got a foothold here in 1830. Three years later all her trading posts were captured by the natives. In 1860, for aid against a rival, Portugal received the territory south of the Manhiça River from Umzila. Upon his death (1884) she got the territory north of that river as far as the present boundary. Upon the attempt to open up the hinterland a two-year border warfare broke out with the British South Africa Company (1890-91), which resulted in more firmly establishing Portugal's claims. Upon the death of Gungunyanu, in 1906, all serious native opposition ceased, and to-day (1914) great strides are being made in the development of the interior and exportation from the seaport towns. Consult R. C. Maugham, *Portuguese East Africa* (London, 1906).

GAZE (ME *gasen*, from dialectic Swed *gasa*, to stare). A term in heraldry (qv), descriptive of a hart or stag represented *affrontée*, or looking full faced from the field. Such an animal is said to be at gaze.

GAZELLE, ga-zél' (OF *gazel*, gazelle, Sp. *gazela*, from Ar *ghazal*, gazelle, from *ghazila*, to be affectionate). A name applied to various small, slender, and graceful antelopes, with large, liquid eyes and short horns. About 20 species are known in southwestern Asia and northern Africa. They are distinguished from each other by the length of the ringed and usually lyrate horns and by color, but the differences are often hard to define, and some zoologists regard as mere varieties what others hold to be perfectly distinct species. The best-known species is the true gazelle (*Gazella dorcas*), which exhibits the typical characters of the group in their highest perfection. It is of a light tawny color, the underparts white, a broad brown band along each flank, the hair short and smooth. The face is reddish fawn color, with white stripes at each side, inclosing a dark triangular space. The horns of the old males are 9 or 10 inches long, bending outward and then inward, like the sides of a lyre, also backward at the base and forward at the tips, then tapering to a point and showing 13 or 14 permanent rings. The horns of the female are smaller. The ears are long, narrow, and pointed, the eyes very large, soft, and black, there is a tuft of hair on each "knee", the tail is short, with black hairs on its upper surface only and at its tip. This gazelle is a native of the north of Africa, Asia Minor, Syria, and Arabia. It was known to the ancients, and is described by Ælian under the name *dorcas*, which was also given to the roe deer. The speed of the gazelle is such that it cannot be successfully hunted by any kind of dog, but in some parts of the East it is taken by the assistance of falcons and is also captured in inclosures made near its drinking places. Although naturally very wild and timid, it is easily domesticated, and when taken young becomes extremely familiar. Tame gazelles are very common in Asiatic countries, and Oriental poetry abounds in allusions to their beauty and gentleness.

Various other species of gazelles should be mentioned. The commonest species of the Sahara is Loder's (*Gazella loderi*), called "reem" by the

Arabs of Algeria, which lives on berries and leaves and is said never to drink.

Another species of the eastern Sahara highlands is the admi, or mountain gazelle (*Gazella cuvieri*), which often comes down at night in small bands to feed upon the grain in the valleys. It is twice the weight of the dorcas, and in quickness and facility in eluding observation it is almost equal to the aoudad. The common gazelle of Arabia is *Gazella arabica*. Abyssinia and the open country southward have several species, among them the beautiful Kordofan species (*Gazella isabellina*), isabelline in color, with a reddish instead of the usual black tail. Grant's (*Gazella granti*), very numerous about Kilimanjaro, and having the longest horns of the genus, the long-necked greenuk (*Lithocranius uelleri*), the diminutive Thomson's gazelle, and others. In South Africa the springbok (*Gazella euchoire*) is widespread and familiar. (See SPRINGBOK.) West Central Africa has several local species, of which the swift gazelle (*Gazella mohr*) and the korin are perhaps best known, and the dig-dig and dama (qv) are familiar in the Sudan. For African forms consult Lydekker, *Game Animals of Africa* (London, 1908).

Of the Asiatic gazelles the Indian chinkara (*Gazella bennetti*), known to Anglo-Indian sportsmen as the "ravine deer," is the most familiar. It inhabits the plains from Central India to Persia, keeps to the broken country, and is so exceedingly swift as to furnish excellent sport with greyhounds or falcons and is also much hunted with the cheeta (qv). It is light chestnut in general color above, and has long ringed horns, the buck stands about 26 inches high at the shoulders. Two other species inhabit the lofty plains of Mongolia and Tibet, and a third, the Persian gazelle (*Gazella gutturosa*), is well known from the Caspian Sea to the Desert of Gobi. Blandford's writings on the zoology of India and Persia contain extensive accounts of these and other Asiatic forms. See ANTELOPE, and the names of various species, and Plate of GAZELLES.

GAZETTE, ga-zét' (It *gazetta*, gazette, small coin, probably a dim of Lat *gaza*, Gk γάζα, treasure). A newspaper. In 1566 the Venetian government established an official news sheet, which was not printed at first, but only written out and exhibited in public places. The fee for reading it was a small coin called *gazetta*. The name was soon applied to the sheet itself. The London *Gazette*, founded in 1665, is the official organ of the government. It appears twice a week. It is recognized in law as the medium of official and legal documents. Similar gazettes are published in Edinburgh and in Dublin. The word *gazette* is now common as a part of the title of many newspapers. See NEWSPAPER.

GAZETTEER. A geographical dictionary, more or less descriptive and statistical. The word is connected with *gazetier*, *gazetteer*, a writer in newspapers, and one of the early publications of this character (that of Laurence Echard) was entitled "The Gazetteer's or Newsmen's Interpreter, being a Geographical Index of all Considerable Cities, Patriarchships, Ports, etc., in Europe." The oldest-known geographical dictionary is the sixth-century fragment of Stephanus Byzantius. Some of the best known of modern gazetteers in the English language are Blackie's *Imperial* (Glasgow, 1850); Alex-

ander Keith Johnston's (1850, new ed, 1877), Lippincott's *Pronouncing Gazetteer of the World* (Philadelphia, 1855, new completely rewritten ed., 1911), Longman's *Gazetteer of the World* (London, 1906). A monumental encyclopædia of universal geography is Vivien de Saint-Martin's *Nouveau dictionnaire de géographie* (Paris, 1879-1900). A very exhaustive gazetteer (as far as the number of entries is concerned) is the so-called Ritter's *Geographisch-statistisches Lexikon* (Leipzig, 1874, 9th ed., 1905 et seq.). On a smaller scale is the *Dizionario geografico universale* of G. Garollo (Milan, 1898), a work remarkable for its accuracy. As a type of special gazetteer on a magnificent scale, may be mentioned Hunter's *Imperial Gazetteer of India* (London, 1881, new ed., 1886-88). There are special gazetteers of the individual States of the American Union.

GAZOGENE A gas generator used in Jessie du Motay process for making illuminating gas (See GAS). Also apparatus for generating carbon dioxide in process of making carbonated waters. See AERATED WATERS.

GEANTICLINE A broad gentle arch or dome in the outer portion of the earth, on the sides of which the strata dip or are inclined in opposite directions. The structure is like that of an anticline (qv), but of larger compass. One of the best illustrations is found in the Cincinnati geanticline which extends from southern Ohio to Tennessee and which dates from Paleozoic times.

GEAR BOX, IN MOTOR VEHICLE. See MOTOR VEHICLE.

GEARING (from *gear*, AS *gearwe*, from *gearu*, ready, Eng *yare*). A term applied to the parts of machinery by which motion in one part of a machine is communicated to another, gearing consists in general of toothed wheels, friction wheels, endless bands, screws, etc., or of a combination of these. When the communication between the two parts of the machine is interrupted, the machine is said to be *out of gear*, and when the communication is restored, it is said to be *in gear*. Gearing has also for its object the transmission of motion or of power, or both, and is usually designed to permit the arrest or disengaging of the source of power or motion, and also to provide for the increasing or diminishing of the original velocity, and in reference to this is distinguished by the term "multiplying" or "retarding." See GEAR WHEEL.

GEAR WHEEL. A toothed wheel used to transmit motion and power from one part of a

axis of the wheel, bevel wheels, in which the teeth are cut radially in the face of a cone, worm wheels, in which the teeth are cut helicoidally. A familiar example of spur gearing is in the works of a watch, and the ordinary chainless bicycle affords a simple example of bevel gears. Forms of gear wheels and their theoretical design are found in treatises on machine design. Consult Kent, *Mechanical Engineer's Pocket Book* (8th ed., New York, 1910), Reuleaux, *The Constructor* (Philadelphia, 1893), Frost, *Essential Data of Bevel Gearing* (Jackson, Mich., 1905), Beale, *Practical Treatise on Gearing* (10th ed., Providence, 1911). See ENDLESS SCREW.

GEARY, gā'ri or gē'ri, JOHN WHITE (1819-73). An American soldier and politician. He was born of Scottish-Irish parentage in Westmoreland Co., Pa., was educated at Jefferson College, but left before graduating, taught school, and then became a clerk in Pittsburgh, at the same time studying both civil engineering and law. He then engaged for some time in civil engineering in Kentucky and on the outbreak of the Mexican War was superintendent of the Allegheny Portage Railway. This position he resigned and helped recruit the Second Pennsylvania Volunteer Regiment, in which he became lieutenant colonel and served throughout the war. After the capture of the city of Mexico he was promoted to the rank of colonel and was placed in command of the city. After peace was declared he settled in San Francisco, where in 1849 he became the first American postmaster, with authority to organize post offices and mail routes on the coast, and the first American *alcalde* of San Francisco and judge of first instance for the district. In 1850, upon the adoption of an American system of municipal government for the city, he was chosen its first mayor. He worked for the California Free-State constitution, and was a prominent member of the convention which drew it up. After serving a year as the head of the Democratic State Committee he returned in 1852 to Pennsylvania. In 1856 he was appointed by President Pierce Territorial Governor of Kansas, succeeding Shannon, whose vacillation had aroused the hostility of both the Free-State and Proslavery factions. Geary's rule was impartial and firm, and in a few months he restored order. The Pierce administration did not support him satisfactorily, and the predominance of Proslavery men in the councils of both Pierce and Buchanan appeared to Geary to render all that he had accomplished of only temporary effect, and, disgusted with the conduct of affairs, he resigned on the day of Buchanan's inauguration. At the beginning of the Civil War, Geary raised the Twenty-eighth Pennsylvania Volunteer Infantry, of which he became colonel, served with distinction in the Army of the Potomac, and was promoted brigadier general in April, 1862. He had his left arm shattered at the battle of Cedar Mountain in the following August and commanded the Second Division of the Twelfth Army Corps at Chancellorsville and Gettysburg. Transferred to the Army of the Cumberland, he distinguished himself at the battles of Wauhatchie and Lookout Mountain, and in 1863-64 commanded a division on Sherman's march to the sea, failed in an attack on the strongly intrenched Confederates at Dug Gap (May 8, 1864), and was military governor of Savannah after its capture. In 1865 he received the brevet rank of major

machine to another. Gear wheels are of great variety of forms, the most common being spur wheels, in which the teeth are parallel to the

general He was elected Governor of Pennsylvania by the National Union party in 1866 and was reelected in 1869, serving until within 18 days of his death

GEBÄ, zhā'ba. A short river in Portuguese Guinea, West Africa, flowing in a southwestern direction through the colony and entering the Atlantic by a wide estuary. At its mouth is situated the small town of Gebä

GEBÄL, gē'bal See BYBLOS

GEBANG (gè-bāng') **PALM** (native name), *Corypha gebang* A fan-leaved palm, native of the East Indies, where it is one of the most useful plants. The trunks of this palm become 60 to 80 feet high and 2 feet in diameter, with leaves 8 to 10 feet in diameter. Its stem yields a kind of sago, its root is medicinal, being both emollient and slightly astringent, so as to be particularly adapted to many cases of diarrhoea, its leaves are used for thatch, for making broad-brimmed hats, and for various other economic purposes, its young leaves are plaited into baskets and bags, in the manufacture of which many of the people of Java find employment, the fibres of its leafstalks are made into mats, ropes, baskets, nets, cloth, etc. To the genus *Corypha* belongs also the talipot palm (q v)

GEBÄUER, gā'bou-ēr, JĀN (1838–1907) A Czech philologist, born at Uhřetřetice, Bohemia, and educated at the University of Prague, where he was appointed instructor in literature and was elected to the professorship of Slavic philology in 1874. He published a number of translations from the Russian, Bulgarian, and Sanskrit, but is best known for his studies and researches into the ancient Czech language and literature such as the *Nová rada* of Siml Fláška (1876), *Zaltár Wittenberský* (1880), and, above all, by his epoch-making *Historical Czech Grammar* (1894–98) and an Old-Czech dictionary (1901–03, incomplete). After 1874 he was associate editor of the *Listy Filologické*. His love of truth, which led him to demonstrate the spurious character of the famous Czech Koniginhof and Grunberg manuscripts, caused him many enemies among the patriotic but misguided Czechs.

GÉBELIN, ANTOINE COURT DE See COURT, ANTOINE

GEBER, gā'bēr. The name assigned to the author of a vast number of Arabic works on alchemy, astrology, and magic, as well as some of genuine scientific value. Who Geber was is uncertain, and some Arabic scholars have even denied his existence. His full name may have been Abu Musa (or Abdallah) Jabir ibn Hajjan al-Sufi, and it is said he lived in the eighth or ninth century. He appears to have resided for some time at Cufa, and according to some Cufa was his birthplace, others say Damascus, and still others favor Harran in Mesopotamia or Tarsus in Cilicia. About 26 works attributed to Geber are known by title, the manuscripts of many being in the libraries of Leyden, Paris, and elsewhere. There are Latin translations of some of them, *Geberi Philosophi de Alchimia Libri Tres* (1531) and *Geberi Arabis Chymia sive Traditio Summa Perfectionis et Investigatio Magisterii* (1668). An English translation of the latter, and of other treatises, by Russell, appeared in 1678. So great was Geber's fame that for many centuries his experiments were repeated by European chemists. Roger Bacon called him *Magister Magistorum*. Consult Berthelot, *La chimie au moyen âge*, vol. III

(Paris, 1893), and Wustenfled, *Geschichte der arabischen Aerzte* (Gottingen, 1840)

GEB'HARD, HEINRICH (1878–) An American pianist. He was born in Germany, but came to America as a boy of 10. In Boston he studied piano and composition with Clayton Johns and then went to Vienna, where he remained four years under Leschetizky. Immediately after his début at Boston he was accorded a place among the foremost American pianists. He is especially fine as an ensemble player. Besides a number of pieces for piano, he wrote a string quartet and a sonata for violin and piano.

GEBHARDT, gēp'hart, EDUARD VON (1838–1925). A German historical painter. He was born at St. Johannes, Esthonia, the son of a Protestant clergyman, and studied first at the Academy of St. Petersburg (1855–58) and at the School of Art in Karlsruhe for the next two years, part of which he spent in traveling. He finally became in 1860 the pupil of Wilhelm Sohn at Dusseldorf, where he permanently settled, and became professor at the academy in 1873. His works mark a new departure in the pictorial treatment of religious subjects in Germany, of which he is the foremost modern representative. Although a thorough realist in the modern sense, he nevertheless adopted in his religious subjects the costumes of the age of Luther and Durer. The chief characteristic of his paintings is their deep and powerful yet varied expression of religious feeling. The more important among the many biblical scenes he painted are "Christ on the Cross" (1866, Reval), "The Last Supper" (1870, National Gallery, Berlin), one of his finest creations, masterly in characterization of the life-sized figures, "Crucifixion" (1873, Hamburg Gallery), with a strong leaning towards the Old Flemish school, "Ascension of Christ" (1881, National Gallery, Berlin), another masterpiece, life size, of more ideal conception, "Taking Care of Christ's Body" (1883) and "Jacob and the Angel" (1893), both in Dresden Gallery, "Christ and the Rich Youth" (1892) and "Sermon on the Mount" (1893), both in Dusseldorf Gallery, "Healing of the Palsied" (1895, Breslau Museum), and "Christ upon the Waters" (1902). Of episodes from the Reformation one is "The Reformer at Work" (1877, Leipzig Museum). To some Pre-Raphaelite impressions received on a visit to Italy in 1882, a cycle of six mural paintings, "Scenes from the Life of Christ" (completed 1891), in the former Cistercian monastery at Lökkum, bear witness, as do also the fine mural paintings of similar subjects in the Friedenskirche, Dusseldorf. He also painted many excellent portraits, and was awarded gold medals at Berlin, Dresden, Munich, Vienna, and Paris, and was elected a member of the academies of Antwerp, Berlin, Brussels, Munich, and Vienna. Consult the monographs by Rosenberg (Leipzig, 1899) and Schaarschmidt (Munich, 1899).

GEBHARDT, gēp'hart, OSKAR LEOPOLD VON (1844–1906). A German Lutheran theologian, born at Wesenberg in Esthonia. In 1893 he became chief librarian and professor of paleography in the University of Leipzig. He published Theile's *Novum Testamentum Græce* (1875–1900) and *Das Neue Testament griechisch und deutsch* (4th ed, 1896), edited *The Minutaries of the Ashburnham Pentateuch* (1883); with Harnack, *Texte und Untersuchungen zur Geschichte der altchristlichen Literatur* (1882–

1905), a serial devoted to New Testament and patristic criticism, and, with Harnack and Zahn, an edition of the apostolic fathers (1875-78)

GEHBART, gá'bar', EMILE (1839-1906) A French writer, born at Nancy and educated at the Lycée of Nancy and the French School in Athens. In 1860 he became professor of foreign literatures at Nancy and in 1879 professor of Romance literatures in the faculty of philosophy at Paris. His works, aside from earlier ones dealing with the poetry and art of classic antiquity, include *Les historiens florentins de la Renaissance* (1875), *Rabelais, la renaissance et la réforme* (1876), *Les origines de la Renaissance en Italie* (1879), *L'Italie mystique* (1890), *Momes et papes* (1896, 4th ed, 1907), *Au son des cloches* (1898), *D'Ulysse à Panurge* (1902), *Jules II* (1904), *Florence* (1906), *Sandro Botticelli* (1907). In 1904 he was elected to the Academy

GEBIRS, gá'bérz See GHEBERS

GEBLER, gä'b'lér, OTTO (1838-). A German animal painter, born in Dresden. He was a pupil at the academy there and afterward studied in Munich under Piloty. He is an animal painter almost exclusively. There is often an element of humor in his careful, finely colored works, the best of which are "Obstinate Sheep", "Disturbed Domestic Peace" (1863), "Art Critics in the Stable" (1873), National Gallery, Berlin, "Sheep and Spamel" (1878), "Two Poachers" (1880), Dresden Gallery, "Reynard's End" (1883), New Pinakothek, Munich, "One of the Seven Sleepers," Dresden Gallery

GEBLER, TOBIAS PHILIPP, BARON (1726-86) An Austrian statesman and dramatist, born at Zeulenroda, Saxony, and educated at Jena, Halle, and Göttingen. After travels abroad he was (in 1748) appointed Secretary of Legation of the Netherlands at Berlin. Five years later he entered the Austrian service, in which he found rapid promotion, rising to the rank of Vice Chancellor of the Court in 1782. He was a liberal statesman and aided in the reforms attempted by Joseph II. He also tried to reform the stage and himself wrote some plays, now forgotten. His *Theatralische Werke* were published in three volumes in 1772-73. His drama *Der Minister* (1771) was very popular in its day.

GEBWEILER, gáp'vi-lér (OHG. *Gebunivolare*). A town and industrial centre in Upper Alsace, Germany, situated on the Lauch, at the mouth of the Blumenthal, about 17 miles southwest of Colmar (Map Germany, B 5). It has a splendid twelfth-century church in the Transition style and a fourteenth-century Dominican church, now used as a market and concert hall. Among its products are machinery, silk, cloth, cotton and woolen goods, wooden articles, sugar, soap, and brick, and especially white wines of a superior grade. Gebweiler is mentioned as early as 774. Pop., 1900, 13,254; 1910, 13,024, mostly Roman Catholics. Consult Dietwiler, *Gebweiler Chronik* (Gebweiler, 1898)

GECKO, gēk'ō. A lizard of the family Geckonidae, which naturalists have divided into many genera. The geckos are of small size and generally of repulsive aspect, the colors of most of them are dull, and the small granular scales with which they are covered are in general mingled with tubercles. The legs are short, the gait usually slow, measured, and stealthy, although geckos can also run very nimbly when danger presses, and often disappear suddenly

when they seem almost to be struck or caught. The feet are remarkable, being adapted for adhering to smooth surfaces, so that geckos not only readily climb trees or walls, but creep inverted on ceilings or hang on the lower side of large leaves. The body and tail are never crested, but are sometimes furnished with lateral

STRUCTURE OF A GECKO'S FOOT

a, the whole foot, from above, b, underside of a toe, with its clinging ridges, c, diagram of a section through a toe, showing the ridges in section, d, a few ridges, in section, magnified, showing their bristles, e, f, bristle cells, much enlarged (After Semper)

membranes, variously festooned or fringed, and sometimes so large as to be of use to arboreal species in enabling them to take long leaps from branch to branch. Such is the case with the flying or fringed gecko (*Ptychozoon homalocephalum*) of the Malayan region. The geckos feed chiefly on insects. They are quarrelsome and will sometimes devour their eggs or young and even their own tails and exuviated skins. They are natives of warm climates, are very widely distributed over the world, and are more or less nocturnal in their habits. Two species are found in the south of Europe, both of which frequently enter houses, as do the geckos of Egypt, India, Ceylon (the "chucha"), and other warm countries. Only one gecko (*Sphaerodactylus notatus*) dwells in the United States, although three or four kinds are found in Lower California and Mexico. It is scarcely 2 inches in length and is sparingly found in Florida and Cuba.

The name "gecko" is derived from a peculiar cry often uttered by some of the species, which in some of them resembles syllables distinctly pronounced, while others are described as enlivening the night in tropical forests by a harsh cackle, such as that which gives the "croaking lizard" (*Theocodactylus levis*), so abundant in Jamaica, its lugubrious name. The geckos have, in almost all parts of the world where they are found, a bad reputation as venomous and as im-

parting injurious qualities to food which they touch, but there is no good evidence in support of any such opinion. They lay a few eggs in some warm hollow of a stump, or similar place, and pay little attention to them or to the young. In cool countries they hibernate. Consult Gadow, *Amphibia and Reptiles* (London, 1901), and Gosse, *A Naturalist's Sojourn in Jamaica* (ib., 1851). See LIZARD.

GED, WILLIAM (1690-1749). The inventor of stereotyping. He was born in Edinburgh, where he was employed for some years as a goldsmith and jeweler. In 1725 he took out a patent for making stereotyped plates from pages of type. He met with active opposition from both compositors and type foundries. He was ruined financially by a man named Fenner, with whom he entered into partnership in London. He procured, in 1731, a contract for printing Bibles and prayer books by his process from Cambridge University, but had turned out only two prayer books when his failure compelled his return to Edinburgh and the surrender of the contract. In Edinburgh he printed, in 1744, an edition of *Sallust* from stereotyped plates, but he was never able to carry his ideas out successfully and died in poverty. His sons continued the use of his patent, and it was eventually perfected by Andrew Wilson.

GEDANUM. See DANZIG.

GEDDES, géd'és, ALEXANDER (1737-1802). A biblical critic, translator, and miscellaneous writer. He was born in Scotland in 1737, of Roman Catholic parents, and educated for a priest in his native country and in Paris, where he acquired an excellent knowledge of languages. In 1764 he returned to Scotland and for 15 years held various positions as priest and became distinguished by his charities, his liberality of sentiment, and decided literary ability. In 1779, in consequence of difficulties with his Bishop, he left his church, and the next year was dismissed on charges of having attended Protestant worship and gone hunting. He went to London and devoted himself to literature, although he still occasionally officiated as priest till 1782. With the support of Lord Petre he was able to carry out a work long planned, viz., a translation of the Bible into English for the use of Roman Catholics. After various preliminary publications to pave the way, the first volume appeared in 1792 under the title, *The Holy Bible, or the Books Accounted Sacred by Jews and Christians, otherwise called the Books of the Old and New Covenants, faithfully translated from the Corrected Text of the Original, with Various Readings, Explanatory Notes, and Critical Remarks*. In 1797 the second volume was published, carrying the translation as far as the end of the historical books, and in 1800 a third volume was issued, containing his *Critical Remarks on the Hebrew Scriptures*. The opinions enunciated in these volumes, especially in the last, were, for their time, startlingly heretical and approximated to some of the results of modern criticism. As a result, Protestants and Roman Catholics united in their condemnation, although the translation was in the main excellent, and many of the remarks of value. In 1792 his translation was interdicted by the Roman Catholic authorities in London. Geddes died in London, Feb. 26, 1802, and mass was prohibited over his remains, though he had always held his loyalty to the Catholic church. For his life, consult Good (London, 1803).

GEDDES, ANDREW (1783-1844). A Scottish portrait and historical painter, born in Edinburgh. He was a pupil of the Royal Academy, traveled much abroad, and frequently resided in Edinburgh, but finally established himself in London in 1831. He painted some genre and historical pictures, such as "The Ascension," in the church of St. James, Garlick Hill, London, "Discovery of the Scottish Regalia" (1821), "Christ and the Woman of Samaria," but was chiefly successful as a portrait painter. His portraits are carefully and charmingly conceived, rich in color, and of searching characterization, but are often incorrect in line. Among the best are those of William Anderson, "The Artist's Mother", Miss Charlotte Nasmyth as "Summer", "Dull Reading"—a portrait of Daniel Terry and his wife—the last three in the National Portrait Gallery, Edinburgh. His copies of the old masters are highly prized. Geddes was a brilliant and spirited etcher and left about 40 plates, mostly portraits.

GEDDES, SIR E. C. First Lord of the British Admiralty. For his biography see Vol. XXIV.

GEDDES, JAMES (1763-1838). An American engineer. He was born near Carlisle, Pa., but removed, in 1794, to Onondaga Co., N. Y., where he engaged in the salt business. He was one of the earliest and most active advocates of the Erie Canal and made the first surveys of the route in 1808. After serving as a member of the State Legislature and as a county judge, he was a Representative in Congress from 1813 to 1815. In 1816 he became supervising engineer of the Erie Canal and in the following year chief engineer in the construction of the Champlain Canal. His success in these undertakings gave him the reputation of being the foremost canal engineer in the country, and his services were much in demand. In 1827 he surveyed and laid out the line of the Chesapeake and Ohio Canal and in 1828 was made chief engineer of the State canals in Pennsylvania.

GEDDES, JAMES LORRAINE (1827-87). An American soldier, born in Edinburgh, Scotland. When 10 years old, he went to Canada with his family. In 1843 he revisited Scotland, whence he went to India, studied at the British Military Academy, Calcutta, entered the army, and won distinction in the Punjab campaign, after which he returned to Canada. In 1857 he emigrated to Vinton, Iowa. He fought in the Civil War from 1861 to 1865, distinguished himself at Shiloh, Vicksburg, Corinth, and Mobile, and in 1865 was brevetted brigadier general of volunteers. After the war he was principal of the College for the Blind at Vinton, and after 1870 he held different posts in the Iowa College of Agriculture in Ames. He wrote some famous war songs, "The Soldier's Battle Prayer" and "The Stars and Stripes" being best known.

GEDDES, JENNY. Popularly supposed to have been the name of a woman who inaugurated a riot in St. Giles's Church, Edinburgh, on Sunday, July 23, 1637. When the dean of Edinburgh began to read from a service book prepared by Archbishop Laud and highly obnoxious to the Scottish Presbyterians, some old woman in the congregation cried out indignantly and threw her stool at the dean's head. A great tumult ensued, which proved the deathblow of the liturgy in Scotland. Who the woman really was is uncertain. It has been claimed that she was the wife of one John Mein, and others say her name was Hamilton. Consult *Proceedings*

of the *Society of Antiquaries of Scotland*, vol. iii (Edinburgh, 1852)

GEDDES, PATRICK (1854-) A Scottish biologist and educator, born in Perth. He was educated at University College (London), at Edinburgh and in France, and was appointed demonstrator of physiology at University College, London, of zoology at Aberdeen, of botany at Edinburgh, lecturer on natural history at the Edinburgh School of Medicine, and professor of botany at University College, Dundee. Perhaps his most important work was in connection with his University Halls project at Edinburgh and Chelsea, each as a beginning of collegiate life. He showed great interest in municipal art and education and also became director of a printing establishment interested chiefly in the publication of works of Celtic literature. His publications include *The Evolution of Sex* (1889), with J. Arthur Thompson, *Chapters in Modern Botany* (1893), *A Study in City Development* (1904), *The Masque of Ancient Learning and its Many Meanings* (1913). In an article entitled "The World's First Sociological Laboratory" (*American Journal of Sociology*, 1899), Professor Zeublin gives a very instructive account of Professor Geddes's educational experiments in Edinburgh.

GEDDIE, JOHN (1821-94). A Canadian missionary. He was born in Banff, Scotland, but in infancy was brought to Nova Scotia. He was ordained to the Presbyterian ministry in 1838, he founded the foreign-mission scheme of the Presbyterian church in Nova Scotia, and was the first missionary (1846) in the islands of the New Hebrides and the first to translate and to print schoolbooks, hymns, and, later, the whole of the New Testament in the language of the natives. In the last-named work he was assisted by Rev. John Inglis. Portions of the Old Testament were also translated. During 1850-61 he wrote letters to Nova Scotia periodicals describing the islands, their inhabitants, and his missionary labors, which were recognized by his own and other churches as eminently successful. He published several pamphlets and sermons, including *Memorial to the Presbyterian Synod, Nova Scotia* (1844), *The Proposed Mission to New Caledonia* (1846), *The Universal Diffusion of the Everlasting Gospel* (1846).

GEDEN, ALFRED SHENINGTON (1857-) An English Methodist theologian, born at Didsbury, Manchester, and educated at the Manchester Grammar School and at Magdalen College, Oxford. He taught theology at London University. His publications include *Hebrew Exercises to Accompany the Hebrew Grammar of Gesenius-Kautzsch, Concordance to the Greek Testament*, with W. F. Moulton (1897, 3d ed., 1913), *Introduction to the Hebrew Bible* (1909), *Studies in Comparative Religion* (1898), *Studies in Eastern Religions* (1900). He also translated P. Deussen's *Philosophy of the Upanishads* (1906).

GEDEN, JOHN DRURY (1822-86). An English Wesleyan minister, born at Hastings, England. He was educated at the Kingswood School, and at Richmond College in Surrey. He held charges at Newcastle-on-Tyne in 1851 and at Durham in 1852 and then spent three years on the Oxford circuit at Manchester. In 1856 he succeeded Jonathan Crowther in the chair of sacred and classical languages at the Didsbury Theological College and soon afterward became coeditor of

the *London Quarterly Review*. He traveled in Egypt and in the Holy Land in 1863. In 1870 he became a member of the Old Testament Revision Company. He published *The Doctrine of a Future Life as Contained in the Old Testament Scriptures* (1874) and *Didsbury Sermons* (1878).

GEDIKE, gä'di-ke, FRIEDRICH (1754-1803). A German educator, born at Boberow, Brandenburg. He studied theology at Frankfurt-on-the-Oder and was successively director of the Werdersche Gymnasium (1779-91) and of the Kollnische Gymnasium, Berlin (1793-1803), which institutions greatly improved under his administration. He greatly promoted the advancement of education throughout Prussia. His works include *Schulschriften* (1789-95), *Vermischte Schriften* (1801), *Geschichte des Friedrich-Werderschen Gymnasiums*, a centenary publication (1781). Consult Horn, *F. Gedike* (Berlin, 1808).

GEDIMIN, gä-dë'min, or GEDYMIN (?-1342). Grand Prince of Lithuania. He fought against the Teutonic Knights and the Russians and conquered a large portion of Russia, including Kiev. He was killed in an assault upon a castle of the Teutonic Knights. The city of Vilna was made his capital about 1323. He tolerated Christianity, though he was a pagan.

GEDON, gä'don, LORENZ (1843-83). A German architect, sculptor, and decorator. He was born in Munich, where he studied sculpture and applied art and in 1872 made his mark with the erection of the Palais Schack. Equally at home in the baroque and rococo styles, he thus gave a powerful impulse to native German art and effected a complete reform in the province of artistic crafts. After applying decorative talent to the architectural arrangement and decoration of the buildings for the various industrial exhibitions in Munich in 1876, 1879, 1882, and 1883, he undertook the adornment of the German art room at the Paris Exposition of 1878, which led to a complete reform in decorating picture galleries. His principal structure is the Heyls-hof, in baroque style, at Worms, besides which he executed much admirable work of a decorative nature in the gorgeous castles of King Ludwig II, in the town hall, and in private palaces in Munich.

GEE, gë, THOMAS (1815-98). A Welsh Methodist preacher, born at Denbigh, Wales. Becoming a printer, he published the quarterly magazine *Y Traethodydd*, the encyclopædia, *Gwyddonadur Cymreig*, and Dr. Silvan Evans's *English Welsh Dictionary* (1868). In 1847 he was ordained a Calvinistic Methodist minister and thereafter was active in temperance and Sunday-school work. In 1857 he founded the newspaper *Baner Cymru*, which was united with the *Yr Amserau* in 1859. He promoted undenominational schools and church disestablishment.

GEEFS, gäfs. A family of Belgian sculptors.—**GUILLAUME GEEFS** (1806-83) was born at Antwerp, Sept. 10, 1806, the son of a baker. He studied at the Academy in Antwerp and in 1828 won the grand medal and a stipend, which enabled him to study in the atelier of the elder Ramey in Paris. Returning to Belgium, he was appointed professor at the Antwerp Academy in 1834. Geefs was an Eclectic, whose art marks the transition from the Classical ideal to the Realistic. His monuments, statues, and busts show versatility and a spirited, facile, but

superficial execution. He modeled the monument of General Beelliard and in 1833 the tomb of the Count Frédéric de Meirde, now in the cathedral of Brussels—the most striking of his works. He designed also the monument to the victims of the revolution of 1830, in the Place des Martyrs in Brussels, and the Rubens monument in Antwerp. In the Paris Exposition of 1855 he exhibited a colossal marble statue of King Leopold I of Belgium and the “Amorous Lion” (Brussels Museum). Geefs was chevalier of the Legion of Honor in France and held many Belgian orders. He died Jan. 24, 1883. His wife, FANNY ISABELLE MARIE, née Corr (1814–83), was very successful as a painter of genre subjects—JOSEPHUS GEEFS (1808–85), brother of Guillaume, was born in Antwerp, was educated there and in Paris and Rome and was appointed professor in the Academy at Antwerp in 1841. His principal works include the statue of the anatomist Vesalius in Brussels (1848), the equestrian statue of King Leopold I in Antwerp in 1868, the statue of Van Hogendorp in Rotterdam, 1869, and the sculpture of the front of the Flemish theatre in Antwerp, 1872—ALOYS GEEFS (1817–41), a younger brother, was also a sculptor, but of less importance. Consult Bartholeyns, *Guillaume Geefs, sa vie et ses œuvres* (Brussels, 1900), and Lemonnier, *Histoire des beaux arts en Belgique* (ib., 1887).

GEEL, gāl, JAKOB (1789–1862). A distinguished Dutch scholar, born at Amsterdam, and educated at the Athenæum of that city, principally under Van Lennep. After living at The Hague from the year 1811 as a family tutor, he became second librarian at Leyden in 1823 and in 1833 head librarian and honorary professor. Meanwhile he had made himself known by editions of Theocritus, with the *Scholia* (1820), of the *Anecdota Hemsterhusiana* (1826), of the *Scholia in Suetonium* of Ruhnken (1828), of the *Excerpta Vaticana* of Polybius (1829), and his *Historia Critica Sophistarum Græcorum* (1823) had called forth several treatises on the same subject from German philologists. In 1840 appeared his edition of the *Olympicus* of Dio Chrysostom, accompanied by a *Commentarius de Reliquis Dionis Oratoribus*, and in 1846 he issued the *Phænissæ* of Euripides, with a commentary, in opposition to Hermann. All these works, which are written in pure and pleasing Latin, are models of thorough scholarship as well as of taste and method. Geel contributed further to the revival of classical learning in the Netherlands by the establishment, along with Bake, Peerikamp, and Hamaker, of the *Bibliotheca Critica Nova* in 1825. The national literature is also indebted to him, not only for the translation of German and English works into Dutch, but also for original treatises on various æsthetical subjects. He won, moreover, the gratitude of the learned throughout Europe by his liberality as a librarian and especially by his *Catalogus Codicum Manuscriptorum, quinde ab Anno 1741 Bibliotheca Lugdun. Batarorum Accesserunt* (1852).

GEELBEC, gāl'bèk (Dutch, yellow beak). The Dutch local name in Cape Colony, South Africa, for the commonest wild duck (*Anas flavirostris*).

GEELONG, jē'lóng'. A city of Grant Co., Victoria, Australia, picturesquely situated on the south side of Corio Bay, 45 miles southwest of Melbourne (Map: Victoria, D 6). The

discovery of gold fields in the neighborhood in 1851 added to the prosperity of the city, which had become noted for its wool trade, the first mill being erected here. The various industries include manufactures of tweeds, cloth, leather, flour, cement, paper, and rope, also meat preserving and fishing. Since 1905, when the city voted \$2,000,000 for harbor and dock improvements, a large export and brokerage trade in wool has sprung up. Ships of 23 feet draft can load at the wharves, which have full railway connection. The town has a produce exchange, a mechanics' institute, botanical gardens, a public park, a college, and a public library. The district is exceedingly fertile. Limestone, coal, and marble are found in the neighborhood. Pop., 1901, 12,399, 1911, 13,618. Including suburbs, 27,000.

GEELVINK (gāl'vīnk) BAY. An inlet of the Pacific Ocean, on the north coast of Dutch New Guinea (Map East Indies, J 6). It penetrates 300 miles inland, nearly across the province, and receives a number of rivers.

GEER AF FINSPANG, yār av fin'spang, LOUIS GERHARD, BARON DE (1818–96). A Swedish statesman and author, born at Finspång. He was president of one of the supreme courts in 1855 and Minister of Justice from 1858 to 1870 and again in 1875. In 1876–80 he was President of the Ministry and then was chancellor of the universities of Sweden until 1888. He introduced numerous legislative reforms bearing on religion, the penal code, maritime and military laws, and copyright, and, above all, the organization of the chief legislative departments of the government, and the introduction of the two chambers with popular representation (1866). Besides several short stories and essays on æsthetics, he wrote sketches of Jarta (1874), Von Hopken (1881), and Von Platen (1886), and his own memoirs, *Minnen* (1892).

GEERTZ, garts, JULIUS (1837–1902). A German genre and portrait painter, born in Hamburg, where he first studied under the brothers Gensler. At the School of Arts in Karlsruhe, from 1856 to 1860, he was a pupil of Descoudres, then in Düsseldorf of Jordan. In 1864 he went to Paris to study the old masters and after visiting Brittany and Holland settled at Düsseldorf, where his genre scenes, serious and humorous, especially those from child life, met with great favor. Besides “The Criminal after the Sentence” (1873), which made his reputation, there may be mentioned “Sour and Sweet” (Royal Château of Babelsberg), “Invested” and “Capitulated,” two merry juvenile scenes, “Prisoners of War”; “Fight between Poacher and Forester” (1883), “The Village Hero” (1884). In 1890–91 he was in New York and painted portraits of Carl Schurz (Liederkrantz Hall), Oswald Ottendorfer, and other prominent German Americans.

GEESE. See GOOSE.

GEESTEMÜNDE, gē'ste-mūn'de. A seaport in the Prussian Province of Hanover, Germany, at the mouth of the Geeste in the Weser, directly opposite Bremerhaven, of which it is a shipping rival, 32 miles northwest of Bremen (Map Germany, C 2). The town dates from 1857, when the construction of the harbor was begun. The main basin, opened in 1863, is 1846 feet long, 386 feet wide, and 23 feet deep. The petroleum basin (1875) has a length of

772 feet and a breadth of 145 feet To the northwest of the main basin is the deep-sea fisheries basin (opened 1896), 3960 feet long, 364 feet wide, and 14½ feet deep It is the most important centre of the fishing trade in Germany There are large dry docks and several extensive shipyards The harbor, which is one of the largest artificial waterways in Germany, is never frozen Geestemunde has a school of marine engineering, a navigation school, and a trade school It is heavily fortified It has large works for making castings, machinery, nets, sails, rope, lumber, and timber Pop, 1900, 20,100, 1910, 25,061

GEEZ, gēz (Ethiopic *Gēz*) The ancient native name of the Semitic inhabitants of Abyssinia, the classical Ethiopia, and of their language, now a dead tongue The word means literally "wandering," and designates the people as "wanderers," "nomads," and their language as the speech of "freemen" See ETHIOPIA, SEMITES, SEMITIC LANGUAGES

GEFFCKEN, gēf'ken, FRIEDRICH HEINRICH (1830-96) A German jurist, born at Hamburg and educated at Bonn, Göttingen, and Berlin He was Secretary of the Legation at Paris in 1854, represented Hamburg at Berlin in 1856, and in 1859 he was Minister of the Hanse cities at Berlin and in 1866 at London In 1872 he became professor of constitutional history and public law at the University of Strassburg In 1880-82 he was a member of the Council of State of Alsace He was a personal friend and adviser of Frederick III before and after he came to the throne, and in 1888 he was arrested at the instance of Prince Bismarck for treason, as he had published without authority in the *Deutsche Rundschau* quotations from the journal of Frederick III, which showed that Frederick and Bismarck had quarreled in 1870 After an inquiry of three months Geffcken was set free He was suffocated by gas in his bedroom His works, published anonymously, include *Die Reform der preussischen Verfassung* (1870), *Der Staatsstreich von 1851 und seine Rückwirkung auf Europa* (1870), and *Die Verfassung des deutschen Bundesstaats* (2d ed, 1870), and, signed, *Die Alabamafrage* (1872), *Das deutsche Reich und die Bankfrage* (2d ed, 1874), *Staat und Kirche* (1875, in English by Taylor, 1877), *Zur Geschichte des orientalischen Krieges, 1853-56* (1881), *Politische Federzeichnungen* (2d ed, 1888), a volume on England, translated by Macmillan under the title *The British Empire* (1889), and *Frankreich, Russland und der Dreubund* (1893)

GEFFCKEN, JOHANNES (1861-) A German classical scholar, born in Berlin, and educated at the universities of Strassburg, Göttingen, and Bonn In 1887 he became a teacher in the Hamburg gymnasium and in 1907 professor in the University of Rostock His published work, mostly on the literature, pagan and Christian, of the early Christian period, includes *Timaios' Geographie des Westens* (1892), being the fragments of the first and second books, *Leonidas von Tarent* (1896), *Oracula Sibyllina* (1902), an excellent critical text, supplemented by his *Komposition und Entstehungszeit der Oracula Sibyllina* (1902); *Aus der Werdezeit des Christentums* (1904, 2d ed, 1909), *Das griechische Drama* (1904, 2d ed., 1909), *Zwei griechischen Apologeten* (1907); *Die christliche Apokryphen* (1908), *Kynika* (1909), *Kaiser Julianus* (1914) He was one of the revisers of

the new (1914) edition of Lubke's *Reallexikon des klassischen Altertums*

GEFFRAED, zhá'frá', FABRE (1806-79). President of Haiti He was the son of Nicholas Geffiard, one of the founders of Haitian independence, and was born at Anse Veau, Haiti In 1821 he entered the army as a private soldier, attaining the grade of captain in 1843, in which year he joined Herard in rebellion against Boyer, whom he defeated near Jacmel Having been appointed general of division in 1845, he was deprived of his command by President Riche, who was jealous of his popularity, and was tried by a court-martial After the death of Riche (1847) he regained his influence From 1849 to 1856 he was actively engaged in the army and distinguished himself in the campaign of 1856 against Santo Domingo, particularly in the retreat from San Juan Finding that it was the intention of the Emperor Faustin (Souloque) to arrest him, he proclaimed himself President in December, 1858, and drove Souloque from Port-au-Prince, Jan 15, 1859 In spite of the insurrections he had to repress, Geffard gave Haiti the most moderate government it had as yet enjoyed Commerce and industry prospered with the reduction of taxes, and schools were founded in many parts of the country Nevertheless the revolutionary spirit continued active, and Salnave, who had twice attempted a rising and failed, was finally successful in February, 1867, when Port-au-Prince went over to him, and Geffard was compelled to flee to Jamaica with French assistance, where he died

GEFFROY, zhe-frwá', EDMOND AIMÉ FLORENTIN (c1806-95) A French actor and painter He was born at Maignelay (Oise) and studied at the College of Angers With little preliminary training he made his successful first appearance in the rôle of Orestes in *Andromaque* at the Théâtre Français (1829) and from that time until his resignation in 1865 was regarded as one of the principal actors at that theatre He played at the Odéon from 1872 to 1878 He also achieved considerable fame as a painter and was a pupil of Amaury-Duval Many of his principal works were exhibited in the Salon, such as "Charles VII and Agnes Sorel" (1839), "La Sainte Vierge et l'enfant Jésus" (1841), "Les sociétaires de la Comédie Française" (1842); and another of the same title (1863-64), which contains portraits of Mesdames Augustine Brohan, Arnould-Plessy, Bonval, Judith, Favart, and many other distinguished actors and actresses of that celebrated theatre

GEFFROY, MATHIEU AUGUSTE (1820-95) A French historian, born in Paris He graduated at the Ecole Normale in that city in 1840 After holding professorships at the lycées Cleimont-Ferrand, Louis le Grand, and elsewhere, he was professor at Bordeaux and then at Paris and in 1875 became director of the French School at Rome His historical works deal especially with Scandinavia and French relations with it and Austria He wrote *Histoire des états scandinaves* (1851), *Des origines et de la formation de l'Europe moderne* (1853), *Marie Antoinette Correspondance secrète* (with Arneth, 1874), in which, as in other treatments on the same subject, he proved that many letters attributed to Marie Antoinette were forgeries, *Mme de Maintenon d'après sa correspondance authentique* (1887), *Etudes italiennes* (1898).

GEFLE, gēv'la The capital and chief commercial town of the Swedish Lun of Gefleborg, situated at the mouth of the river Gefle, about 71 miles north of Upsala (Map Sweden, F 6) The town has been in great part rebuilt since the fire of 1869 The principal buildings are the castle, the fine town hall, the library, the residence of the Governor, the high school, and a school of commerce and navigation The town is increasing in industrial importance, producing chiefly linen, sail cloth, leather, electrical machinery, lumber, paper, cotton goods, and tobacco There are also some shipbuilding and iron molding Fishing is an important industry As the chief outlet for the Kopparberg district, it carries on a large export trade in iron and lumber, imports are mainly grain, cotton, spices, textiles, and fertilizers Pop, 1900, 29,522, 1910, 31,941 Population of province or lan, 1912, 256,566

GEGENBAUR, gā'gen-bour, JOSEPH ANTON VON (1800-76) A German historical painter He was born at Wangen, Wurtemberg, and studied under Robert von Langer at the Munich Academy, and from 1823 to 1826 in Italy, where he devoted himself to fresco painting To his appreciation of Raphael his "Expulsion from Paradise" and "Moses Striking the Rock," both in the royal palace at Stuttgart, bear witness On his return to Stuttgart he was intrusted with the execution of frescoes in the Royal Villa Rosenstein, near Cannstatt, depicting the story of "Cupid and Psyche" according to Apuleius, and "The Four Seasons" After a second sojourn in Italy, from 1829 to 1835, he was appointed court painter at Stuttgart and for nearly 20 years was employed in decorating a number of rooms in the new royal palace with episodes from the mediæval history of Wurtemberg He also painted portraits and easel pictures of religious and mythological subjects, and was a draftsman of superior skill His frescoes display invention, clear composition, animation, and vigorous coloring

GEGENBAUR, KARL (1826-1903) A German comparative anatomist He was born in Wurzburg, Germany, and studied medicine in Wurzburg, where he was a pupil of Kolliker and of Virchow, received the degree of M.D. and was afterward privatdocent from 1853 to 1855 In the latter year he became professor of anatomy and director of the Anatomical Institute in Jena and remained there until 1873, when he became professor of anatomy at Heidelberg He spent two years in Sicily studying invertebrate life, making important researches on pteropods and heteropod mollusks He also worked on the histology of *Limulus* He was not only the leading comparative anatomist in Germany, but one of the first class, ranking with Huxley and Owen, and was distinguished by the great range of his learning, which covered the entire field of animal morphology, as well as by the boldness of his speculations He was the first comparative anatomist to place the study of anatomy on an evolutionary basis and thus became the founder of modern anatomy His most important works are: *Grundzuge der vergleichenden Anatomie* (1870), *Grundriss der vergleichenden Anatomie* (1878), translated into English by F. J. Bell, under the title *Elements of Comparative Anatomy* (1878), *Lehrbuch der Anatomie des Menschen* (1883, 3d ed, 1886); *Vergleichende Anatomie der Wirbelthiere mit Berücksichtigung der Wirbellosen* (1898) From 1876 he was edi-

tor of the *Morphologisches Jahrbuch*, which he founded In his *Comparative Anatomy of Vertebrates* (1898) Gegenbaur shows how conditions prevailing among invertebrates can be made to throw light upon the more complicated vertebrate forms Gadow characterizes this great work as "a mine of most suggestive ideas" In this, as in all his works, he strove to derive any given organ from some earlier, more ancestral or generalized structure, instead of being satisfied with its conditions or its present degree of specialization Gegenbaur's most fruitful work was his theory of the origin of limbs and their girdles from the embryonic visceral arches His views on the derivation and evolution of free limbs were also the outcome of a masterly research

GEHENNA, gē-hēn'a (Gk Γέεννα, or Γεέννα, *Gecenna*) A term used in the New Testament as a designation of the place of punishment of the wicked after death The word is a transliteration of the Aramaic *Gehennam*, or *Gehinnam*, which is an equivalent of the Hebrew *Ge Hinnom* (For origin of name, see HINNOM, VALLEY OF) In the New Testament it never refers to the valley south of Jerusalem It occurs 12 times Outside of the Synoptic Gospels it is found only in James iii 6, where the tongue is said to be set on fire by Gehenna In Luke it is used only once—viz, xii 5, where God is said to have the power of casting into Gehenna after He has killed In the corresponding passage in Matthew (x 28) the disciples are warned to fear Him who is able to destroy both soul and body in Gehenna The only passage in Mark that has the word is ix 43-47, where it occurs three times, the sacrifice of a head, a foot, or an eye being recommended in preference to Gehenna (cf Matt v 29, 30, xviii 8, 9) In addition to the parallels to the passages quoted from Mark and Luke, Matthew records three sayings of Jesus, in which He declares that the man who says *more*, i.e., "thou fool," is liable to the Gehenna of fire (v 22), that the Pharisees make their proselyte twice as much a son of Gehenna as they are themselves (xxiii 15), and that the Pharisees are a brood of vipers not likely to escape the judgment of Gehenna (xxiii 33) Whether Jesus actually used the language ascribed to Him upon these occasions, and, if so, what meaning He attached to the term, are questions that have been seriously discussed without any definite agreement having been reached It will be noted that all of these statements are found only in Matthew that xxiii 23-33 seems to be a duplicate of the words of John the Baptist, and that Luke (xvii 1, 2) records the saying as to offenses that must come, without the amplifications of Matthew and Mark It is also manifest that in some instances the word is used in a figurative sense The counsel to sacrifice hand, foot, or eye can certainly not be taken literally, and there is no valid reason for supposing that Gehenna is, in the same connection, to be understood more literally Manifestly Jesus cannot have intended to draw such a distinction between an angry disposition and a contemptuous epithet like, *raka*, 'empty head,' on the one hand, and a similar epithet, *more*, 'fool,' on the other hand, as to affix temporal penalties for the former and eternal punishment for the second As He cannot have desired the local courts to take cognizance of the feelings of a man's heart, or the supreme court to make a capital case of a

hasty word, but must have used *beth din* and Sanhedrin figuratively, so He is likely to have employed Gehenna in a similar way "Son of Hell" as a characterization of a hypocrite and formalist is also to be understood as a figure of speech. But in Matt x 28 (Luke xii 5) Gehenna is evidently meant to be taken more literally, of man's fate after death. The most natural interpretation of this passage is that the destruction of both body and soul in Gehenna means complete cessation of being. But the evangelical tradition scarcely permits any definite conclusions on this point. See HADES, HELL.

GEIB, gip, KARL GUSTAV (1808-64). A German criminologist, born at Lambsheim, Bavaria. He studied at Heidelberg, Munich, and Bonn. In 1832 he was sent to Greece as secretary to the regency appointed during the minority of King Otho, and after his return (1834) was appointed to the chair of law at the University of Zurich (1836), where in 1842 he became professor of criminal and civil procedure. In 1851 he went to Tübingen. Geib was a strict adherent of the historical method. The work entitled *Geschichte des römischen Kriminalprozesses bis zum Tode Justinians* (1842), although superseded by more recent investigations, had an extraordinary influence in Germany. Consult the biographical sketch by Lueder (Leipzig, 1864).

GEIBEL, gî'bel, EMANUEL (1815-84). A popular German lyric poet. He was born at Lubeck, Oct 17, 1815, was graduated at Bonn (1836), lived for two years in Berlin in literary society, went as tutor to Athens (1838), traveled extensively with Ernst Curtius in the Grecian Archipelago, and returned to Lubeck in 1840. He led a studious life there and on the Rhine, at Stuttgart, Hanover, and Berlin, received a pension from the King of Prussia in 1843, and in 1852 was made professor of aesthetics at Munich. He returned to Lubeck in 1868 and resided there till his death, on April 6, 1884. His fame rests chiefly on his lyric poetry *Gedichte* (1840), *Juniuslieder* (1848), *Neue Gedichte* (1856); *Gedichte und Gedenkblätter* (1864), *Spätherbstblätter* (1877), and the posthumous *Gedichte aus dem Nachlass* (1896). He wrote also two tragedies—*Brunhild* (1858) and *Sophonisbe* (1868)—and a comedy, *Meister Andrea* (1865). He collaborated with others in several volumes of noteworthy translations—viz, *Klassische Studien*, with Ernst Curtius (1840), *Volksheder und Romanzen der Spanier* (1843), *Spanisches Liederbuch*, with Paul Heyse (1852), *Fünf Bücher französischer Lyrik*, with Leuthold (1862). Selected translations from Greek and Latin poets appeared as *Klassisches Liederbuch* (1875). Geibel's Works are in eight volumes (3d ed, 1893), his correspondence is contained in part in *Briefe an Karl Freiherrn von Malsburg* (1885). Geibel's lyric gift was genuine, but marked rather by a talent for carefully and skilfully chiseled form than for strong, virile content. For his biography, consult Goedeke (Stuttgart, 1869), Litzmann (1887), Leimbach (Wolfenbüttel, 1894), Gaedertz (Leipzig, 1897), and also Predels, *E. Geibel und die französische Lyrik* (Münster i W., 1905).

GEIERSTEIN, gî'er-stîn, ANNE OF See ANNE OF GEIERSTEIN.

GEIGER, gî'ger, ABRAHAM (1810-74). A distinguished rabbi and Jewish scholar. He was born at Frankfurt-on-the-Main and was educated at Heidelberg and Bonn. At Bonn he gained a prize for an essay on the Jewish sources of the

Koran, published (1833) under the title *Was hat Mohammed aus dem Judentum aufgenommen?* (reprint of Eng trans, Madras, 1898), which is still of considerable value. In 1832 he became rabbi in Wiesbaden and in 1835 one of the editors of the *Zeitschrift für jüdische Theologie*. In 1838 he was chosen associate rabbi at Breslau, in 1863 he removed to Frankfurt, where he was rabbi until 1870, and was then elected to the charge of the largest Jewish congregation in Germany—viz, at Berlin—and remained there till his death, in 1874. From 1862 to the end of his life he published at Breslau *Jüdische Zeitschrift für Wissenschaft und Leben* (11 vols.). Geiger's work was mainly in theological lines, and he was one of the foremost advocates of the "reform" of Judaism, standing for liberality in the construction and observance of the Jewish traditional law. In line with this work he published a new Hebrew ritual and became professor in the Hochschule für die Wissenschaft des Judenthums, a school to train Jewish rabbis according to the modern interpretation of Judaism, which he had helped to found. Endowed with an unusually active mind, he worked untiringly, and of his extremely numerous works on Jewish history, literature, and theology, only a few can be mentioned here. *Lehr- und Lesebuch zur Sprache der Mischna* (1845), *Beiträge zur jüdischen Literaturgeschichte* (1847), *Diwan des Castigers Abul-Hassan Juda ha-Levi* (1851), the two very important works, *Urschrift und Uebersetzungen der Bibel in ihrer Abhängigkeit von der innern Entwicklung des Judentums* (1857) and *Sadduzaer und Pharisäer* (1863), a collection of lectures published under the title *Das Judentum und seine Geschichte* (1864-71), and *Salomo Gabirol und seine Dichtungen* (1868). His posthumous works, *Nachgelassene Schriften*, were published by his son Ludwig, the last volume of this collection contains his biography and letters. The most important of his works is the *Urschrift*, an exceedingly valuable contribution to the history of Old Testament literature.

GEIGER, LAZARUS (1829-70). A German philologist, born at Frankfurt-on-the-Main. He studied at Bonn, Heidelberg, and Würzburg. During the last nine years of his life he was instructor in German, Hebrew, and mathematical geography at the Jewish High School of Frankfurt. His principal philological works are respectively entitled *Ursprung und Entwicklung der menschlichen Sprache und Vernunft* (2d ed, 1899, Eng trans, 1880) and *Der Ursprung der Sprache* (1869). Consult L. Rosenthal, *L. Geiger* (Stuttgart, 1884).

GEIGER, LUDWIG (1848-) A German author and historian, born at Breslau. After study at Heidelberg, Göttingen, and Bonn, he became docent in history at Berlin in 1873 and in 1880 was appointed to a chair of modern literature there. His more important researches have been concerned with the history of humanism, to which he contributed such studies as *Nikolaus Ellenbog, ein Humanist und Theolog des sechzehnten Jahrhunderts* (1870), *Johann Reuchlin, sein Leben und seine Werke* (1871), *Petrarca* (1874), an examination of Petrarch's significance as author and scholar, and *Renaissance und Humanismus in Italien und Deutschland* (1882). He also revised Jakob Burckhardt's *Die Kultur der Renaissance in Italien* (7th ed, 2 vols, Leipzig, 1899). In 1880 he began the publication of the *Goethe-Jahrbuch*

and from 1886 to 1892 was proprietor and an editor of the *Zeitschrift für Geschichte der Juden in Deutschland* (5 vols.), in connection with which subject he published *Das Studium der hebräischen Sprache in Deutschland vom Ende des 15ten bis zur Mitte des 16ten Jahrhunderts* (1870) and *Geschichte der Juden in Berlin* (1871). Other works are *Vorträge und Versuche* (1890), *Berlin 1688-1840* (1893-95), *Das junge Deutschthum und die preussische Zensur* (1900), *Bettina von Arnim und Friedrich Wilhelm IV* (1902), *Aus Chamisso's Frühzeit* (1905), *Goethe und Zelters Briefwechsel* (1905), *Chamisso's Leben* (1907), *Chamisso's Werke* (1907), *Der Briefwechsel Goethes mit Humboldt* (1908), *Charlotte von Schüller* (1908).

GEIGER, NIKOLAUS (1849-97). A German sculptor and painter, born at Laungen, Bavaria. He was a pupil of Knabl at the Munich Academy. In 1873 he went to Berlin and soon became known through ornamental work in the Tiefe-Winkel Palace. After a visit to Italy he studied painting in Munich and in 1884 returned to Berlin, where he was awarded a gold medal in 1886, was elected member of the academy in 1893, and was made professor in 1896. His most important works in Berlin are the groups of "Inspiration" and "Homage of Art" (1886), in the Exhibition Building, the high relief "Adoration of the Magi" (1894), in St Hedwig's Church, the statue of Barbarossa for the Kyllhäuser monument, a statue of "Work" for the National Bank, Berlin, and "Centaur and Nymph," in the National Gallery. A frieze in relief for the Soldiers' Monument at Indianapolis may also be mentioned. His style is decorative, with a leaning towards the pictorial. His painting, "The Communion of the Saints," on the ceiling of St Hedwig's, Berlin, is the most noteworthy.

GEIGER, WILHELM (1856-) A German Orientalist. He was born at Nuremberg and was educated at the University of Erlangen, where in 1891 he became professor of Sanskrit and Indo-Germanic philology. In 1905 he became a member of the Landtag of Bavaria. He wrote *Handbuch der Awestasprache* (1879), *Ostirämische Kultur* (1882), translated into English as *The Eastern Iranians* (London, 1885), *Elementarbuch der Sanskrit-Sprache* (2d ed., 1909), *Ceylon* (1898), *Litteratur und Sprache der Singhalesen* (1901), and, as co-editor, *Grundriss der iranischen Philologie* (2 vols., 1885-1905), to which he contributed the portions on Afghan, Baluchi, and minor Iranian dialects, and on the geography of Iran. He also wrote *Dipavamsa und Mahavamsa und die geschichtliche Ueberlieferung in Ceylon* (1905), and *Mahavamsa* (1908-12).

GEIJER, JY'ER, ERIK GUSTAF (1783-1847). A Swedish historian, poet, and composer, born at Ransäter, Varmland, Jan 12, 1783, of parents who were of Austrian descent. He was educated at the Gymnasium of Karlstad and at the University of Upsala and in 1803 competed successfully for an historical prize offered by the Academy of Sciences at Stockholm. In 1806 he obtained his master's degree from Upsala and in 1809 traveled in England. The year following he became a lecturer in history at Upsala and in 1815 assistant to Fant. In 1817, on the death of his chief, Geijer was made professor in his place. In 1824 he was elected a member of the Swedish Academy. Geijer was

hardly less famous as a poet than as an historian, and he exercised a marked influence on the poetic literature of Sweden. According to the testimony of his countrymen, his *Sista Skalden*, *Vikingen*, *Odalbonden* and other heroic pieces place him in the foremost rank of Swedish poets. He and his friends Adalbeth, Tegner, and Nilsen adhered to the Gothic school of poetry, which owed its origin to the Society of the Goths, established as early as 1810, they published at the same time a magazine, *Iduna* (1811-24), in which first appeared several of Geijer's best poems. Great as is the value of Geijer's historical works, he did not complete any one of the vast undertakings which he planned. Of the *Speci Rikes hufder* (or Records of Sweden), which were to have embraced the history of his native country from mythical ages to his own times, he finished only the introductory volume. His *Scensha folkets historia* (3 vols., 1832-36), which was intended to form one of the series of European histories edited by Leo and Ukert, was not carried beyond the abdication of Queen Christina (1654), the reason probably being the author's conversion to liberalism in history and politics, yet, incomplete as they are, these works rank among the most valuable contributions to Swedish history. To Geijer was intrusted the task of examining and editing the papers which Gustavus III (qv) had bequeathed to the University of Upsala, with the stipulation that they were not to be opened for 50 years after his death. In fulfillment of his charge Geijer arranged these papers in a work which appeared in 1843-45 under the title of *Gustaf III's efterlemnade papper*, but they contained little or nothing of value. During the last 10 years of his life Geijer took an active part in politics, but although his political writings possess great merit, the very versatility of his powers diverted him from applying them methodically to the complete elaboration of any one subject. In 1828-30 and 1840-41 he was a member of the Swedish Diet as a representative of his university. In addition to being an historian, poet, and publicist, Geijer was well known as a musician and composer of no mean order. He set many of his own songs to stirring music, and hymns of his rendering appear in the Swedish Service Book. In 1814-15 he cooperated with Afzelius in producing a three-volume edition of Swedish folk songs of the Middle Ages. In 1846 increasing ill health forced him to resign his position as professor at Upsala. He died April 23, 1847, at Stockholm. He left some personal memoirs of value, *Minnen* (Upsala, 1834). His collected works, *Samlade Skrifter*, with a bibliographic treatise by Teodorblad (8 vols.), appeared at Stockholm (1873-75). His *History of the Swedes* down to Charles X was translated into English by Turner, with biographical introduction (London, 1845). For brief biographical treatises, consult Malmström (Upsala, 1848), Fries (Stockholm, 1849), Carlson (Stockholm, 1870), Niekse (Odense, 1902).

GEIKIE, GE'KI, SIR ARCHIBALD (1835-1924). A distinguished British geologist, born in Edinburgh, where he attended the high school and university. Becoming a member of the Geological Survey of Scotland under Murchison, he was raised in 1867 to the office of director. From 1871 to 1882 he held the Murchison professorship of geology and mineralogy in the University of Edinburgh, resigning the position

to become director general of the Geological Survey of the United Kingdom and director of the Museum of Practical Geology in London. He retired from these offices in 1901. Geikie rose to be an eminent authority and contributor on geological subjects. His studies in inorganic geology, particularly physiography, dynamism, and the structure of the earth, show a keen appreciation of natural processes, while his geological textbooks are models of arrangement, general balance, and facility of expression. He received the honorary degree of DCL from Oxford, that of DSc from Cambridge and Dublin, and that of LL.D. from Edinburgh, Glasgow, Aberdeen, St. Andrews, and other British universities. In 1891 he was elected president of the Geological Society of London and was knighted. He also served as president of the British Association for the Advancement of Science and as president of the Royal Society (after 1908). In 1897 Geikie visited the United States to deliver the first series of lectures on the George Huntington Williams foundation at Johns Hopkins University. He was created KCB in 1907, was awarded the Order of Merit in 1914, received gold medals from numerous scientific societies at home and abroad, and became a corresponding member of the French Institute. Among his more important works, some of which have passed through several editions, are *Scenery of Scotland, Viewed in Connection with its Physical Geography* (1869), *Field Geology* (1879), *Text Book of Geology* (1882), *Class-Book of Geology* (1886), *Ancient Volcanoes of Britain* (1897), *The Founders of Geology* (1897, 2d ed., 1906), *Types of Scenery and their Influence on Literature* (1898), *Scottish Reminiscences* (1904), *Landscape in History* (1905), *Love of Nature among the Romans* (1912).

GEIKIE, CUNNINGHAM (1824-1906). An English clergyman and writer. He was born in Edinburgh. He studied at Queen's College, Toronto, Canada, held Presbyterian pastorates at Halifax, Nova Scotia, and at Toronto, and later in England. In 1876 he took priest's orders in the English Establishment and was successively settled in Dulwich (1876), Paris (1879), Barnstaple (1883), and Norwich (1885). He retired to Bournemouth in 1890. His wide fame rests upon his *Life of Christ* (1876), his history of the *English Reformation* (1878), *Hours with the Bible* (12 vols., 1880-96), *The Holy Land and the Bible* (1887).

GEIKIE, JAMES (1839-1915). A Scottish geologist and author, brother of Sir Archibald Geikie, born at Edinburgh. He was educated at Edinburgh University, was appointed an assistant in the British Geological Survey in 1861, and in 1869 was made director of the Survey in Scotland. In 1882 he was elected to succeed his brother as Murchison professor of geology and mineralogy at Edinburgh University, where later he was made dean of the faculty of science. He wrote much on various geological subjects and especially those connected with glacial geology. His works include *The Great Ice Age* (1874, 3d ed., 1894), *Prehistoric Europe* (1882, 4th ed., 1903), *Outlines of Geology* (1884, 4th ed., 1903), *Songs and Lyrics of Heinrich Heine and Other German Poets* (1887), *Fragments of Earth-Lore* (1892), *Earth Sculpture or, The Origin of Surface Features* (1889, 2d ed., 1909), *Structural and Field Geology* (1905, 3d ed., 1912), *Mountains Their Origin, Growth, and*

Decay (1913), *The Antiquity of Man in Europe* (1913).

GEIL, gil, WILLIAM EDGAR (1865-1925). An American explorer and author. He was born near Doylestown, Pa., was educated at Doylestown Seminary, attended Lafayette College in 1890, and made archaeological studies in western Asia in 1896. In 1901 he started on a four-year world journey for comparative study of primitive peoples. He traveled in all parts of China, explored the Great Wall, and penetrated the pigmy forest of Africa. He also lectured in China, Japan, India, Australia, Great Britain, and the United States. His publications include *Pocket Sword* (1895), *Laodicea* (1898), *The Isle that is Called Patmos* (1898, 1905), *Ocean and Isle* (1902), *A Yankee on the Yangtze* (1904), *The Man of Galilee* (1904, 1906), *A Yankee in Pigmallyand* (1905), *The Men on the Mount* (1905), *The Automatic Calf* (1905), *Cannibals Before and After* (1907), *The Great Wall of China* (1909, 1911), *Eighteen Capitals of China* (1911).

GEILER VON KAYSERSBERG, gī'lē fōn kī'zērs-bērk, JOHANN (1445-1510). A famous German Catholic mystic and popular preacher, born at Schaffhausen, but brought up by his grandfather at Kaysersberg (Alsace), whence his epithet. He was educated at Ammersweier and at Freiburg and soon after his taking orders went (1471) to Basel, where he became dean of the philosophic faculty (1474) and a professor of theology (1475). A year later he returned to Freiburg and became rector of the university. In 1478 he became preacher at the cathedral of Strassburg and held this office for 32 years. In the nave of the cathedral is the pulpit built for him in 1481. He has been called "the German Savonarola." Of his sermons, the best known are the cycle based on Brant's *Narrenschiff* (1494) and called *Navicula sve Speculum Fatuorum* (1510). In the same satiric form and showing the same power and religious depth are *Das Schiff der Pontenz* (1514), *Der Seelen Paradies* (1510), and *Christliche Pilgerschaft* (1512), all first composed in Latin and delivered in German. His more important works may be found in De Lorenzi, *Geilers ausgewählte Schriften* (1881-83), with a biographical sketch, and an excellent biography and general criticism in Godeke, *Grundriss zur Geschichte der deutschen Dichtung*, vol. 1, p. 397 et seq. (1884). Consult Dacheux, *Un réformateur catholique à la fin du XVe siècle* (Paris, 1876), on which is based Lindemann, *Johann Geiler von Kaisersberg* (Freiburg, 1877), and Schmidt, *Histoire littéraire de l'Alsace à la fin du XVème siècle* (Paris, 1879).

GEILFUS, gī'l'fōos, GEORG (1815-91). A Swiss historian, born at Lampertheim, Germany. He studied at Gessen, and from 1856 to 1868 was superintendent of schools of Winterthur. Besides numerous minor writings, historical and biographical, he published the important work entitled *Helvetia Vaterländische Sage und Geschichte* (4th ed., 1879).

GEINITZ, gī'nīts, HANS BRUNO (1841-1900). A German geologist, born at Altenburg and educated at Berlin and Jena. He was appointed professor of mineralogy and geognosy at the Polytechnic Institute of Dresden in 1850 and was director of the Museum of Mineralogy there from 1857 to 1894. His works include *Charakteristik der Schichten und Petrefakten des sächsisch-bohmischen Kreidegebirges* (1843);

Die Versteinerungen der Steinkohlenformation in Sachsen (1855), *Geologie der Steinkohlen Deutschlands und anderer Länder Europas* (1865), *Carbonformation und Dyas in Nebraska* (1866), *Geologie von Sumatra* (1875), *Ueber fossile Pflanzen und Thierarten in den argentinischen Provinzen San Juan und Mendoza* (1876)

GEISHA, gā'sha (Chino-Japanese, person of pleasing accomplishments) One of a class of young women in Japan endowed with more than the ordinary share of personal attractions, elegant and accomplished in the arts of gayety and especially in music and the peculiar rhythmic dances of the country which form the chief feature at entertainments in the average social life of Japan. It is customary to speak of geishas as "singing girls." They correspond in some degree to the Alinceh of Egypt and other parts of the Orient. Usually the training of the girl begins when she is seven years old. The geisha is the imposing theme of a large number of rhapsodical and erotic writings on Japan, but in the new and better social life of Japan and reconstruction in national habits and ideals the solution of the geisha problem is a serious one. A capitation tax of one yen per month is levied on each geisha. Consult Bacon, *Japanese Girls and Women* (Boston, 1891), Chamberlain, *Things Japanese* (London, 1891), Grifis, *The Japanese Nation in Evolution* (New York, 1911), Lloyd, *Everyday Japan* (London, 1911), Nitobé, *The Japanese Nation* (New York, 1912)

GEISHUSLER, gis'hys-lër, OSWALD See MYCONIUS, OSWALD

GEISSEL, gis'al, JOHANNES VON (1796-1864). A German Roman Catholic prelate. He was born at Gimmeldingen in the Palatinate and was educated at the Episcopal Seminary in Mainz. He was ordained a priest in 1818. In 1819 he was appointed professor at the Gymnasium of Speyer, and three years later became canon of the chapter. He was made dean in 1836 and Bishop in 1837. In 1842 he became the coadjutor, and three years later the successor, of the Archbishop of Cologne. After the revolution of 1848 he was chosen a member of the Prussian Constituent Assembly, and largely through his influence the independence and rights of the church in Prussia were assured by the new constitution. In 1850 he was made Cardinal. He was a zealous defender of the Ultramontane position in Germany and distinctly favored the Jesuits. One of his most noteworthy achievements was the suppression of Hermesianism. (See HERMES, GEORG) The long-delayed completion of the Cologne Cathedral was undertaken about the time of his appointment as coadjutor, and in 1863 he celebrated its completion, except the towers. His writings, edited by Dumont (Cologne, 1869-76), include addresses, poems, and miscellaneous writings, and Dumont edited *Diplomatische Correspondenz über die Berufung des Bischofs Johannes von Geissel* (Freiburg, 1880). Consult the biography by Pfulf (Freiburg, 1895-96)

GEISSLER, gis'lër, HEINRICH (1814-79) A German scientific-instrument maker, born at Igelshieb, Saxe-Meiningen. After acquiring considerable proficiency as a glass blower, he established at Bonn, in 1854, his well-known factory for making chemical and other scientific apparatus. He was noted for his inventive genius and also for the excellence of the scientific instruments of his manufacture. The celebrated

mercurial air pump used for obtaining high vacua, and known as the Geissler pump (see AIR PUMP), was first constructed by him, as were also the well-known Geissler's tubes.

GEISSLER'S TUBES The general name for sealed vessels arranged to show the brilliant effects of electricity passed through rarefied gases. They usually consist of glass tubes and bulbs with platinum wires inserted to form the electrical connections. These tubes are filled with various rarefied gases and show an infinite variety of delicate lights in figures or patterns, depending upon the shape of the tubes, the arrangement of the wire connections inside, the gas contained, and the degree of rarefaction. The effects produced, besides being very curious, are of value to the investigator, as they afford a means of examining various incandescent gases with the spectroscope, and numerous other experiments.

GEIST, gist (Gei, spirit) Used oftenest in the compound term *Zeitgeist*, or 'spirit of the age,' 'time spirit,' introduced into English literary language by Matthew Arnold.

GEITNER, git'nër, ERNST AUGUST (1783-1852) A German chemist, born at Gera. After conducting a chemical factory at Lossnitz he founded another at Schneeberg, in 1815, which he conducted until his death. He was eminent as a chemical investigator and was the discoverer of the alloy *argentan*, or German silver. He also devoted considerable attention to the chemistry of dyeing and was the first to utilize chromic salts for animal and vegetable dyes. He published *Briefe über die Chemie und Die Familie West, oder Unterhaltungen über Chemie und Technologie*.

GETTONOG'AMY. See POLLINATION.

GELA (Lat., from Gk. Γέλα) In ancient times an important town on the southern coast of Sicily, on the river of the same name. It was founded by a Rhodian and Cretan colony (about 690 B.C.). Its rapid prosperity may be inferred from the circumstance that as early as the year 582 B.C. Agrigentum was founded by a colony from Gela. After Cleander had made himself tyrant in the year 505 B.C., the colony reached its highest power under his brother Hippocrates (498-491 B.C.), who subdued much of east Sicily. Gelon, the successor of Hippocrates, pursued the same career of conquest, and Syracuse itself fell into his hands and was even made his principal residence, Gela being committed to the government of his brother Hiero. Here Æschylus, after having been honorably received by Hiero, died and was buried about 456 B.C. During the Carthaginian wars Gela suffered greatly (405 B.C.), but its ruin was completed by Phintias, of Agrigentum, who before 280 B.C. removed the inhabitants to a town in the neighborhood which he had founded and named after himself. Its site is believed to be occupied by Terranova, at the mouth of the Fiume di Terranova. For the excavations there, consult Lubker, *Reallexikon des klassischen Altertums*, 8th ed. (Leipzig, 1914).

GELADA (jél'a-da) **BABOON** See BABOON

GELASIUS The name of two popes. 1. **GELASIUS I** (Pope, 492-496). He restated the supremacy of Rome over Constantinople and insisted on the removal of the name of Acacius, Bishop of Constantinople, from the official list of holy persons for whom prayers were to be offered. During his pontificate the canonical books of the Old Testament were determined by a council at Rome. He vigorously opposed the

Manichæan, Pelagian, and Arian heresies, and defended the purity of Christian life against immoral heathen practices. After his death he was canonized, his day being November 18. His works are in Migne, *Patrol Lat.*, lxx (Paris, 1844-80). Consult his life by Roux (Paris, 1880), the *Gelasian Sacramentary*, ed by Wilson (Oxford, 1894), McKilliam, *Chronicles of the Popes from St Peter to Pius X* (New York, 1912). 2 GELASIUS II (Pope, 1118-19). He was born of noble descent at Gaeta about 1050. He received his theological education in the abbey of Monte Cassino and afterward held the office of cardinal deacon under Urban II and of chancellor under Paschal II. On the death of Paschal II he was elected Pope by the cardinals Cencius Frangipani, a partisan of the Emperor Henry V, laid violent hands upon him and threw him into prison, but he was set at liberty through the general uprising of the people in his behalf. The sudden appearance of the Emperor, however, compelled him to leave Rome for Gaeta, and the Imperial party chose an antipope, Burdinus, Archbishop of Braga, Portugal, under the name of Gregory VIII. Gelasius held a council at Capua and excommunicated his rival and the Emperor. Returning to Rome, under the protection of the Norman princes, he lay concealed for a while narrowly escaping capture once more by the Frangipani, and, after wandering through Italy and France, died at Cluny in 1119. His letters are in Migne, *Patrol Lat.*, clxiii (Paris, 1844-80). Consult H. K. Mann, *Lives of the Popes in the Middle Ages* (9 vols., St Louis, 1914).

GELASIUS A SANTA CATHARINA. See DOBNER, JOB FELIX

GELATIN (from Neo-Lat *gelatina*, from Lat *gelatus*, p.p of *gelare*, to freeze, from *gelu*, frost), or **GLUTIN** (not *gluten*). A term applied to the purest form of glue. Gelatin is not found as such in animal tissues, but is obtained by the hydrolytic action of hot water or hot dilute acids on protein substances of the albumenoid or sclero-protein type, principally collagens. Skins or hides, tendons, hoofs, bones, muscle, intestines, bladders, etc., are utilized for making gelatin and glue. The former, however, is usually prepared from selected connective tissue in skins and bones and appears as a yellowish, transparent, brittle, tasteless, and odorless substance. The ordinary commercial process for preparing gelatin consists in carefully washing the connective tissue employed, then cutting it and digesting in a dilute solution of soda lye for 10 days at a moderate heat. The material is then removed into an air-tight chamber lined with cement, where it is heated at a temperature of 70° F. It is next transferred to revolving cylinders supplied with an abundance of clean cold water for washing and afterward is placed in another chamber, lined with wood, where it is bleached and purified by exposure to the fumes of burning sulphur, after which it is washed with cold water to remove traces of sulphurous acid. The next operation is to squeeze it as dry as possible and transfer it to the gelatinizing pots, which are large earthen vessels inclosed in steam-tight wooden cases. Into these vessels water is poured, and the mass is kept at a high temperature by means of steam coils surrounding the pots. By this process the gelatin is dissolved out of the tissue and is strained off while still hot. It is then poured out in thin layers, which, as soon as they are sufficiently cool and consoli-

dated are cut into small oblong plates and laid on nets to dry. If the solution is dark-colored, it may be purified by treatment with animal or vegetable charcoal. The gelatin of bones may be extracted on a large scale by the combined action of steam and a current of water trickling over their crushed fragments in a properly constructed apparatus. When the gelatin is to be used as an article of food, the bones must be quite fresh, well preserved in brine, or dried by a stove, and should be crushed by passing between grooved iron rollers. The purification of commercial gelatin may be effected by soaking in distilled water for some days in order to remove salts, dissolving in hot distilled water, and filtering while hot into 90 per cent alcohol. The gelatin then separates in the form of white thready masses, which can be subsequently dried. The pure gelatin thus obtained contains only about ½ per cent of ash. The ash of a high-grade gelatin should not exceed 2 per cent and should contain no heavy metals, such as copper. Glue may have 4 per cent or more of ash. The limit of sulphur dioxide (SO₂) in a standard gelatin is generally accepted as not more than 5 parts per 100,000. It should contain no appreciable amount of chondrin, a hoiny substance derived from cartilage and having a lower gelatinizing power than gelatin. When soaked in cold water for four hours and then made into a jelly by heating in water, it should give no offensive odor.

Although gelatin is classed as a protein, it differs from other proteins in dissociation products and in properties and cannot be considered a true protein food. It is known as a protein sparer and as such has a food value.

Gelatin is soluble in concentrated acetic and mineral acids, if thus treated, it loses its gelatinizing property, but the solution may be used as a cement for glass and for certain other purposes. In contact with cold water it takes up from 5 to 10 times its weight, swelling to an elastic transparent mass, which readily dissolves in warm water. On cooling, the solution "gelatinizes," and thus gelatin is extensively used for culinary purposes, being employed as a vehicle for other materials, e.g., in making jellies. Gelatin is further used in taking casts and impressions for electrotyping, and besides being employed for gelatin dry plates in photography, it is used in the carbon processes of photographic printing, which depends on the power of certain bichromates to render the gelatin insoluble when exposed to the action of light. This last property has also led to the use of gelatin as an insoluble glue or waterproofing material. Gelatin is one of the ingredients of printers' rollers, it is also employed in dyeing and as a size in paper making and painting. As a fining, it is employed in beer brewing, and it also finds application in medicine as a coating for pills and capsules. The crude gelatin, prepared by the simplest processes, is called *glue*.

Consult Davidowsky, *Practical Treatise on the Raw Materials and Fabrication of Glue, Gelatin, etc.*, trans by Brannet (Philadelphia, 1884), Standage, *Cements, Pastes, Glues, and Gums* (London, 1893), Thorpe, *Dictionary of Applied Chemistry* (1b, 1912). See also ISINGLASS. GLUE

GELATIN, VEGETABLE. See AGAR AGAR

GEL'ATIN PROCESS. Gelatin is used in many photographic and photomechanical processes as a vehicle for certain chemicals which

either alone or in combination are sensitive to the action of light and under its influence experience changes in their condition. The substitution of the gelatin film of the dry plate for the collodion surface of the wet plate was an important development in photography, while the fact that gelatin mixed with bichromate of potash becomes insoluble when acted upon by light furnishes the basis for many photographic processes. See PHOTOGRAPHY and PHOTO-ENGRAVING for a description of the more important uses of gelatin in photography and photomechanical printing processes.

GELCICH, gél'tsik, EUGEN (1854-) An Austrian naval expert and scientist, born at Cattaro, Dalmatia. He was director of naval schools at Lussinpiccolo and Trieste and in 1902 became chief inspector of commercial and naval schools in Austria. He wrote extensively on geographical and chronometric topics and magnetism, as well as studies on the discovery of America, such as *Geschichte der Uhrmacherkunst* (5th ed, 1887), *Estudios sobre el desenvolvimiento histórico de la navegación* (1889), *La scoperta d'America e Cristoforo Colombo nella letteratura moderna* (1890), *Die Uhrmacherkunst und die Behandlung der Präzisionsuhren* (1892), *Die astronomischen Bestimmungen der geographischen Koordinaten* (1904), *Weichs-Glon oesterreiche Schifffahrts-Politik und unseres nautisches Bildungswesen* (1912).

GELDERLAND, or **GUELDERS**. An eastern province of the Netherlands, bounded by the Zuyder Zee and the Province of Overijssel on the north, Westphalia and the Rhine Province on the east and southeast, north Brabant on the south, and south Holland and Utrecht on the west (Map Netherlands, D and E 2). Area, 1906 square miles. The northern part is sandy except in the eastern corner. The southern portion between the Rhine and the Meuse is low and marshy, but very fertile. The province is watered by the Rhine, Meuse, Waal, Barkel, Schipbeek, and a few smaller rivers. The chief occupations are agriculture and stock raising, and the products are exported, notably cereals, fruits, flax, tobacco, and horses. The manufactures include brick, cotton goods, paper, leather, footwear, and beer. The commerce is facilitated by a canal from Yssel to Zwolle. Pop., 1912, 662,250. Capital, Arnhem (qv).

History. Gelderland was a part of the Holy Roman Empire and first appears in history clearly as the County of Gelre, under Otto of Nassau, about 1061. In the first half of the fourteenth century it was one of the foremost provinces in the Netherlands. In 1339 it became a duchy, but soon thereafter the house of Nassau died out, and after a long struggle Gelderland, in 1379, was united to Julich. Continual wars about the succession devastated the country, and from 1472 to 1477 Charles the Bold of Burgundy held the duchy, his claims passing to his daughter Mary, wife of Maximilian of Austria. The latter, however, was unable to conquer the country, and only in 1543 was Charles V able to incorporate the country with the rest of his Empire. The larger portion, known as Lower Gelderland, shared the history of the rest of the Protestant Netherlands (See NETHERLANDS). Upper Gelderland remained with Spain, but was claimed by Frederick I of Prussia as Duke of Cleves and taken possession of during the War of the Spanish Succession (1701-13), and recognized as his in the Treaty

of Utrecht, but he could retain only a portion of it permanently, the rest going to Austria as a part of the Spanish Netherlands. Finally the Austrian portion fell to the independent Netherlands. During the French Revolution Upper Gelderland was united for a time to France by the Peace of Basel (1795) and Lunéville (1801). In 1815, by the Peace of Vienna, most of it was given to the Netherlands and the rest (around Dusseldorf) to Prussia. Consult Westerate, *Gelderland in den patriottentijd* (Utrecht, 1903).

GELDNER, gél'tnër, KARL FRIEDRICH (1853-) A German Orientalist. He was born at Saalfeld, Saxe-Meiningen, and studied at the universities of Leipzig and Tübingen. In 1887 he went to the University of Halle, and in 1890 to Berlin as professor associate of Indo-Iranian languages. In 1907 he was elected to the chair of Indo-Iranian languages at Marburg. His important publications are *Ueber die Metrik des jüngeren Avesta* (1877), *Studien zum Avesta* (1882), *Die Yasht aus dem Zendavesta* (1884), *Vedische Studien*, with Pischel (3 parts, 1889-1901), "Die altpersische Litteratur" in *Die orientalischen Literaturen* (1906), *Glossar zu den Rigveda* (1907), *Der Rigveda in Auswahl* (1907), *Zur Kosmogonie des Rigveda, mit besonderer Berücksichtigung des Liedes 10, 129* (1908), *Vedismus und Brahmanismus* (1911). He edited *Avesta the Sacred Books of the Parsis* (Stuttgart, 1886-95), *Grundriss der iranischen Philologie* (2 vols, 1896-1904), English trans by Mackichan in *Avesta, Pahlavi, and Ancient Persian Studies in Honor of the Late Sanjana* (Bombay, 1904).

GÈLE, zhél, ALPHONSO VAN (1849-) A Belgian explorer of Africa, born in Brussels. In 1882 he was sent to Africa and became administrator of the region near Stanley Falls. Three years later he revisited the Congo and explored its branches, subsequently tracing the Ubangi to long 23° E, and proving (1889) that the Ubangi was the same as the river that Schweinfurth had called Welle.

GELÉE, zhe-lá', CLAUDE (1600-82), generally called Claude Lorrain, from the country of his birth. A French landscape painter, the most important and influential master of the so-called Classical school, also an etcher. He was born in the village of Chamagne in Lorraine in 1600. His parents were of humble origin, and he was the third son of five children. He became an orphan at 12 and in consequence sought work for his own support, which led him to Rome about the age of 16. His talent and enthusiasm for art were aroused when he saw landscapes by a Flemish painter, Godfrey Wael, then residing at Naples. He made the journey on foot to Naples to discover the master of his choice and lived in the artist's family for two years, while he made special studies in architectural design and perspective. On his return to Rome he sought employment in the studio of Agostino Tassi, a pupil of Paul Bril, another landscape painter from Flanders. The subjects of Tassi's pictures were picturesque ruins, harbors crowded with fleets and throngs of men from all nations, which were reflected later in the works of Claude. In 1625 he visited Venice and several cities in Germany and France. On his return to Rome, where he lived for the rest of his life, he formed an intimacy with the painter Joachim Sandrart, to whom we owe his biography, and to whom Claude owed the incentive to study directly from

nature. He enjoyed the patronage of Pope Urban VIII, for whom he painted two pictures, now in the Louvre—the "Village Fête" and a "Seaport at Sunset." Pope Clement IX also conferred upon him many favors.

Thirty years of residence in Rome, studying the ancient buildings, made it possible for Claude to give to his pictures a true setting for the semipagan tastes of the ruling class. His popularity reached such a point that he found it difficult to supply the demand for pictures, and they brought such high prices that other artists plagiarized his style and name. In order to prevent the sale of fraudulent copies, he designed the *Liber Veritatis*, a book of 200 sketches in pen and ink wash, which could be used to verify the original work. It was reproduced in mezzotint by Earlom and published in two volumes in 1777, a third volume of 100 drawings was added in 1819. Three of the four paper books which composed the original are now in possession of the King of England. He worked up to the last year of his life, dying at 82 years of age, on Nov. 25, 1682. His character was without reproach, one of his chief traits was thoughtfulness for others. His testament gave instructions that his body should be buried in the church of Santissima Trinità de' Monti. The French government, in 1836, had the remains removed to the French church, San Luigi de' Francesi, near the Pantheon.

Claude Lorrain was by far the most important and influential painter of classic landscape during the seventeenth century, if not of all time. His influence affected the landscape of all European countries, especially that of England in the works of Richard Wilson in the eighteenth century and Turner in the nineteenth century. The subjects of Claude's works are marines and landscapes, often with sylvan groves and classical architecture. His technique is smooth, but expressed with great simplicity. His color is warm and rich in quality, often glowing with a yellow tone, producing brilliant effects of light reflected in the sky, clouds, and water. One of the charms of his pictures is the unlimited space they present, always interpreted with poetic feeling.

In 1630 he appeared as an etcher and engraver, on the 44 etchings ascribed to him there are at least 18 signatures, some in French and others in Italian. The technique of his drawings is curious, combining lines and wash. The lines are used only to emphasize the shadows and to delineate the figures.

Most of his paintings are in England, but he is also represented in all the important galleries of Europe. In the National Gallery, London, are the "Embarkation of the Queen of Sheba," "Embarkation of St. Ursula," a "Seaport," and others; in Madrid, the "Finding of Moses," "Embarkation of St. Paula"; in Munich, the "Expulsion of Hagar and Ishmael," "Hagar in the Desert"; in the Louvre (Paris), the "Landing of Cleopatra at Tarsus," the "Village Dance," six marine views, and two landscapes, in the Hermitage, St. Petersburg, the "Meeting of Jacob and Rachel," the "Flight into Egypt," "Apollo and Marsyas."

Bibliography. A contemporary account of Claude's life and art was written by his friend and fellow artist, Joachim Sandrart, *Teutsche Academie der edlen Bau-, Bild- und Malerkünste* (Nuremberg, 1675-79). Consult also D'Argenville, *Abrégé de la vie des plus fameux*

peintres (Paris, 1745), Cousin, *Du vrai, du beau, et du bien* (ib., 1853), and monographs by Sweetzer (Boston, 1878), Lady Dilke (London, 1884), Pattison, *Claude Lorrain, sa vie et ses œuvres* (Paris, 1884), Dullea, *Claude Gelée, le Lorrain* (London, 1887), Grahame, *Claude Lorrain, Painter and Etcher* (ib., 1895), Rouyer (Paris, n. d.), Rose, *Renaissance Masters and a Study of the Art of Claude Lorraine* (3d ed., New York, 1908). No satisfactory monograph on Claude Lorrain has as yet appeared.

GELERT, JOHANNES SOPHUS (1852-). An American sculptor. He was born at Nybel, Schleswick, Denmark (now Prussia), and came to the United States in 1887, becoming a citizen five years later. His studies were made at the Royal Academy of Copenhagen and in Italy, where a Danish government scholarship took him. He succeeded early in America and received many important commissions and honors. Among his more important works are the "Haymarket Monument" in Chicago, the statue of General Grant in Galena, Ill., "Hans Christian Andersen" and "Beethoven" in Chicago, "Denmark" (New York Custom House), and "Roman Civilization," four statues on the façade of the Brooklyn Institute Museum, "Gothic Art" and "Napoleon," St. Louis Museum, the statue of Col. J. F. Stevens, at Minneapolis, and the extensive decorations of the courthouse at Hackensack, N. J.

GELIGNITE. See EXPLOSIVES.

GELIMER, gél'i-mēr or jél'-, or GILIMER, gil'i-mēr or jil'-. The last King of the Vandals in Africa. He was a great-grandson of Genseric, the conqueror of Carthage, and founder of the Vandal Kingdom in Africa. After deposing his cousin, Hilderic, about 530, and occupying the throne, he was defeated (after he had put Hilderic to death) in the battles of Carthage and Tricamarum (533) by the Byzantine army under Belisarius, and brought as a captive to Constantinople. It is said that when he walked as a captive in the triumphal procession, he constantly repeated the words of Solomon "Vanity of vanities, all is vanity." He afterward retired to his domain in Galatia, which had been bestowed upon him by the Emperor Justinian.

GELL, gél, SIR WILLIAM (1777-1836). An English antiquary and traveler, the younger son of Philip Gell, of Hopton, Derbyshire. He was educated at Jesus College, Cambridge, and for some time was a fellow of Emmanuel College in that university. Save for a diplomatic mission to the Ionian Islands (1800) and his service of Caroline, Princess of Wales, mentioned below, he devoted his time principally to topographical and geographical studies and published in London the following works, which, though not marked by scholarship, contain much material of value: *The Topography of Troy* (1804), *The Geography and Antiquities of Ithaca* (1807), *The Itinerary of Greece with a Commentary on Pausanias and Strabo* (1810), *The Itinerary of the Morea* (1817, new ed., 1827), *Pompeiana or, Observations upon the Topography, Edifices, and Ornaments of Pompeii*, in conjunction with J. P. Gandy, an interesting and beautiful work (1817-19, Ser. 2, 1832), *Narrative of a Journey in the Morea* (1823), *The Topography of Rome and its Vicinity* (1834, new ed. by Bunbury, 1846), *Rome and its Environs* (map, 1834). In August, 1814, Caroline, Princess of Wales, consort of George IV, on her departure for the

Continent, appointed him as one of her chamberlains. In that capacity he attended her in various parts of Italy, but, being attacked with the gout, was soon obliged to resign his situation. In 1820 he was examined as a witness at the bar of the House of Lords during the proceedings against her after she became Queen and had returned to England. He testified in her favor. (See CAROLINE, AMELIA ELIZABETH.) Subsequently he resided in Italy, principally at Naples, having a house also at Rome, where he occasionally took up his abode. He died at Naples and was interred in the English burial ground of that city. His original drawings of classical ruins, about 800 in number, were bequeathed to the British Museum; these are exact and detailed.

GELLERT, gəl'ért, CHRISTIAN FURCHTEGOTT (1715-69). A noted German fabulist and professor, of unusual personal influence in his day. He was born at Hainichen, Saxony, and studied theology at Leipzig, where he afterward passed most of his life as tutor, teacher, professor, and author. His didactic and religious poems, fables, plays, and novels were in their day immensely popular, as were his lectures on morals and literature. His *Works* (10 vols., 1769-74 and 1867) are types of the innocuous and rationalistic. His *Fabeln und Erzählungen* (1746) and the religious poems are still often republished separately. His *Tagebuch* (1869) is the best available biography. Consult also his *Life* by Döring (Greiz, 1833).

GELLIUS, AULUS. A Latin author of the second century A.D. Little is known of his life. He is supposed to have been born at Rome, where, at all events, he studied rhetoric. Subsequently he proceeded to Athens to pursue the study of philosophy. On his return to Rome he entered upon a legal career, without, however, abandoning his literary pursuits. Gellius' well-known work, *The Attic Nights* (*Noctes Atticæ*), begun during the long nights of winter in a country house near Athens and completed during the latter years of his life, is a collection of miscellaneous matter on language, antiquities, history, and literature, in 20 books, of which the eighth is wanting. The work is destitute of any plan or arrangement, is disfigured by archaisms, and derives its value mainly from being a repository of curious knowledge, and by its preservation of many extracts from Greek and Latin works no longer extant. The *editio princeps* appeared at Rome in 1469, the earliest critical edition is that of Gronovius (Leyden, 1706), the most important editions are those of Hertz (Berlin, 1883-85, *editio minor*, Leipzig, 1886), and Hosius (Leipzig, 1903; this book contains a good bibliography of writings on Gellius). There are editions of selections, with notes by Nall (London, 1888), and Knapp (New York, 1895). There is an English translation by Beloe (London, 1795). Consult the Introduction to the edition by Knapp, Sandys, *A History of Classical Scholarship*, vol. i (2d ed., Cambridge, 1906), Nettleship, "The *Noctes Atticæ* of Aulus Gellius," in *Lectures and Essays* (Oxford, 1885), Knapp, "Archaism in Aulus Gellius," in *Classical Studies in Honour of Henry Drisler* (New York, 1894), Foster, *Studies in Archaism in Aulus Gellius* (ib., 1912).

GELNHAUSEN, gəl'n-hou'zen. An ancient town in the Prussian Province of Hesse-Nassau (Map Germany, C 3), situated on the river

Kinzig, 27 miles northeast of Frankfurt. It is surrounded by walls, and has the church of St. Mary, built in Transition style in the thirteenth century with four towers (recently restored), the Rathaus, a building dating from the time of Frederick I. and supposed to be a guild house, and a so-called Hexenturm (witches' tower). On a small islet in the Kinzig lie some well-preserved parts of an Imperial palace erected by Frederick Barbarossa in the twelfth century and destroyed by the Swedes in the Thirty Years' War. The town has also a monument to Philip Reis, the alleged inventor of the telephone and a native of Gelnhausen. The town once had the rank of an Imperial city and was the temporary residence of several emperors. It has manufactures of rubber goods, electric lamps, shoes, chemicals, cigars, sealing wax, organs, and has a trade in wine, fruit, and sandstone. Pop., 1910, 4859.

GELON (Lat., from Gk Γέλων). Tyrant of Gela and Syracuse. He was the son of Dimomenes and a native of Gela. His family was one of the oldest and most distinguished of that city. Gelon first figures in history as general of horse in the army of Hippocrates, Tyrant of Gela. On the death of the latter he contrived to obtain the supreme power, 491 B.C., and about 485 B.C. made himself master of Syracuse also, to which he transferred the seat of his government, and which he rendered the first Greek city in Sicily. All the inhabitants of Camarina, more than half of those of Gela, and many from other neighboring towns, he brought to Syracuse. His influence soon extended itself over a great part of the island. At the time of the invasion of Xerxes Gelon refused to come to the aid of the Greeks, ostensibly because they would not make him commander in chief. He soon after came into collision with the Carthaginians, but defeated them in a decisive battle at Himera in 480 B.C.—on the same day, it is said, on which the battle of Salamis was fought. He thereafter ruled in peace. He is praised as a merciful and wise ruler, who was beloved by his people and hailed as their deliverer and sovereign. After his death, about 478 B.C., he was honored as a hero. His brother Hiero succeeded him.

GELSEMIUM (Neo-Lat., from It *gelsomino*, jasmine, from Ar. *yasmin*, from Pers. *yāsmīn*, jasmine). A drug, consisting of the rhizome and rootlets of *Gelsemium sempervirens*, a climbing shrub of the natural order Loganiaceæ, having a milky juice, opposite lanceolate, shining leaves, and axillary clusters of from one to five large, funnel-shaped, very fragrant yellow flowers. The fruit is composed of two separable jointed follicles, containing numerous flat-winged seeds. The stem often runs underground for a considerable distance. The plant is a native of the United States, growing on rich clay soil by the side of streams near the coast, from Virginia to Florida and Texas. Its principal constituents are two alkaloids, gelsemine and gelseminine, a volatile oil, and gelseminic acid. The physiological action of the drug is to paralyze the motor centres, affecting successively the third, fifth, and sixth nerves. Its fatal action is due to asphyxia from paralysis of the respiratory centre. In large doses it produces alarming symptoms, which have terminated fatally. These appear to vary in different cases, but the more prominent are pain in the forehead and in the eyeballs, giddiness, a feeling of muscular fatigue, slurred pronunciation, labored respira-

tion, ptosis, wide dilatation of the pupils, and impossibility of keeping an erect posture. The mind in most cases remains clear until shortly before death. The earliest and most prominent symptom of a fatal or dangerous dose is the drooping of the eyelids, which indicates the immediate administration of stimulants, for when the paralysis of the tongue, which ensues, extends to the epiglottis, deglutition becomes impossible, and, unless the sufferer be placed in a forward position, the epiglottis is apt to fall back and close the windpipe. The antidotes which have been found most efficient are carbonate of ammonia, brandy, aromatic spirits of ammonia, and morphine. Gelsemium is not much used in modern medicine on account of its dangerous qualities and uncertain effects, but it has proved valuable in some cases of malarial fever and is occasionally used as a cardiac depressant and in spasmodic affections and as a remedy for rheumatism and neuralgia.

GELSENKIRCHEN, gél'zen-kirk'en. A thriving industrial town on the Rhine-Herne Canal in the Prussian Province of Westphalia, 5 miles north of Essen. It has extensive coal mines, large iron and steel works, rolling mills, soap factories, and flour and saw mills, manufactures boilers, glass, mirrors, soap, chemicals, safes, electric machinery, furniture, vehicles, bricks, leather; and carries on a trade in grain, wood, horses, and cattle. Its rapid growth is due to the large coal deposits discovered in 1855 in the vicinity. In 1910 5,630,000 tons of coal were mined. It was made a city in 1875. In 1903 several adjacent localities were incorporated with it, and the growth of the town since has been rapid. Pop., 1852, 844, 1900, 36,935, 1910, 169,513. It is the headquarters for many German labor organizations, and has a museum of fire protection.

GELVES, hel'vās, Los. A small island in the Gulf of Cabes, Mediterranean. It was the scene of a great battle between the Spaniards and the Turks in 1790. Combined land and naval forces of 13,000 Spaniards defended the island; but when the Turks attacked, the Spanish commanders deserted. The fleet of 65 vessels and 5000 men was immediately captured, and of the 8000 soldiers who stoutly defended the shore from their trenches only 1000 were left at the end of an eight weeks' siege, and most of them were slaughtered. It was a great blow, not only to Spain, but to all Christendom.

GEMARA, ge-ma'ra (Aram, complement). That portion of the two Talmuds, the Babylonian and the Palestinian, containing the annotations, discussions, and amplifications of the Mishna, or Talmudical law, by the schools of Babylon and Palestine. The Babylonian Gemara is far more complete than the Palestinian, as well as more lucid, and is a more highly valued authority. It was not completed till about 600 A.D. See MISHNA, TALMUD.

GEMATRIA. A Hebrew word, derived in a transliteral way from the Greek γεωμετρία, *geomatRIA*, geometry, and describing a system, of uncertain antiquity, by which the Scriptures were given mystic interpretation. Its process was to substitute for or find in a word another, the numerical value of whose letters totaled the same sum.

GEMBOURS, SIGEBERT OF. See SIGEBERT OF GEMBOURS.

GEMBOUX, zhan'blōō'. A town of the

Belgian Province of Namur, 24 miles southeast of Brussels (Map Belgium, C 4). It is noted for its Benedictine abbey, founded in the tenth century and now occupied by the Royal Agricultural College. It has large railway and engine works. Gembloux was the scene of the defeat of the Dutch by the Spanish under Don John of Austria in 1578. Pop., 1910, 4759.

GEM'INI (Lat., twins). The third constellation of the zodiac, containing the two bright stars Castor and Pollux, its sign is II. It contains a couple of interesting spectroscopic binaries, ζ and η Geminorum, the former has a period of 10 days, 4 hours, while the latter is a long-period variable of the Mira class and runs through its phases in 229 days. Two novæ have appeared in this constellation; the first was discovered by Turner as a star of the seventh magnitude at Oxford in 1903, and the second—of the fourth magnitude—by Enebo at Domaas, Norway, in 1912, they are now, according to Barnard, of the sixteenth and eighth magnitudes respectively.

GEMINIANI, FRANCESCO (1667-1762). A famous Italian violinist and composer, born in Lucca. He was a pupil of Lunati and Corelli (qv). In 1714 he went to London, where, through his sensational success as soloist and teacher, he exerted a lasting influence upon the art of violin playing. In 1749-55 he lived in Paris, after which time he returned to London. His original compositions consist of 12 violin sonatas and 12 concerti grossi. However, his most important work is *The Art of Playing on the Violin*, written in English and published in London in 1751. It is the first instruction book for the violin ever compiled, and in it the principles laid down by Corelli are fully explained.

GEMINUS (Lat., from Gk Γεμινός). A Greek writer, probably of the first half of the first century B.C. His birthplace is unknown, although Rhodes is often given. It is equally uncertain where he lived, the claim on behalf of Rome being insufficiently established. Of his works only one is extant, the *Introduction to Phenomena*, an astronomical work, published with Latin translation by Hilderic (Altorf, 1590), by Petau, in his *Uranologian* (Paris, 1630), and with a French translation by Halma, in his *Chronologie de Ptolémée* (Paris, 1819). Of his best works, the *Arrangement of Mathematics*, comprising at least six books, was the most important. Fragments of this work have been preserved by Pappus, Eutocius, and especially by Proclus, and form one of the chief sources for the study of the early mathematical history of the Greeks.

GEMISTUS (Lat., from Gk Γεμιστός), GEORGE, called GEORGIUS PLETHON, and more commonly GEMISTUS PLETHON. A Byzantine philosopher. The exact dates of his birth and death are uncertain, but he is known to have lived between 1350 and 1450. He was probably born at Constantinople, and the greater part of his life was passed in the Peloponnesus, where he probably died, almost a centenarian. He was one of the deputies sent by the Greek church to the council which was held at Ferrara and Florence in 1438-39, for the purpose of arranging a union between the Latin and Greek churches. Gemistus was more celebrated as a philosopher than as a theologian. In his time the Aristotelian philosophy reigned supreme, but it had degenerated into a mere science of

words, from the study of which Gemistus turned away disgusted and applied himself to Plato. Plato's philosophy so charmed him that thenceforward he devoted himself to its propagation, and in furtherance of this view, when in Italy, induced Cosmo de' Medici to embrace it. Cosmo's example was followed by others in Florence, and thus a Platonic school was founded in the West which flourished for nearly 100 years afterward. During the latter part of his life Gemistus was engaged in bitter conflicts with the most eminent of the Aristotelians, among whom George of Trebizond held a high position, and the discussion was carried on with unseemly violence. Consult Schultze, *Geschichte der Philosophie der Renaissance*, vol. 1 (Jena, 1874), Fabricius, *Bibliotheca Græca*, vols. viii, xii (12 vols, Hamburg, 1790-1809), Symonds, *The Renaissance in Italy*, vol. 11 (new ed., New York, 1897-98). For his own writings consult Migne, *Patrologia Græca*, vol. cix (161 vols, Paris, 1854-66).

GEMMÆ, jēm'mē (Lat., buds). Peculiar vegetative reproductive bodies which are formed upon the thallus of certain liverworts. See **HEPATICÆ**.

GEMMELLARO, jēm'mēl-la'rō, GAETANO GIORGIO (1836-1904). A Sicilian naturalist, born at Catania. He was educated in that city and in Naples and subsequently became professor and rector at the University of Palermo. His researches in archæology and volcanology are valuable, and the Monte Gemmellaro, a volcanic formation caused by the eruption of Mount Etna in 1886, was named after him. His works include *Descrizione di alcune specie di minerali dei vulcani estinti di Patagonia* (1854-56), *Pesci fossili della Sicilia* (1858); *Studi paleontologici sulla fauna del calcare a Terebratula janitor* (3 vols, 1868-76); *La fauna dei calcari* (1887-99), *I crostacei dei calcari* (1890), *I celalopodi del Frias superiore della regione occidentale della Sicilia* (1904).

GEMMI (gēm'mē) **PASS**. A mountain pass across the Alps in Switzerland, at an altitude of 7640 feet, and connecting the cantons of Bern and Valais. It contains a very dangerous mule path along which travelers are now not allowed to ride.

GEMMULE, jēm'ul (from Lat. *gemma*, little bud, dim of *gemma*, bud). In biology, (1) a mass of cells cut off from the parent for reproduction, (2) a hypothetical self-multiplying particle upon which inheritance depends.

(1) Among animals, gemmules are found in the groups of sponges and Polyzoa. In sponges, as winter approaches, numbers of the migratory cells form an aggregation in which two layers are eventually distinguishable. The central cells are loaded with yolk, the cells of the outer layer become club-shaped and arrange themselves in a sort of high epithelium. This layer of cells secretes a cuticular membrane around the inner mass of cells and forms a layer of dumbbell-shaped spicules close set in a radial fashion. The central cells are those from which the embryo is to arise next spring. The outer layer is protective. The gemmules thus constituted are set free when winter kills the sponge tissue. Next spring the inner cells grow and the bonds of the outer layer are broken. Such gemmules are found chiefly in fresh-water sponges, but within the last decade they have been found in marine sponges also. In the fresh-water Polyzoa the gemmules are of somewhat

different character and are called statoblasts. The statoblast arises in a special threadlike organ, the funiculus, that is composed of ectoderm within and of mesoderm without. The ectodermal core proliferates to form a hollow square, which later flattens and eventually produces the tough cuticula by which the statoblast is covered. The outer mesodermal layer thickens, stores food material, and becomes enveloped by the ectoderm. In addition to the cuticula, which the ectodermal layer secretes, the statoblast is often provided with spines and a float which permits the statoblast to swim. In the spring the embryo develops within the brown cuticula, bursts open this shell, and emerges to lay the foundations of a new colony. Both of the foregoing gemmules are devices for enabling the species to outlast the winter.

(2) The hypothetical material basis of inheritance called *gemmule* by Darwin has been recognized by one name or another by almost every philosophic writer in biology, other nearly or quite synonymous terms are the physiological units of Spencer, the bioblast of Beale, the pangene of De Vries, the plasome of Wiesner, the micella of Nageli, the plastidule of Haeckel and Ellsberg, the biophore of Weismann, somacule of Foster, idioblast of Hertweg, idiosome of Whitman, biogen of Verworn, and gemmule of Haeckel. The hypothesis has arisen on account of the necessity of assuming a structure to protoplasm intermediate between the visible foam-work and granules and the invisible molecules. The line of argument is briefly this. The qualities of the adult are inherent in the egg and also in each of the cleavage spheres, each quality is represented by material particles, which divide when the cell divides, the particles are not molecules, for it is hardly conceivable that a molecule stands for a somatic quality, therefore there must be some sort of unit groups of interacting and internally associated molecules. Darwin's hypothesis (see **PANGENESIS**) was that each cell threw off one or more gemmules, they floated in the blood to the germ cells and became lodged in these cells. Galton tested this theory by transplanting the blood of one species of hare into a second. The progeny of the second was not influenced by the blood of the first species. Weismann believed in no such migration of gemmules. The gemmules of the germ cells receive no influx of gemmules from outside by which their characters might be changed, on the contrary, the composition of the germ cells is unchanged, says Weismann, except as a result of crossing or internal spontaneous modifications. See **EMBRYOLOGY**.

GEMOT, ge-mōt' (AS *gemōt*, assembly). Among the Anglo-Saxons, a public assembly of freemen or men of noble rank for the purpose of legislative or judicial action, but *gemot*, or *moot*, is also used for any formal meeting. Besides the great council of the nation, the witenagemot (qv), there were among the Anglo-Saxons various minor motes, or moots, which were local bodies dealing with local affairs. There was a *shire-gemot*, or county court, which met usually twice a year; a *burg-gemot*, and a *hundred-gemot* (see **HUNDRED**) which met every month, and a *halle-gemote*, or lord's court. These institutions are regarded as being derived from the old Teutonic assemblies where every freeman had a voice, and where a clashing of arms betokened the approval, and a groan the rejection, of a plan.

GEMS (from Lat *gemma*) Precious or beautiful stones, especially those cut or engraved for use as jewels or seals. The art of engraving gems at the earliest period of the Egyptian monarchy was comparatively unknown, although beads and vases were cut out of many varieties of stone. About the beginning of the fourth dynasty scarabs (see *SCARABÆUS*) of obsidian or crystal began to take the place of the wooden cylindrical intaglios previously used as seals, of which a few examples have been found at Abydos and Nagada. Beginning with the eighteenth dynasty, scarabs are counted by thousands. While the beetle forms are usually naturalistic, the flat underside affords a splendid surface for hieroglyphic engraving. Historically the scarab is of especial importance, because adopted and improved by the Phœnicians, the Greeks, and the Etruscans. However, other forms were numerous in Egypt. An oblong of green jasper in the Louvre shows on one side Thothmes II (1800 B.C.) killing a lion, and on the other in his war chariot drawing his bow. A square signet of yellow jasper is in the British Museum engraved with the name, titles, and horse of Amenophis II (about 1450 B.C.). Figurines of deities and animals were carved out of amethysts, emeralds, agates, sardonyx, carnelian, obsidian, hematite, lapis lazuli, etc. There are in museums numerous cats, lions, crocodiles, eagles, frogs, hippopotami, and other symbols. Under the Ptolemies and Romans the Gnostic gems, called *abraxas*, generally of lapis lazuli, bloodstone, and jasper, began to appear, but these are made by the same process as the Greek, from which they were derived. The earliest engraved gems are Babylonian, always until a late period in the form of cylinders from 1 to 2 inches long and about $\frac{1}{2}$ or $\frac{3}{4}$ of an inch thick, pierced through their long axis for a cord or pin, and used for impressing the sign manual by rolling on soft clay. Their universal use multiplied them to such an extent that they form our main source of information as to the periods and themes of Babylonian sculpture, the favorite theme was the figures of the patron god and goddess being worshiped by the owners of the gem, and the figures are arranged in a single friezelike row. There are also many scenes purely mythological, such as the legends of Gilgamesh, the Babylonian Hercules, of Merodach, of Samas, of Raman, and other deities. The seals of the ancient kings Sargani (c 3850 B.C.), Naramsin (c 3800), and Ur-gur (c 2800 B.C.), of Gilgamesh breaking the lion's back, of the captives of Erech, are treated in a conventional style that indicates long traditions. These Babylonian traditions, together with the cylinder seal, were adopted by the Assyrians, but with less use of the nude and a narrower range of themes. Also the outlines are sharper and the details cleaner. It was the Assyrian style which most influenced the gem cutting of Persia, the seal of Darius, with the King in his war chariot, is only a puny copy of the corresponding spirited Assyrian scenes. In late Assyrian times the rolling cylinder was partly replaced by the conical signet with figures cut on the base. Meanwhile all the Orient had copied Babylonian models. The Phœnicians, Hittites, Syrians, and other races used cylinders of similar style. A cruder style, with animals and heads, came into vogue under the Parthians, often accompanied with Pahlavi inscriptions. Among the Jews the use

of signets (see *RING*) was common, and the breastplate of the high priest consisted of 12 cylindrical stones of different colors—sard, topaz, emerald, carbuncle, sapphire, jasper, jacinth, agate, amethyst, chrysolite, beryl, onyx—each engraved with the name of one of the 12 tribes, but no Hebrew engraved stones earlier than the fifth or sixth century B.C. are known. The earliest Greek engraved gems are those revealed by the recent excavations in Ciete. These are triangular prisms with hieroglyphs, dating from before 3000 B.C. and made of the native soft steatite, which later was superseded by the harder carnelian and chalcedony. About 2000 B.C. the picture signs began to be superseded by script, and simultaneously the engravers acquired great skill in rendering animal forms. The Cretans used engraved gems not only as seals but also for inlaying, and in the palace at Cnossus was found a lapidary's shop with unfinished pieces of marble, steatite, jasper, and beryl. Also prehistoric, and closely resembling the Cretan gems, are those unearthed by Dr. Schliemann at Mycenæ, where a lapidary's shop like the one at Cnossus has since been found. While there is no mention of seals in the *Iliad* or the *Odyssey*, Solon about 600 B.C. had a law forbidding engravers to retain the impressions of seals made by them. Mnesarchus, the father of Pythagoras, who lived about the same time, was an engraver of gems. Theodorus of Samos about 540 B.C. made for Polycrates the famous ring with engraved emerald that he tried to lose by throwing into the sea (Herodotus, III, 41). At the period of the Persian wars signet rings were in common use, and later the writings of the Platonists and Stoics constantly allude to gems. The flute player Ismenias (437 B.C.) purchased an emerald engraved with the figure of Amyclone. One of the Ptolemies presented as a most precious gift his portrait engraved on an emerald to Lucullus, and Cleopatra had a gem with Bacchus.

Although the principal varieties of decorative stones were known to the Greeks and Romans, yet, owing to the absence of scientific and chemical analysis, they appear to have distinguished them only by color, specific gravity, and density. The nomenclature, too, has caused confusion, so that it is impossible to identify all the stones mentioned by Theophrastus and Pliny. The ancients seldom engraved diamonds, rubies, or sapphires, being content with stones of less hardness and value. The principal stones they used were (1) the *carnelian* and its more transparent variety the *sard*, in common use in the days of Plato (so called from *Sais* in Lydia, but chiefly obtained from India and Babylonia), (2) the *chalcedony*, used for seals and reliefs, (3) the *onyx*, or nail stone, variously described by Pliny and his predecessors, but distinguished by a white layer resembling the nail, (4) the *nuculo*, or *Ægyptilla*, obtained from the onyx, a blue spot with a black zone encircling it, (5) the *sardonyx*, which was a variety of the onyx, having black, blue, white, and red colors, and particularly used for cameos and vases, by cutting down the lighter-colored layers to the darkest for a background to the figures, (6) the *agate*, or *achates*, so named from a Sicilian river, embracing many varieties, as the *jaspachates*, *dendryachates*, but confounded with the jasper, considered a charm against scorpions and spiders, used for whetstones, and as a talisman by athletes, and obtained from Egypt,

Greece, and Asia, (7) *plasma*, or the *prasius*, root of emerald, its varieties were the *molochates* and *nilon*, (8) numerous varieties of the *jasper*, green, blood red, yellow, black, mottled or porcelain, and even blue, were employed for signets at the Roman period, and procured from India, Persia, and Cappadocia, (9) *garnets*, the *granatici*, or red hyacinths of antiquity, principally in use in the latter days of the Roman Empire, (10) the *carbunculus*, supposed by some to be the name given by the ancients to the ruby, brought from India, Calamantis, Carhedon, and Anthemusia, (11) the *hyacinthus*, or *jacinth*, a yellow variety of the garnet, used for signets, and imported from Ethiopia and Arabia, (12) the *lyncurium*, or *lychnis*, the ancient name of the true modern jacinth, (13) several varieties of the *emerald*, or *smaragdus*, as the Bactrian or Scythian, supposed to be a green ruby, principally derived from the emerald mines at Zabora in the neighborhood of Coptos, (14) the *beryl*, obtained from India, cut in shape of a hexagonal pyramid, used at an early period and for engraving, (15) the *amethyst*, brought from Arabia Petraea and Armenia Minor, used for intaglios at all periods, (16) the *sapphirus*, supposed by some to be *lapis lazuli*, brought from Media and in use among the Egyptians and Persians, (17) the *anthrax*, supposed to be the ruby, (18) the *topaz*, a name applied by the ancients to a green stone found by the Troglodytes in the island of Cytis in the Red Sea, and first sent by Philemon to Berenice, out of which a statue of Arsinoe was made and placed in the so-called "golden temple" by Ptolemy Philadelphus, (19) the *chrysolithus*, (20) *chrysopraxe*, (21) the *magnes*, or *lodestone*, used for cylinders and gems of a late period, (22) the green *tourmaline*, or *avanturine*, (23) the *obsidian*, four elephants made of which were dedicated by Augustus in the Temple of Concord, besides which we read of a statue of Menelaus, made of the same material, returned to the Heliopolitans by Tiberius; (24) the *opal opalites*, obtained from India, the largest of which then known was of the size of a hazelnut, (25) the *adamas*, of which seven varieties were known to the ancients, used only for cutting other gems, or worn rough, but not engraved, or even faced. Other stones in Pliny's list had fanciful names, as (26) the *aromatites* of Arabia and Egypt, so called from its fragrance, (27) the *alektorius*, worn by the wrestler Milo, so called from being taken out of the gizzard of a fowl, (28) the *aspilates*, a fiery stone, said by Democritus to be found in the nest of the Arabian birds. In the selection of stones for engraving the gem engravers adapted the material to the subject. Bacchanalian subjects were often engraved on amethysts, marine, on beryls, martial, on carnelian, sards, and red jaspers; rural, on green jasper, celestial, on chalcedonies. Virtues were also superstitiously attributed to the different varieties of gems. Thus, the amethyst was supposed to be a protection against the influence of wine, and Hercules engraved on a Median stone, against colic.

Among Etruscan products were scarabs entirely carved out of sard, carnelian, and agate, with engravings often of exquisite work, but generally harsh, and sometimes of severe style, with subjects derived from the earliest Hellenic myths, and occasional inscriptions in the Etruscan language, the names of the personages repre-

sented, seldom more than one figure appearing on the gem. The subject is surrounded with a guilloche, or engraved border, and the scarabs were pierced through their long axis, to set as rings or to wear as other objects of attire. The contents of Etruscan tombs show how the numerous imported gems, both Oriental and Greek, furnished the models to native artists. The Romans of the later Republic collected and copied Etruscan and Greek engraved gems, largely set as rings. The device of Scipio Africanus was a head of Syphax, that of Sulla, the submission of Jugurtha, of Pompey, a lion carrying a sword, and of Cæsar, Venus armed with a dart. Scaurus, the stepson of Sulla, had a collection of gems, *dactylhotheca*. Pompey sent the collection of Mithridates as an offering to the Capitol, Cæsar, to outvie his great competitor, presented six such collections to the shrine of Venus Genetrix, and Marcellus, another to the cella of the Palatine Apollo. At the commencement of the Empire the portraits follow the costume and art of the period, the hair is expressed by broad strokes, the compositions rarely contain more than two figures. Artists of great merit were Dioscorides, Apollonides, and Chionius.

After the Antonines the art rapidly declined, and portraits after Severus are rare, although even that of Mauricius is said to occur. At the middle period of the Empire the work is exceedingly rude, often merely scratched out by a diamond point in carnelians, jaspers, and garnets. The gems of this latter period are sometimes square, generally, however, the long or convex oval. During the Empire, cameos (see *CAMEO*), or gems engraved in relief, the ancient *ectypa sculptura*, were much in vogue. The smaller ones were used for rings, the larger, which are often perforated, are supposed to have been often attached to the dress as *phaleræ*. They were worked out with the diamond point. The first great cameos are those of the Ptolemies, such as the great Naples cameo of Zeus by Sosus, that of Ptolemy and Arsinoe in the Hermitage of St Petersburg, the onyx cap of Ptolemy at the Cabinet des Médailles in Paris, the famous Farnese cup, the vase of St Martin d'Agaune—all masterpieces and serving as models for the artists of the Augustan age. To the early Roman Empire belong some superb pieces, such as the "Triumph of Augustus," a sardonyx in the Vienna collection, and the so-called "Apotheosis of Augustus" in the Bibliothèque Nationale in Paris, also a sardonyx. The composition in these Roman works is elaborate, and the figures numerous and sometimes in several rows. On the Vienna sardonyx Jupiter, Augustus, and Roma are enthroned above, in the middle row are Earth, Ocean, Abundance, Germanicus, Victory, and a triumphal chariot, while below are German and other captives. The cameo at St Petersburg is 1 foot long, and that in the Marlborough collection, with the heads of Didius, Julianus, and Mancio Scantilla, is 8½ inches long by 6 inches high. Still larger carvings are in the form of vases, cups, boxes.

The subject matter of classic gems embraces the whole circle of ancient art and follows the laws of its development, animal forms being succeeded by those of deities and subjects derived from the battles of Greeks and Amazons and centaurs, the exploits of Hercules and other heroes; then by scenes from tragedians and later

myths, and finally by portraits, historical representations, and allegories. The inscriptions consist of the names of artists (often forgeries), sometimes in the genitive case, but often accompanied with the verb *évolet*, made, addresses to individuals, gnomic or other sayings, indicating that the gems are amulets against demons, thieves, and various evils, or charms for procuring love, the names of the possessors, and sometimes addresses, occasionally even distichs of poetry, and various mottoes. These inscriptions were often added by subsequent possessors and are not of the age of the gem itself.

The chief implement used by the ancient engravers (see LAPIDARY'S WORK) appears to have been made by splitting diamonds into splints with a heavy hammer and then fixing these points like glaziers' diamonds into iron instruments, with which the work was executed by hand. The drill was often used for hollowing out the deeper and larger parts of the work, before the diamond point was brought into operation, and emery powder was used for polishing. The wheel, a minute disk of copper, secured to the end of a spindle, and moistened with olive oil, emery powder, or diamond dust, and driven by a lathe, does not appear to have come into use till the Byzantine epoch. It has been conjectured that the artist used lenses of some kind, or globes filled with water, to execute his minute work, but the ancient, like the modern engraver, rather felt than saw his way. A more primitive method was that in which nothing but a copper tool was used, moistened as described. A still more primitive technique is that of many rude, early, or provincial Babylonian cylinders, where the drill is the only instrument, and the forms are indicated either by larger or smaller hollows connected usually by straight lines.

The decadence in sculpture was very quickly felt in gem cutting, which produced little, and that of hardly any value, after the second century A.D. Even the small skill shown in Gnostic and early Christian examples was lost, and the Merovingian and Carolingian monarchs, except in the case of monograms engraved on signet rings, were obliged to use antique gems, instead of those engraved by the artists of their day. Rock crystals, however, were employed in a Byzantine style of art, with sacred subjects, in the ninth century, and a few other examples have been preserved in the treasury of St. Mark's at Venice, and in Paris (Bibliothèque Nationale). The art was all but lost in the West, except for a few pieces such as the Gothic rings of the Guerrazar treasury, the seal of Lothar at Aix-la-Chapelle, and the crucifix of Conques. It was revived during the pontificate of the Venetian, Paul II, himself a collector, by Lorenzo de' Medici (1449-92), who had Giovanni delle Corniole, at Florence, and Domenico dei Camei, at Milan, work under his patronage. A subsequent school of gem engravers originated with Pietro Maria da Pescia, who worked for Leo X, the chief representatives of the school are Michelino, Matteo de' Benedetti, the celebrated painters Francia, M. A. Moretti, Caradossa of Milan, Leonardo da Vinci, J. Tagliacarne, Giovanni Bernardi of Castel Bolognese, celebrated for a Tityus copied from Michelangelo. These were succeeded by Matteo del Nassaro of Verona, who worked for Francis I and produced a crucifixion on heliotrope, so that the red spots

seemed drops of blood issuing from the wounds of Christ, Caraglio, who flourished in Poland about 1570, Velerio dei Belli, who chiefly employed rock crystal, Marmita, Domenico di Polo, Nanni, Anichini of Ferrara, and Alessandro Cesari, celebrated for a cameo head of Phocian, Dei Rossi, a Milanese, who engraved the largest cameo of modern times, Giacomo da Trezzo, celebrated for its portraits, who is said to have been the first to engrave on the diamond (in 1564)—an honor disputed, however, by Birago, another Milanese, who made a portrait of Don Carlos and the arms of Spain on this gem.

The art, which had declined at the close of the sixteenth century in Italy, flourished in the seventeenth century in Germany under Rudolph II, for whom Lehmann engraved at Vienna, and in France, where Colderé worked for Henry IV and Louis XIII. In the seventeenth century Sirletti, who died at Rome in 1737, excelled in portraits and copied antique statues with great excellence. The two Costanzi were celebrated about 1790, one for the head of Nero on a diamond. Rega of Naples is said to have come nearest to the antique. Natter of Nuremberg, who died in 1763, is celebrated for his intaglios, Guay and Barrier were celebrated in the French school, and the English produced Reisen, who died in 1725, Claus, who died in 1739, Smart, celebrated for the rapidity of his works, and his pupil Seaton, a Scotchman, who engraved portraits of the great men of his day. The greatest artist of the age, however, was Natter. Of the subsequent Italian school, Ghinghi, Girometti, Cerbara, Bernini, and Putentati are much praised. The nineteenth century produced Marchant, Burch, Wray, and Tassie, while Pistrucci, celebrated for his charming cameos, Weigall, and Saulini, who made intaglios, complete the list.

With respect to ancient gems in the Middle Ages they were preserved in magnificent book-bindings—especially of manuscripts of the Bible—in reliquaries, ciboriums, shrines, chasses, and other ecclesiastical vessels, in which they were set. The collections of St. Mark's, Venice, of Aix-la-Chapelle and other churches, the Bibliothèque Nationale at Paris, the cabinets of the museums of Florence, Vienna, St. Petersburg, etc., show how this was done by Byzantine, Carolingian, Romanesque, and Gothic artists. The collecting of antique gems for their own sake, as examples of ancient art, commenced with Lorenzo de' Medici, who formed the Florentine collection and had his name incised on his gems. The large cameos of the European collections, however, appear to have been brought by the Crusaders from the East. The French collection dates from Charles IX and was augmented by the successive kings of France, it is very rich in gems of all kinds, that of Berlin, containing the united cabinets of the Elector of Brandenburg and the Margrave of Anspach, collected by Stosch, consists of nearly 5000 stones. The Vienna collection, far less numerous, is remarkable for its large cameos. In England the collection of the British Museum, collected originally by Townley, Hamilton, Payne-Knight, and Cracherode, consists of about 1500 stones, some of great beauty and merit, but is very poor in cameos. The private collection of the Duke of Devonshire, formed in the last half century, comprised upward of 500 intaglios and cameos, including some of the finest known. The Pulzky collection contains many rare and choice

intaglios A celebrated collection, the Poniatowski, formed upon the basis of the old collection of Stanislas, last King of Poland, was so filled with forgeries by its last possessor, executed by Roman artists, with inscriptions by Diez, that it entirely lost its value on dispersion. The Hertz collection was remarkably rich in fine Etruscan scarabæi and other intaglios. The Tyszkiewicz collection enriched the Boston Museum with many fine pieces. The Morgan collection, in the American Museum of Natural History, New York, begun in 1899 and added to since, is one of the largest. There are in existence probably about 10,000 gems reputed to be antique. Yet these are only a small portion of those formerly existing. During the Renaissance numerous and successful imitations (see GEMS, IMITATION) of antique gems were made and the signatures of Greek and Roman artists were manufactured. Such forgeries are still frequent.

Bibliography. The chief ancient literary sources of information about gems are Theophrastus, who wrote *περί λίθων* at the end of the fourth century B.C., and the thirty-seventh book of Pliny's *Natural History*, that is mainly a compilation from Theophrastus and other Greek and Latin authors, Babelon, *La gravure en pierres fines* (Paris, 1894), King, *Antique Gems* (London, 1866), id., *Antique Gems and Rings* (ib., 1872); id., *Engraved Gems* (ib., 1885), Middleton, *Engraved Gems of Classical Times* (Cambridge, 1891). A pioneer for the Babylonian, Assyrian, Syrian, Phœnician, and Hittite schools is Ménant, *Les pierres gravées de la Haute Asie* (1883-86). Consult also Dana, *Manual of Mineralogy and Lithology* (3d ed., New York, 1878), Kunz, *Gems and Precious Stones of North America* (ib., 1890), Furtwangler, *Die antiken Gemmen* (3 vols., Leipzig, 1900); Bauer, *Precious Stones* (Philadelphia, 1903), Claremont, *The Gem-Cutter's Craft* (London, 1906), Kunz and Stevenson, *The Book of the Pearl* (New York, 1908), Wodiska, *Book of Precious Stones* (ib., 1910), Osborne, *Engraved Gems* (ib., 1912), Kunz, *Curious Lore of Precious Stones* (Philadelphia, 1913), and on prehistoric Cretan gems, articles by A. J. Evans in the *Journal of Hellenic Studies* and other periodical publications. Important catalogues are Prendeville, *Antique Gems of Prince Pomiatowski* (London, 1857), *Engraved Gems in the British Museum* (ib., 1888), Babelon, *Le cabinet des antiques à la Bibliothèque Nationale* (Paris, 1887), id., *Catalogue des camées de la Bibliothèque Nationale* (ib., 1897); Southesk, *Catalogue of [his] Collection of Antique Gems* (London, 1909), Fitzwilliam Museum, *Catalogue of the Ivories, Gems, etc.* (New York, 1912).

GEMS, IMITATION AND ARTIFICIAL. The high appreciation in which gems were held by the ancients naturally led to the manufacture of imitations, and as early as the time of Pliny imitation opals and emeralds were well known. Seneca mentions that Democritus invented a process for making imitation emeralds by giving a green color to rock crystal. According to Thomas Aquinas, emerald, hyacinth, ruby, sapphire, and topaz were made in the twelfth century. The "Sacro Catino" of the cathedral of Genoa, and the celebrated table of Solomon taken by Vespasian from the temple at Jerusalem, are known to have been imitations. The powder of crystal was largely used in the manufacture of imitation gems among the Romans, with the result that thousands of spurious gems

accurately imitating the sapphire and the ruby were passed upon the uninitiated, indeed, modern examination shows that many of the famous gems of antiquity were made simply of glass.

Imitation Gems. Imitation gems may be divided into two groups, imitation and counterfeit. The first includes mineral substitutes and doublets and triplets, the second, gems made from natural substances by chemical means. The first class includes quartz, white Brazilian topaz, and the colorless varieties of beryl, emerald, sapphire, and zircon, which have been sold as diamonds. Colored varieties of quartz are frequently substituted for other gems, thus, the yellow varieties, as carnegorm and citrine, are sold as topaz, and the purple varieties of quartz as the Oriental amethyst. The application of heat to certain gems, such as topaz and sapphire, frequently renders them colorless and increases their brilliancy, in consequence of which they are cut and sold as imitation diamonds. Doublets and triplets are thin plates of a genuine gem attached to a valueless backing by means of a thin layer of gum mastic. Those imitation gems that are made by chemical processes are generally a special variety of glass known as *paste*, or *strass*, which consists of pure powdered quartz (preferably rock crystal) 38-59 parts, red lead 28-53 parts, and dry potassium carbonate 8-14 parts. These proportions admit of considerable variation, and arsenious oxide, borax, potassium nitrate, aluminum oxide, and calcium carbonate are frequently added. The ingredients are powdered separately, carefully mixed, and heated in a sand crucible. The heat is gradually raised to fusion and is maintained and carefully regulated at that temperature for about 30 hours, after which it is gradually lowered. The value of the product depends chiefly on the regularity of the temperature, the intimacy of the previous admixture, and the slowness of cooling, and is much increased by prolonged fusion.

This glass forms the basis of nearly all of the imitation gems, and the imitation diamonds are cut directly from it. The required tint for the colored gems is imparted by the solution in the paste of certain metallic oxides and other substances, as is shown in the following formulas. *amethyst*, paste 1000 parts, glass of antimony 8 parts, cobalt oxide 5 parts, purple of Cassius 0.2 part, *beryl*, paste 1000 parts, glass of antimony 7 parts, and cobalt oxide 0.4 part, *carbuncle*, paste 1000 parts, glass of antimony 500 parts, purple of Cassius 4 parts, and manganese dioxide 4 parts, *emerald*, paste 1000 parts, copper oxide 8 parts, and chromium oxide 0.2 part, *garnet*, paste 1000 parts, with variable proportions of purple of Cassius, *ruby*, paste 1000 parts, glass of antimony 40 parts, purple of Cassius 1 part, and gold 1 part, *sapphire*, paste 1000 parts, cobalt oxide 14-25 parts, *topaz*, paste 1000 parts, glass of antimony 40 parts, and purple of Cassius 1 part. The temperature at which these mixtures are fused, and the time occupied in fusion, naturally affect the product, and the proportion of the colorless ingredients also varies considerably. The manufacture of these imitation gems is an important industry in Switzerland and in various parts of France and Germany. Agate, carnelian, chalcedony, and onyx, for making jewelry and for engraving, have been artificially stained at Oberstein and elsewhere in Germany. The stone is soaked in oil or other organic liquid and

then boiled in strong sulphuric acid. The organic matter absorbed by the stone is thus carbonized, and a black color is produced. A red color may be obtained by soaking the stone in a solution of ferrous sulphate, and a deep blue color results by afterward soaking in a solution of potassium ferricyanide.

The manufacture of imitation pearls is an important industry. The pearls are made by coating the inner surfaces of glass beads with a preparation made from the scales of certain fishes. This extract is prepared as follows: Several pounds of scales are washed in fresh water to remove dirt, and they are then churned for several hours in cold fresh water, and the mass subjected to pressure in a linen bag. The silvery, lustrous runnings are caught and set aside, and the operation repeated until the scales have lost their silvery appearance. The runnings, to which a little ammonia has been added, are put aside to clarify, care being taken to prevent putrefaction. The sediment is washed repeatedly with fresh water and left to settle, when the washings are quite clear, the lustrous sediment is bottled with its own volume of alcohol, shaken, and allowed to settle. The alcohol is then decanted off, and the operation repeated until the sediment has lost its water and is of the consistency of butter. For use, the preparation is mixed in small quantities with a hot aqueous solution of gelatin, to which a small quantity of alcohol has been added. In the manufacture of colored pearls the desired shade is obtained by the addition of some suitable coal tar dyestuff.

Artificial Gems. As early as 1837 Gaudin obtained rubies by fusing alum in a carbon crucible at a high temperature, a small quantity of chromic oxide was used to give the red color. In 1847 Ebelman made the same experiment, using boracic acid as a flux. Sainte-Claire Deville and Caron, in 1858, described various processes by which they obtained small crystals of white and green corundum, rubies, sapphires, etc. Frémy and Feil, in 1877, were able to produce crystals that possessed the form of natural rubies and easily scratched topaz. Their process involved the fusion of lead oxide and pure alumina in a clay crucible, holding the mass in fusion until the silica of the clay united with the lead, leaving the alumina in crystallized masses. In 1888 Frémy and Verneuil announced their successful preparation of artificial rubies by heating to redness a mixture of barium fluoride and alumina containing a trace of potassium bichromate. In 1902-04 Verneuil described a new and eminently successful method of preparing gem rubies of large size and fine quality. The process makes use of a vertical oxyhydrogen blowpipe whose oxygen tube contains a fine screen through which finely divided pure alumina mixed with 2½ per cent of chromium oxide can be passed. Under the orifice of the blowpipe is a small rod of fused alumina on which the flame impinges. Using coal gas, the flame temperature is maintained at 1800° F. to 2000° F. with reducing action. The small particles of oxides falling through the flame melt and build up a pear-shaped mass on the lower support, which must be lowered as the mass increases. The rate of formation is 12 carats per hour, and the limit of size 80 carats. The annual output of the Paris factory is 5,000,000 carats, at an average cost uncut of 25 cents per carat.

Artificial Diamonds. J. B. Hannay (1880) and R. S. Maissen (1881) announced the production of artificial diamonds, subsequent tests proved their product to be carborundum. Later H. Moissan, by means of the electric furnace and the ingenious introduction of iron as a matrix, produced genuine diamonds of minute size. Moissan's process is briefly as follows: Pure iron is melted with excess of pure carbon prepared from sugar in the electric furnace, employing a temperature of 4000° C and using 700 amperes of current at 40 volts. The hot carbon crucible containing the molten mass is suddenly plunged in cold water and cooled below red heat. Under these conditions the cooling of the exterior exerts great pressure on the interior of the mass and causes part of the carbon to liquefy and deposit minute crystals. These crystals are subsequently recovered by dissolving the mass of cooled iron, and further purified from graphite and silica.

The electric furnace has yielded another product which, while, strictly speaking, it is not a synthetic gem, is nevertheless essentially an artificial gem. Imperfect rubies, chips, and small stones are fused in the furnace, together with a small amount of coloring oxide, such as that of chromium. The fused product is then cut and polished, and the result is a gem of good color and fairly large size. Emeralds and other colored stones have been made by this method, and so important has the industry become that the courts have been called upon to decide what constitutes an artificial gem. A decision which has applied to the rubies was obtained, in which it was decided that the word applied only to the red-colored corundum or anhydrous aluminum oxide that also occurs already formed in nature.

GEMSBOK, gënz'bök (Dutch, chamois buck). A large South and West African antelope (*Oryx gazella*), representing a group which contains the beisa (q v) and similar straight-horned antelopes of the North. (See ORYX.) It is a

HEAD AND HORNS OF GEMSBOK

heavy, stout animal, about 4 feet high, with rough reversed hair on the neck and along the ridge of the back, large pointed ears, and almost perfectly straight horns, sometimes over a yard long, in the plane of the forehead, little diverging, and ringed at the base. The record length is 47½ inches. The colors are harshly contrasted, dark rusty gray above, and white on the

underparts, separated by a broad dark-brown or black band, the head white, with black traverse bands, the thighs black, and the legs white. The hoofs are remarkably long and well adapted to the rocky mountainous districts which the animal frequents. It will thrive in utterly waterless and apparently barren deserts, goes about in pairs or small bands, and is by no means fleet of foot, but in lieu of speed for escape is able to defend itself against even the lion with its spearlike horns, which are sought by the negroes to be converted into weapons. Its flesh and hide are highly esteemed. The "bastard gemsbok" of the Boeis is the roan antelope (q v). See Plate of ANTELOPES.

GEMUNDER, ge-mun'der, AUGUST (1814-95). A naturalized American violin maker, born at Ingelfingen, Württemberg. With his brother George (q v) he learned his trade under the famous Baptiste Vuillaume, of Paris, but in 1846 he settled at Springfield, Mass., and established himself in business there. He speedily earned an international reputation and in 1860 moved his business to New York. Several famous violinists used his instruments, but perhaps his greatest masterpiece was the celebrated copy of Sarasate's Amati, which that artist pronounced equal to the original. He died in New York.

GEMUNDER, GEORGE (1816-99). A brother of August Gemunder (q v), born at Ingelfingen. He worked at violin making in Germany and France, followed August to the New World in 1847, and settled in New York in 1852. His instruments took the first prize at the great English Exhibition of 1851. In 1873 his copy of a Guarnerius was pronounced by the jury of awards at the Vienna Exhibition to be a genuine instrument. He claimed as the secret of his success that he did not use chemicals in the preparation of his wood, but instead used it in its natural condition. His instruments were even finer than his brother's and were beyond question the best violins ever made in the United States. He was the author of a book entitled *George Gemunder's Progress in Violin-Making* (Astoria, N. Y., 1881). His death occurred in New York.

GEN'ABUM CARNUTES, CHARTRES

GENALA, jà-na'la, FRANCESCO (1843-93). An Italian legislator, born at Soresina, Province of Cremona. He took a conspicuous part in regulating the finances of the city of Florence, where he was a lawyer after 1862, and where he published *Rappresentanza proporzionale* (1871). In the House of Deputies he was a member of the Left, and in 1883 was appointed Minister of Public Works in the Depretis cabinet, and held this portfolio again in Giolitti's cabinet of 1892-93. The leasing of the Italian railroads to three great corporations in 1885 was due chiefly to him.

GENA'VA. The Latin for Geneva (q v), a city in Switzerland.

GENAZZANO, jà-nát-sa'nò. A town in the Sabine Mountains, Province of Rome, central Italy, 27 miles east of Rome. It is famous for the chapel of the Madonna del Buon Consiglio, visited by many pilgrims, at the festivals of the Virgin, and for the old castle of Colonna. Pop (commune), 1901, 4121, 1911, 4206.

GENDARMES, zhàn'dárm' (Fr, men at arms). From 1445 to the time of the French Revolution, the most distinguished cavalry corps in the service of the French kings, to whom they

formed a sort of bodyguard. They were dressed in armor and had five soldiers of inferior rank to wait on them. Under existing arrangements the gendarmes constitute a military police and comprise both cavalry and infantry. The force consists principally of soldiers taken from the army, generally on account of intelligence and good conduct. The men receive much higher pay than the rest of the army, of which, however, the corps is a part, liable in cases of emergency to be sent on active service. The gendarmes amount to about 21,000 men and are intrusted with the execution of many of the most delicate details of government. They form a national police, embracing all the departments and colonies of France. In war they are employed for the maintenance of order in camp and on the march. Germany and Russia likewise possess a force of similar nature, combining the functions of soldier and national police officer. These are mostly employed on patrol duty in rural districts and on the border. Consult H. Delattre, *Esquisse historique de la gendarmerie française* (Paris, 1885).

GENDER (OF *gendie*, *genre*, Fr *genre*, from Lat *genus*, race, from *gignere*, to beget, Gk. *γίγνεται*, *gignesthai*, Skt *jan*, to be born). A grammatical category, commonly regarded as indicating the sex of a noun. Gender is either grammatical or natural. In the former case there is no necessary coincidence of sex and gender. Thus, Lat. *femina*, woman, is both naturally and grammatically feminine, but Lat. *mensa*, table, is naturally sexless and grammatically feminine. In natural gender, on the other hand, sex and gender must agree, as in Eng *man* (masculine), *woman* (feminine), *thing* (neuter). In the Indo-Germanic languages (q v) the inflectional group, as Greek, Russian, or German, have grammatical gender, while the analytic group, as English or Persian, have only natural gender, except in a few apparent instances, as Eng *ship*. Gender in all Indo-Germanic tongues is divided into three classes: masculine, feminine, and neuter. It was long supposed, according to a theory promulgated by Jakob Grimm (q v), that grammatical gender depended upon personification, that, in other words, a noun had sex ascribed to it on account of some attribute, either real or fancied. Thus, Lat. *sol*, sun, was masculine because of its burning rays and the energy which it imparts to all human activity; *luna*, moon, was feminine as being gentle and calmly beneficent, *mare*, sea, was neuter from its obvious sexlessness. The faults of this theory in a wider study of language, e.g. the fact that *Sonne*, sun, is feminine in German, while *Mond*, moon, is masculine, led to a rejection of Grimm's theory and the substitution of entirely new hypotheses. A study of gender, however, as of all primary linguistic categories, is incomplete if the Indo-Germanic languages alone are considered. Natural gender, the application of which is too obvious to require exemplification, is found in practically all languages, even the most primitive, many of which have no grammatical gender, as in Dinka Negro (*tye dāonkor*, female horse; *muor adžnd*, bull fowl), Melanesian and Polynesian (as in the dialect of the island of Viti, *a toa tainane*, of fowl male, *a toa alewaq*, of fowl female), or Annamese (*kon-trar*, son child; *kon-gai*, daughter child). Other languages have a division into animate and inanimate, as Algonquin, Iroquois, and Cherokee, or the Dra-

vidian high caste and low-caste genders. More elaborate schemes are also found, as in certain languages of the North Caucasian group, which have six genders—for animate and inanimate, rational and irrational, masculine and feminine. (See GEORGIAN OR IBERIAN LANGUAGE.) It seems safe, therefore, to conclude, on such analogies as these, that the most primitive form of the pre-Indo-Germanic languages also had a natural rather than a grammatical gender. The question then arises as to the origin of grammatical gender. This problem, one of the most difficult of all those presented by linguistic science, has been answered in several ways, and all theories concerning it must be regarded, in the present state of linguistic knowledge, as merely tentative. Of the two most plausible, the first is the one defended by Brugmann (q v). The masculine-neuter must be set over against the feminine. In this all scholars of prominence are agreed. It is then to be noted that the nominative plural neuter and the so-called nominative singular feminine are identical in their termination, as Vedic Skt *yugā*, yokes (classical Skt. *yuganti*), and *sēnā*, army (cf. with shortened final syllable, Gk *δῶρα*, gifts, with *χώρα*, land, Lat *oppida*, towns, with *animā*, soul, while Oscan and OChurch Slav retain representatives of original *-ā* in the neuter plural, as Oscan *priftū*, things proved, beside *iuu*, way, and OChurch Slav *iucha*, garments, beside *noga*, foot). Again, in Greek and Avesta a neuter-plural subject takes a singular root, as *rā olkē-mata ēperon*, the buildings fell, *yū iaiasaite*, what things shall be done. In view of facts like these, the feminine singular is regarded as a collective, originally identical with the neuter plural. This has an interesting and suggestive analogue in Arabic, where the so-called broken plural, which is preeminently a collective word, takes its verb in the feminine singular, as *jā'a rajulun*, there came a man, but *jā'at rijālun*, there came men. The termination of the broken plural is also often identical with that of the feminine singular, as *ikhwatun*, brothers, from *akhun*, brother (cf. *malikātun*, queen, from *malikun*, king). This theory, however, is not altogether adequate, and it has been supplemented by such scholars as Wheeler and Jacob. They have pointed out the influence of the pronoun, whose declension was perhaps once entirely unrelated to that of the noun, upon the noun. Here the origin of grammatical gender seems to lie. It is true that the feminine singular was originally a collective noun, merely differentiated in meaning from the neuter plural, and that it was occasionally concretized to denote a female being, as in the case of the Gk *γυνή*, woman, Boeotian *παρά*, Skt *gnā* (originally 'bearings' in the discrete, then 'bearing' in the abstract, finally she who bears' in the concrete). From such instances many words in *-ā* were termed feminine by analogy (q v). On the other hand, the pronoun in all languages expresses natural, not grammatical, gender, denoting male, female, and sexless. The feminine singular of the pronoun may have terminated originally in *-ā*, like its neuter plural, but independently of it, differing herein from the noun, as already stated. On account of the true feminine termination of the pronoun, the collective noun, which chanced to coincide with it in form, was regarded as feminine, and by analogical extension a numerous class of "feminines," some female and others sexless, was

evolved. In this way the so-called feminine gender probably arose. The so-called masculine gender was similar in development. The neuter originally differed from the masculine only in the nominative singular (as Lat *servus*, *servum*, slave, but *templum*, *templum*, temple), and its plural, except for the collective form in *-a* (the so-called nominative and accusative, as *templa*, temples), was merely an extension analogical with the masculine. The neuter seems to have been a passive noun, while the masculine was active, and it was thus originally identical with the so-called accusative or objective case (cf. Lat *servus currit*, the slave runs, but *servum cadit*, he kills the slave, with *templum cadit*, the temple falls, and *templum eruit*, he pulls down the temple). The principle of personification, on which Grimm laid such emphasis, was developed after, not before, grammatical gender. The original independence of natural gender is seen from the so-called epicene nouns, which have but one grammatical gender for both natural ones, as Lat *lepus*, hare (masculine), *vulpes*, fox (feminine), Ger *Hase*, hare (masculine), *Mause*, mouse (feminine), which leads to such apparent incongruities as *vulpes mascula*, male fox, *weiblicher Hase*, female hare. With the decay of the inflection grammatical gender is gradually disappearing, and the more primitive system of natural gender, so long superseded, is resuming its original position, so that the classification of nouns as masculine, feminine, or neuter is being based more and more on sex, and not gender.

In English, where grammatical gender does not exist, natural gender is indicated in three ways. The first and most common method is by distinctive terminations for the feminine, especially by *-ess* (of Romance origin), as *emperor*, *empress*, *lion*, *lioness*, *count*, *countess*; and also by *-ia* (of Latin origin), as *executor*, *executrix*, *-ine* (of Latin-Romance origin, primarily an adjectival formation of relation, as Lat *regina*, queen, lit. kingly woman), as *hero*, *heroin*, and other more sporadic terminations. The second method is by prefixing words denoting the sex, as *he-goat*, *she-goat*, *manservant*, *maidservant*, etc. The third method is the use of different words for the two sexes, as *king*, *queen*, *boy*, *girl*, *stag*, *hind*, and the like.

In the highly inflected languages there are certain terminations distinctive of the different genders. It is probable, indeed, that originally every noun or adjective had a suffix indicative of the sex, real or imaginary, of the object designated, although, like other inflections (q v), these suffixes of gender were in process of time mutilated beyond recognition or in many cases altogether worn off. The terminations most characteristic of the three genders in Latin are *masc us*, *fem a*, *neut um*, corresponding to the Greek *os*, *ē*, *on*. In a great majority of the adjectives in both those languages the genders are thus marked. In English the gender of a noun affects only the personal pronoun substituted for it; in most other languages the adjectives (including the articles) have different forms for the several genders—a useless complication, in the case of modern languages at least. See ADJECTIVE.

The prevalent feminine termination in German is *-in*, as in *Tänzerin*, a female dancer (Fr *danseuse*); of this there are two instances in English, in the provincial *carlin*, the fem of *carl*, and *wixen* = Ger. *Fuchsin*, a female fox.

This affix was already in use in Latin, as in *regina*, a queen (*reg(s)*), a king), and in this form it is used in Europe generally to feminize proper names, e.g., *Georgina*, *Wilhelmina*, *Caroline*.

In such pairs as son—daughter, man—maid, horse—mare, cock—hen, there is no etymological relation between the words, they are from distinct roots. But with regard to *hen*, e.g., the Anglo-Saxon had the two forms, *han* for the male, and *hen* for the female, and *mare* was originally applicable to both sexes, as *horse* still is (cf Fr *maréchal*, Frankish *marahskalk*, originally an officer who had charge of the horses, *marah* being the equivalent of the Eng *mare*). The oldest-known form of the Teutonic speech, the Gothic, had the two words *magus*, son, and *magaths*, daughter, both from the root *mag*, to beget, or to make. *Magaths* has become in Ger *Magd*, in Eng *maid*, *magus* has been lost in the Teutonic tongues, but it is possibly represented by the Celtic *mac* (son), which may be derived from the same root. *King*, *queen*, were in Skt *gamika*, father, and *gona*, mother, both from the root *gan*, to generate, produce. The masculine form appears in OGer as *chünig*, in mod Ger *könig*, in Eng *king*, the feminine was represented by the Gk *γυνή*, a woman, as well as the Saxon *cwen*, Swed *qvinna*, OEng *quene* or *quean* applied to a woman generally, and the modern *queen*, the chief woman of the land. See GRAMMAR.

GENEALOGY, jěn'ě-ăl'ō-jī or jě'ně- (Lat. *genealogia*, Gk *γενεαλογία*, pedigree, from *γενεαλόγος*, *genealogos*, one who draws up a pedigree, from *γενεά*, *genea*, family + *-λογία*, *-logia*, account, from *λέγειν*, *legen*, to say). The science whereby the history of the origin and descent of a family or race may be ascertained. There has been a growing interest, especially in the United States, in matters pertaining to genealogical research, and although it is not of sufficient importance to rank as an independent science, it forms a very important part of history. This is largely due to the growth of the patriotic hereditary societies which have flourished so extensively in the United States since 1890. In these organizations membership is granted only to those who are descended from an ancestor who was conspicuous in some historic event. Its literature is for the most part shut up in the archives of historical libraries, but that natural instinct which prompts one to love the place of his birth and the chief circumstances in the lives of his progenitors is gradually attracting the attention of the intelligent public.

From the earliest times, genealogy has always formed the basis of all true history. In the ancient records of Assyria, Egypt, and Arabia, the lineage of an individual was the thread upon

which were strung the stirring events of centuries, and so important a place did its preservation occupy among the Jewish people that it was established as a positive obligation upon every Levite of the temple. Nor was this genealogical form of history peculiar to Semitic races. The first Greek records were those of ancestry. The progress of civilization in states, and in particular the institution of corporations and guilds in the towns, afforded a wider scope for genealogy. But the absence of criticism and the desire to flatter the great were the causes of introducing the most ridiculous fables into genealogy. Ancestors were fabricated in the most impudently false manner, and families carried back in an unbroken line, not only to the age of Charlemagne, but even, in many cases, to the heroes of the Trojan War. The fact, however, is that scarcely any family, however distinguished, can trace its ancestors even to the middle of the eleventh century.

GENÉE, zhe-ná', ADELINE (1878–) A noted ballet dancer, born at Aarhuus, Jutland, Denmark. She first danced in public when only eight years old, and in 1895 she had become principal dancer at the Copenhagen Opera House. After appearing in the opera houses of Berlin and Munich she entered upon a 10-year engagement with the Empire Theatre of Leicester Square, London, in 1897, taking leading parts in all the notable ballets there produced. In 1908 she appeared with great success in "The Soul Kiss," in New York City and subsequently toured the United States in the same ballet. She played return engagements in New York in 1909, 1910, and 1912, reappeared in London in 1911, and toured in Australia in 1913.

GENÉE, zhe-ná', RICHARD (1823–95). A German opera composer and librettist, born at Danzig. Upon abandoning medicine for music he became a pupil of Stahlknecht in Berlin. He held many important appointments, principally as orchestra leader, in the following towns and cities: Riga, Reval, Cologne, Aix-la-Chapelle, Danzig, Düsseldorf, Mainz, Schwerin, Amsterdam, Prague, and Vienna. His operettas had considerable local success, but are little known abroad. They are as follows: *Der Geiger von Tirol* (1857), *Der Musikfeind*, *Die Generalprobe*, *Rosina*, *Am Runenstein* (1868), *Der Seekadett* (1876), *Der schwarze Prinz*, *Im Wunderlande der Pyramiden*, *Die letzten Mohikaner*, *Die Piraten*, *Nisida*, *Zwillinge*, *Die Dreizehn* (1887). He also wrote some of his own librettos, and others for Millöcker, Strauss, and Suppé. His death occurred at Baden, near Vienna.

GENÉE, RUDOLF (1824–1914). A German author and Shakespearean reader. He was born in Berlin, a son of Friedrich Genée, formerly stage manager of the Königstädtisches Theater in that city. He at first devoted himself to wood carving under Professor Gubitz, but later wrote several successful plays, of which the comedy entitled *Das Wunder*, performed at the Court Theatre, Berlin, in 1854, was particularly successful. For a time, as editor of the *Danziger Zeitung* and of the *Koburger Zeitung* (1861–64), he published his *Frauenkranz*, a series of readings on dramatic female figures in history. It was at Coburg that he began his public readings of Shakespeare, which he continued with marked success at Berlin, Dresden, Vienna, and

other cities of Germany His works include *Geschichte der shakespeare'schen Dramen in Deutschland* (1870), *Shakespeares Leben und Werke* (2d ed, 1874), *Hundert Jahre des königlichen Schauspiels in Berlin* (1886), *Marienbourg*, a novel (2d ed, 1886), *Bismarckade* (1891), *Zeiten und Menschen* (1897); *W Shakespeare in seinem Werden und Wesen* (1905)

GENELLI, jâ-nêl'le, BONAVENTURA (1798-1868) A German painter and designer. He was born in Berlin, the son of Janus Genelli, a landscape painter Although he painted biblical and mythological subjects, he was more celebrated for his bold and ingenious designs after the manner of Carstens He had the imagination of a poet, but in working rarely soared beyond contour and silhouettes Everything was sacrificed to line He essayed much in water color and oil, but failed to express himself with success in those mediums He was a pupil of the Berlin Academy, where he studied under Bury and Hummel, and also spent 10 years in Rome, where he was especially influenced by Koch, Cornelius, and Friedrich Müller In 1836 he settled at Munich, where he lived in poverty, but executed his principal works In 1830 he removed to Weimar, where he was appointed professor Among his best designs are the copper prints of the "Life of a Prodigate" and the "Witch" He also designed 48 outline illustrations for Homer and 36 for Dante In the Leipzig Museum are his water color "Triumph of Bacchus and Ariadne" and four others The Vienna Academy possesses 284 of his plates, and six of his best oil paintings are in the Schack Gallery, Munich, including "Hercules and Omphale," "Abraham and the Angels," and a drop curtain with allegories He died in Weimar, Nov 13, 1868 Consult Pecht, *Deutsche Künstler des 19 Jahrhunderts* (Ser 2, Nordlingen, 1879), and Muther, *History of Modern Painting* (4 vols., London, 1907)

GENERAL (Lat. *generalis*, general, belonging to a race, from *genus*, family, from *gignere*, to beget) A military rank and title denoting an officer holding a general command, or a rank and grade equivalent thereto In modern armies, practically every officer commanding an organization of troops larger than a regiment is a general officer In the United States the rank has the following grades brigadier general, major general, and one lieutenant general in supreme active command of the army as a whole Officers of other ranks are sometimes given the temporary and relative rank of general, as inspector general, judge advocate-general, quartermaster-general, etc In European armies the rank of general is a step higher than that of lieutenant general, and is the next in importance to field marshal in England, and to marshal in the armies of continental Europe See RANK AND COMMAND

The title is also applied in the Roman Catholic church to the superior head, under the Pope, of a religious order The governing authorities of the monastic orders may be arranged in three classes (1) the superiors of individual convents or communities, called in different orders by the various names of abbot, prior, rector, guardian, etc (2) the provincials, who have authority over all the convents of an entire province, the provinces, in the monastic sense of the word, being usually coincident as to local limits with the several kingdoms in which the

order is established, (3) the general, to whom not only each member of the order, but all the various officials of every rank, are absolutely subject The general is usually elected by the general chapter of the order, which, in the majority of orders, consists properly of the provincials, with whom, however, are commonly associated the heads of the more important monasteries, as also the superiors of certain subdivisions of provinces The office of general in most orders is held for three years In that of the Jesuits it is for life, but in all, the election of the general chapter must be confirmed by the Pope In most orders, too, there is assigned to the general a consultant (*admonitor*) or associate (*socius*), who, however is only entitled to advise and has no authority to control the superior The general also is supposed to consult with, and to receive reports from, the various local superiors He sends, if necessary, a visitor to inquire into particular abuses or to report upon such controversies as may arise, and he holds a general chapter of the order at stated times, which differ according to the usage of the several orders The general is exempt from episcopal jurisdiction, being subject to the immediate jurisdiction of the Pope He lives in Rome, where he has certain privileges, the most important being the right to sit and vote with the bishops in a general church council

GENERAL EDUCATION BOARD An organization established for the purpose of distributing gifts made by John D Rockefeller for educational purposes It was chartered by Congress in 1903 The board has received gifts from Mr Rockefeller amounting to \$50,000,000, of which \$30,000,000 has been set aside as endowment As will appear below, it is the policy of the board to make its gifts to existing agencies and institutions, and accordingly it does not undertake independent educational work The gifts are made mainly for the four following purposes:

1 The promotion of practical farming in the Southern States After a careful study of educational conditions in the South the board decided that the problem which needed greatest assistance was the improvement of farming and of rural life in general Through the Department of Agriculture the board has, since 1906, made appropriations amounting in 1912-13 to \$659,700 for the purpose of promoting agriculture by the establishment of demonstration farms under the direction of the late Dr Seaman A Knapp According to recent reports, 236 men were engaged in supervising such farms, while 23,301 farmers were employing improved methods under their direction, and these in turn were influencing the work of nearly 200,000 farmers in the South In connection with the public schools State agents have been appointed to conduct demonstration work among boys under actual farming conditions and by the establishment of corn clubs To improve home life and household management in connection with the farms, girls' clubs have also been organized—some under the titles of girls' canning and poultry clubs.

This form of plea survives and retains its principal characteristics even under the reformed systems of pleading which, in England and many of the United States, have supplanted the common-law system. See PLEA, PLEADING

The general staff corps of the United States army, created in conformity to the Act of Congress approved Feb 14, 1903, and subsequently amended, is composed of 4 general officers (the chief of staff, the assistant chief of staff, the chief of the division of militia affairs, the chief of the coast artillery corps), 4 colonels, 6 lieutenants, and several hundred non-commissioned officers.

tenant colonels, 12 majors, and 12 captains. Two of these, the chiefs of coast artillery and of the division of militia affairs, are members of the general staff corps by law. All the other officers are detailed for service in the corps for a period of four years under rules of selection prescribed by the President. Upon expiration of the four-year detail these officers return to the branch of the army in which they hold permanent commissions. The law established the general staff corps as a separate and distinct staff organization, the chief of which has supervision, under superior authority, over all branches of the military service, line and staff, with a view to their coordination and harmonious cooperation. The general staff corps, under the direction of the chief of staff, is charged with the duty of investigating and reporting upon all questions affecting the efficiency of the army and the state of preparation for military operations. It prepares plans for the national defense, studies possible theatres of war and strategic questions in general, and collects military information at home and abroad.

The members of the general staff are assigned to two general classes of duty: first, to duty on the staff of commanders of armies, divisions, separate brigades, and territorial departments—these officers are collectively known as the *general staff serving with troops*; second, to duty under the immediate direction of the chief of staff at the War Department, Washington, D. C. The latter constitute the *War Department general staff*. The senior of the general staff officers on the staff of a commander is called the chief of staff of that command. He sees that the ideas, intentions, and decisions of the commander are executed, coordinates the work of all the other staff officers, is responsible for the performance of the necessary reconnaissance and security of the command, establishes an *information division*, exercises a general supervision over all records and returns, and sees that a war diary is kept.

All vacancies below the grade of brigadier general are filled on the recommendation of a board of five general officers of the line, not more than two of whom shall be general staff officers. Since its creation by law in 1903, the general staff corps, composed of officers from the line of the army, to which they return after a four-year detail, has fully justified its existence by steadily and progressively increasing the administrative and fighting efficiency of the army. Consult *United States Army Regulations* (Washington, 1913) and *Field Service Regulations, United States Army* (ib., 1914). See **STAFF, ARMY ORGANIZATION**.

GENERAL THEOLOGICAL SEMINARY.

The leading seminary in the United States of the Protestant Episcopal church. The seminary was established by order of the General Convention in 1817, and instruction was begun in New York City in 1819. In 1820 the seminary was removed to New Haven, but was reestablished in New York in 1822 on a part of the plot of land given in 1819 by Clement C. Moore. For many years the seminary suffered severely from financial deficiencies, and it was not until the administration of Eugene A. Hoffman, dean of the school from 1878 until his death in 1902, that it was placed upon an independent basis. Dean Hoffman's personal gifts to the seminary were most generous. The theological course proper extends over three years, and there is

also a graduate course. The degrees of D.D. and B.D. are conferred; the former is both a higher academic and an honorary degree, while the latter is conferred on graduates of any theological seminary of the Episcopal church or of any church in communion therewith who has accomplished prescribed work and written a thesis satisfactory to the faculty. This degree is not conferred "in course" nor "honoris causa." The control of the seminary is vested in a board of trustees composed of the presiding Bishop of the church, the Bishop of the diocese in which the seminary is located, the dean of the seminary, and 10 bishops, 10 presbyters, and 10 laymen elected by the General Convention, and three bishops, three presbyters, and three laymen elected by the alumni of the seminary. The student attendance in 1913-14 was 137. No tuition fee is charged, and prizes of value are offered. Within 30 years the student body has largely increased, and extensive buildings have been erected, including the library (59,000 volumes), Hoffman Hall, the chapel of the Good Shepherd, and nine dormitories. The productive funds in 1914 amounted to about \$2,170,000. The dean in 1914 was W. L. Robbins, D.D.

GENERATION. See **REPRODUCTION**.

GENERATION (Lat. *generatio*, from *generare*, to beget, from *genus*, family). In mathematics, the formation of a magnitude or geometric figure by the movement of another magnitude or figure. For example, a moving point describes a line, a moving line, in general, describes a surface, and a moving surface, in general, describes a geometric solid. An angle is said to be generated by revolving a line about a fixed point from an initial position. A figure called the *generatrix*, moving according to a fixed law, generates a particular figure called the *generant*, e.g., a straight line moving so as constantly to pass through a given curve, and to remain parallel to its original position, generates a cylindrical surface. The given curve is called the *directrix*. The volume of a ring generated by revolving a polygon about an axis not cutting the polygon is equal to the area of the polygon multiplied by the length of the path of the mean centre of the polygon. This proposition is known as Pappus's or Guldin's theorem, Pappus (qv) being the real discoverer.

GENERATION, ETERNAL. See **TRINITY, DOCTRINE OF THE**.

GENERATIONS, ALTERNATION OF. See **ALTERNATION OF GENERATIONS**.

GENERATIVE CELL. A term, technically applied in seed plants to the first cell which appears in the sperm series. In gymnosperms (pines and their allies) it is the cell which divides to form the stalk and body cells, the latter of which subsequently divides to form the male cells. In angiosperms (true flowering plants) it is a cell which is formed by the first division of the nucleus of the pollen grain and in turn by division forms the male cells. See **SPERMATOPHYTE**.

GENERATOR, ELECTRIC. See **DYNAMO-ELECTRIC MACHINERY** and **Plate**.

GENERATRIX. See **GENERATION**.

GENESEE (jén'e-sé') **RIVER** (Amer. Indian, shining valley, or beautiful valley). A river which rises in Potter Co., Pa., and which empties into Lake Ontario 7 miles north of Rochester (Map New York, C 4). It is about 135 miles long and is navigable for lake vessels.

for only 5 miles. At Portage there are three falls of 65, 90, and 110 feet respectively, and within the city of Rochester there are three more of 96, 26, and 83 feet, all of which furnish excellent water power.

GENESEO, jĕn'-sĕ's. A city in Henry Co., Ill., 20 miles east by south of Moline, on the Chicago, Rock Island, and Pacific Railroad (Map Illinois, D 3). It is the seat of the Geneseo Collegiate Institute and contains a city hospital and public library. It is in a rich agricultural and stock-raising region, has a canning factory, and has extensive trade in farm products and live stock. Under a charter of 1865 it is governed by an annually elected mayor and a unicameral council. The city owns and operates its water works. Pop., 1900, 3356, 1910, 3199.

GENESEO. A village and the county seat of Livingston Co., N. Y., 28 miles by rail south of Rochester, on the Genesee River, and on the Erie Railroad (Map New York, C 5). It is the seat of a State normal school and has the Wadsworth Public Library. The village is in an agricultural region, has a large vegetable canning factory, and manufactures jam, flour, gloves and mittens. The water works are owned by the municipality. Pop., 1900, 2400, 1910, 2067.

GENESIS (Lat. from Gk *γένεσις*, *genesis*, origin, from *γενεσθαι*, *gignesthai*, to become). The name given in the Greek version to the first book of the Bible. In the Hebrew canon it is called *B'reshith* (in beginning), from the initial word, in the Talmud it is sometimes referred to as "the Book of Creation." The Masoretic division into 12 *parashoth* (out of 54 in the Pentateuch), or 45 *sedarim* (out of 154 in the Pentateuch), is based on the custom of reading through the Law in one year or three years respectively; the division into 50 chapters is of Christian origin, 20 of the breaks being contrary to Masoretic custom. R. Solomon b. Ismael (c 1330 A.D.) adopted the Christian numeration of chapters and placed the numerals in the margin of the Hebrew Bible, for controversial purposes, in order to facilitate reference to particular passages. In the Complutensian polyglot the Masoretic sections were disregarded, and in 1517 Felix Pratensis indicated in the margin the Christian chapters in Hebrew letters. A much earlier division seems to be indicated by the inscription *Toledoth* (generations, history), which occurs 10 times in the course of the book. The book naturally falls into two parts, chaps 1-xi and xii-l. The first extends from the beginning to the call of Abraham and includes the accounts of creation, the fall, the generations between Adam and Noah, the deluge, the giants, the tower of Babel, and the dispersion of the human race, and the generations between Noah and Abraham. The second gives the history of the patriarchs—Abraham, Lot, Ishmael, Isaac, Jacob, Esau, and Joseph—and concludes with the settlement of Jacob's family in Egypt.

The Jewish canon makes Genesis the first of a series of five books, which it comprises under the term *Torah*, or Law, and according to the tradition of the synagogue Moses was the author of all of these books. There is no intimation in Genesis itself as to its authorship. But since, in spite of its distinct subject matter and origin, it forms a natural and appropriate introduction to the history of Moses and the legislation, it

was inferred at an early age and long maintained that Genesis too was written by the author of the following books, who was held to be Moses. Some indications of a later date, such as references to Dan, the Canaanites who were then (in the time of Abraham) in the land, the kings who reigned in Edom before there was a king in Israel, and some other facts, led many scholars, among them Ibn Ezra, Carlstadt, Masius, Perena, Hobbes, Spinoza, Simon, and Le Clerc, to believe that there was post-Mosaic material in the book. In order to offset the tendency to deny the Mosaic authorship, Astruc published in 1753 his conjectures as to the documents that may have been used by Moses in Genesis. He observed that in some sections one divine name (Yahwe), in other sections another (Elohim), was employed by preference, and assumed that these sections represented different documents written by various patriarchs and incorporated by Moses in his narrative, and that he used also certain shorter fragments. Through Eichhorn, Ilgen, and a long line of distinguished scholars this conjecture was further developed. A particularly clear description of these sources was given by Hupfeld. By the end of the nineteenth century a very large number of Protestant, and some Catholic and Jewish, scholars had reached the conclusion that three documents, usually designated as J, E, and P, and some fragments made up the Book of Genesis. The prevailing view was that J, the Judean or Yahwistic document, was written in the ninth or eighth century, but subsequently enlarged, that E the Ephraimite or Elohist document, was about a century younger, and was likewise amplified before the union of the two, and that P, the Priests' Code, was post-exilic and also somewhat expanded before the final redaction of the Pentateuch. As further research seemed to show that the same documents were used in Exodus, Leviticus, and Numbers, the defenders of the Mosaic authorship, among them such Protestant scholars as Hengstenberg, Keil, and Green, and such Catholic scholars as Welte, Knabenbauer, Ubaldi, Kaulen, and Cornely, rejected the critical analysis, while those who accepted this analysis either rejected the Mosaic authorship of the Pentateuch in toto, or ascribed to Moses only some sections distinctly claimed for him in the other books, but not the Book of Genesis. (See PENTATEUCH.) Recently some independent scholars, among them Eerdmans, Wiener, Dahse, and Schmidt, have been led by text-critical studies to abandon the current system of analysis. They do not deny, however, the composite origin of Genesis or of the Pentateuch, but only the applicability of the criteria generally relied upon in the analysis of sources and the consequent division. Thus, Schmidt has shown that in the story of the garden of Eden, regarded as the finest and most characteristic example of the Yahwist's art, the Greek translator in the third century B.C. in all probability had before him a Hebrew text in which the divine name Yahwe was never used, yet he does not doubt the separate origin of the two stories of creation (q.v.). Eerdmans has given good reasons for rejecting the theory that the names Jacob and Israel are characteristic of the supposed Yahwistic and Elohist documents, but he recognizes that the name Israel was used in a different source from that which employed Jacob. Dahse has called attention to the fact

that interpolations and additions are likely to occur at the end of pericopes, and this is an important consideration, even if the annual and triennial sections are too late to furnish a clew to the earlier booklets, and Wiener has emphasized the need of separating the accretions and taking note of the marked changes the text has undergone in the course of its transmission. These investigations seem to point the way to a new theory as to the origin and growth of Genesis as well as the rest of the Pentateuch.

Archaeological discoveries in western Asia have in recent times brought us into more direct contact with the social life and the world of thought in which the stories recorded in Genesis are likely to have developed. There is no room for doubt that the accounts of creation, the first man (see ADAM), the tree of life (see EDEN), the antediluvian patriarchs, the deluge (q v), and the tower (see BABEL, TOWER OF) were derived from Babylonian stories, ultimately of Sumerian origin. But while it was at first thought that familiarity with these would not be possible in Palestine before the invasions of Assyrian armies, or even before the settlement of Jewish exiles in Babylonia after 586 B.C., it is now known that Babylonian myths had traveled as far as into Egypt in the fourteenth century B.C. (see ADAPA), and many scholars regard it as probable that they were already told among the Amorites (q v) long before the immigration of Hebrew tribes into Syria, which may have begun in the fifteenth century B.C. (See JEWS, TEL EL-AMARNA TABLETS). There is, indeed, nothing that forbids the assumption that in their original form they were committed to writing by the Hebrews as soon as they became acquainted with the Semitic alphabet. (See ALPHABET.) In view of the cuneiform tablets found in Syria it is not even inconceivable that some Hebrews may have known this system of writing and thus had a means of learning something of Babylonian lore which had found its way into the land of the Amorites. But of this there is as yet no evidence. It should be observed that some scholars, notably Gunkel and Gressmann, who maintain the current documentary hypothesis and the dates usually assigned to the sources, are quite ready to admit that these Babylonian myths may have been known in Palestine and among the Hebrews centuries before they were given their present form by the supposed Judean and Israelitish writers. The patriarchal stories clearly have their home in the Negeb (q v). They were first told concerning the heroes of Hebron, Beersheba, Beerlahairoi (Ain el Muweilih), and probably the southern Bethel (Halasa). Even Jacob lived in "the vale of Hebron" (Gen xxxvii 14). As these stories spread to the north, they naturally received here and there an Israelitish setting. How early the Negeb heroes were connected with Babylonia and Mesopotamia on the one hand, and Egypt on the other, is not easily determined. It has been maintained that the term "Ur of the Chaldees" was possible only in the time of the Chaldean Empire (625-539 B.C.), but it is not improbable that the city of Ur was largely inhabited by Chaldeans already in the Kassite period, and some of the succeeding dynasties on the throne of Babylon may have been Chaldean. (See BABYLONIA.) It is not the Aramæans of Damascus, but those of Mesopotamia, who flourished at an earlier period, that figure in the amplified story of Abraham, Isaac, and Jacob

Steindorff and Lagarde attempted to prove that such Egyptian names as those in Gen xli 45—Zaphenath-paneah, Asenath, and Potiphara—as well as the designation of Pharaoh, did not become common before the twenty-sixth dynasty, and that consequently the Elohist could not have written before the middle of the seventh century, and it has been widely held that these names are due to a reviser of the document. As names of this type are rarer in earlier days, and some of them tend to disappear later, it is not impossible that they are interpolations made at this time, but such names occur sporadically at least as early as the twenty-second dynasty, and familiarity with Egyptian names is not improbable in Syria in the age of Solomon and Rehoboam. An important observation, bearing on the age of the stories in Genesis, has been made by Soderblom (*Gudströms uppkomst*, Stockholm, 1914). He calls attention to the striking contrast between the conception of the divinity that prevails in Genesis and that of Yahwe in the story of Moses. Whatever the name may be, El, El olam, El Bethel, El shaddai, El elyon, Elohim, or (in our present text) Yahwe, there is a marked distinction in character between him and the terror-inspiring, jealous god of Sinai, whom Soderblom regards as an animistic divinity, while the deity in Genesis reminds him more of the originators, or creators, of primitive peoples. (See CREATION.) It would certainly be strange if these stories were written down, in the days of Elijah or Isaiah, by the same men who related the awful dealings of the god proclaimed by Moses. This also seems to militate against the theory of a Mosaic authorship. Besides, the patriarchal narratives reveal an acquaintance with Palestine, its many sanctuaries, and the often divergent etymologies of their names which many students regard as an evidence that they were written there, and not by one who according to tradition never was in that country, and they give the impression of having been written originally in Hebrew, and not in Egyptian hieroglyphics or Babylonian cuneiform writing, such as might have been known to an Egyptian in the fifteenth century B.C., and, so far as we now know, Hebrew was never written with the wedge-shaped signs.

As to the historical value of Genesis, there is much difference of opinion. The obvious fact that even the earlier stories show a remarkable suppression of mythical elements characteristic of the Babylonian originals is still interpreted by some as evidence of a primitive tradition preserved in relative purity among the Hebrews, while it has been overlaid with polytheistic, mythical, and superstitious features in the pagan narratives. Most Protestant scholars, however, seek to account for the difference by the gradual growth of monolatry and monotheism in Israel and no longer attempt to harmonize the stories in the first part of Genesis, which they regard as of mythical origin, with the results of modern scientific and historical investigation. On the other hand, there are not a few scholars who consider Abraham an historic personality and are inclined to look for a kernel of facts in the stories of Jacob (q.v.) and Joseph (q.v.), while others regard these patriarchs in the same light as the long-lived antediluvians. Future discoveries, especially in connection with Gen. xiv (see ABRAHAM, AMRAPHEL, HAMMURAPI), may throw light upon this question so far as Abraham is concerned.

Bibliography Of the numerous commentaries on Genesis the more recent are those of Delitzsch (1887), Dillmann (1892), Hummelauer (1895), Ball (1896), Strack (1897), Holzinger (1898), Driver (1906), Minocchi (1908), Mitchell (1909), Skinner (1910), Gunkel (1910), Ryle (1914). Among the introductions to the Old Testament the following, written from different points of view, should especially be consulted viz, those of Richard Simon, Carpzov, Eichhorn, De Wette, Havernick, Herbst-Welte, Kuenen, Keil, Vatke, Bleek-Wellhausen, Cornill, Driver, Baudissin, Sellin, Ubalde, Cornely, and Kaulen. Special introductions to the Hexateuch have been written by Westphal, Holzinger, and Carpenter-Battersby. Consult also Hobbes, *Leviathan* (London, 1651), Spinoza, *Tractatus theologico-politicus* (Hamburg, 1670), Le Clerc, *Sentimens de quelques théologiens de Hollande* (Rotterdam, 1685), id., *Commentarius in Pentateuchum* (Amsterdam, 1693), Astiuc, *Conjectures sur les mémoires originaux dont il paraît que Moïse s'est servi pour composer la Genèse* (Paris, 1753), Ilgen, *Urkunden des jerusalemischen Tempelarchivs* (Halle, 1798), Tuch, *Commentar über die Genesis* (ib., 1838), Hengstenberg, *Die Authentie des Pentateuchs* (Berlin, 1836-39), Welte, *Nach-Mosaisches im Pentateuch* (Tubingen, 1841), Hupfeld, *Die Quellen der Genesis* (Berlin, 1853), Knabenbauer, "Der Pentateuch und die unglaubliche Kritik," in *Stimmen aus Maria Laach* (Freiburg, 1873), Lamy, *Commentatio in Genesin* (Meehlín, 1883), Budde, *Die biblische Urgeschichte* (Giessen, 1883), Lagarde, *Mitteilungen*, iii, pp 226 ff (Göttingen, 1889), Bacon, *The Genesis of Genesis* (New York, 1892), Halévy, *Récherches bibliques* (Paris, 1895), Green, *The Unity of the Book of Genesis* (New York, 1896), Spurrell, *Notes on the Text of the Book of Genesis* (ib., 1896), Gunkel, *The Legends of Genesis* (Chicago, 1901), Ehrlich, *Randglossen zur hebraischen Bibel I* (Berlin, 1908), Eerdman, *Alttestamentliche Studien* (ib., 1908), Wiener, *Pentateuchal Studies* (Oberlin, 1912), Dahse, *Textkritische Materialien zur Hexateuchfrage* (Leipzig, 1912), Gressmann, *Mose und seine Zeit* (ib., 1912), N. Schmidt, in *Journal of Biblical Literature*, xxxiii (New York, 1914), Jastrow, *Hebrew and Babylonian Traditions* (ib., 1914).

GENET, jên'êt, or **GENETTE** (Fr *genette*, from Sp. *gineta*, from Ar *jarnat*, genet) One of several species of small animals forming the genus *Genetta* of the family Viverridae, and nearly allied to the true civets (q v), but having only a rudimentary odoriferous pouch, and claws perfectly retractile, as in the cats. The approximation to that family also appears in the vertical contraction of the pupil of the eye. The species are numerous, smaller and more slender animals than the civets, mostly natives of Africa and southwestern Asia. One, the common genet (*Genetta genetta*, or *vulgaris*), is found in the south of Europe, western Asia, and northern Africa, and is divisible into several subspecific forms. It is gray, with small round or oblong black or brown spots, the tail, which is as long as the body, ringed with black and white. It frequents the banks of brooks. Its fur is a considerable article of commerce. It is easily domesticated and is kept in houses in Constantinople to catch mice. Of the other species two are South and East African, and one is restricted to West Central Africa.

The genet is sometimes met with in heraldry. There was an order of knighthood in France, which was said to have been founded by Charles Martel, called the Order of the Genet, but it has long ceased to exist.

GENÊT, or **GENEST**, zhe-nê', EDMOND CHARLES EDOUARD (called "Citizen Genêt") (1765-1834). A French diplomat, born at Versailles. His father, Edme-Jacques (died 1781) was the chief of the Bureau of Correspondence of the Department of Foreign Affairs, and the youth, with the rank of captain of dragoons, was attached to the bureau as interpreter in 1775. The son developed remarkable powers as a linguist, and at the age of 12 translated from the Swedish into French the *Histoire d'Eric XIV, roi de Suède* (1777) and *Recherches sur l'ancien peuple finnois* (1778). In 1779 and 1780 he was successively attached to the French embassies at Berlin and Vienna and in 1781 succeeded his father in the Department of Foreign Affairs. In 1788 he accompanied the Comte de Ségur to St Petersburg, as Secretary of the French Embassy, remaining in charge after Ségur's retirement until 1792, when he was given his passports at the demand of the Empress Catharine II. In Paris Genêt allied himself to the Girondists, and in November, 1792, was named Ambassador to Holland, whence he was transferred in the following spring as "Minister Plenipotentiary to the Congress of the United States." Before it was decided to execute King Louis, Thomas Paine suggested that he be sent to the United States, and Lebrun that Genêt escort him thither. His actual mission was to induce the United States to declare war against Great Britain, and he came with the intention not only of accomplishing that purpose, but of raising a volunteer army to regain Louisiana from Spain and of commissioning privateers in American ports. He landed at Charleston, S C April 8, 1793. He was enthusiastically welcomed and fêted at Charleston and Philadelphia, and encouraged by the expressions of sympathy and friendship for France which he heard on all sides, he began to commission privateers and seek recruiting agents. He planned expeditions against East Florida from Georgia, against Louisiana from the Carolinas, and against New Orleans from Kentucky, the last to be led by George Rogers Clark. Washington, by the unanimous advice of his cabinet, had issued a proclamation of neutrality on April 22, and on June 5 Jefferson, the Secretary of State, notified the French envoy that he must cease arming and equipping privateers in American ports. Genêt replied that he was acting under the treaties of 1778 and continued to disregard Jefferson's warning. In the next few months eight privateers, commissioned by him, had, with the assistance of two French frigates, captured 50 British merchantmen, some of which had been taken within the jurisdiction of the United States. Genêt asserted that these prizes could be condemned by French consuls in American ports, demanded the right to enter the condemned goods duty free, and declared that the United States Constitution did not give Washington the right to treat with him and made the demand that an extra session of Congress be called for that purpose. His criticisms and attacks upon Washington, and the continuance of his activities in fitting out privateers and raising recruits, lost him most of the allies he had at first possessed, and the arrest of two of his agents

and the expulsion of the French Consul at Boston were followed by a demand for his own recall, which was acceded to by the French government in the following year. In December, 1793, he published his instructions, *Genêt and the Federal Government*. The fate of his fellow Girondists warned Genêt not to return to France, and he became a naturalized American citizen, settling in New York, where he married a daughter of Gov. George Clinton, whose campaign for the presidency in 1808 he favored in *Communications on the Next Election*. by a *Citizen of New York* (1808). Consult Turner, "Genêt's Projected Attack on Louisiana and the Floridas," in *American Historical Review*, vol. III (New York, 1898), and his "Policy of France toward the Mississippi Valley," in the same *Review*, vol. X (1905).

GENETHLIALOGY (Gk γενεθλιαλογία, *genethliologia*, casting of nativities, from γενέθλη, *genethlē*, birthday, from γίνεσθαι, *gignesthai*, to be born + -λογία, -logia, account, from λέγειν, *legein*, to say). A term sometimes used to describe astrology as used in calculating nativities or predicting future occurrences from the stars that preside at the birth of persons. See **ASTROLOGY** **DIVINATION**.

GENETIC PSYCHOLOGY (from Gk γένεσις, *genesis*, origin, from γίνεσθαι, *gignesthai*, to be born). Under this head are included all those branches of psychology which treat of the growth or development of mind, individual or social. Hence, like experimental psychology (qv), it is rather psychology as viewed from a particular standpoint than a particular department of general psychology. It is customary to bracket together animal and child psychology (qqv) under the genetic heading, but while the child mind may be investigated as the immediate, and the animal mind as the more remote, source of origin of the adult human mind, both the animal and the child may also be examined for themselves, without overt regard to their place in the evolutionary series. Ethnopsychology and social psychology, in the same way, may be treated either statically or genetically, though, as a rule (especially in the discussion of the great mental products, myth, language, and custom), the genetic method is followed.

Modern science is so thoroughly dominated by the evolutionary idea that it may seem, at first thought, as if a scientific psychology must necessarily be genetic. And this is true, in the sense that the psychologist, in whatever field he may be working, must never forget the organic character of mind, the fact that our present consciousnesses are what they are by reason of the past history of the organism as well as of current stimuli. Even when we attempt to analyze so apparently simple a process as perception, we are invariably referred to genesis for the explanation of certain of its features. At the same time it would be impossible to-day to write a satisfactory genetic psychology, in the full meaning of the term. For (1) the most assured results of mental science lie in the domain of analysis, not of genesis. When we think of the development of mind, we think instinctively of the development of mental function. Now, a psychology of function tends to become a merely classificatory psychology (see **FACULTY**); and the writers who have escaped this tendency are not in agreement among themselves, some making will, and some feeling, and some an intellectual process, the root function of

mind. It follows that the works on genetic psychology have a distinct personal flavor; it is as natural to speak of "Spencer's psychology" as it is unnatural to speak of "Kelvin's physics" or "Liebig's chemistry." Again, (2) while the belief is practically universal among psychologists that the human mind is in some sort continuous with the rudimentary consciousness of primitive organisms, it is still very difficult to envisage the course of development, to imagine what the primitive mind was and how—by what steps or stages, by what mechanism—it has developed. Some investigators (e.g., Romanes) write as if there were a simple superposition of function on function, faculty on faculty, others (e.g., Baldwin) give us rather a development of a motor than of a mental organism, others offer descriptions of special consciousnesses at various levels of development, without asking how the earlier become transformed and differentiated into the later.

A genetic psychology is, therefore, not so much an accomplished fact as the conscious and necessary ideal of psychological inquiry, itself the final term of a psychological development. Meanwhile there are, as we have just indicated, a number of concrete genetic psychologies, some of which rest upon a psychological basis, others upon a physiological, or an anatomical, or an anthropological basis. We may, e.g., mark off periods in the growth of mind by changes in mental capacity—development of the senses, of speech, of emotional activity, of power of attention, etc., or by the functional activities of various organs, or by stages of physical growth, or by the successive appearance of racial characteristics. This last principle of division implies a similarity between racial evolution and individual development, which is summed up in the "recapitulation theory." The theory posits a parallelism, physical and mental, between the epochs through which the race has passed from primitive to civilized man, on the one hand, and the growth of the individual on the other. One phase of recapitulation has been adopted by the Herbartians in their theory of "culture epochs." They contend that the individual passes through the same stages of culture that the race has traversed. The theory seems to hold only when it is taken broadly. The "young savage" in the child is strikingly apparent at times, and his passion for hunting, fishing, roving, and his intolerance of restraint are strong reminders of lower grades of culture. But there are many unlike factors in the environment of the child and the savage. The race wrought its own culture, the child has its culture thrust upon it. It lives in a social and moral forcing house, from which a primitive race is exempt, except in so far as it comes into contact with more civilized peoples. These differences, together with the physical immaturity of the child, can but cut across and modify "recapitulation." And yet this may be clearly traced in certain general tendencies of the child, e.g., in the use of gesture language, in word inventions and onomatopoeia, in rhythmic movements, in the character of his drawings, and in his aesthetic preferences. We should, however, find similar resemblances between the child of civilization and the child of primitive culture. The two seem to differ chiefly in the shorter period of infancy and adolescence which is allotted to the primitive child. So that we are led to a fact which is perhaps more important than the alleged recapitulation—the fact

that childhood differs comparatively little between one level of culture and another, whereas the mental status of the adult varies materially.

But not only does the evolutionary study of the child mind hint at the parallelism of individual and racial development, it intimates that the child often "harks back" to experiences of his animal progenitors. Many of his emotions, as fear and anger, his instinctive and impulsive actions, his vegetarian propensities, habits of scratching, biting, clawing, teasing, his cruelty, many of his games and plays, have been instanced as showing atavistic tendencies. In this matter, again, the *via media* is the only safe way. Many so-called atavisms are simply analogies, some of them poor analogies, whose real explanation is to be found within the experience of the individual himself. We grant that the experience of the human young has many points in common with the experience of certain of the lower animals, but the question is whether the likeness is not usually coincidental. Take, e.g., the cruelty of the child. It is due largely to a failure to appreciate the significance of pain, while in the savage it is the natural result (where it really exists) of a hard struggle for survival.

A like criticism must be passed upon other current attempts to work out a genetic psychology, in the concrete, upon some special basis, their generalizations are limited in scope and uncertain in application. Such psychologies must, at the best, be classificatory or explanatory rather than descriptive, and it may be doubted whether they can ever furnish material aid to that ideal genetic psychology of which we spoke earlier in this article.

Consult Darwin, *Descent of Man* (New York, 1906), Baldwin, *Mental Development in the Child and the Race* (ib, 1906), Spencer, *Principles of Psychology* (ib, 1890), Romanes, *Mental Evolution in Animals* (London, 1885), id., *Mental Evolution in Man* (ib, 1888), Hall, *Adolescence* (New York, 1905), Kirkpatrick, *Genetic Psychology* (London, 1910), Partridge, *The Genetic Psychology of Education* (New York, 1912).

GENEVA. See GIN

GENEVA. The southwesternmost canton of Switzerland, bounded by the Canton of Vaud and Lake Geneva on the north, and by France on the east, south, and west (Map Switzerland, A 2). Area, 108 square miles. The surface consists of low hills, watered chiefly by the Rhône. The soil is not naturally fruitful, but the careful industry of the inhabitants has rendered over 81.5 per cent of the total area of the canton productive. Grain, wine, fruits, and vegetables are produced in considerable quantities, and domestic animals are raised. Industrially Geneva is one of the leading cantons of Switzerland and is famous for its watch-manufacturing industry, which was introduced from France as early as 1587. The manufacture of music boxes and jewelry was begun later, and at present the products of the canton include machines, mathematical instruments, and electric apparatus. Large manufacturing establishments which utilize the power of the Rhône have materially changed the character of the industries and increased the total value of the output. The number of factories subject to federal inspection in 1911 was 519, employing 13,433 workers. The silk industry, formerly of great importance, is now in a state of decline. The

commerce is greatly facilitated by the proximity to France, and the products of Geneva, especially watches, are exported to all parts of the world. Budget receipts in 1910 were 11,730,000 francs, in which year expenditures amounted to 11,634,000 francs.

The constitution of the canton, first adopted in 1847 and repeatedly modified, provides for a true democratic form of government. The legislative power is vested in the *Grosser Rat*, consisting of 100 elected members, the executive power, in a Council of State of 7 elected members. The referendum was introduced in 1880. Besides a number of higher and inferior courts, Geneva has also arbitration courts for the settlement of industrial disputes. Pop., 1900, 132,609, 1911, 156,288. Nearly one-third of the population is of foreign birth, chiefly French and Italian. The inhabitants are divided about equally between Roman Catholic and Protestants, about 30 per cent being foreigners and nearly 90 per cent speaking French. Capital, Geneva (qv).

GENEVA. The capital of a canton of the same name, Switzerland, situated at the southwest extremity of the Lake of Geneva, at the outlet of the river Rhône, which divides the city into two equal parts (Map Switzerland, A 2). It is magnificently situated, in full view of the Alps (including Mont Blanc) and the Jura. The old city, on the left bank of the river, constitutes the business and financial quarter and is irregularly laid out, with steep, crooked streets, except for the portion along the river, which has fine quays and broad avenues. On this side of the river is the section of the city called *Eaux Vives*. Several bridges span the Rhône, one of which rests upon an islet called Rousseau's Island. On the right bank is the Quarter of Saint-Gervais, which is chiefly residential, containing a great part of the laboring population. Here are also hotels for the accommodation of foreigners, who form a considerable colony in Geneva. There are numerous squares, parks, and gardens, most of them in the old city. The most notable are the *Jardin Anglais*, or *Promenade du Lac*, along the lake shore, and the *Place Neuve*, with the *Promenade des Bastions*, leading southward to the botanical gardens. The most important square in the Saint-Gervais Quarter is the *Place des Alpes*, with a magnificent memorial cenotaph of the Duke Charles II of Brunswick, who left his fortune of \$4,000,000 to the city. Boulevards laid out on the site of the ancient walls extend around the city. The principal buildings are the Romanesque cathedral of St Peter, built in the eleventh century, the sixteenth-century town hall, with the house near by in which Rousseau was born, the university (see GENEVA, UNIVERSITY OF), the *Musée Fol*, with archaeological collections, and the *Musée Rath*, an immense art collection given by the Russian General Rath to the city. Also note worthy are the Anglican and American Episcopal churches and the new theatre. Besides the university, Geneva has the *Collège de Genève*, founded by Calvin in 1559, various industrial, technical, and commercial schools, academies of art and music, a deaf and dumb institute, and a municipal library with about 200,000 volumes. There are many learned and art associations, notably the Natural Science Association, the Geographical Society, and the Society of Artists. Geneva has long been known as a manufacturing city and especially as a clock, watch, and

jewelry making centre Besides these industries the most important are enameling, diamond cutting, and the production of music boxes and scientific instruments There are also iron and chemical works The town enjoys a favorable position for trade with France and the Mediterranean shore, exporting its own manufactures and those of the surrounding districts A large part of the area surrounding the city is a 'free zone,' into which material for use in manufacturing for exportation may be introduced duty free It is the seat of a United States consul The town is a railroad centre and is traversed by horse-car lines and steam suburban railroads The municipality's progressiveness has been particularly marked since 1847 by radical improvements throughout the city Breakwaters, protecting the lake harbor, hydraulic works in the Rhône, supplying the city with water and furnishing power for factories, and gas, electric-lighting, and power plants are owned by the city Pop, 1888, 52,043, 1900, 105,710, 1910, 125,520

At the time of Cæsar's campaign against the Helvetii Geneva belonged to the country of the Allobroges It was afterward included in the Roman Provincia Maxima Sequanorum and was a place of some importance under the Burgundian kings In the year 534 it came under the rule of the Franks and towards the close of the ninth century became part of the new Kingdom of Transjura Burgundy It had been made a bishop's seat in the fifth century, and from the twelfth century continual feuds arose between the bishops and the counts of Savoy with regard to supremacy In 1032 Conrad II of Germany got possession of the town and put a bishop in charge of it In 1531 the Genevese renewed their alliance with Fribourg and Bern, and thus Geneva became a member of the Swiss Confederation The doctrines of the Reformation, boldly and enthusiastically preached by Guillaume Farel, a Frenchman, met with general acceptance in Geneva In conjunction with Bern the citizens expelled the adherents of the dukes of Savoy from the town and declared the bishopric vacant In August, 1535, the Reformed religion was established by law, and in 1541 Calvin was invited to take up his residence permanently in Geneva as public teacher of theology It was he who chiefly impressed the stamp of rigid morality, not unalloyed with pedantry, on the minds of the citizens of Geneva and awakened a taste for the exact sciences The town, which had hitherto been merely a place of trade, thus acquired an important influence over the spiritual life of Europe and became the centre of education for the Protestant youth of Great Britain, France, Germany, and Spain In 1602 the last attempt of the dukes of Savoy to recover the town was frustrated by the energy and resolution of the citizens During the eighteenth century Geneva was distracted by a continued feud between the aristocratic and popular parties, until in 1782 Bern, Sardina, and, in particular, France interfered in favor of the aristocracy The French Revolution led to a new crisis, the government was overthrown in July, 1794, equality in the eye of the law was established, a national convention appointed, and a reign of terror commenced In 1798 Geneva with its territory was annexed to France, under the name of the Département du Léman After the overthrow of Napoleon Geneva recovered its independence,

and the Congress of Vienna increased its territory considerably and guaranteed its neutrality From 1841 to 1878 its history was one of political struggles between clerical, conservative, radical, and independent factions, which resulted in the separation of church and state and the triumph of the progressive parties In 1879 the Referendum was introduced and in 1891 the Initiative and Recall In 1907, by a referendum, the church and state were separated The most important event in the history of the town since 1907 was the purchase, on March 23, 1912, by the Canton of Geneva of the main railway station from its French owners, the Paris, Lyons, and Mediterranean Railway Company Consult Pictet de Seroy, *Genève, origine, etc* (Geneva, 1843-47), and *Genève ressuscitée* (ib, 1869), Cherbuliez, *Genève, ses institutions, etc* (ib, 1868), Galfie, *Genève historique et archéologique* (ib, 1869), Blavignac, *Études sur Genève* (ib, 1872-74), Boissonnas, *Genève à travers les siècles* (ib, 1900), Chapuisat, *La municipalité de Genève pendant la domination française 1798-1814* (2 vols, ib 1910)

GENEVA. A city and the county seat of Kane Co, Ill, 38 miles west of Chicago, on the Fox River, and on the Chicago and Northwestern Railroad (Map Illinois, H 2) It is popular as a residential place for Chicago business men, has a public library and one of the finest courthouses in Illinois, and is the seat of the State Reformatory for Female Juvenile Offenders There are manufactures of wind-mills, sadrons, boxes, flour, candy, shoes, sanitary cups, and hardware It is also a milk and butter centre Settled about 1833, Geneva was incorporated in 1835 as a village and as a city in 1887 The water works and electric-light plant are owned and operated by the municipality Pop, 1900, 2446, 1910, 2541

GENEVA. A city and the county seat of Fillmore Co, Neb, 54 miles (direct) west by south of Lincoln on the Burlington and Missouri River and the Chicago and Northwestern railroads (Map Nebraska, G 4) It is the seat of the State Industrial School for Girls and contains a Carnegie library The principal industries are farming, brickmaking, and stock raising A large nursery is situated here Geneva owns its water works Pop, 1900, 1534 1910, 1741

GENEVA. A city in Ontario Co, N. Y, 51 miles southeast of Rochester, on Seneca Lake, the Seneca and Cayuga Canal, and the New York Central and Hudson River and the Lehigh Valley railroads (Map New York, C 5) It commands a magnificent view of the lake and surrounding country and is the seat of Hobart College (Protestant Episcopal, opened in 1822), a college for girls, and of the State Agricultural Experiment Station It contains also a city hospital The city is noted for its extensive nurseries and has manufactures of stoves, steam boilers, motors and motor boats, optical supplies, cereals, canned goods, wagons, cutlery, glass bottles, etc Geneva was chartered as a city in 1898 and is governed by a mayor, chosen every two years, who controls appointments to most of the municipal offices, and a unicameral council The city owns and operates its water works Near Geneva stood the Indian village, Kanadesaga, destroyed by Gen James Clinton in 1779 Pop, 1900, 10,433, 1910, 12,446, 1914 (U. S. est.), 13,303, 1920, 14,648,

GENEVA (from OF *genevric*, Fr *genèviève*, It *ginepro*, juniper, from Lat *juniperus*, juniper, corrupted by popular etymology with *Geneva*, a city of Switzerland) One of the names of the juniper berry, but also often applied to the spirit distilled from grain and flavored with juniper berries and manufactured in Holland and hence called Hollands or Holland gin. The word "gin" is itself a corruption of "Geneva."

GENEVA, LAKE (Fr *Lac Léman*, the *Lacus Lemannus* of the Romans) A crescent-shaped lake, the largest in Switzerland, extending around the northern part of the Département of Haute-Savoie, France, and with its west, north, and east shores bordering the Swiss cantons of Geneva, Vaud, and Valais (Map Switzerland, A 2). It has an area of 224 square miles. It is 45 miles long and attains a maximum breadth of 8½ miles between Morges and Amphion, its greatest depth is 1015 feet, between Evian and Ouchy. At the Strait of Promenthoux, 2 miles wide, it is divided into the Great Lake, about 39 miles long, with an average breadth of 6 miles, and the Little Lake, 6 miles long and 2 miles broad. The river Rhône, turbid and yellow, enters the lake at the northeastern end and leaves it at the southwest, through the city of Geneva, perfectly clear and of a deep-blue tint. The deposits of this river at the northeast end have contracted considerably the area of the lake, former towns and villages on its shores in some cases now being miles inland. About 20 other streams, all insignificant, flow into the lake, which is 1230 feet above the sea, with the melting of the mountain snow in summer the lake rises from 6 to 8 feet above its usual level. It is subject to the phenomena known as *seiches*, caused probably by local alterations in the atmospheric pressure, which frequently occasion a rise and fall of from 2 to 5 feet in the course of half an hour. The *seiches longitudinales* traverse the lake from one end to the other, the highest on record being over 6 feet high, the *seiches transversales* cross from the Swiss to the French side in 10 minutes. The lake is never entirely frozen over. It abounds in trout, lake salmon, perch, pike, and carp.

The beauties of Lake Geneva have been celebrated for centuries and annually attract thousands of tourists, its shores have been favorite residential resorts of numerous celebrities. The shore on the side of the Pays de Vaud is celebrated for the magnificence of its scenery, the southern French shore rises solemn and stern, with the mountains of Savoy in the background. From the Lake of Geneva Mont Blanc is visible, and, although 40 miles distant, is often reflected in its intensely blue waters. The principal places on Lake Geneva are Geneva, Coppet, Nyon, Morges, Lausanne (with its port, Ouchy), Vevey, Montreux, Evian-les-Bains, and Thonon. Consult Lewis and Gribble, *The Lake of Geneva* (London, 1909).

GENEVA, UNIVERSITY OF A Swiss university, known under its present name only since 1873, but the outgrowth of one of the oldest and most famous of Protestant institutions of learning, the Academy of Geneva, founded by the Genevan Republic in 1559. The academy had the usual faculties of philosophy, science, law, and theology, but the last named, under the direct oversight of Calvin and Beza, was the most renowned. The institution soon became the leading resort of Protestant scholars and

students of all nations and lent much lustre to a city already famous for its curious theocratic republican form of government. After the Huguenot persecutions Geneva became more than ever the centre of French Protestant culture and influence, a characteristic maintained throughout the eighteenth century. The names of Scaliger, Casaubon, De Saussure, and De Candolle have given the university distinction. It is still a place of educational importance. It was attended in 1913 by 1669 students, many of them from abroad, who were mainly in the faculties of medicine and philosophy. Women are admitted on the same conditions as men. Consult C. Borgeaud, *Histoire de l'Université de Genève* (2 vols., Geneva, 1909).

GENEVA ARBITRATION The international adjudication of the controversies between the United States and Great Britain growing out of the depredations of the *Alabama* and other Confederate cruisers upon the commerce of the former country during the Civil War. The arbitration tribunal was instituted as the result of the Treaty of Washington, signed February, 1871, by the joint commission which had met at Washington to settle those controversies. For the nature of the differences thus adjudicated and the constitution of the tribunal and the results of the arbitration, see **ARBITRATION, INTERNATIONAL, ALABAMA CLAIMS**.

GENEVA BIBLE See **BIBLE**.

GENEVA CATECHISMS A smaller and a larger French catechism by Calvin, published in 1536 and 1541, the second of which was afterward translated and adopted as the formulary of the Reformed churches of Switzerland, France, and Hungary.

GENEVA CONVENTION An agreement concluded at an international conference which was held at Geneva, 1864, under the presidency of General Dufour, the Swiss Plenipotentiary, for the purpose of ameliorating the condition of the sick and wounded in time of war. The credit of originating this conference belongs to two citizens of Geneva—Dumnant, a physician, who published a startling account of what he had witnessed in two military hospitals on the field of Solferino, and his friend Moynier, chairman of the Society of Public Utility, who took up the idea of "neutralizing the sick wagons," formed associations for its agitation, and at length pressed it upon the governments of Europe, most of which sent representatives to the conference. The convention was drawn up and signed by them on August 22, and since then it has received the adherence of every European power, the United States, and several Latin American and Asiatic countries. The convention consists of 10 articles, which provide (1) for the neutrality of ambulances and military hospitals as long as they contain any sick, (2) for that of the staff, (3) that the neutrality of these persons shall continue after occupation of their hospitals by the enemy, so that they may stay or depart, as they choose; (4) that if they depart, they can only take their private property with them except in case of ambulances, which they may remove entire, (5) that a sick soldier in a house shall be counted a protection to it and entitle its occupants to exemption from the quartering of troops and from part of the war requisitions, (6) that wounded men shall, when cured, be sent back to their own country on condition of not bearing arms during the rest of the war,

(7) that hospitals and ambulances shall carry, in addition to the flag of their nation, a distinctive and uniform flag bearing a red cross on a white ground, and that their staff shall wear an arm badge of the same colors, (8) that the details shall be left to the commanders

A second conference was held at Geneva on the same subject in 1868 and a supplementary convention drawn up. It consists partly of interpretations of the former convention and partly of an application of its principles to maritime wars. Its main provisions are these: That when a person engaged in an ambulance or hospital occupied by the enemy desires to depart, the commander in chief shall fix the time for his departure, and when he desires to remain, that he be paid his full salary, that account shall be taken in exacting war requisitions not only of the actual lodging of wounded men, but of any display of charity towards them, that the rule which permits cured soldiers to return home on condition of not serving again shall not apply to officers, for their knowledge might be useful. that hospital ships, merchantmen having wounded on board, and boats picking up wounded and wrecked men shall be neutral, that they shall carry the red-cross flag, and their men the red-cross armlet, that hospital ships belonging to the government shall be painted white with a green strake, those of aid societies white with a red strake that in naval wars any strong presumption that the convention is being abused by one of the belligerents shall give the other the right of suspending it towards that power till the contrary is proved, and, if the presumption becomes a certainty, of suspending it to the end of the war. See RED CROSS SOCIETIES. WAR

GENEVA GOWN. See **COSTUME, ECCLESIASTICAL**

GENEVIEVE, jën'e-vëv' The heroine of a poem by Coleridge, which is sometimes known by the same name, but more frequently by that of "Love." It was added to the second edition of the *Lyrical Ballads* (1800)

GENEVIEVE, zhën'vyäv', SAINT (Lat *Genovefa*) (c 422-512) The patron saint of Paris and the subject of many popular and highly poetical legends. She was born in 419 or 422, in the village of Nanterre, near Paris, where, as a mere child, she attracted the notice of St. Germanus of Auxerre (q.v.), who passed a night at Nanterre on his way to Britain (c 430) and who is said to have marked her out as specially destined to a life of holiness and purity. She devoted herself to a life of virginity and conventual seclusion. On the death of her parents she removed to Paris, and her active charity, and the extraordinary reputation for sanctity which she acquired, both there and in other cities of France which she visited on missions of Christian benevolence, won for her the admiring veneration, not alone of her own people, but even of the heathen or half converted. The Frankish rulers Childeric and Clovis set prisoners free at her intercession. When (c 450) it was proposed to abandon Paris in alarm at the approach of Attila and the Huns, Geneviève, assembling the matrons and consecrated virgins in one of the churches, exhorted them to avert, by prayer and fasting, the threatened calamity. The unexpected alteration of Attila's march towards Orléans, leaving Paris untouched, added still more to her reputation and to her influence. Later, when Clovis besieged the city, Geneviève,

with her sisters in religion, set out on an expedition for the relief of the starving people and successfully conveyed to Paris a supply of provisions. After his conversion the city opened its gates to him by her advice (497). She died in Paris, Jan 3, 512. Under her patronage and with her name a religious congregation of priests—The Canons of St. Geneviève—was founded in the eleventh century, which with some vicissitudes continued until the Revolution (1789). A religious congregation of women, under the name of Sisters of St. Geneviève, was established in 1636 for the purpose of caring for the sick and the education of girls. An edifice built in her honor and upon the supposed site of her tomb in 1764-90, which is now called the Pantheon, contains the famous mural painting of the saint by Puvis de Chavannes. Adjoining is the Library of St. Geneviève, containing 200,000 volumes, and near by is a relic of the abbey of St. Geneviève. Her day is January 3. Consult her life by Delalain (Paris, 1872), Vidieu (ib, 1884), and Lesetre (ib, 1899)

GENEVIEVE DE BRABANT, de brä'ban' According to the legend, daughter of a duke of Brabant, and wife of Siegfried, Count Palatine of Treves in the first half of the eighth century. During Siegfried's absence with Charles Martel against the Saracens, she was criminally solicited by Golo, a knight in whose charge her husband had left her. When he returned, finding that his wife had given birth to a child (which in reality was his own), he ordered both mother and child to be killed. But their lives were preserved, and many years later the repentant Siegfried found them out and acknowledged the injustice of his suspicions. Consult Sauerborn *Geschichte der Pfalzgräfin Genoveva und der Kapelle Frauenkirchen* (Regensburg, 1856), and Goltz, *Pfalzgräfin Genovefa in der deutschen Dichtung* (Leipzig, 1897)

GENGA, jën'ga, **GIROLAMO** (c 1476-1551) An Italian painter, architect, and sculptor, born at Urbino. He received instruction from Luca Signorelli, whom he assisted in the frescoes in the chapel of the Virgin at Orvieto, and afterward became the pupil of Perugino, in whose company he met Raphael. The frescoes he painted in the Petrucci Palace at Siena (1508) are destroyed except the two preserved in the Accademia of Siena, representing "Aeneas and Anchises" and "Escape of Prisoners." Four years afterward he went to Urbino and did some decorations at the command of the Duke Guidobaldo II. Soon after this he went to Rome, where he executed what is probably his best picture, "The Resurrection," in the church of St. Catharine of Siena. Recalled to Urbino, he worked for the Duke, in company with Timoteo Viti, and after his patron's deposition went with him to Cesena, and returned with him in triumph to Urbino. From that time on his work was architectural. He restored the palace of Castel Durante at Urbino and built Monte Imperiale near Pesaro, the church of San Giovanni Battista at Pesaro, the Bishop's Palace at Sinigaglia, and the cloister of the Zoccolanti at Monte Baroccio. In painting Genga was an eclectic, influenced by many masters—Viti, Raphael, and Sodoma, besides the teachers mentioned.

GENGHIS, JENGHIS, or ZINGIS KHAN, jën'gîs kân (1162-1227). A celebrated conqueror, originally known as Temujin (after a

great Tatar chief), the title "Genghis Khan" merely signifying 'Great Khan' or 'Ruler'. He was born at Deylun Yeldak, near the northern bend of the Hoang-ho, in Mongolia, being the son of Yesuka Bahadur, a Mongol chief who ruled over the tribe of Neyrum, dwelling between the Amur and the Great Wall of China, and paying tribute to the Khan of East Tartary. On his father's death Temujin assumed the reins of government, though only 13 years of age. Some of the subject tribes, however, refused to obey him and chose another chief belonging to the same family. A war of several years' duration was the result, carried on mostly by Temujin's mother. At its termination the young ruler was compelled to retire to Karakorum, the capital of Toghrul Ungh, Khan of the Keraites, and place himself under that monarch's protection. Ungh Khan gave him his daughter in marriage and appointed him to the command of the army, in which capacity Temujin gave proof of great military talent, conquering the Mekreit, Tanjut, Jellaier, and other neighboring tribes. His growing reputation aroused the jealousy of his master, who ordered him to be assassinated, but Temujin fled to his own country, where he arrived after many hairbreadth escapes at the head of 5000 cavalry. Raising an army, he marched against his father-in-law, and Toghrul, vanquished in battle in 1203, sought refuge among the Naymans, but was slain by the guards situated on the frontiers. Temujin immediately seized upon Toghrul's dominions. In the following year a number of Tatar tribes, alarmed at his increasing power, formed a powerful league against him. The command was given to Tai Ungh Khan, chief of the Naymans, but in a battle fought on the banks of the Amur, Temujin routed his enemies, slew their leader, and became at once master of almost all Mongolia. Grandeur views of conquest seemed now opened up before him. In the year 1206 he convoked a general assembly on the banks of the Onon, a tributary of the Amur, flowing through his native land. This meeting was attended by deputies from the subjugated hordes of Tartary, and the astute monarch contrived to obtain a religious confirmation of his designs. Up to this period he had borne the name of Temujin, but a renowned magician or priest, surnamed Bout-Tangri ("Son of Heaven"), venerated by all the Mongols, now came forward and pronounced him Genghis Khan — i.e., Greatest of Khans, or Khan of Khans, declaring that he should rule over the whole earth. The deputies were duly impressed. About this time the Uigurs, an agricultural and civilized people, inhabiting the country at the sources of the Hoang-ho and Yang-tse-kiang, voluntarily submitted to his sway. From this people, who professed Buddhism, the Mongols appear to have acquired a knowledge of writing. They adopted the Uigur alphabet, but preserved their own language, and Genghis selected one of the tribe to instruct his children.

The most important incident in the career of Genghis was the conquest of the northern part of China, or Khatai. The immediate cause of the war between him and the Emperor of China, Tchong-Hei, was the refusal of the former to recognize the latter as his suzerain, or liege lord. Most of the Tatar tribes which Genghis had subdued were really vassals of the Chinese Empire, and Tchong-Hei, though he had not interfered to prevent the conquests of the Mon-

gols, now called upon Genghis to acknowledge his superiority by paying tribute. Genghis immediately prepared for war, scaled the Great Wall in 1211, divided his army into three divisions, and after a series of bloody and protracted campaigns succeeded in taking Peking in 1215. Meanwhile Genghis had quelled an insurrection, headed by the Naymans, and conquered the Gur-Khan of Kara-Khatai. These tribes were nearly exterminated in a great fight which took place near the sources of the Yenisei. Pressing westward, the Mongols at length reached the Sihun, the northeastern boundary of the Empire of Khwarezm, or Khorasmia, whose ruler, Ala-ed-Din Mohammed, was one of the most powerful sovereigns in Asia. The dynasty to which he belonged had risen into power through the weakness of the Seljuk sultans, and its sway now extended from the borders of Syria to the river Indus and from the river Sihun to the Persian Gulf. The murder of some Mongol merchants at Otrar, a town on the Sihun, afforded Genghis a pretext for invasion. In 1219 an army of 700,000 men, according to the Eastern chroniclers, commanded by Juyi, the son of Genghis Khan, entered Khwarezm. Samarkand, Bokhara, and all the other important cities of the country were captured. In 1221 Genghis Khan assumed personal command. The Mongols in three separate divisions now scoured and ravaged Khwarezm in all directions. In the course of five or six years they overran Persia, subdued the inhabitants of the Caucasus, crossed into Russia, and plundered the land between the Volga and the Dnieper. They swept over the whole of southern Asia, as far as the Sutlej in northern India, but the exhaustion of the Mongol hordes compelled Genghis to return to Karakorum, the capital of his Empire, in 1224. During his absence his generals had been prosecuting the Chinese war with the greatest success. Genghis had still the old thirst of conquest, and, having recruited his forces, he led them across the great Desert of Gobi to the Kingdom of Tanjout, in the northwest of China, the capital of which, Nin-hai, he besieged. Disheartened by the loss of the greater part of his army, the King of Tanjout promised to capitulate at the end of a month, but in the interval Genghis died, Aug. 24, 1227, on the hill Lioupan, worn out with years and toils. He is said to have had 600 wives and concubines and to have left a great number of children, among three of whom he divided his enormous possessions. The third son, Ogotai, was appointed Grand Khan and received for his share the region now called Mongolia, with Khatai, or northern China, as far north as the mouth of the Amur. The second son, Tcheghatai, received Turkestan north of the Amur. Juyi, for his share, obtained Kiptchak (qv) and all the country west and north of Turkestan, an immense tract extending from the Caspian Sea almost to the Arctic Ocean. Sanguinary and barbarous though he was, Genghis showed many statesmanlike qualities and many virtues. He was a strict monotheist, but tolerated all religions, exempted from taxes and military service physicians and priests, made obligatory the practice of hospitality, established severe laws against adultery, theft, and homicide, organized a system of communication throughout his dominions, mainly no doubt for military purposes, and so thoroughly organized what may be called the police or civil authority that it

was said that one might travel without fear or danger from one end of his Empire to the other. He would appear to have respected men of learning and to have retained several of such about his person. The only memorial of Genghis now known to exist is a granite tablet, with a Mongol inscription deciphered by Schmidt, of St Petersburg, discovered among the ruins of Nertchinsk. This tablet had been erected by Genghis in commemoration of his conquest of the Kingdom of Kara Khatai. Consult Howorth, *History of the Mongols* (London, 1876-88), Fildmann, *Temudschin der Ueerschutterliche* (Leipzig, 1862), Douglas, *Life of Genghis Khan* (London, 1877), Hoyle, *History of the Mongols* (ib, 1876-88), Curtin, *The Mongols* (ib, 1876-88), Johnston, *Famous Cavalry Leaders* (ib, 1908).

GENGLER, gēng'lēr, HEINRICH GOTTFRIED (1817-1901). A German jurist, born at Bamberg, and educated at Wurzburg and Heidelberg. For more than 50 years he occupied the chair of law at the University of Erlangen. His works include *Das deutsche Privatrecht in seinen Grundzügen für Studierende eivortet* (1856, 4th ed, 1892), *Germanische Rechtsdenkmäler*, with a glossary (1875), *Des Schwabenspiegels Landrechtsbuch* (2d ed, 1875), *Ueber die deutschen Städteprivilegien des 16, 17, und 18 Jahrhunderts* (1901).

GÉNIE DU CHRISTIANISME, zhǎ'né' du krēs'tyá'nēs'm (Fr, Genius of Christianity). A celebrated work by Chateaubriand (1802), a defense of Christianity on purely æsthetic and emotional grounds, avoiding all frank discussion of dogma. The work gathers together illustrations of the sublime in Christian dogma, poetry, art, and literature, and, besides its religious importance, had a distinct influence on the literary tendency of the nineteenth century.

GENII, jē'nī-i (Lat, guardian spirits). Spirits supposed to protect human beings, or tutelary divinities who presided over places and things. The classical nations believed that there were orders of spirits whose function it was to take in charge the infant at birth, to watch over the person day and night during the whole life, to point out to him the right and fortunate thing to do, to warn him of danger and wrongdoing, and thus to guide him safely throughout his life. The genii had access to their wards at all times and could change themselves into any desired form. The demon (Gk δαίμων) of Socrates is often mentioned as an example of a guardian spirit. In his case, however, the philosopher seemed to have believed not so much in an everpresent genius prompting him as in a friendly hand holding him back from danger and wrongdoing. But, according to the classical belief, not only persons were thus cared for, but also there were special spirits in whose keeping the protection of the land itself was believed to be placed. Rome, e.g., had its tutelary genii, and the Lares and Penates were looked upon as household gods embodying the spirit of the hearth and home. As such, the various genii received honors and divine worship in ancient Italy and Greece.

It is an easy step from this belief in guardian spirits to that in evil, misleading, tempting spirits, who are sent either to test the virtues of the good or to guide the evil mortal in ways of wrongdoing. (See **DEMONOLOGY**) The Greeks had kakodaimones as well as agathodaimones. The Romans came to believe in evil

genii as well as good. It will be readily understood that the early Christians seized upon these ideas, and out of them grew the belief in guardian angels, ministering spirits, and evil genii or spirits.

In classical art the genii are sometimes represented in the form of a youth with wings, sometimes as closely wrapped in a mantle and holding within the hand some emblem of their office, and the *genius loci*, or guardian spirit, of a place is often pictured as a serpent partaking of some offering on an altar. Under Christian influence the good genius is frequently represented as an angel, the bad genius under some evil guise.

The idea of such spirits is a belief widely spread and by no means confined to the classical nations or ancient peoples or uncivilized races. The same sort of conception prevailed in ancient and modern India, and the Zoroastrian doctrine of the *fravashis* in the Avesta as heavenly spirits presiding over man and over the house, village, tribe, and country, shows how old this notion was in Persia. The Eskimo recognize the same idea in the spirit of the person after whom one is named acting as his guardian genius. Among the Mohammedans there is a kindred belief in the existence of jinns, spirits of good and spirits of evil. According to their belief, the jinns were the offspring of fire, being superior to man by their magical power, but far inferior to angels. They were supposed to be ruled by a race of kings called *Suleyman*, one of whom is believed to have built the pyramids of Egypt. They dwelt in the mountain Kōf and assumed at will both human and animal forms.

The rôle played by the jinns in the *Arabian Nights*, or by the afrits, or evil genii, in Arabic stories, is familiar to every reader of Oriental literature or of Eastern folklore. With the Arabic *jinn*, the Latin *genius* became entangled in the popular mind through the influence of the *Arabian Nights*, although there was no etymological connection between the two. The Greek word δαίμων, which was originally used in the general sense of spirit, as explained above, has become degraded to mean *demon* in Christian theology. The question of the belief in genii lies near the inquiry into the origin of religion itself, but it is not difficult to trace backward all such beings to the primitive, childish faith which endows everything with human traits and capabilities. The shadow, the dream-self, the physiological hallucination, all helped to give substantiality to the creatures of the imagination. Consult B. Bekker, *Le monde enchanté* (Amsterdam, 1691), M. D. Conway, *Demonology and Devil-Lore* (3d ed., 2 vols., New York, 1889), R. C. Thompson, *Devils and Evil Spirits of Babylonia* (2 vols., London, 1903-04). See **ANGEL**, **MAN**, **SCIENCE OF**, **APPARITION**, **DEMONOLOGY**, **JINN**, **RELIGION**, **COMPARATIVE**.

GEN'IPAP (from *genipapo*, the native name). A much esteemed fruit of the West Indies and warm parts of South America. The tree which yields it is *Genipa americana* of the family Rubiaceæ. The fruit is a two-celled berry, containing many seeds, about as large as an orange, of a whitish-green color, with a dark-purple juice of an agreeable, vinous taste. The species resembles the popular hothouse shrubs of the genus *Gardenia*, of which genus the Cape jasmine (*Gardenia jasminoides*) is perhaps the best-known species.

GENIPI, jēn'ī-pē See **ACHILLEA**

GENIS'TA A genus of low shrubs of the family Leguminosae. The species, of which there are about 80, natives of the Old World, have small deciduous or almost evergreen leaves, terminal racemes, or clusters of handsome yellow flowers, borne in great abundance in spring or summer, and little pods. Few of the species are perfectly hardy in cold climates. *Genista tinctoria*, *Genista angelica*, and *Genista germanica* withstand the winters when given covering. *Genista tinctoria*, the dyer's greenweed, has become established in New England and New York. The plants succeed best on sandy or rocky, well-drained soils in sunny places. The so-called genista that the florists usually bring into blossom about Easter time is a species of *Cytisus*.

GENITIVE (Ger, Dan, Swed *genitiv*, Fl *génitif*, Lat *genitivus*, of or belonging to birth, from *gignere*, to produce) The name of one of the cases in grammar (See **DECLENSION**). In such an expression as (Lat) *regis filius*, (Eng) the *king's son*, the form *regis* or *king's* is called the genitive case, and according to the usual explanation, this name was given it because it indicates the source or origin of the thing joined with it. In reality, however, the terms of grammar were originally applied, not to the parts of speech, but to the elements of thought, they were logical terms before they were grammatical. The Greek writers on dialectics, in analyzing the different parts of an expressed thought, had distinguished the principal notion, the subject or nominative as it is called, from secondary or dependent notions, the dependency of the latter they expressed by the word *πρώσις* (Lat. *casus*), a fall or leaning of one thing upon another, and in such a proposition as "The king's son is dead," they indicated the exact nature of the dependence by calling it the *γενική πρῶσις*,—i.e. the case showing the genus, kind, or class, the generic case, for while the name "son" is applicable to every man having parents, "king's son" is limited to the class of sons having kings for their fathers. The names thus applied to ideas were transferred to the words expressing them by the Greek grammarians of Alexandria and were afterward translated into their Latin equivalents by the Greek grammarians who taught their language to the youth of Rome. But by this time the terms had become strictly technical, and their original significance little thought of, and this may account for the Greek *γενική*, the Latin equivalent for which is *genialis*, being rendered by *genitivus*, 'generating or producing,' which would have been expressed in Greek by *γεννητική*.

In English the genitive is the only case or relation among nouns expressed by a difference of termination, and even it is often expressed by the preposition *of*, as, the *river's* brink, or the brink *of the river*. From the frequency with which the form in 's indicates that one thing belongs to another, it is often called the *possessive* case. But this name is little applicable in such expressions as a *day's* journey, still less in many cases where the genitive is used in the ancient languages, e.g., *fons lactis*, a fountain of milk. The *generic* case, however, meaning that which limits the other noun to a class or kind, will be found to express the real relation in every conceivable combination. Besides the *possessive*, the typical usages of the genitive in English are the *partitive* genitive, as "a glass

of milk," and the genitive denoting that the governing substantive is what it is in virtue of what depends upon it, as 'the author of the book.'

The termination 's was often erroneously supposed to be a contraction for *his*, as if "the king's son" = "the king his son", but it is a genuine relic of the inflections (qv) common at an early stage to all the Indo-Germanic languages. *S* was one of the prevalent endings of the genitive singular in the Anglo-Saxon. With the ordinary plural termination in *s*, and sometimes in the singular when the noun ends in *s*, the additional *s* of the genitive is omitted, for the sake of the sound, as, kings' sons, Francis' store. Consult Van Ginneken, *Principes de linguistique psychologique* (Paris, 1907), Paul, *Principien der Sprachgeschichte* (Halle, 1909), Mauthner, *Zur Grammatik und Logik* (Stuttgart, 1913).

GENIUS, jēn'yūs (Lat, tutelary godling, from *gignere*, Gk *γίγνεσθαι*, *gignesthai*, Skt *jan*, to be born) The name given by the ancients to the lesser divinities, good and bad, to whose charge are committed the destinies of the individual human being. This usage is still retained, metaphorically, in such phrases as "his good (or evil) genius prompted him." Hence arises, further, the employment of the term for a special aptitude or characteristic, as when we speak of the bent of a man's genius or of the genius of nineteenth-century thought. The current meaning of the word, however, which naturally suggests itself in the absence of a limiting context, is that of "an ability that is exceptionally high and at the same time in-born" (Galton). That man is possessed of genius—or is a genius—whose natural abilities are of an unusually high order and display themselves in creation or construction, while that man is talented whose natural abilities, though far above the average, depend for their realization upon education and training, and whose superiority is displayed rather in acquisition or in artistic execution than in invention. The man of talent, says Galton, is one in four thousand, the man of genius is one in a million, or even in many millions.

Many attempts have been made to define genius. Carlyle remarks that it means, first of all, "the transcendent capacity of taking trouble", and when we think of the leaders in science or of great military geniuses, we shall admit the measure of truth in his statement. Lowell, on the contrary, declares that "talent is that which is in a man's power; genius is that in whose power a man is"—an account that seems to contradict Carlyle's definition outright, but one whose justice we shall concede when we think, e.g., of a poet like Shelley. This contrariety of description shows how foolish is the attempt to put a technical interpretation upon the word "genius" or to characterize a "typical" genius. There is a popular belief that the man of genius is a puny and unhealthy being, all brain and no muscle, and the work of Lombroso has given new vogue to the old idea that genius is closely related to insanity.

Now, there can be no doubt that men of extraordinary gifts have often had poor constitutions; we have only to think of the philosopher Kant as an example. But the rule is to the reverse effect: a "collection of living magnets in various branches of intellectual achievement" is good to see, writes Galton, for the reason that

they are "such massive, vigorous, capable-looking individuals." For the second belief there seems, unfortunately, to be better evidence. We are not called upon to suspect insanity wherever we find an unusually high intelligence; this position is negatived by the remark just quoted. But high intelligence implies a finely wrought and peculiarly excitable brain, and these characteristics of the nervous system, balanced in the case of the genius by preservative conditions, may appear in his near relatives, without the required checks and preservatives, as some form of eccentricity, if not of mental derangement. Consult Galton, *Hereditary Genius* (London, 1892); Lombroso, *The Man of Genius* (New York, 1891); Nordau, *Degeneration* (ib., 1895); Ellis, *A Study of British Genius* (London, 1904); Reibmayr, *Die Entwicklungsgeschichte des Talents und Genius* (2 vols., Munich, 1908); Larned, *A Study of Greatness in Men* (Boston, 1911); Nisbet, *The Insanity of Genius* (London, 1913).

GENLIS, zhân'lês', STÉPHANIE FÉLICITÉ DUCREST DE SAINT-AUBIN, COUNTESS DE (1746-1830). A French novelist, dramatist, and memoir writer, born at the Château de Champcéri, near Autun. She afterward became preceptress (1781) of the sons of the Duke of Chartres, known later as Philippe Egalité. Among these was the future King Louis Philippe, for whom she wrote several educational books. During the Revolution she lived in Switzerland, in Berlin, and in Hamburg. Napoleon recalled and pensioned her. She continued to write voluminously during the Revolution and seems to have enjoyed the literary quarrels roused by her cleverly sarcastic *Diners du baron d'Holbach*, witty perisage of the intolerant fanaticism of eighteenth-century philosophy. Her *Mémoires inédits sur le XVIII^{ème} siècle et la révolution française* (10 vols., 1825), and a novel, *Mlle de Olermont* (1802), are other noteworthy works among her 90 volumes, many of which were translated into English. She died in Paris. Consult Sainte-Beuve, *Causeries*, vol. III (Paris, 1857); L. Chabaud, *Les précurseurs du féminisme* (ib., 1901); C. M. Bearne, *Heroines of French Society* (New York, 1907); J. Harmaud, *A Keeper of Royal Secrets* (London, 1913).

GENNADIUS (Lat., from Gk Γεννάδιος). A learned Greek, Patriarch of Constantinople (c. 1453-59). His lay name was Georgius Scholarius. But little is known of his life, and it has even been thought that there were two writers of the same name living at the same period. The first appears in history in 1439, when he accompanied the Emperor John Palæologus to Florence, whither the Council of Ferrara had been adjourned, and where an effort was made to unite the Eastern and Western churches. (See FERRARA-FLORENCE, COUNCIL OF, EUGENIUS IV.) Scholarius, at this time a layman, played a politic and cautious part, admitting the necessity of union and trying to draw up a form which from vagueness and ambiguity might be accepted by both parties. After his return to Constantinople he became a monk and opposed the union which he had formerly favored. He next appears in 1453, after the capture of Constantinople by the Turks. The conqueror Mohammed, finding that the patriarchal chair had been vacant for some time, chose the monk Gennadius for the office. At the request of Mohammed he drew up a symbol or confession of faith, which is valuable as an expression of

the belief of the Greek church. After four or five years he resigned his episcopal dignity and retired to a monastery. Gennadius was a prolific writer, many of his extant works have never been edited. He was an able champion of the Aristotelians in the contest between Platonism and Aristotelianism which marked the transition from mediæval to modern thought. For his confession, consult Schaff, *Creeds of Christendom* (4th ed., 3 vols., New York, 1905). Some of his works are in Migne, vol. clx (Paris, 1854-66).

GENNESARET, jën-nës'sa-rët, LAKE OF. See GALILEE, SEA OF.

GENNESARET, LAND OF. A term derived from the faulty rendering in the Authorized Version of the two passages in the New Testament (Matt. xiv. 34, Mark vi. 53) where the name "Gennesaret" is used as referring to a locality. Properly rendered, both passages should read "And having crossed over, they came to land at Gennesaret." The locality so named was a small plain on the western shore of the Sea of Galilee, which derives from it the name "Lake of Gennesaret" (Luke v. 1), first used in 1 Macc. xi. 67 in the form "water of Gennesareth," and appearing several times under differing forms in later writers. The plain extended north and south some 3 miles, between the high promontories of Magdala (El-Mejdel) on the south and the hills of Capernaum (Tell Hüm) on the north, and for about 1½ miles inland to the foot of the western upland. In form it was crescent-shaped, lying, with the Sea of Galilee, some 650 feet below the level of the Mediterranean. It was exceedingly fertile, being watered by plentiful streams from the western hills and by copious springs within its own area. Josephus' glowing description of its fruitfulness (War, III, x, 8) gives what, after all, is quite likely to have been its condition in the gospel times. It was also thickly populated, as is implied in the passage in Mark (vi. 53-56), and confirmed by the ruins of towns and villages found scattered over it today.

As to the origin of the name, there is much uncertainty. On philological grounds it is not probable, though it has been strongly urged, that it is derived from Chinnereth, the Old Testament name of the lake. It is more likely that it comes from some combination of *gan*, 'garden,' or *gey*, 'valley,' with some following element no longer discoverable in the word. It is called to-day El-Ghuweir, 'the little hollow.' For bibliography, see GALILEE, SEA OF.

GENOA, jën'ô-a (It. *Genova*, Genoese *Zêna*, Fr. *Gênes*). A fortified seaport of Liguria, Italy, capital of the Province of Genoa, formerly the capital of the Republic of Genoa, situated on the Gulf of Genoa and the Bisagno River, in lat. 44° 24' N and long. 8° 54' E (Map Italy, B 2). It is one of the principal ports and important commercial centres of Italy. The tonnage of vessels entering and leaving in 1910 was slightly less than that of Naples, but double that of any other port of Italy. The mean temperature is 61° F., 9° above that of Turin in the interior, 100 miles northwest. At Genoa the January temperature averages 46° F. and seldom falls below 23° F., but the changes are sudden, and the winter winds from the surrounding Ligurian Apennines are raw. The average temperature at Genoa in July is 76° F.

Seen from the sea, the city justifies its title of "la superba" (the proud). In a 9-mile cir-

cut it rises like an amphitheatre of churches, palaces, and houses. Picturesqueness is added to the panorama by terraced gardens and by bridges, the most remarkable of which is the Ponte Carignano, that leads over seven-story buildings to the church of Carignano and was built in 1718 by the Sauli family. It is 361 feet long, 17 feet wide, and 112 feet high. The old town is a network of steep, narrow streets lined with high buildings, but the modern encircling and radiating boulevards are broad and magnificent. Among these avenues are the imposing Via di Circonvallazione a Mare, on the site of the exterior fortifications, and the Via di Circonvallazione a Monte, stretching superbly along the heights back of the city. One of the most characteristic streets in the business section is the Via Garibaldi, with stately palaces. The Piazza Ferrari, with its large equestrian statue of Garibaldi, is the converging point of the extensive system of electric street railways, some of which reach the adjacent country through tunnels, giving ample suburban residence facilities. There are also three lines of cable cars.

The harbor, with an area of over 600 acres, consists of the Porto, or old harbor, with 19 feet of water, the Porto Nuovo, with 32 feet of water, and the Avamporto for war vessels, with 45 feet of water. The Porto is partially inclosed by the Molo Vecchio, said to have been built in the twelfth century, and by the eighteenth-century Molo Nuovo. The additions to the Porto were made (1877-95) at an expense of over \$12,000,000, of which the Duke of Galliera contributed \$4,000,000. These increases of the area and capacity of the harbor were in part due to increased demands upon the opening of the St Gothard Tunnel, which increased the area served by the port. Much of the sea traffic of Switzerland and southern Germany now utilizes this port. The harbor now has, besides an elaborate system of quays, a steel floating dock, 282 feet long, a graving dock, and two stone dry docks, 588 and 722 feet long respectively. To the west, on rocky Cape Faro, stands the lighthouse (La Lanterna), 384 feet high, with a magnificent view of the sea, harbor, city, Riviera, and mountains. Modern batteries and forts render the city a sea and land fortress of great strength. The rowing and bathing in and about the harbor add to the attractions of the city.

Genoa is famous for the number of marble palaces in the style of the best period of the Renaissance. It is also unique for its many noble staircases. It accordingly presents a proud and grand appearance and is the least agreeable and *sympathique* of the great Italian towns. The most splendid palaces it owes to the designs of Galeazzo Alessi (died 1572) and his successors, Bianco (1604-56), Tagliafico (1729-1812), and Cantoni (1736-1818), who interpreted Alessi in the spirit of Michelangelo. The oldest of the 82 churches is the cathedral of San Lorenzo, founded in 987, rebuilt in the Romanesque style about 1100, restored in Gothic in 1307, and given a Renaissance dome in 1567. The choir was modernized in 1617, and in 1896 the interior was properly restored. In it are statues, paintings, vestments, relics, of which perhaps the most interesting is the *Sacro Catino*, in which tradition says that Joseph of Arimathea caught drops of the blood of his crucified Saviour. There are excellent altarpieces by

Baroccio and Battista. The most magnificent church in Genoa is the Santissima Annunziata, the most beautiful is the sixteenth-century Santa Maria di Carignano. The Annunziata dates from the sixteenth century and is a basilica with a dome, the vaulting being borne by fluted and inlaid shafts of marble. Services are held in English at the Episcopal Church, at the Presbyterian Church, and at the Sailors' Missions.

Genoa, so rich in architecture, is poor in masterpieces of painting and sculpture. The principal picture galleries are in the Palazzo Rosso and Bianco, presented to the city by the Duchess of Galliera, in the seventeenth-century Palazzo Balbi-Senarega (private), and in the Palazzo Duizzo-Pallavicini, which also contains a library with examples of early printing. The Rosso collection embraces meritorious paintings by Paris Bordone, Bassano, and Van Dyck. The Bianco contains letters by Columbus, majolica, coins, miniatures, tapestries, Oriental vases, and noteworthy paintings by Rubens and David. The Balbi-Senarega Palace is perhaps the most pleasing one in the city, owing to its Doric court with colonnades set off by an orangery. Among the good paintings here are works by Rubens, Titian, and portraits by Van Dyck. The city owns the Villetta di Negro, with its artistic pleasure gardens and fountains. It contains the municipal museum and zoological gardens. The Palazzo Doria was presented in 1522 to Andrea Doria (q.v.), "father of his country," and, as the Latin inscription on the building says, admiral of the Papal, Imperial, French, and Genoese fleets. The building was remodeled in 1529 by Montorsoli, after plans suggested by Doria, and was at that time decorated with frescoes by Perino del Vaga, a pupil of Raphael. The interior of the little thirteenth-century Gothic church of San Matteo was also remodeled by Montorsoli. The facade of the church bears inscriptions in honor of the Doria family, the sword of Andrea Doria hangs over the high altar, and his tomb is in the chapel. The thirteenth-century Palazzo Ducale, remodeled in the sixteenth century, and, after a fire, modernized in 1777, was once the residence of the doges, now it is given over to judges and police commissioners. The seventeenth-century Palazzo Reale, acquired by the royal family in 1815 and restored in 1842, is magnificently furnished. In the church of Santo Stefano is a celebrated painting by Giulio Romano, "The Stoning of Stephen."

In the Piazza Acquaverde, before the railway station, there is a marble statue of Columbus, who was born near or in Genoa. This monument, sculptured in 1862 by Canzio, has four allegorical figures—Religion, Science, Strength, and Wisdom. At the foot kneels a figure representing America. On the pediment of the Palazzo Farragiana, opposite, are scenes from the life of Columbus in marble relief. In the sixteenth-century Palazzo Municipale (City Hall) is a mosaic portrait of him, and in the pedestal of his bust are preserved the originals of some of his letters. There are also memorials of him in the Palazzo Bianco. He is said to have been baptized in the architecturally interesting church of Santo Stefano. The Municipale possesses also Paganini's famous violin (Guarneri). Among the many monuments which enrich the spacious piazzas and corsos of Genoa are those of Victor Emmanuel and Mazzini, who was born here, and an immense bronze monument to the Duke of

Galliera The modern Campo Santo (cemetery) is beautifully laid out on the north bank of the Bisagno. It contains many splendid monuments and is famous for its imposing appearance, crowning rotunda, and galleries with their striking variety of sculptured monuments. In the environs are several lordly and celebrated villas, and gorgeous views of sea and shore abound on every hand, as in the city itself.

The finest court and stairway in Genoa are in the Palazzo dell' Università, which was begun as a Jesuit college in 1623 and transformed into a university by Napoleon in 1812. The university had in 1914 about 175 instructors (including docents) and over 1000 students. Among the principal libraries are that of the university, the city library (in the Academy of Fine Arts), that in the Palazzo Rosso, the Missioni Urbane, and the Franconia. Genoa has two royal gymnasia, two royal lyceums, a theological seminary, a royal school of shipbuilding, a commercial school of university rank, five technical schools, three royal normal schools, two technical evening schools, a school of technical design, and the industrial school Duchessa Galliera.

Among the splendidly equipped institutions of charity, to which the city grants liberal appropriations, are the Pammatone Hospital, with beds for 700, founded in 1420 by Bartolommeo Bosco, the poorhouse, founded in 1655 and enlarged in 1835, with accommodation for 1400, the hospital for the incurable, the Sant' Andrea Hospital, the asylum for the deaf and dumb, the orphan asylum, with accommodation for 600 girls, the insane asylum, the asylum for the blind, the Protestant Hospital; and the children's hospital.

Of the seven principal theatres the most important—one of the largest in Italy—is the Teatro Carlo Felice, built in 1828, with 3000 seats. There are excellent electric-lighting, gas, telephone, water, and sewerage systems, and the death rate has declined appreciably during the past generation. The city government has a high reputation for efficiency. Genoa is the seat of an archbishop.

There is regular communication by steamship with the principal Mediterranean ports, with Germany and the British Isles, with New York, and with Asia and Australia. The headquarters of the Navigazione Generale Italiana and of other steamship companies are here.

As a commercial centre, Genoa has made very rapid advances and is one of the most important of the Mediterranean ports. The connections by rail with the St Gothard Tunnel, 200 miles north, render it the principal port on the Mediterranean for Switzerland, Germany, and a part of Austria. The east railway station in the city is connected with the main, or west, station by a subway $1\frac{1}{2}$ miles long, which has a branch diverging to the harbor station. The harbor station is connected with the various docks by rail. The warehousing system has been greatly strengthened.

In 1912 the total commerce of Genoa, exclusive of the transit trade by land and sea, amounted to \$306,140,000. The imports were valued at \$207,680,100, the exports were valued at \$98,360,000. The transit trade amounted to approximately \$60,000,000, chiefly merchandise for Switzerland and southern Germany. In 1891 the value of the imports was about \$78,000,000, of the exports about \$18,000,000, in 1877

the imports were valued at \$58,000,000, exports at about \$9,500,000. The number of vessels entering in 1910 was 5970, with a tonnage of 7,475,583, clearing 5979, tonnage 7,485,717. The number of vessels entering and clearing in 1891 was 12,256, with registered tonnage of only 6,421,637. In the seventies the number of vessels entering and clearing averaged only 5000, with tonnage of about 2,000,000. The principal imports in 1912 were coal, chiefly from Great Britain, about \$20,000,000, wheat, \$25,310,000, cotton, valued at about \$44,000,000, metals, \$24,000,000. The principal exports were cottons, valued at about \$20,000,000, also fruits, wine, cheese, macaroni, soap, hats, and marble. American cottonseed oil is mixed here in large quantities with olive oil and exported. The industrial interests are also important.

The manufactures are velvet and silk fabrics, woolen goods, cotton goods, ribbons, damask, embroidery, artificial flowers, hats, paper, leather and leather goods, furniture, objects in gold, silver, ivory, marble, alabaster, and coral, essences, soap, preserved fruits, chocolate, macaroni, and vermicelli. San Pier d'Arena (qv), the most important suburb of Genoa, is a manufacturing centre. The large imports of grain have led to the establishment in the neighborhood of Genoa of numerous flour mills. Pop. (commune), 1901, 234,710, 1911, 272,221.

History In ancient and mediæval times Genoa was probably an important seaport. At the time of Augustus Genoa was, according to Strabo, "a flourishing town and the chief emporium of the Ligurians," but there is surprisingly little material for its early history. A Greek cemetery of the fifth and fourth centuries B.C. has been discovered. We learn that Genoa was destroyed by the Carthaginians and restored by the Romans, that it had municipal rights, that its wine was good, and that is about all the information. During the Dark Ages Genoa, with different barbarian overlords, maintained in greater part its municipal organization. In 936 it was plundered by the Saracens, against whom it had been a bulwark of defense for the whole of Liguria. In the following century Genoa and Pisa formed an alliance to expel the Saracens from the strongholds of Corsica and Sardinia. This being effected, the Genoese obtained, by papal arbitration, the grant of Corsica, while Sardinia was assigned to the Pisans. For the next two centuries the two cities were almost continually at war, until in 1284 in the naval battle of Meloria the Genoese broke the power of Pisa. Meanwhile the Genoese had vigorously cooperated in the Crusades and, as material reward, had obtained important commercial privileges in the Holy Land. The city had also established settlements at Constantinople, in the Crimea, in Syria, Cyprus, Tunis, and Majorca, and rose to such a height of maritime power throughout the Mediterranean that the natural sequence was a long-continued struggle with Venice, which terminated after the Venetian victory at Chioggia in 1380, decidedly disadvantageously to Genoa.

During both the Pisan and the Venetian wars internal dissensions had weakened the city and occasioned changes in the form of government. The election of the first Genoese Doge was in 1339. This supreme magisterial office, which was held for life, and from which nobles were excluded, continued for two centuries. The great

Genoese Bank of St George was the most important factor in the city.

The ambitious contentions of four leading families—viz, the Adorni, the Fregosi, the Guerci, and the Montaldi—succeeding those of the patrician houses of Doria, Spinola, Grimaldi, and Fieschi, engendered such disastrous civil strife under the early doges that in 1396 the citizens invoked the protection of the French King Charles VI and finally submitted to the rule of the Visconti (qv), the lords of Milan, in 1464. After the invasion of Louis XII in 1499, Genoa was subject to the French till 1528, when the genius and resolution of a great citizen, Andrea Doria (qv), freed his country from foreign invaders and restored to Genoa Republican institutions. But the power of Genoa was on the wane. The Turks seized her Oriental possessions, the French bombarded the city in 1684, and the Austrian troops occupied it for a brief time in 1746. In 1736 the Corsicans, who had for seven years been in rebellion, chose a Westphalian nobleman named Neuhof (qv) as their King. He was soon expelled by the Genoese with the aid of the French, who in 1768 obtained the island. During the French Revolution, when the French swept over Italy, Genoa sought to remain neutral, but, being threatened by the English under Nelson, finally joined France. Then a Democratic uprising favored by Napoleon put an end to the sway of the nobility. In 1797 a Democratic constitution was adopted, and the Ligurian Republic established. In 1800 the French general Masséna was besieged in Genoa by the Austrians and English and forced to capitulate. In 1805 Napoleon annexed the Ligurian Republic to the French Empire. After the fall of Napoleon Genoa was, against her will, awarded by the Congress of Vienna to the Kingdom of Sardinia (qv). Consult Mallison, *Studies from Genoese History* (London, 1875), Canale, *Nuova Istoria della Repubblica di Genova* (4 vols, Florence, 1858-64), Bent, *Genoa: How the Republic Rose and Fell* (London, 1881), Duffy, *The Tuscan Republics, with Genoa* (New York, 1893), Carden, *The City of Genoa* (ib, 1903), Staley, *Heromes of Genoa and the Riviera* (ib, 1911).

GENOA, GULF OF The portion of the Mediterranean, near the Italian city of Genoa, which is partially inclosed by the Province of Liguria (Map Italy, B 3).

GENOUDE, zhā'nōōd', the name by which ANTOINE EUGÈNE GENOUD is usually known (1792-1849). A French publicist, born at Montélimar (Drôme). At first a student of eighteenth-century philosophy, he became an ardent Catholic and upholder of the Bourbons. He worked zealously for universal suffrage. He was one of the founders of *Le Défenseur* (1820), which was replaced by *L'Étoile* (1821), the government organ, and he revived the old *Gazette de France* (1825), in which he opposed the Martignac ministry. After the revolution of July (1830) he attacked the new party with much vigor. In 1835, the year following the death of his wife, he took orders. He was elected a deputy in 1846. His works include *Voyage dans la Vendée et dans le midi de la France* (1820), *La raison du christianisme* (1834-35); a translation (1837-43) in French of the Church Fathers of the first three centuries; and a 16-volume *Histoire de France* (1844-47).

GENOUILLERE, zhā'nōō'yār' (Fr. knee-

piece). A term in fortification (qv), denoting that part of the interior slope of the parapet which serves as a cover for the lower part of a gun carriage. The term itself is derived from one of the articulated pieces of metal used in suits of armor. In the thirteenth century it was a kneepiece of beaten metal (iron) held in place by a leather bandage or strap, but subsequent improvements made it much more pliable and added (in the fourteenth century) large rings which projected rearward on each side of the knee joint.

GENOVESI, jā'nō-vā'sé, ANTONIO (1712-69). An Italian writer on philosophy and political economy. At an early age he was destined by his father for the Church and began the study of theology in a monastery. He took orders and was appointed to the chair of rhetoric in the theological seminary of Salerno. He now read with eagerness the works of the chief modern philosophers and was particularly attracted by Locke. Dissatisfied with ecclesiastical life, Genovesi resigned his post at Salerno and proceeded to Rome, where he undertook the study of law and qualified as an advocate. The details of legal practice, however, proved as distasteful as theology, and for some years he gave himself up entirely to the study of philosophy, attending most of the distinguished lectures at the University of Naples. At this place, after having obtained the appointment of professor extraordinary of philosophy, he opened a seminary or private college for students. His reputation as a teacher was increased by the publication in 1743 of the first volume of his *Elements of Metaphysics* and in 1745 of his *Logic*. Both works are imbued with the spirit and principles of the Empirical school of philosophy. On account of the accusation of infidelity and heresy excited by his discussions of metaphysical principles, he had some difficulty in obtaining the professorship of moral philosophy and failed in his effort to be appointed to the chair of theology. He published a continuation of his *Elements of Metaphysics*, but with every new volume he experienced fresh opposition from the partisans of scholastic routine. In spite of this Genovesi obtained the approbation of Pope Benedict XIV, of several cardinals, and of most of the learned men of Italy. Among them was Intieri, a Florentine, who founded at his own expense, in the University at Naples, the first Italian chair of political economy, under three conditions, viz, that the lectures should be in Italian, that Genovesi should be the first professor, and that after his death no ecclesiastic should succeed him. In 1765 he published the results of his economic studies in *Lezioni di commercio o sua economica civile*. He was one of the first in Italy who dared to write upon philosophy in the common language of the country. His *Opere scelte* were published (4 vols, Milan, 1835). Consult Bobba, *Commemorazione di A. Genovesi* (Benevento, 1867), and Gentile, *Dal Genovesi al Galluppi* (Rome, 1903).

GENRE (zhā'n', Fr, sort) **PAINTING.**

A term used in art to denote that class of subjects which portray the intimate and everyday life of any people. This draws the line sharply between genre and historical painting, which latter depicts important moments of national life. The subjects are the familiar life of the family, street scenes and sports, festivals and picnics, tavern scenes—all that goes to make up the occupations of a people. These may be

comic, serious, or pathetic, but genre painting, strictly speaking, always includes as a dominant note the human element. If actual historical personages are represented, the picture is termed 'historical genre.'

History Genre painting was practiced by the Greek artists of the late Greek and Roman epochs, as may be seen in the surviving examples unearthed at Pompeii. During the fifteenth century real genre subjects were represented, both in Italy and the Netherlands, as religious pictures, at Florence by Ghirlandaio and Gozzoli and others, and in Venice in the sixteenth century by Giorgione and the Bassani. It was first developed as an independent art in Flanders during the sixteenth century, particularly by Pieter Breughel the elder, and after him by Brauer and Teniers in the seventeenth century, which was indeed the golden age of genre. This was especially the case in Holland, where even the greatest masters, like Hals and Rembrandt, were genre in tendencies. Around them a group of painters developed who depicted, in pictures of small form, every phase of Dutch life—Ostade, Dou, Jan Steen, Ter Borch, Metz, Pieter de Hoogh, Vermeer van Delft, to mention a few of many names. During the eighteenth century genre painting was practiced by many able painters in France, such as Watteau, Lancret, Chardin, Boucher, Fragonard, and in England by Hogarth. In the second quarter of the nineteenth century genre painting became popular in all the European countries, in the works of such artists as Meissonier, Roybet, Barye, Vibert, and others in France, Fortuny and his many followers in Spain and Italy, Wilkie, Newton, the American Leslie, Mulready, and Frith in Great Britain, and Knaus, Defregger, Dietz, and Grützner in Germany. In the United States most of the figure painters of the middle period also painted genre subjects, and a few, like J. G. Brown and Mount, devoted themselves entirely to it. The more recent modern naturalistic tendency, which regards nature as a whole, is hostile to specialization, and genre painting is at present little practiced as a special branch. See PAINTING, and the articles on the genre painters mentioned above.

GENS (Lat., race). A word sometimes used by the Romans to designate a whole community, the members of which were not necessarily connected by any known ties of blood, though some such connection was probably always taken for granted. In this sense we hear of the *gens Latinorum*, *Campanorum*, etc. But *gens* had a far more definite meaning in the constitutional law of Rome. According to Scævola the pontifex, those alone belonged to the same *gens*, or were "gentiles," who satisfied the four following conditions: (1) who bore the same name, (2) who were born of freemen, (3) who had no slave among their ancestors, and (4) who had suffered no *capitis diminutio* (reduction from a superior to an inferior condition). In the identity of name some sort of approach to a common origin seems to be implied. The Roman *gens*, in fact, included all those who could trace their descent, through males, from a common ancestor. The *gens* thus consisted of many families, supposed to be nearly allied by blood. Consult Lange, *Römische Alterthümer*, vol. i (3 vols., Berlin, 1877).

The Roman form of organization is found among all races and in every part of the world and is now known generically, by the common

consent of ethnologists, as the clan (*qv*), although in literature and in history *gens* is the familiar term. The clan is a body of kindred wider than a family or household and narrower than a tribe (*qv*), and recognizing relationship, together with the right to names and to property, in one line of descent only, through the mother but not through the father, or through the father but not through the mother. The primitive clan, found in savagery and the lower stages of barbarism, is a totemic group (see TOTEMISM), or "totem kin." Its members hold sacred some species or variety of plant or animal, regarded as female in sex, and claim to be descended from it. Such are in many cases the clans of the Australian aborigines and of the North American Indians. Clans thus tracing descent through the mother are called matrilineal, the clans found in a higher stage of social evolution, as among the Arabs, the Greeks, and Romans, and the Slavs, the Celts, and the Teutons at the dawn of European history, in which descent is reckoned through fathers, are called patrilineal. The Greek *γένος*, and its equivalent form the Roman *gens*, were highly developed patrilineal clans. The discovery that the totemic organization of the North American Indians was in all essentials like that of the Roman *gens*, except in being matrilineal, was made by Lewis H. Morgan. From this discovery to that of the practical universality of the clan as the characteristic social form of tribal communities was but a step, and the wider generalization was offered by Morgan in his *System of Consanguinity and Affinity of the Human Family* (Washington, 1869). The functions of this clan are economic, religious, and juristic. It usually holds common property and a burial place. It regulates marriages, in the primitive clan the clansman may not marry his own clanswoman. This restriction was breaking down in the Roman *gens* at the beginning of the authentic historic period. All clansmen were bound to defend one another and to redress one another's injuries. In Morgan's writings the word *gens* is everywhere used for clan, and his use of *gentile* to distinguish tribal from civil society has been usually followed. Consult the article "Gens," in Smith, *A Dictionary of Greek and Roman Antiquities*, vol. 1 (3d ed., London, 1890), the article "Gens," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vii (Stuttgart, 1912), Greenidge, *Roman Public Life* (London, 1901), Botsford, "The Social Composition of the Primitive Roman Populus," in *Political Science Quarterly*, vol. xxi (Boston, 1906), id., "Some Problems Connected with the Roman Gens," in *Political Science Quarterly*, vol. xxii (1907), id., *The Roman Assemblies* (New York, 1909).

GENSAN, *gên'sân'*. See WONSAN.

GEN'SERIC, or, more correctly, **GAI'SERIC** (400-477). King of the Vandals (*qv*). He was an illegitimate son of Godigisudus, who led the Vandals into Spain. After the death of his brother Gonderic, Genseric became sole ruler. In the year 429 he invaded Africa, on the invitation of Boniface, Count of Africa, the Viceroy of Valentinian III, Emperor of the West, who had been goaded to rebellion through the machinations of his rival Aetius. (See BONIFACE.) Genseric's army at first amounted to 50,000 warriors. As they swept through Mauritania, the Kabyle mountaineers and the Donatist heretics swelled the horde and more than equalled

their associates in acts of cruelty and blood-thirstiness. The friends of Boniface, astonished that the hero who alone had maintained the cause of the Emperor and his mother Placidia during their exile and distress should have invited the Vandals to Africa, attempted, with ultimate success, to bring about an interview between the Count of Africa and an agent of the Empress. The army Boniface hurriedly collected to oppose the Vandals was twice defeated by Genseric, and he was compelled to retire to Italy, where he was soon afterward slain by Aetius. All Africa west of Carthage fell into the hands of Genseric, who shortly after seized that city itself and made it (439 A.D.) the capital of his new dominions. He also took possession of part of Sicily, Sardinia, and Corsica. In 451 he encouraged Attila to undertake his great expedition against Gaul. Tradition states that, at the request of Eudoxia, the widow of Valentinian, who was eager for revenge upon her husband's murderer, Maximus, Genseric in 455 marched against Rome, which he took, and abandoned to his soldiers for 14 days. On leaving the city he carried with him the Empress and her two daughters, one of whom became the wife of his son Huneric. The Empire twice endeavored to avenge the indignities it had suffered, but without success. First, the Western Emperor, Majorian, fitted out a fleet against the Vandals in 457, which was destroyed by Genseric in the Bay of Cartagena; secondly, the Eastern Emperor, Leo, sent an expedition under the command of Heraclius and others, in 468, which also was destroyed, off the city of Bona. Genseric died in 477, in the possession of all his conquests. He seems to have regarded himself as a "scourge of God." In creed Genseric was a fierce Arian and inflicted the severest persecutions upon the orthodox, or Catholic, party. Consult Hodgkin, *Italy and her Invaders*, vols. II and III (6 vols., 1892-95); Gibbon, *Decline and Fall of the Roman Empire* (Bury's ed., London, 1906-12); Martroye, *Genseric. La conquête vandale en Afrique* (Paris, 1907); *Cambridge Mediaeval History*, vol. I (New York, 1911).

GENSFLEISCH, gën'sflīsh. See GUTENBERG, JOHANNES.

GENSICHEN, gën'sīk-en, OTTO FRANZ (1847-) A German author, born at Driesen, Prussia, and educated at Berlin. After an association as dramaturgist with the Wallner Theatre in Berlin (1874-78), he devoted himself exclusively to literary work. His principal publications include *Gedichte* (2d ed., 1871); *Vom Deutschen Kaiser*, 12 poems (4th ed., 1871); *Felicia*, an epic (16th ed., 1882); plays, including *Robespierre* (1873), *Phryne* (1878), and *Jungbrunnen* (1901); and novels, including *Blutschuld* (1905).

GENSONNÉ, zhān'sō'nā', ARMAND (1758-93) A French legislator, born at Bordeaux. He was elected a deputy from the Gironde to the Legislative Assembly, was Commissioner to La Vendée, with Gallois, and proposed the Law of Dec. 31, 1791, accusing the brothers of the King and several members of the aristocracy. The decree of confiscation against the property of the emigrants (Feb. 9, 1792) and the declaration of war against the King of Bohemia and Hungary (April 20, 1792) were drawn up by him. He was President of the National Convention for two weeks in March, 1793, but was imprisoned (June 2, 1793), was tried for

treason (October 3), and was executed with his Girondin associates (on the 31st).

GENTH, gënt, FREDERICK AUGUSTUS (1820-93) An American analytical chemist and mineralogist, born at Wachtersbach, Hesse. He was educated at Heidelberg and other German universities. From 1845 to 1848 he assisted Bunsen. He went to Philadelphia in 1848 and set up an analytical laboratory. In 1872 he was appointed to the chair of chemistry in the University of Pennsylvania, but resigned in 1888 and reopened his laboratory. He established 23 new minerals, wrote extensively on chemistry and mineralogy, and was best known for his publications, which included *Researches on the Ammonia-Cobalt Bases*, with Wolcott Gibbs (1856), a study of "Corundum," in *American Philosophical Society Proceedings* (1873), and a report as chemist and mineralogist to the Geological Survey of Pennsylvania, on the mineralogy of the State. He was a founder, and president (1880), of the American Chemical Society.

GENTH, gënt, LILLIAN MATHILDE (1876-) An American figure painter. She was born in Philadelphia and studied there at the School of Design for Women, under Elliott Daingerfield. Later she continued her studies under Whistler in Paris, returning to America in 1903. From an early style, in which her color was sombre, she turned to painting in a higher key, her usual subject being the female nude with a landscape background. She also did some work in portraiture, attaining a measure of popularity in both fields. In 1904 she received the Mary Smith (Pennsylvania Academy) prize for pictures done by women, in 1907 the Shaw memorial prize, and in 1911 the first Hallgarten prize at the National Academy of Design (of which she was elected associate). Pictures by Miss Genth are in the National Gallery, Washington, the Carnegie Institute, Pittsburgh, the Metropolitan Museum, New York, and the Brooklyn Institute Museum.

GENTHITE, gënt'hīt A hydrated magnesium silicate closely related in composition to serpentine (qv), but with part of the magnesium replaced by nickel. It occurs in amorphous crusts of a resinous lustre and apple green to yellowish green in color. A variety known as garnierite, which is found extensively near Noumea, New Caledonia, is an important ore of nickel.

GENTIAN, jën'shan (Lat. *gentiana*, Gk. γέντιανη, *gentianē*, said to have been named after an Illyrian king, defeated by the Romans about 160 B.C., *Gentius*, Gk. Γέντιος, who first discovered the properties of the plant) A genus of plants of the family Gentianaceae. The species are numerous, natives of temperate and boreal parts of Europe, Asia, North and South America, and New Zealand, many of them growing in high mountain pastures and meadows, which they adorn by their beautiful blue or yellow flowers. The common gentian, or yellow gentian (*Gentiana lutea*), is abundant in the meadows of the Alps and Pyrenees at elevations of 3000 to 6000 feet. It has a stem 3 or 4 feet high, ovate-oblong leaves, and numerous whorls of yellow flowers. The part employed in medicine is the root, which is cylindrical, ringed and more or less branched, and which appears in commerce in a dried state, in pieces varying from a few inches to more than a foot in length, and from 1/2 inch to 2 inches in thickness. It is

collected by the peasants of the Alps. Although gentian root has been examined by various chemists, its constituents are not very clearly known. It contains, however, gentiopicroin, gentianin or gentisic acid, pectin, fixed oil, and sugar. As much as 14 per cent of the last is present, and in consequence of it an infusion is capable of undergoing fermentation and of forming the "bitter snaps," or "Enziangeist," which is much employed by the peasants on the Swiss Alps. Gentian is a highly valued medicine, a simple tonic, bitter without astringency, and is much used in diseases of the digestive organs and sometimes as an anthelmintic. The bitter principle on which its virtue depends exists in other species of this genus, probably in all, and appears to be common to many plants of the same order. Roots of inferior quality of the species *Gentiana purpurea*, *Gentiana punctata*, and *Gentiana pannonica* are often mixed with the gentian of commerce. Among the most common European species are *Gentiana campestris* and *Gentiana amarella*, plants of a few inches in height, with small flowers, both species being used as tonics in domestic medicine. *Gentiana saponaria*, a North American species, is extensively used in its native country as a substitute for common gentian, and *Gentiana kurrroo* is employed in the same way in the Himalayas. Several species of gentian are common ornaments of gardens, particularly *Gentiana acaulis*, a small species with large blue flowers, a native of the countries of Europe and of Siberia, often planted as an edging for flower borders. *Gentiana andreauxii* and *Gentiana puberula*, American species—the former known as closed gentian or bottle gentian from the nonopening of the flowers, and the latter with blue, funnel-shaped flowers—are common in American gardens. Of the fringed-gentian species *Gentiana crinita* is particularly celebrated for the beauty of its flowers, which are large, blue, and fringed on the margins. It has a branched stem and grows in wet ground. The brilliancy of the flowers of the small Alpine species has led to many attempts to cultivate them, which have generally proved unsuccessful, apparently from the difficulty of imitating the climatic and soil conditions of their native heights. The horse gentian is *Triosteum perfoliatum*. See FEVERWORT, and Colored Plate of MOUNTAIN PLANTS.

GENTIANACEÆ, jěn'shan-ä'se-ä (Neo-Lat. nom. pl., from Lat. *gentiana*, gentian), the gentian family. A family of dicotyledonous plants, most of which are herbaceous, though a few are small shrubs. Many of the herbaceous species are perennial from a rhizome. The leaves are, for the most part, opposite and without stipules. The inflorescence is some form of cyme, and the flowers are usually regular. The calyx is 5, sometimes 4, 6, 8, or 10, parted. The corolla, which is hypogynous, has the same number of lobes as the calyx. The stamens are of the same number as the corolla lobes and the ovary, which consists of two carpels and contains numerous small seeds. The family comprises about 60 genera and more than 750 species. Species of this family are found in nearly every part of the globe and in all sorts of situations. Some are arctic and alpine plants, some are saprophytes, some grow in dry situations, others in marshes, while the species of one genus are aquatic in habit. The flowers of many are of great beauty, both as to color and form, and some are cultivated as ornamentals. Medicinal properties

are attributed to some. The principal North American genera are *Sabbatia*, *Centaurea* (centaury), *Gentiana* (gentian), *Fraxea* (American columbo), and *Menyanthes* (buck bean). See BUCK BEAN, GENTIAN, CENTAURY.

GENTILE DA FABRIANO, jěn-tě'lä da fa'brě-a'nō (c. 1360–c. 1428). The chief Umbrian painter of the transition from the Middle Ages to the Renaissance. He was born at Fabriano, in the March of Ancona, and studied with Allegretto Nuzi. He has also been called the pupil of Fra Angelico, but this is not probable. He must have attained a high reputation in his art by 1411, for about this time he was summoned by the Doge to Venice to fresco the great audience hall of the Ducal Palace. The subjects were scenes glorifying the part of Venice in the struggle between Pope Alexander III and Emperor Frederick Barbarossa, which he depicted with such success that he was rewarded by a pension and certain privileges accorded to the nobility. He exercised a very important influence on the early Venetian school, particularly on the painters of Murano. About 1422 he went to Florence, where he was enrolled in the painters' guild. In 1423 he painted his chief surviving masterpiece, "The Adoration of the Magi," now in the Florentine Academy. He was active also in other Italian cities, as in Orvieto, where his fresco of the Madonna still survives in the cathedral. For Pope Martin V he painted frescoes in St. John Lateran, of which fragments still survive in the Vatican Museum and elsewhere. His chief surviving panels, besides the "Adoration," are a "Madonna in Glory," with other parts of an altarpiece representing saints, in the Brera, Milan, a "Presentation in the Temple," in the Louvre (formerly belonging to the "Adoration" altarpiece), "The Magdalen, St. John the Baptist, St. Nicolas of Bari, and St. George" (1425), and Madonnas in the museums of Berlin, Perugia, Pisa, and in the Jarves collection (New Haven, Conn.).

Gentile's beautifully studied pictures sparkle with gold and colors like jewels. The figures are always animated and the faces smiling. Although he clung to primitive methods of painting, in technical knowledge he went beyond most artists of his time. His chief pupil was Jacopo Bellini, who worked with him in Venice and Florence. Consult Vasari, *Lives of the Most Eminent Painters* (10 vols., New York, 1912).

GENTILES, jěn'tilz (Lat. *gentilis*, belonging to a clan, or family, from *gens*, tribe, family). A term often used in the Bible, especially in the New Testament, to designate the non-Israelitic peoples. It represents the Hebrew *goyim* (pl. of *goy*), 'nations'. The peculiar significance of the term "Gentile" in Jewish and early Christian usage simply marks the crystallization of a long previous process of doctrinal development.

Prior to the conquest of Canaan Israel's life was of a strictly tribal character, and in accordance with the common Semitic ideas the tribes constituting Israel probably felt that they differed from other tribes or peoples only in the fact that they worshiped their God, Yahweh, while the other peoples worshiped their particular deities. Hence in the old stories of the patriarchal age there is manifest no special hostility or attitude of superiority towards the surrounding nations.

The occupancy of Canaan and the development of a vigorous Hebrew nationality after a long

struggle with the old inhabitants and with outside nations led to a new and more positive national consciousness. Israel was now a people (Heb. 'am), Yahwe's people, one of the *goyim* of the earth, ready to assert its peculiar rights and privileges.

The historical narratives pointed out how Israel was specially called of Yahwe to be His own peculiar people, and the legislation defined the legal status of foreigners residing in the borders of Israel. The early Hebrew law distinguished two classes of such non-Israelites—the *ger*, or *tōshabbh*, i.e., sojourner, a permanent resident and in sympathy with Israel's life, and the *sar*, or *nokri*, i.e., the stranger or foreigner, who was not looked upon so favorably. As to the *ger*, the law required of him obedience to the Sabbath law and provided that he was not to be vexed or oppressed. He could also present an offering to the priests, which was not allowed to the *nokri* (Lev. xxii. 25).

In the prophetic teaching (c. 750 B.C. to the Exile) the contrast between Israel and the nations (*goyim*) is most forcibly expressed. Israel's place is unique, and while Yahwe's gracious attitude towards other nations is sometimes asserted, still it is only through Israel that His blessings can be shared by them. With this advocacy of Israel's peculiarly exalted position, the prophets also insisted on the open-hearted favorable treatment of the sojourners in Israel required by the older laws.

The legislation in Deuteronomy, influenced by prophetic thought and the later teachings of Ezekiel, and the still later priestly legislation of the Pentateuch, reveal the growth of the tendency to draw the lines more rigidly between the Israelites and the foreigners. As a result, we have such teachings as these: The *ger* and *nokri* may eat that which dies of itself (Deut. xiv. 21), which is strictly forbidden to the Israelite, the *nokri* is not entitled to the privilege of the year of release (xv. 3), no *nokri* has a right to the throne of Israel (xvii. 15), one may lend on interest to the *nokri* (xxiii. 20). Furthermore, not only could no *nokri* make an offering, but he also could not enter the sanctuary (Ezek. xlv. 7, 9) nor eat of the Passover (Ex. xii. 43). If a *ger* desired to eat of the Passover, he must be circumcised and thus become legally a full Israelite (Ex. xii. 48).

Such principles as these, which became the fundamental law of the Jewish communities of postexilic times, show how at last the conviction became deeply rooted and clearly expressed that Israel was, theoretically, a holy entity, a people by itself, altogether unique among the peoples of the earth. The other peoples, the *goyim*, were per se profane. The Israelite could not meet them as equals. The work of Haggai and Zechariah at the time of the building of the second temple (520–516 B.C.) and later that of Ezra and Nehemiah were of great influence in this respect. Henceforth the attitude towards the non-Israelite manifested two marked phases. On the one hand was the insistence on the idea of separation, of exclusiveness, under all circumstances, so that the Jew, not only in Palestine, but also in the Dispersion, scattered among the Gentiles, was ever a Jew, holding himself aloof from intimate familiar intercourse with the non-Israelite, with a lofty contempt for Gentile ideas and customs. A protest against this narrow view, as it was held c. 400 B.C., was circulated in the form of the parabolic story of

Jonah in which God's sympathy for the heathen world is set forth with great pathos. The prejudices against the Gentiles were intensified by the bitter struggles of the Maccabean times and were at last shared by the great majority of Jews, even of the humble classes (cf. Acts x. 28). Practically violations of these principles were constantly occurring. There were certain limits, however, which no Gentile could ever overstep, e.g., the prohibition in the temple of Herod marking off the court of the Gentiles from the precincts in which Israelites were allowed, reading as follows: "No foreigner may enter within the railing and fence about the sanctuary. Whoever is caught so doing renders himself guilty, for death follows."

On the other hand, the early and prophetic teachings, and the legal sentences recommending kindness to the *ger* and emphasizing Yahwe's care for the nations, coupled with the conviction that as Jews they possessed in their Scriptures the only satisfactory, all-sufficient revelation, all combined to make many Jews willing, even anxious, to win over to adhesion to Judaism the foreigners with whom they were in contact. Hence arose the practice of proselytizing. In later Jewish usage the word for proselyte was the old word *ger*, which indicated the most favorable status of the foreigner. The Maccabean princes compelled conquered peoples—the Idumæans, e.g.—to become Jews, i.e., be circumcised. But more usually these efforts were carried on privately and with astonishing success, when we remember the almost universal contempt for Jews among the cultivated Greeks and Romans. Strictly speaking, there was but one class of proselytes—those who fully accepted Judaism and, if males, became circumcised. These were called in later rabbinical literature "proselytes of righteousness." Others, who did not fully embrace Judaism, but were favorably disposed towards it and accepted many of its doctrines and practices, were held in high esteem in the Jewish communities.

In the early Church the relation of the Gentiles to Christianity became a most important question—they were they to be received mediately, through Judaism, and thus become Christian Jews, or immediately accepted into the Christian brotherhood without being required to be circumcised and obligated to keep the Jewish law? While many early Christians took the former position, Paul advocated the latter and thus broke down the barrier between the religion of Yahwe, Israel's God, and the Gentile world. Consult A. Bertholet, *Die Stellung der Israeliten und der Juden zu den Fremden* (Freiburg, 1896), also the article by Hirsch and Eisenstein in *The Jewish Encyclopædia*, vol. v (New York, 1901–06).

GENTILESCHI, jén'té-lës'kè. A family of Italian painters—**ORAZIO** (c. 1565–1647), the father, was born at Pisa. He was also called Lomi, being a pupil of his half brother and uncle by that name. At Rome, in conjunction with Agostino Tassi, a landscape painter, he decorated the interiors of a number of palaces. In 1621 he went to Genoa, where he painted "David after the Death of Goliath," in the Palazzo Doria. He visited England in 1626, under the patronage of Charles I, and was himself painted by Van Dyck in his series of portraits of illustrious men. Among his best works are "Saints Cecilia and Valerian," in the Palazzo Borghese, Rome, "Joseph and Potiphar's Wife,"

at Hampton Court, "Moses Saved from the Waters," in the Madrid Museum, and an "Annunciation," in the Turin Gallery. His pictures are striking and vivid in color, but weak in composition and lacking in nobility. He died in London—His son FRANCESCO assisted his father in England, but of his work little is known—ARTEMISIA GENTILESCHI (1590-1642), the daughter of Orazio, was born at Rome, and studied under her father and Guido Reni. She accompanied her father to England and, in the opinion of Horace Walpole, excelled her parent in portraiture. She married Antonio Schiattesi and spent the latter part of her life in Naples. Among her most important paintings are "Judith and Holofernes," in both the Pitti and Uffizi galleries, Florence. "Mary Magdalen," in the Pitti Gallery, a portrait of herself, at Hampton Court, and "Christ among the Doctors," in the New York Historical Society. Her paintings are careful in execution and remarkable for a skillful use of chiaroscuro, but are poor in composition.

GENTILESSE, jěn'ti-lēs'. A poem of Chaucer's which has been preserved as the fifteenth to seventeenth stanzas of "a morale balade of Henry Scogan, Squyer." The latter has been printed in toto in all editions of Chaucer's works from Caxton to Skeat, but the interpolation was pointed out long ago by John Shirley, the fifteenth-century copyist. Skeat was the first to print Chaucer's part of the poem separately. The poem was originally addressed to "the Lordes and Gentilmen of the Kinges house." Scogan was an admiring fellow poet and disciple of Chaucer.

GENTILI, jěn-tě'lě, ALBERICO (called in Latin ALBERICUS GENTILIS) (1552-1608). An Italian-English jurist, born at San Ginesio (Ancona). In 1572 he received the degree of LL.D. from the University of Perugia. Because of his Protestant views he was forced to leave his native town and to flee to Carniola and in 1580 to England, where he was appointed lecturer on Roman law at Oxford and in 1587 regius professor of civil law there. So great was his reputation that he was consulted by the government when Mendoza, the Spanish Ambassador, was found to be plotting against Elizabeth (1584). His book *De Legationibus* (1585) discusses this subject. He also wrote *De Jure Belli* (1598), a collection of disputations on the law of war. In 1605 he was made standing counsel for the King of Spain. The notes he made while acting in this capacity were published posthumously, under the title *Hispanicae Advocations Libri Duo* (1613). The last decade of his life he spent in London in active practice. Gentili rendered valuable services to international law, and Grotius is indebted to him for much that is valuable in his own writings. Gentili's works were put on the Index Expurgatorius. In 1908 a statue of him was unveiled at his birthplace. Consult Holland's edition of *De Jure Belli* (Oxford, 1877) and his *Studies in International Law* (ib., 1898).

GENTILLY, zhàn'tě'yě'. A town of France, situated in the metropolitan Department of Seine, about 2½ miles south of Paris. The great bastioned wall of Paris passes through the town, separating it into two portions, called Great and Little Gentilly. The parish church dates from the thirteenth century. There are extensive chemical works, potteries, and tanneries. Pop., 1901, 7433; 1911, 10,744.

GEN'TLE. A maggot. See FLESH FLY.
GEN'TLEMAN (OF, Fr. *gentilhomme*, ML. *gentilis homo*, man of breeding, from Lat. *gentilis*, relating to a family, from *gens*, family, and *homo*, man). Originally a person whose kindred was known and acknowledged, which is the sense in which it is still employed when it is not intended to make any reference to the moral and social qualities of the particular individual. One who was *sine gente*, on the other hand, was one whom no *gens* acknowledged and who might thus be said to be ignobly born.

The term "gentleman" is often confounded with that of "esquire," but the terms are not equivalent, though the latter is in England generally used to-day in correspondence when addressing any man who has no title and is above the class of manual laborers or small tradesmen. The same custom holds more or less in America, except in business or official letters, where "Mr." is the more general form of address. In America "Mr." is increasingly used also in private correspondence. The distinction involved in the choice of these terms is invidious and ridiculous, and "esquire," now a pseudolabel of gentility, might well, in accordance with Matthew Arnold's suggestion, be abolished altogether. The term "gentleman," whatever of definite class significance may from time to time have attached to it, has always had as well a certain moral significance, while "esquire" was a word simply descriptive of function, and signifying one who was an attendant upon a knight and in the apprentice stage of knighthood. Now it has become a vague and well-nigh meaningless social epithet. To assign anything like precise social significance to the word "gentleman" until the fifteenth century would seem difficult. At that time a statute of Henry V's required, in legal actions, that the degree and estate of a man should be specified. Those who under this requirement called themselves gentlemen were chiefly sons of men of title, hangers-on of great nobles, and fighting men at home or abroad. That the gentleman was at first a fighting man is indicated by the fact that he who would be beyond cavil counted such was wont to procure himself a coat of arms, coat armor being originally a distinguishing badge worn in battle. This custom persisted, and Shakespeare, by a grant of a coat of arms, became technically a gentleman. That the gentleman was originally a soldier is suggested, too, by the custom, long prevalent on the part of those who claimed to be rightly so styled, of wearing a sword—a custom now generally honored in the breach, though still observed in the case of the sword required in England as a part of court dress. In the special sense in which the word "gentleman" was used in the fifteenth century the term soon became obsolete, and it is now, as it has for the most of its history been, of somewhat uncertain or ambiguous meaning. On the one hand, there is "nature's gentleman," by which phrase is intended the man of fine, generous, and delicate instincts, whether a son of toil or a man of lineage. According to Chaucer, e.g., he who is virtuous and does gentle deeds (consult the *Wife of Bath's Tale*) is a gentleman. On the other hand, for centuries past and at the present time, the word often is used in a narrower sense, and one in which it is more nearly synonymous with the French *gentilhomme*, as denoting those whose blood and

race were noble and known. Even here, however, it scarcely seems that any connection with a titled family was considered necessary to confer the character, for it is described as corresponding, not to nobility, in the English sense, but to *nobilitas*, in the Roman sense, and as resting on "old riches or powers remaining in one stock." There can be no doubt that in still earlier times patents of gentility were granted by the King of England. There is one still in existence by Richard II to John de Kingston, and another by Henry VI to Bernard Angevin, of Bordeaux. These patents corresponded to the modern patents of arms which are issued by the heralds' colleges in England and Ireland, and by the Lyon office in Scotland, and were probably given on the payment of fees. A patent of arms confers the rank of esquire, and there probably is no other legal mode by which an untitled person can acquire it, unless he be the holder of a dignified office. The word, however, is loosely applied to all persons who have not themselves "risen from the ranks," or in a still less limited sense to those who, whatever their origin, display the qualities associated with "gentle" birth. Consult Stevenson's essay, "Gentlemen," in *Familiar Studies* (Thistle ed., New York, 1895).

GENTLEMAN DANCING-MASTER, THE. A comedy by Wycherley (1671).

GENTLEMAN GEORGE. A sobriquet of George IV of England.

GENTLEMAN USHER, THE. A comedy by Chapman. It appeared in 1606.

GENTLEMEN-AT-ARMS. One of the bodyguard of the British sovereign. Its full title is "His Majesty's Bodyguard of the Honorable Corps of Gentlemen-at-Arms." Instituted in 1509 by Henry VIII, under the name of "Speers" or "Men-at-arms," it became known later in the same reign as "Gentlemen Pensioners," and it received its present name in 1834. With the exception of the Yeomen of the Guard, it is the oldest corps in the British service. It is composed of a captaincy, the Gold Stick, value £1200 a year, a lieutenantcy, the first Silver Stick, £500, a standard-bearership, the second Silver Stick, £310, a clerkship of the check, £120, an adjutancy, a subofficership, and 40 memberships, £70 each. The corps does duty only at drawing rooms, levées, and on important state occasions. The appointments are crown gifts on the commander in chief's recommendation, and are given to military officers of distinction chosen from the retired list. The captaincy is vacated with each ministry.

GENTLE SHEPHERD, THE. A pastoral drama by Allan Ramsay (1725).

GENTLE SHEPHERD, THE. A nickname of George Grenville originating from a satirical aside of Pitt's during debate in the House. In considering the advisability of an additional duty on cider, Grenville bewailed in languid utterance the increase of taxes after the late war and demanded *where* they could now be laid. Not receiving an answer, he repeated the inquiry, and Pitt responded softly in the words of the old song "Gentle Shepherd, tell me where."

GENTOO'. A corruption of the Portuguese *gentio* (gentile, heathen), formerly used to designate various Hindu and Dravidian-Kolarian peoples of India—the Telugu, or Telingas, in particular.

GENTRY, MEREDITH POINDEXTER (1809-66). An American statesman. He was born in Rock-

ingham Co., N. C. With a natural aptitude for oratory, he became widely known as a public speaker, was a State representative in 1835-39, and in 1839 was sent by his Whig constituents to Congress. There he became distinguished for his advocacy of the policy of receiving petitions for the abolition of slavery and his strong speech favoring the restoration of exclusive patronage. He was a Representative in Congress from Tennessee from 1839 to 1843 and from 1845 to 1853. In 1862 and again in 1863 he was a member of the Confederate Congress, where he was noted for his moderate policy. He was one of the best-informed men of his day on political history, according to Alexander H. Stephens, who called Gentry's extempore eulogy of Henry Clay, "apt, powerful, and pathetic."

GENTZ, GENTS, FRIEDRICH VON (1764-1832).

A German publicist and statesman, born at Bieslau. He studied law at Frankfurt and Königsberg, became in 1786 Secretary of the General Directory in the Prussian service, and in 1793 was made a Prussian war counselor. He was very much addicted to liquor and high living. A pupil of Kant and a disciple of Rousseau, he at first looked with favor upon the revolutionary movement in France, but was converted by the course of the extremists, and by the influence of Burke, whose essay on the French Revolution Gentz translated in 1794, together with the writings of Mallet du Pan and Mounier (1794-95). He spent some time in England and became a strong advocate of the English constitutional system. He founded two reviews, *Neue Deutsche Monatsschrift* (1795-98) and the *Historisches Journal* (1799-1800). The latter was the vehicle of English attacks against the Revolution. He wrote several articles against the Revolution and was forced to leave the country because the government did not want to give up its strict neutrality. He became an Imperial counselor in Austria in 1802. He was a bitter opponent of Napoleon and advocated the coalition with England against France. In 1804 he wrote *Fragmente aus der Geschichte des politischen Gleichgewichts von Europa*, and he was the author of several of the proclamations directed against the French. After the Peace of Vienna, in 1809, Gentz dropped his liberalism and became the facile instrument of Metternich's reactionary policy. He brought out, in 1818, a reactionary review, the *Weimer Jahrbucher der Literatur*, and was the secretary of the Austrian plenipotentiaries at the congresses of Vienna (1815), Aix-la-Chapelle (1818), Troppau, Labach, and Verona (1820-22). For these services he received large pecuniary rewards, which he squandered in dissipation. He was a political thinker of some ability, and his classic and vigorous literary style made his services sought for, but he was always mercenary and wholly lacking in fixed principles. He died at Vienna, June 9, 1832. His more important writings are contained in the collection ed. by Weickz, *Ausgewählte Schriften* (5 vols., Stuttgart, 1836-38), in the *Kleine Schriften*, ed. by Schlesier (5 vols., Mannheim, 1838-40), and in the *Mémoires et lettres* ed. by Prokesch-Osten (4 vols., Vienna, 1873-74); also *Briefwechsel zwischen Friedrich Gentz und Adam Müller, 1800-29* (Stuttgart, 1857); and *Dépêches inédites du Chevalier de Gentz aux hospodars de Valachie 1819-28* (Paris, 1876). For his biography, consult Fournier, *Gentz und Cobenzl* (Vienna, 1880), Reiff, *Friedrich Gentz, an Op-*

ponent of the French Revolution and Napoleon (Urbana, Ill., 1912), Lubbe, *Friedrich Gentz und Heinrich von Sybel* (Gottingen, 1913)

GENTZ, WILHELM (1822-90) A German genre and landscape painter, noted for his delineations of Oriental subjects. He was born at Neuruppin, Brandenburg, and studied at the Berlin Academy, under Kloeber, at the Academy of Antwerp, and in Paris under Gleyre and Couture. He traveled widely through the Orient, then settled in Berlin in 1858 and began his remarkable delineations of life in the Orient. His early pictures, biblical subjects with life-size figures, such as "Christ among the Pharisees and Publicans" (1857, Chemnitz Museum), met with scant appreciation, and even his Oriental scenes worked their way to success only gradually. Gentz may be called the founder of the modern Berlin school of Oriental painting. Although he was a skillful technician, he appears too dryly realistic when compared with the French masters, and lacks in harmony and animation. Among the most prominent of his numerous paintings are "Transportation of Slaves through the Desert" (1860, Stettin Museum), "Funeral Rites near Cairo" (1872, Dresden Gallery), "Entry of the Crown Prince of Prussia into Jerusalem, 1869" (1876, National Gallery, Berlin), one of his masterpieces, for which he made special studies in Palestine in 1873, "Memorial Service at a Rabbi Grave in Algiers" (1881, Leipzig Museum), "Palm Sunday in Early Christian Times" (1886), "Evening on the Cataracts of the Nile" (1887). He also contributed illustrations to Ebers's *Egypt* and to some of his novels. He was professor at the Berlin Academy and received gold medals at Vienna, Munich, and Berlin.

GENUA. The ancient Roman name for Genoa (q.v.).

GENUFLEX'ION (ML *genuflexio*, from Lat. *genuflectere*, to bend the knee, from *genu*, knee + *flectere*, to bend). The act of kneeling or bending the knees in worship. While the common attitude of the Jews in prayer was standing, yet in times of special urgency or solemnity the suppliant sometimes knelt (1 Kings viii 54, Dan vi 10, Luke xxii 41, Acts vii. 60, ix 40, Phil. ii 10). That the use continued among the early Christians is plain from the *Shepherd of Hermas*, from Eusebius' *History*, and from numberless other authorities, and especially from the solemn proclamation made by the deacon to the people in all the liturgies—*Flectamus genua* (Let us bend our knees), whereupon the people knelt, till, at the close of the prayer, they received a corresponding summons—*Levate* (Arise). In celebration of Christ's rising from the dead the practice of kneeling at prayer, as early as the age of Tertullian, was discontinued throughout the Easter time and on all Sundays through the year. The kneeling posture was especially assigned as the attitude of penance, and one of the classes of public penitents in the early Church took their name, *genuflectentes*, from this circumstance. The custom is a modification of the Oriental prostration, as an attitude of supplication or of reverence. In the modern Roman Catholic church the act of genuflexion implies the highest form of worship and is frequently employed during the mass, as well as whenever persons enter or leave the church or pass in front of the altar on which the Blessed Sacrament is reserved, if it is publicly exposed, the genuflexion is made on both knees. In the

Anglican church the rubric prescribes the kneeling posture in many parts of the service, and thus, as well as the practice of bowing the head at the name of Jesus, was the subject of much controversy with the Puritans.

GENUNG, jê-nûng', JOHN FRANKLIN (1850-1919) An American rhetorician and biblical scholar, born at Wilseyville, N. Y. He graduated from Union College in 1870 and from Rochester Theological Seminary in 1875 and received the degree of Ph.D. from the University of Leipzig in 1881. He was a Baptist minister for several years, but after 1882 taught at Amherst College, becoming professor of literature and biblical interpretation in 1906. In 1911 he became editor of the *Amherst Graduates' Quarterly*. His writings include *Practical Elements of Rhetoric* (1885, 4th ed., 1902), *The Study of Rhetoric in the College Course* (1887), *The Passing of Self* (1899), *The Working Principles of Rhetoric* (1901), a standard college text, *Ecclesiastes and Omar Khayyam* (1901), *Words of Koheleth* (1904), *The Hebrew Literature of Wisdom in the Light of Today* (1906), *The Man with the Pitcher and his Story* (1912).

GENUS, IN BIOLOGY See CLASSIFICATION OF ANIMALS

GENU VAL'GUM. See KNOCK-KNEE

GENU VA'RUM, or BOWLEGS See LEG

GE'OCENT'RIC (from Gk γῆ, *gê*, earth + κέντρον, *kentron*, centre) A term used in astronomy to describe the motions and positions of the heavenly bodies such as they would appear to an observer at the earth's centre. See HELIO-CENTRIC

GE'ODES (Lat. *geodes*, sort of gem, from Gk γεωδής, earthlike, from γῆ, *gê*, earth + εἶδος, *eidos*, form) Rounded hollow aggregates of mineral material, or indurated nodules, either empty or containing a more or less solid and free nucleus and having the cavity frequently lined with crystals. They are sometimes called 'potato stones' on account of their size and shape. The name seems to have been given them because they are occasionally found filled with a soft earthy ochre. Agate is a geode built up of concentric layers of chalcedony.

GEOD'ESY (from Gk γεωδαιρία, *geōdaisia*, art of mensuration, from γῆ *gê*, earth + δαίω, *daïw*, to divide) That science which deals with the size and shape of the earth. In a geodetic survey the curvature of the earth is considered, and the exact horizontal locations of places on the earth are determined with relation to two great circles of the earth at right angles. Those generally accepted are the equator and the meridian passing through the observatory at Greenwich, England. The vertical location of a point is determined with relation to the surface of the geoid (see below).

In any accurate survey of the earth's surface it is necessary to know the relative positions of some points in order to control the detailed work. If the area is limited, the positions of these points may be determined by traverses, but if the survey extends over a large area or a great distance, such as a state or along the coast, the controlling points must have their relative positions determined by the method called *triangulation*. It rests upon the mathematical principle that when three elements of a triangle are known, one being a side, the other three can be computed.

The usual procedure in triangulation is to measure directly a side of a triangle as a base, the line $a b$ in the figure, and then to observe each angle in the scheme. At the station a the angles $c a d$ and $d a b$, at the station b the angles $a b c$ and $c b d$, and at station c the angles $e c f$, $f c d$, $d c b$, and $b c a$ are measured,

and so on throughout the whole network. The triangulation may be carried on by a system of single triangles, but usually a double system is used, as shown in the illustration. This insures greater accuracy and prevents mistakes. In extensive triangulation additional lines are measured directly to give greater strength. In each of the triangles $c b a$ and $d b a$ the measured line $a b$ is used as the base, but for each of the other triangles the base is a computed length.

Measurement of Bases. The apparatus used for measuring a base has its length determined in terms of some standard unit, such as the foot or meter. The earliest base measurements were made with wooden bars and glass tubes, but they were found to be unsatisfactory. Later, bars of various metals were used. A bar consisted of a small rod incased in wood or other material. The single-rod bars were not very satisfactory, owing to the difficulty of obtaining the exact temperature during the measurements. The best bars were composed of two rods made of metals, having a wide difference between their coefficients of expansion, which were fastened together in such a way as to make a metallic thermometer. Some of these bars gave satisfactory results. Nearly all measurements with bars were made in daylight. A great advance in accuracy and economy was made when tapes and wires of steel and brass were substituted for bars in base measurements. The field work was done with them at night when the temperature of the air is more constant and the temperature of the apparatus could be more accurately determined. Wires and tapes were first employed on bases by Dr. Edward Jäderin, of Sweden, about the year 1882. Metal tapes were first used in the United States on primary base measurements in 1891 on the Holton base in In-

diana by Prof. R. S. Woodward of the Coast and Geodetic Survey. He made elaborate tests and proved that the tapes, which were of steel, gave as accurate results as the best bars.

All nations are now measuring primary bases with tapes or wires made of the alloy of nickel and steel called *invar*, which has a coefficient of expansion as low as one twenty-fifth that of steel. It is not necessary to obtain the temperature of the apparatus with extreme accuracy, therefore measurements can be made during the day. A base can be measured with *invar* apparatus with an accuracy greater than one part in one million. Therefore the uncertainty in a base 10 kilometers in length is less than 10 millimeters.

Tapes and wires of various lengths are used, but they are seldom more than 50 meters long. The apparatus has a single line or a scale at each end. The length of the tape or wire is the straight-line distance between the zero lines at the two ends, while the apparatus is supported at a certain number of points, under a definite tension and at a given temperature. The length is found by comparison, in a vault of constant temperature, with a standard bar whose length in meters, feet, or some other unit, is known.

The measurement in the field is made with the same number of supports and at the tension used during the standardization. The apparatus is supported by stakes driven into the ground or by portable tripods. The zero mark at one end of the tape or wire is placed in contact with one end of the base line, and, with the tension applied, the zero of the other end is transferred to the forward support. The apparatus is then moved forward, the rear zero is placed in coincidence with the mark on the support, and the tape length is transferred to the second support. This procedure is continued throughout the whole base. One or more additional measurements are made to increase the accuracy. The inclination of each tape or wire length is determined by spirit levels, and the measurement is reduced to a horizontal distance. Since in triangulation all lengths are referred to the sea-level surface, a correction must be applied to the measured length of the base, to obtain the distance at sea level between the verticals through the two base ends.

Measurement of Horizontal Angles. Triangulation is classified as primary, secondary, and tertiary, according to the accuracy of the measured bases and angles. Primary triangulation is usually considered to be that grade which has an average probable error of about one part in one million in the base measurements and an average closing error of triangles of about one second of arc. The closing error of a triangle is the difference between 180° and the sum of its three measured angles, but in large triangles the spherical excess is taken into account. Primary triangulation is used to extend the control over large areas, tertiary triangulation furnishes the detailed control for surveys and maps, and secondary triangulation is employed to connect the tertiary and primary schemes. (See SUBVEYING.)

The angles for primary triangulation are measured with a large theodolite. It consists of a horizontal circle, divided usually into five-minute spaces, mounted upon a base, and an alidade supporting the telescope and several micrometer microscopes. The telescope is pointed on the distant stations in turn, and for each

pointing the position of the telescope is determined by readings of the circle by the microscopes. The angle formed by any two lines is obtained from the recorded circle readings. The measurements are repeated many times to lessen the effect of errors of pointing and reading. For each series of observations the readings are made on different parts of the circle to eliminate accidental and periodic errors of graduation. The use of two or more microscopes equally

THEODOLITE

spaced eliminates the errors due to any eccentricity of the centres of the alidade and of the circle.

The observations in daylight are made upon poles, various kinds of targets, or heliostopes accurately centred over the distant stations. The heliostope is a small plane mirror by which the sun's rays are reflected towards the observer. At night the observations are made on lamps set over the stations. The most successful lamp for long lines is an acetylene searchlight. In 1910 and 1911 such lamps were used on triangulation in New Mexico and Arizona for lines more than 100 miles in length.

Geographic Positions. In addition to the measurement of the bases and angles, it is necessary to determine by astronomic observations the latitude and longitude of some one station and the true azimuth, or direction, of a line of the triangulation. The azimuth is expressed as the horizontal angle between the line and the plane of the meridian through the station. Then an ellipsoid is selected which closely represents the mean shape and size of the earth. The geographic positions of the various stations of the triangulation can then be computed from the initial station which was located astronomically.

In a continuous network of triangulation, with the geographic positions of all points referred to this initial station, the relative positions of even the most widely separated points are correct, but, on account of the phenomenon called *deflection of the vertical*, the whole network may not be in its true position on the earth's surface with relation to the equator and the Greenwich meridian. In order to appreciate the effect of the deflection of the vertical and the method of eliminating it, we must consider the actual water surface and the ellipsoidal surface.

If we imagine a network of sea-level canals extended over the continents and the cessation of the movement of the oceans represented by tides, then the surface of the oceans and of the water in the canals would define an equipotential surface called the geoid. This surface would be irregular, but its mean would be an ellipsoid of revolution, a regular geometric figure. Owing to the material above sea level on the continents and to the deficiency of mass in the oceans, the geoid surface over the water would be below the ellipsoidal surface, at or near the seacoast the actual water surface and the mean surface would intersect, while within the continental areas the geoid would be above the mean surface. The greatest separation would occur under the largest mountain masses and over the deepest parts of the oceans. The direction of the plumb line at a point on the earth's surface is normal to the geoid surface and is not coincident with the normal to the ellipsoid at that point unless the two surfaces there coincide or are concentric. As the astronomic latitude of a station is the angle between the plumb line and the plane of the equator, and the astronomic longitude the angle between the initial meridian and the meridian at the station, it is evident that the astronomic observations at the station may not give its true geographical position with relation to the position of some distant point, also determined astronomically. The island of Porto Rico furnishes a notable example of this phenomenon. At two stations on the north and south coasts accurate determinations of the astronomic latitudes were made from which the width of the island was computed. These stations were later connected by triangulation which gave the *true* distance between them, and it was found that the two distances differed by more than one mile. The angle formed at a point by the normals to the ellipsoid and to the geoid is called the *station error*, or *deflection of the vertical*. See DEFLECTION OF THE PLUMB LINE.

The astronomic determinations at a single station cannot be used as the datum for a large area like the United States. Therefore geodesists have determined the astronomic positions of many triangulation stations and then, by the method of least squares, have computed the mean position of the initial station, which brought the astronomic and geodetic data, as a whole, into close agreement. The geodetic bureaus of the United States, Canada, and Mexico have adopted for their triangulations the North American Datum, which is the computed latitude ($39^{\circ} 13' 26.686''$), longitude ($98^{\circ} 32' 30.506''$), and azimuth (to Waldo triangulation station, $75^{\circ} 28' 14.52''$) at the triangulation station Meades Ranch, Kans. Points are said to be on the North American Datum (called the United States Standard Datum before its recent adoption by Mexico and Canada) when they are connected with the station Meades

Ranch by continuous triangulation, through which the corresponding latitudes, longitudes, and azimuths have been computed on the Clarke spheroid of 1866, expressed in meters, starting from the above data

Elevations The elevations of points back from the coasts are determined by geodetic spirit leveling in which the curvature of the earth is considered. The elevations are referred to the sea surface, the *geoid*, not to the mean surface, the *ellipsoid*. The mean sea level at the starting points of the lines of levels is determined by long series of tidal observations

Mapping After the triangulation and geodetic levels cover an area it is a simple matter for the surveyor to fill in the topographic details in their proper horizontal and vertical positions. See SURVEYING

Figure of the Earth The determination of the shape and size of the earth would be a simple problem if the water surface were a regular geometric figure, for then it would only be necessary to measure accurately the distances between each two of several points located on a meridian and to determine the astronomic latitude of those points. But the earth's water surface (see above) is an irregular one. The problem is to determine the dimensions of the mean surface which most closely fits the actual one. For this purpose many arcs measured by connected triangulation, covering a large area, are necessary, with determinations of the astronomic latitude and longitude of many of the stations and the astronomic azimuth of a number of lines of the triangulation. A least square solution of the data furnishes corrections to the dimensions of the provisional ellipsoid on which the triangulation was computed. After these corrections have been applied a new figure of the earth is obtained.

The theory of *isostasy* was taken into consideration by the United States Coast and Geodetic Survey in its recent determination of the figure of the earth, conducted under the direction of Prof. John F. Hayford. This theory postulates that at and below a certain depth (found to be about 122 kilometers below sea level) the earth's materials are in hydrostatic equilibrium. In consequence the vertical pressures on unit areas at that depth are the same at all points. Therefore, under the continents the lithosphere has deficiencies of density and under the oceans excesses of density. These deficiencies and excesses of matter exactly balance the materials above sea level on the continents and the deficiencies of matter in the oceanic volumes. Investigations prove this theory to be substantially true. Before making the computations which gave the dimensions of the mean figure of the earth, the direction of the plumb line (or vertical) at each astronomic station was corrected for the attraction, positive or negative, of the masses above sea level, the deficiency of matter in the oceans, and the deficiencies and excesses within the lithosphere. See ISOSTASY

The resulting values for the dimensions of the earth have greater precision than those previously found, and are: equatorial radius, 6,378,388 meters, polar semidiameter, 6,356,909 meters, reciprocal of the flattening, 297.0.

Bibliography Some important works on geodesy are: Jordan, *Handbuch der Vermessungskunde* (Stuttgart, 1857); Helmert, *Theorien der Geodäsie* (Leipzig, 1880-84); Clarke, *Geodesy* (London, 1888); Hayford, *Geodetic*

Astronomy (New York, 1898); Merriman, *Geodesy* (ib., 1899); Wright and Hayford, *Adjustment of Observations* (ib., 1906); Crandall, *Geodesy* (ib., 1907); Hayford, *Figure of the Earth and Isostasy* (Coast and Geodetic Survey, Washington, 1909, 1910); Bowie, *Geodetic Astronomy* (Coast and Geodetic Survey, 1913); Woodward, *Iced Bar and Tape Base Apparatus* (Coast and Geodetic Survey, 1892); Baldwin, *Measurement of Base Lines along the 98th Meridian* (Coast and Geodetic Survey, 1901); various other publications of the United States Coast and Geodetic Survey, and publications of the geodetic bureaus of other countries

GEOFFREY (jě'f'ri) **CRAY'ON**, GENT. See CRAYON.

GEOFFREY DE VINSAUFE. See VINSAUFE, GEOFFREY DE

GEOFFREY OF MONMOUTH, mōn'mūth (c 1100-1154). A Welsh chronicler, born at Monmouth, Wales. Little is known of his life, except that he obtained the archdeaconry of Llandaff about 1140, was consecrated Bishop of St Asaph in 1152, and died probably in 1154. He is the author of a famous book in Latin called *Historia Regum Britanniae* (History of the Kings of Britain), which was in circulation as early as 1139 and assumed its final shape about 1147. The book purports to be a translation from an ancient Kymric chronicle, which Walter, Archdeacon of Oxford, brought over from Brittany and communicated to Geoffrey. As to how much truth there may be in the statement, scholars do not agree. It has been shown that some parts are merely amplifications of the *Historia Britonum*, attributed in its earliest form to a certain Nennius (fl. 796). But for other parts no sources have been discovered. The book can hardly be regarded as a fabrication by Geoffrey, for it undoubtedly rests upon a mass of Kymric traditions which may have already assumed the form of a saga. Geoffrey gives the history of the kings of Britain from Brutus, the great-grandson of Æneas, down to Cadwallader, who at length, defeated by the Saxons, flees to Armorica and then to Rome, where he dies. In the line of kings are Gorboduc, Cymbeline, and Lear. The story of the latter is related at large. Geoffrey's history is also one of the main sources (though not the only source) of the Arthur legend, and, as such, it is of the highest interest and value. Arthur indeed had been mentioned earlier, in Nennius he appears as a leader of the Britons (*dux bellorum*) in 12 great battles against the Saxons, and in William of Malmesbury's *Gesta Regum Anglorum* (1125) there are allusions to fables concerning Arthur. But in Geoffrey first appears the Arthur legend somewhat as we now know it. Under the title of *Brut* (1155), Geoffrey's history was translated, with additions, into French verse by an Anglo-Norman poet named Wace. This version was rendered into English, with other additions, by Layamon in a poem also entitled *Brut* (about 1200). The critical edition is by San Marte (Halle, 1854). For English translation, consult Thompson, *Geoffrey of Monmouth*, ed. by Giles (2d ed., London, 1842); *Geoffrey of Monmouth*, trans. by S. Evans (London, 1904; new ed., 1911). For criticism and biography, consult Ulbrich, "Ueber das Verhältniss von Waces Roman de Brut zu seiner Quelle des Gottfrid

von Monmouth *Historia regum Britanniae*," in *Romanische Forschungen*, vol. xxvi (Erlangen, 1909), Maclean, *The Literature of the Celts* (Glasgow, 1906), Rhys and Brynmor-Jones, *The Welsh People* (London, 1909). See ARTHUR GEOFFRIN, zhō'frān', MARIE THERÈSE (1699-1777). A wealthy patroness of letters, who inherited the famous salon of Madame de Tencin. Her hospitality and liberality to men of letters earned her eulogies from D'Alembert, Thomas, and Morellet (*Eloges sur Mme de Geoffrin*, Paris, 1812). To the *Encyclopédie* of D'Alembert and Diderot (qv) she contributed 100,000 francs. She died in Paris. Her correspondence with Prince Stanislas Auguste Poniatowski, later King of Poland, published in 1878, makes very interesting reading. Consult Ségur, *Le royaume de la rue Saint-Honoré*, *Mme Geoffrin et sa cour* (Paris, 1897), and Janet Aldis, *Mme de Geoffrin Her Salon and her Times* (New York, 1905).

GEOFFROY, zhō'frwa', JEAN (1853-) A French figure painter, born at Marennes (Charente-Inférieure). He studied under Levasseur and Eugène Adan and first exhibited in 1874. His paintings and illustrations depict chiefly childhood and poverty. Good examples are "The Unfortunates," Amiens Museum. "Visiting Day in the Hospital," in the Luxembourg, and "The Prayer of the Humble," all sympathetically painted in a low key with much charm and sincerity. He received a gold medal at the Paris Exposition in 1900.

GEOFFROY, JULIEN LOUIS (1743-1814). A French dramatic critic, born at Rennes. He studied to join the Order of the Jesuits, but upon its suppression became a teacher. He edited the *Année Littéraire* (succeeding the younger Fréron) and the Royalist *Journal de Monsieur* and *L'Ami du Roi* (1790-92), and during the Revolution he was obliged to live in retirement. In 1806 he began his connection with the *Journal des Débats* (for a time called the *Journal de l'Empire*) as dramatic critic. He was a most vigorous opponent of eighteenth-century ideas, and Voltaire was his especial detestation, but, despite his narrowness, bitterness, and inordinate love of the classic, he had solid learning and a powerful pen. His daily criticisms were collected by Gosse under the title *Cours de littérature dramatique* (1819-20). He also wrote, among other volumes, *Discours sur la critique* (1779).

GEOFFROY DE VINSauf, de vān'sōf' See VINSauf.

GEOFFROY SAINT-HILAIRE, sǎn'te'lār', ETIENNE (1772-1844). A French zoologist, born at Etampes, France. He studied with Brisson, Haüy, and Daubenton. In 1793, when only 21 years old, he became professor of vertebrate zoology in the newly instituted Museum at Paris and began to make the famous collection of animals in the Jardin des Plantes. In 1794 he invited Cuvier to Paris, and the two men became thenceforth associates in the field of natural history. In 1798 Geoffroy accompanied Bonaparte to Egypt, where he remained three years. In 1807 he became a member of the Académie des Sciences and in 1809 professor of zoology in the Faculté des Sciences. Geoffroy Saint-Hilaire was by nature a philosopher and by education an anatomist, and in his speculations held that a single plan of structure prevails throughout the animal kingdom. In this he was violently opposed by Cuvier, who was

an empiricist and not a philosopher, and who maintained that four distinctively different types of structure were present. The two naturalists differed also in their conception of the mutability of species, Geoffroy arguing for it and Cuvier against it. He raised teratology, or the study of monstrosities, to the rank of a science. Of his many works, we may mention *Philosophie anatomique* (1818-20), *Sur l'unité de composition organique* (1828), *Principe de philosophie zoologique* (1830), *Etudes progressives d'un naturaliste* (1835), *Notions synthétiques, historiques et physiologiques de philosophie naturelle* (1838). For his views on species, and the relation he bore to Lamarck and the agitation leading towards the announcement of the hypothesis of evolution, consult Packard, *Lamarck His Life and Work* (New York, 1901), and *Life of Geoffrey*, by his son (Paris, 1847).

GEOFFROY SAINT-HILAIRE, ISIDORE (1805-61). Son of Etienne. A French zoologist. He was born in Paris, became assistant at the Museum of Natural History in 1824, and received a medical degree in 1829. He became professor of zoology in the Museum in 1841 and in the Faculté des Sciences in 1854, and in the same year he founded the Société d'Acclimatation. He wrote a life of his father, and also *Histoire générale et particulière des anomalies de l'organisation chez l'homme et les animaux* (1832-37) and *Histoire naturelle* (1854-62).

GEOG'NOSY (from Gk γῆ, gē, earth + γνῶσις, gnōsis, knowledge). A study of the materials of which our planet consists. The term is not synonymous with geology, which concerns itself not only with the materials of the earth, but with theories as to their arrangement, succession, and development. As applied to rocks, the term "geognosy" is now superseded by "petrography." See GEOLOGY.

GEOGRAPHICAL BOTANY. See DISTRIBUTION OF PLANTS.

GEOGRAPHICAL DISTRIBUTION OF ANIMALS. See DISTRIBUTION OF ANIMALS.

GEOGRAPHICAL SOCIETY, AMERICAN. A society, organized in 1852, for the investigation and dissemination of geographical knowledge by discussion, lectures, and publication, for the encouragement of geographical exploration and discovery, and for the establishment in the chief maritime city of the United States, for the benefit of commerce and navigation and the great industrial and material interests of the country, of a place where the means shall be afforded of obtaining correct information for public use concerning every part of the globe. The society maintains a large library, containing about 50,000 volumes. Two gold medals are awarded yearly at the discretion of the executive council. These medals are bequests from General Cullum and Charles P. Daly and are called the Cullum and Daly medals respectively. In 1911 a new building for the society, erected at a cost of \$300,000, was completed. It was erected in New York City, at Broadway and 156th Street, on land which was the gift of the family of the late Collis P. Huntington. The building is equipped with the most modern appliances for research and includes rooms for the editorial and library force, the map floor, and drafting room, besides accommodations for meetings in the social life of its members. The society issues a monthly *Bulletin*, containing geographical news, original papers, and critical

and bibliographical departments. The collections are open for free reference to the public. The membership in 1914 was about 1200.

GEOGRAPHICAL SOCIETY, ROYAL. See ROYAL GEOGRAPHICAL SOCIETY.

GEOGRAPHICAL SOCIETY OF PHILADELPHIA. The Geographical Society of Philadelphia had its inception in 1891. Two years later a charter was granted to the Geographical Club of Philadelphia, of which Angelo Heilprin was first president. In 1897 the society assumed its present title. It has contributed to the extension of geographical knowledge by supplying funds to exploring expeditions, by issuing a bulletin at intervals during the year, and through its library. The society confers annually a gold medal—known as the Elisha Kane medal—as a reward for eminent geographical work. It has been awarded in turn to Dr. A. Donaldson Smith, Rear Admiral R. E. Peary, U. S. N., Prof. Angelo Heilprin, Capt. Robert F. Scott, R. N., Prof. William B. Scott, Capt. Roald Amundsen, Dr. Sven Hedin, Sir Ernest H. Shackleton, Rear Admiral George W. Melville, U. S. N., and Prof. William Morris Davis. The membership in 1914 numbered 991.

GEOGRAPHIC NAMES, UNITED STATES BOARD ON. An organization for the purpose of introducing uniformity in the orthography of geographic names, instituted in 1890 by President Harrison, at the instance of a number of the government departments. The arbitrary manner in which geographic names were spelled and pronounced prior to that time resulted in considerable confusion, particularly in the Post-Office Department, where names were often assigned to stations not at all in accord with common usage. The transliteration of Indian names and the Russian nomenclature in Alaska were also found to be misleading. To remedy these evils this board, at first a voluntary organization, was instituted with power to make final decision, binding upon all departments of the United States government in cases where there existed a divergence in the spelling of geographic names. The board consists of 15 members, representing the executive departments, the Smithsonian Institution, and the Government Printing Office. The board aims, as a rule, to follow local usage and to simplify names by dropping unnecessary letters, syllables, and the combination of compounds. By executive order, dated Jan. 23, 1906, there was added to the duties of the board the determining, changing, and fixing of place names within the United States and insular possessions, and it was also decided that all names hereafter suggested for any place by any officer or employee of the government shall be referred to said board for its consideration and approval, before publication. In 1898 the board was called to decide upon an extensive list of geographic names in the Philippines, but at present there is an independent board of geographic names in the Philippines. Also there is an advising committee on native names in Hawaii, whose reports are passed upon by the United States Board. The board's reports have been published by direction of Congress.

GEOGRAPHIC POSITIONS. See GEODESY.

GEOGRAPHIC SOCIETY, NATIONAL. A society, founded in 1888, at Washington, D. C., with the object of collecting and diffusing geographic knowledge chiefly through its official organ, the *National Geographic Magazine*. The society maintains research work, both inde-

pendently and in connection with other organizations and institutions. The society has organized or participated in scientific and exploring expeditions in Alaska, South America, and the Hudson Bay region. The results of these explorations are published in the *National Geographic Magazine*. The society has a membership of about 300,000. It occupies its own building in Washington and maintains an excellent library, containing about 50,000 volumes. A course of 20 lectures is given by the society from November to April in each year.

GEOGRAPHY (Lat. *geographia*, Gk. *γεωγραφία*, from *γεωγράφος*, *geōgraphos*, geographer, from *γῆ*, *gē*, earth + *γράφειν*, *graphein*, to write). Geography is the science which deals with the phenomena of the earth's surface, their distribution and their interaction upon each other. Inasmuch as the influence of the phenomena upon man is the most important phase of geographical inquiry, the subject may also, following Mackinder, be defined as the study of the earth as the home of man. Up to 30 or 40 years ago, geography was confined, in the main, to a bald description of the earth, its phenomena, its countries, and its inhabitants. It comprised little more than a collection of facts. Since then, however, it has advanced greatly, especially in the study of the causes of phenomena. Modern geography is not merely descriptive, but interpretative.

The subject may be divided into general geography and regional geography. General geography deals with the general principles of the subject, as deduced from phenomena from all over the world. Regional geography portrays the geography of a definite region, large or small, by systematically applying these principles to it. General geography may be conveniently subdivided into three large divisions—mathematical geography, physical geography, and biogeography.

Mathematical geography treats of the form, size, and movements of the earth, and herein is connected closely with astronomy; it also deals with the methods of delineating the earth's surface, and hence includes geodesy, surveying, and cartography.

Physical geography treats of the three layers of the earth's surface—the lithosphere, hydrosphere, and atmosphere, or the land, sea, and air. It discusses the land forms and the forces that shape them (this subdivision of physical geography is generally termed physiography and touches closely upon the domain of geology) as well as the hydrography of the land—its lakes and rivers, it investigates the ocean and its phenomena—physical properties of the water—waves, tides, and currents (this subdivision is termed oceanography) and, finally, it deals with the phenomena of the air—temperature, atmospheric pressure, winds, and precipitation (the subject matter of meteorology and climatology).

Biogeography treats of the living organisms of the earth's surface. It discusses the distribution and life conditions of plants (phytogeography), animals (zoogeography), and man (anthropogeography). In view of the fundamental difference between the nonintelligent organisms, plants and animals, on the one hand, and man on the other, phytogeography and zoogeography are often classified as subdivisions of physical geography, and anthropogeography, or the geography of man, is considered by itself one of the three major divisions of the

subject The geography of man discusses the races of man and their cultural divisions, linguistic and religious, it discusses the distribution and density of population and the various types of human occupations—fishing, hunting, pasturing, agriculture, mining, manufacture, and commerce On account of its intrinsic importance that subdivision of human geography which deals with man's industries has been especially well developed It is generally termed economic geography it treats of natural products and raw materials, of manufactures, by which their forms are changed, and of trade and transportation, or commerce by which commodities are exchanged Because of the emphasis laid on the last factor, this subdivision of human geography is often styled commercial geography Another phase of human geography has also received special attention, viz, man's adaptation to his environment This specific application to human affairs of the modern geographical principle of interaction is termed anthropogeography, in this sense the term is therefore more restricted than when used to denote human geography as a whole.

MATHEMATICAL GEOGRAPHY

Astronomy and Geodesy. The form of the earth is spherical, with a slight flattening at the poles Its equatorial diameter is 7926, and its polar diameter 7900, miles, the difference between them, 26 miles, measuring the eccentricity. This flattening of the earth at the poles is a necessary consequence of the earth's rotation about its axis See EARTH

The chief method employed in the determination of the size and form of the earth may be explained in general terms without going into details The latitudes and longitudes of two points, widely separated, are determined by astronomical means, and the direct distance between them is measured by geodetic methods. A comparison of the two methods gives the length of a degree, or series of degrees, of latitude and of longitude. Such arcs have been measured in various parts of the earth, from northern Africa northward across Europe, in India, in the Andes of South America, across the United States from east to west, and southwest from New England to the Gulf coast

Latitude is distance north or south of the equator expressed in terms of the angle subtended at the earth's centre. It is determined by measuring the angle of elevation of the sun or of any star whose position is known, when crossing the meridian of the place of observation; or, most accurately, by measuring the difference between the zenith distances of two stars, whose position is known, such measurements being made by zenith telescope. Longitude is distance east or west of a selected meridian, expressed in terms of the angle subtended at the earth's axis. The meridian of the observatory at Greenwich, England, has been almost universally adopted as the initial point for the statement of longitudes. Difference of longitude is difference of time. Since the earth revolves on its axis, i.e., turns, 360° once in 24 hours, an hour corresponds to 15° of longitude. Hence, in order to determine the difference of longitude between two places it is only necessary to determine and compare the local sidereal times of those two places The determination of time is made by observing, with a transit in-

strument and chronometer, the passage across the meridian of stars, whose position is known The observed sidereal times of their passage, or transit, compared with their right ascensions, gives the error of the chronometer, and hence the true sidereal time Local sidereal time of the two places is compared by the use of the telegraph See LATITUDE AND LONGITUDE, DEGREE OF LONGITUDE.

Measurements of distance on the earth's surface are commonly made by triangulation A base line, 2 to 5 miles long, is first measured directly, using steel wire, or tape, or bars Angles are measured at each end of the base, between the other end and certain signals erected to the right and left, and from these signals the third angle of each triangle is measured Then, with the angles and one side known in each triangle, the other sides may be computed, and these in turn become the bases for other triangles, as the work is extended See ASTRONOMY, GEODESY

The plane of the earth's orbit about the sun, known as the ecliptic, is inclined to the earth's equator at an angle of $23^\circ 28'$ Hence, in the course of the year the sun apparently moves north and south through an angle of $46^\circ 56'$, the equator being in the middle The sun reaches its most northern position, which is known as the tropic of Cancer, about June 21, and its most southern point, the tropic of Capricorn, about December 21, passing the equator about March 21 and September 21 This apparent movement of the sun causes the change of seasons

There is an area about each of the poles of the earth where in midwinter the sun fails to rise above the horizon, even at midday, and where in midsummer it does not sink below the horizon, even at midnight The circles bounding these areas are the polar circles, and the areas are the polar zones, distinguished as the Arctic and Antarctic. The areas lying between the polar circles and the tropics are the temperate zones, and that lying within the tropics the torrid zone

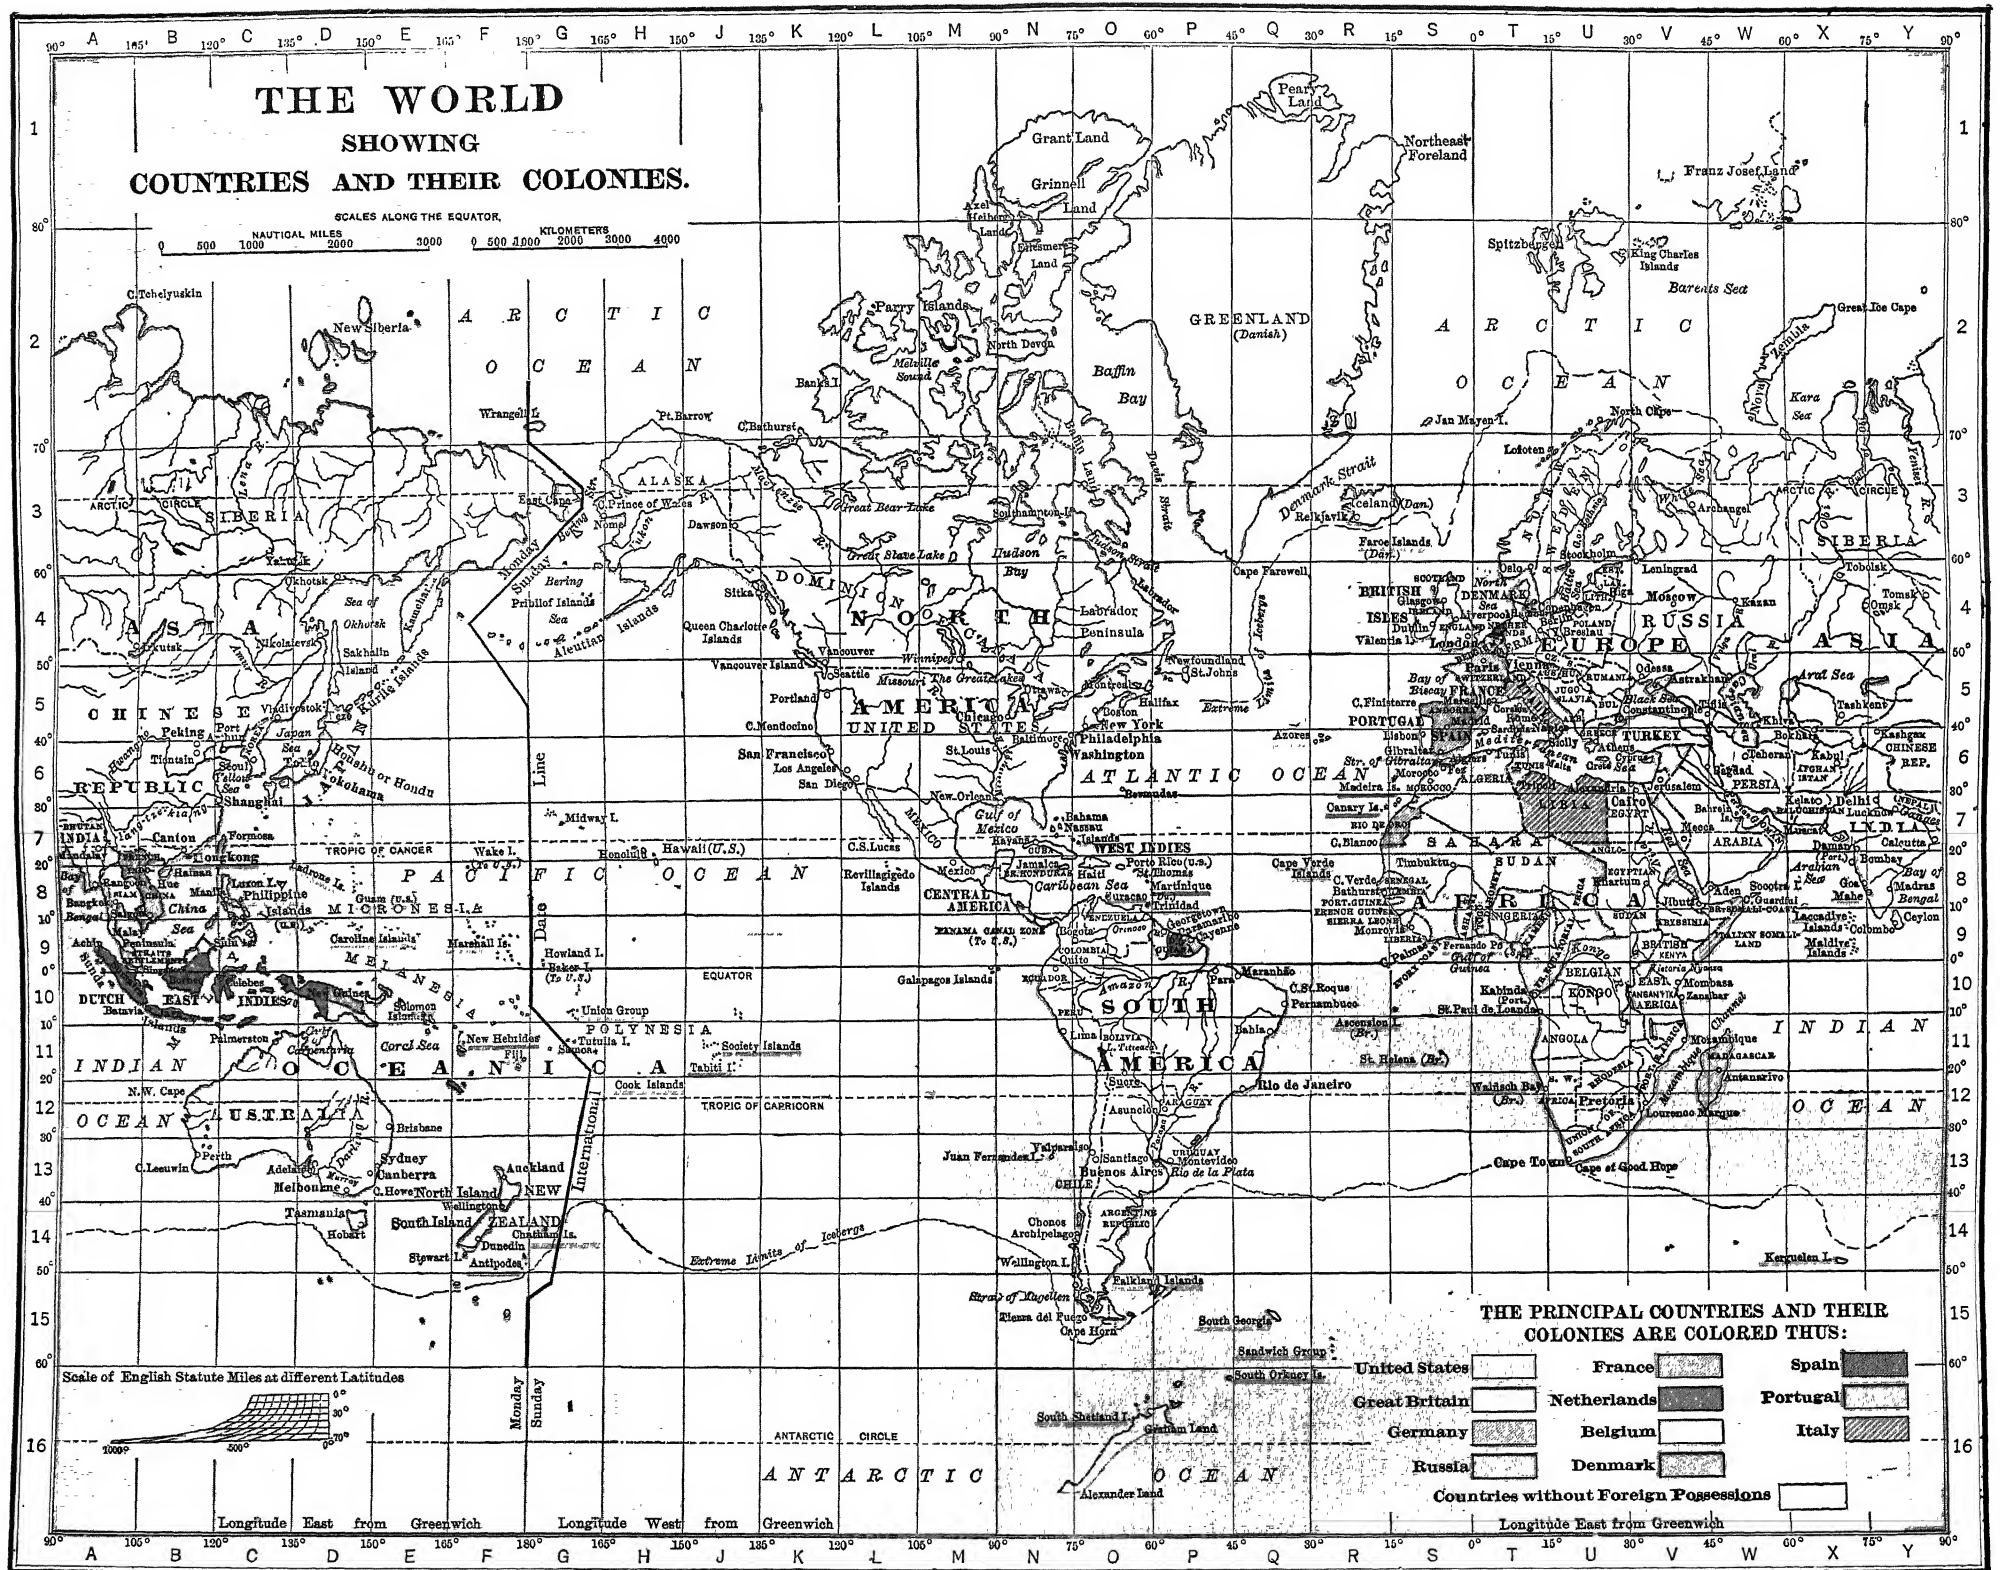

Cartography—Maps are representations, commonly upon flat surfaces, of all or parts of the earth's surface The scale of a map is the relation which distances on the map bear to distances upon the area represented They may be expressed in terms of miles or kilometers on the ground to an inch on the map, or by a fraction, as $\frac{1}{100,000}$, or 1 : 100,000, in which the numerator refers to the distance on the map, and the denominator to that on the ground, both being expressed in the same units, as feet, meters, or miles The last is known as the natural scale. A third method is by the linear scale, in which actual measurements are drawn on the map and marked with the distances which they represent in nature

Maps may be classified in accordance with the kind of information which they present Thus, there are geological, climatic, and statistical maps The maps considered here, however, are those only which represent the topographical features proper, the streams and other bodies of water, the relief of the country, its mountains, valleys, and plains, and the culture or the works of man, the cities, roads, railroads, boundaries, etc Restricted to this definition, maps may be classified as (1) plans, which are upon large scales and represent limited areas, such as a city or township, (2) topographic maps, upon smaller scales, say from 1 to 8 miles to an inch and covering much larger

SCALES ALONG THE EQUATOR.

gravel, and other detritus. Strains in the earth's crust, produced perhaps by shrinking of the interior on cooling, result in folds and breaks in the crusts. These may be of small extent, producing mountain ridges, or they may involve large parts of the earth, resulting in raising continents above the sea. They may be low and flat, or they may be high and sharp, even to so great an extent that the sides of the fold pass beyond the vertical. (See FAULT, ANTICLINE, SYNCLINE.) Lava flows out from vents and spreads over great areas, or it may be forced in between beds of stratified rock, or, in a plastic state, be forced up through such beds.

No sooner has a region been uplifted than the agencies of erosion, always at work, attack it with renewed activity. Water percolates into the seams and crevices of the rocks, and, freezing, splits them into fragments by its expansion. Water, often with acids in solution, dissolves the soluble portions of the rocks and thus disintegrates them. Flowing water, glacial ice, and the wind wear the rock away. The rock waste thus produced is transported, always downward, by the winds, streams, glaciers, and its own weight, most of it having the sea bottom as its ultimate destination. On the way, however, some of it is deposited, as in dunes, moraines, and deltas, and thus the agencies of destruction are also constructive agents. Thus there is a constant movement downward, from the land to the sea. Unless this is offset by elevation movements in the crust of the land, it results eventually in the reduction of the land to a low plain. Furthermore, if the limits of sea and land remain constant, there is a vast accumulation of sediment on the sea bottom, and a corresponding thinning of the solid crust over the land. See PHYSIOGRAPHY, GEOLOGY.

Hydrosphere. The sea, including the Pacific, Atlantic, Indian, and Arctic oceans, with many great gulfs and bays, covers 72 per cent of the earth's surface. Of these the Pacific is far the largest, comprising much more than half the water surface of the globe. The average depth of the sea is about $2\frac{1}{2}$ miles, or 13,200 feet. The greatest depth yet measured in the Atlantic, at a point north of the West Indies, is 1660 fathoms. This depth is considerably exceeded in the Pacific, where, in the Philippine Trough, to the east of Mindanao, a sounding of 9788 meters, or 32,114 feet, has been obtained. See OCEAN, ATLANTIC OCEAN; ETC.

The water of the ocean is strongly saline, being supplied constantly by streams whose waters contain saline material in solution in greater or less amount. Even if the amount be trifling, since there is no outlet save evaporation, its degree of salinity is merely a question of time. The salinity of certain landlocked seas, situated in hot regions, such as the Red Sea and the Mediterranean, is greater than that of the open ocean, owing to excessive evaporation from their surfaces.

The temperature of the surface water ranges from the freezing point in Arctic regions to 90° in landlocked seas, in the tropics, such as the Red and Caribbean seas. The annual range of temperature at the surface is small, except in localities where currents change their positions with the seasons. At moderate depths there is no change of temperature throughout the year, and at great depths the temperature in all parts of the sea is very nearly the same, being but little above the freezing point.

The surface waters of the sea are disturbed by waves and tides and moved about by currents and drifts. Waves are set in motion by the wind, but have little movement of translation, consisting mainly of vertical oscillations. They are rarely $\frac{1}{4}$ of a mile in length from crest to crest, and 50 feet in height. The tides (qv) are oscillations in the sea surface, occurring twice a day, one of them following the passage of the moon across the meridian, the other nearly 12 hours later. They are slight in the open sea, being not more than 2 or 3 feet, but upon the seacoast they are commonly much higher, and at the heads of funnel-shaped bays are in many cases very high. The tides are due to the difference in the force of attraction, mainly of the moon, upon the surface of the earth and its centre, owing to their difference in distance from it. Drifts are surface water transported by the wind. The movement is commonly very slow and changes in direction with the wind. When driven by constant winds, such drifts do in some cases develop into currents. (See OCEAN CURRENTS.) The great ocean currents, such as the equatorial currents, the Gulf Stream (qv), and the Japan current, thus originate. The constant trade winds, blowing from the northeast and the southeast diagonally towards the equator, induce great drifts in these directions. These, meeting near the equator, flow westward across the oceans. See HYDROGRAPHY.

Atmosphere. The height of the atmosphere is unknown, but from the rate at which its density diminishes with altitude above the earth's surface, it is clear that in a few miles it becomes extremely rare, so rare that its effects may be neglected. The pressure of the atmosphere at sea level has an average value over the earth of 14 pounds per square inch, equivalent to about 30 inches of the mercurial column. In equatorial regions the pressure is slightly below, and in temperate regions slightly above, this average. See AIR, ATMOSPHERE, BAROMETER.

Heat is produced by the absorption of the sun's rays by the earth. The more nearly overhead the sun is, the more heat is received per unit of area, and the higher is the temperature, other things being equal. The degree of temperature at the earth's surface is, however, affected by other conditions, chief among which is the relative moisture of the air, since a moist air absorbs much of the heat before the rays reach the earth. Hence very high temperatures are not observed in moist equatorial regions, while in desert regions extraordinarily high temperatures have been observed. On the whole, however, the equatorial regions receive the greatest amount of heat, and the polar regions the least. Hence the air over the equator rises, being forced upward by the pressure of air on the north and south. This produces a flow of air towards the equator from both sides—a flow which would be directly south and north were it not for the rotation of the earth, which deflects the currents to the westward and thus produces the well-known uniform trade winds. (See WIND.) The land absorbs heat rapidly and is as rapidly cooled, the sea, on the contrary, absorbs heat slowly and gives it out slowly. Moreover, by means of its waves, tides, and currents, the waters of the sea circulate freely and thus tend to establish a uniformity of temperature in its various parts. Hence it is that the sea is on an average throughout the

year warmer in the north and south and cooler in the tropics than is the land in the same latitude. Moreover, the sea is cooler in summer and warmer in winter than is the land. The difference in the attitude of land and sea towards temperature produces monsoons and land and sea breezes. The latter are diurnal and strictly local. The land being heated during the day, the air over it rises and thus induces an inward draft of air from the sea. At night, the air over the land being cooled, a reverse current is set up. The monsoon (qv) is a similar land and sea wind, but on a much greater scale, and is induced by differences of temperature between land and sea in summer and winter. There is a monsoon tendency on the margins of all continents, but in most cases it has little influence upon the more general movements of the atmosphere. The cooling of the land surface, and consequently of the surface atmosphere, after nightfall induces a local circulation of air in the interior of continents. This air, being cooled and consequently heavier, flows down slopes and collects in the valleys. Hence in mountainous regions there is a wind at night down the cañons, and the air in the depressions is cooler than on the slopes above. Frosts occur in the valleys, while the slopes above may be exempt from them.

A fall of rain or snow requires the coexistence of two conditions—an atmosphere partly or wholly saturated with moisture, and the chilling of this atmosphere below the saturation point, which may be brought about by forcing the air currents up to an elevation, to a higher latitude, or by mixture with colder air. The trade winds of the Atlantic bring to the Amazon basin and the eastern slope of the Andes an atmosphere loaded with moisture, which, as the land is during most of the year cooler than the air, is deposited freely, giving this region a profuse rainfall, while the summit and western slope of the Andes within the tropics are mainly desert. The southwest monsoons of India and southern China bring vast stores of moisture from the Indian Ocean, which are deposited freely upon the colder land. The west coast of the United States and Canada, under the influence of the prevailing westerlies from the Pacific, receives in winter, when the land is cold, a profuse rainfall, while in summer, when the land is warmer, these moist air currents carry much of this moisture over into the Rocky Mountain region. Hence in Colorado, Arizona, and New Mexico the summer is the rainy season. The same westerly winds supply moisture from the Atlantic to western Europe, and here since there are no great mountain ranges to intercept it all at once, the rainfall is more generally distributed than in North America, being greatest on the coast and diminishing gradually eastward, so that it is only in the far interior of Asia that desert conditions prevail. The southern part of South America lies within the region of the prevailing westerly winds, and here the western slopes of the Andes have an ample rainfall, while over the pampas of Argentina these winds, drained of most of their moisture in the passage over the Andes, blow as dry winds. See METEOROLOGY.

BIOGEOGRAPHY

Phytogeography and Zoogeography. The distribution of plants and animals is determined by a number of factors, which are more or less

interdependent. The chief of these are the physical characteristics, the climate, topography, etc., of the region, with which should be coupled the characteristics of plant and animal life. Closely related to these are the changes in climate, topography, etc., and the adaptability of various species. Other factors are the means of dispersal of forms of life, and the results of the competitive struggle for existence among them. Under the last should be included the results of man's interference with the adjustment of life conditions which prevailed upon his advent.

The play of the above agencies has resulted in a somewhat complex distribution, some of whose features are not yet easy to explain. In some cases widely separated regions have fauna and flora remarkably similar, like the British Isles and those of northern Japan. The physical conditions are quite similar, but the areas are separated by almost the semicircumference of the globe. On the other hand, adjacent regions, with similar physical conditions, often differ widely in fauna and flora, as in the case of Australia and New Zealand. Regions with very different fauna and flora are in some cases connected by transition zones, through which the change is made gradually, while in other cases the change is a sudden and violent one. Certain well-marked types occur in scattered localities in various parts of the earth without apparent connection one with another.

Although much study has been devoted to the subject, no satisfactory classification of the earth's surface with respect to its life has yet been evolved.

In polar regions, such as the northern parts of North America, Europe, and Asia, the soil is permanently frozen below, thawing only at the surface in summer, thus forming the well-known tundra, whose chief vegetation is reindeer moss, among which bloom in summer many bright-colored flowers. This tundra passes in less cold regions into moors and heaths.

Desert regions are characterized by a scanty growth of yucca and many species of thorny shrubs, where desert conditions are less intense, various species of *Artemisia* abound. The great plains of North America, the pampas of Argentina, and the Siberian steppes, which may be characterized as subhumid regions, are clothed with grasses, and these pass by insensible degrees through prairie regions of mingled grasses and woods to forested regions. These differ widely in character in different parts of the earth. In the colder regions coniferous forests prevail, in the more temperate regions coniferæ and broad-leaved trees are mingled, while the forests of tropical regions are commonly of the latter class, with dense undergrowth. The greatest and densest forests are, as a rule, found in regions of heaviest rainfall. Thus, the broader distinctions in the character of the vegetation are in great part controlled by temperature and rainfall. See DISTRIBUTION OF PLANTS.

The faunas of the earth are less dependent upon climate than the floras, since animals can migrate somewhat freely and have in greater or less degree the ability to protect themselves from its adverse elements. Still, each climatic zone has a fauna of its own, differing markedly from neighboring ones—the polar from the temperate, and the temperate from the tropic zone. The musk ox, polar bear, and Arctic foxes, blue and white, are confined to regions of ice and

snow In temperate regions their nearest relatives are the bison, the black and grizzly bears, and the red fox, who range with the wapiti, antelope, and many species of deer The tropic fauna is probably less closely related to that of temperate regions It is characterized by large mammals, the elephant, rhinoceros, hippopotamus, camel, lion, tiger, leopard, many species of marsupials (in Australia), monkeys, etc The fauna of the desert differs widely from that of well-watered regions in amount, variety, and species, which is due, in great part, of course, to the difference in plant food supply In the same latitudes and similar climates there are both close agreements and wide differences Thus, the faunas of Europe and North America do not differ materially, but between Australia, Africa, and South America there are wide, even radical differences Australia, with its marsupial fauna, resembles no other region on earth, and at few points are there resemblances between Africa and South America The great carnivora of the former continent have few representatives in South America See DISTRIBUTION OF ANIMALS.

Anthropogeography Of all forms of life, man is the most cosmopolitan. He is found from the frozen region to the equator. His ability to protect himself from hostile climatic conditions enables him to survive even under those most adverse, but certain conditions seem to be the most favorable to his development Arctic conditions, where besides a hostile climate the economic struggle is severe, are not conducive to his development On the other hand, the languid climate of the tropics, with the ease of living, seems equally unfitted for the development of civilization It is in temperate climates, which stimulate exertion, and where effort meets with adequate reward, that man has reached the highest level.

The races of mankind are commonly classified according to color and other characteristics as fair-complexioned or Caucasian, yellow or Asiatic, brown or East Indian, red or American Indian, and black or negro. The Caucasians (including all the Indo-European peoples, the Semites and the Hamites, the last-named being dark-skinned) inhabit Europe, a large part of Asia (mainly in the south and southwest), northern Africa, North America, South America (in parts of which they are outnumbered by the red race), and Australia, and are scattered, in greater or less numbers, over other parts of the earth The yellow race comprises the Chinese, Japanese, Koreans, Tibetans, and various peoples of Central and southeastern Asia. The brown peoples are those of the Malay Peninsula, the East India Islands, and Polynesia. The American Indians inhabited the entire continent from Bering Strait to Cape Horn, but in Central and South America they have become much mixed in blood with their Spanish conquerors The black race, whose home is Africa, have been subjected to forced migrations, under slavery, and many millions of them are now found in the United States, the West India Islands, and Brazil See MAN, SCIENCE OF

The migrations of man over the earth's surface, his present location, and the stage of civilization which he has reached, are, in the last analysis, the results of geographical environment, whatever the immediate cause may be. Great Britain has become, because of her insular position and her limited farming area, a great commercial nation. New England, by reason of

the destructive competition of Western farms, has changed her industries from agriculture to manufactures Thus, the climate, soil, and surface determine in great measure the products and leading industries of a region, subject, of course, to the degree of civilization of the inhabitants

The leading industries of mankind—pastoral pursuits, mining, fishing, agriculture, manufactures, and commerce—require different forms of distribution of the inhabitants Pastoral pursuits imply a very sparse population scantily distributed, since cattle and sheep require large areas for their sustenance In agriculture a much smaller area to a family suffices, implying a much denser population, while manufacturing and commerce require that people be closely grouped in towns and cities Hence, in the history of the settlement of a region, we may often trace a direct connection between the principal vocations of the people and the average density of population In early stages of settlement, when the people are few in number and widely separated, pastoral pursuits are the principal ones. As population increases, the herders are crowded out by the farmers, and still later cities spring up and grow, and manufactures and commerce become the dominant industries

Cities have been located from a great variety of considerations Anciently a common cause of their location was protection from enemies, and hence they were placed in easily defensible positions. As wars have become less frequent, and as private property has become more exempt from danger, they have been placed in industrially strategic positions—commercial cities on harbors, manufacturing cities at sites of water power, etc. Often, however, through changes in industrial methods, such locations cease to be advantageous, yet through sheer inertia the cities remain and grow

The form of landholdings is significant of the degree of civilization, and often, on the other hand, may hasten or retard its progress Among savage and barbarous peoples, and even those possessing some degree of civilization, such as the Russian peasantry, land is held in common by communities Among most highly civilized peoples individual ownership is well-nigh universal, and such a form of ownership undoubtedly conduces to a high development of the race, as it carries with it a sense of proprietorship and responsibility.

The people of the earth are organized into communities, various in form, size, and character, for governmental purposes Savages are grouped in clans and tribes, civilized man into empires, kingdoms and republics With primitive man the functions of government are few and are mainly confined to war, offensive and defensive, and the organization is feeble and often short-lived With advance in civilization come an increase in the strength of the government and an extension of its functions From being only an offensive and defensive league, the government of a civilized nation defends the rights of its citizens against one another, protects them in person and property, in many cases educates them, and maintains public utilities, such as surveys, means of communication, water supply, lighting, etc

The most important geographical bibliographies are the critical *Bibliographie Annuelle*, published annually as a supplement to the *Annales de Géographie*, and the *Geographisches Jahrbuch* (Gotha), ed by Hermann Wagner, an annual in which the literature of the various departments of geography is reviewed by specialists. These reviews generally cover a period of several years, so that all departments are not represented in each issue of the *Jahrbuch*.

HISTORY OF GEOGRAPHY

The history of geography falls naturally into two divisions, the first of which records the development of ideas regarding the shape and size of the earth, while the second deals with the gradual increase of definite information about the actual facts of land and water distribution. The conception of the earth as a flat surface, probably encircled by water, is common to all primitive peoples. This idea, which is still held by many savage tribes, was gradually discarded as the mathematical sciences and philosophical speculation in general developed, and the Greeks finally succeeded in proving that the world is a globe. Aristotle is ordinarily credited with this discovery, though the Pythagoreans taught the doctrine of the rotundity of the earth long before his time. Aristotle estimated the circumference of the globe at about 40,000 miles.

The earliest map representing the known portion of the earth is that of the Greek Anaximander, who lived 610 to 546 B.C. Hecataeus, also a Greek, who lived between 550 and 475 B.C., and who had traveled extensively in Egypt, Persia, Libya, Spain, and Italy, wrote a book describing these countries and made a map improving and extending that of Anaximander. Thales, a Greek of Miletus, who flourished about 600 B.C., divided the earth into five climatic zones, much as they are recognized to-day, and introduced the equator and meridians. He discovered that the plane of the ecliptic is inclined to that of the equator and made a rough measurement of the inclination.

The real founder of scientific geography was Eratosthenes, librarian of Alexandria (c 276-195 B.C.). He made accurate measurements of the length of the sun's shadow at Alexandria and at the First Cataract of the Nile, assuming that they were on the same meridian, and thus calculated the earth's circumference as about 25,000 miles, which is surprisingly near the actual figure.

Strabo, who was born about 60 B.C., was the first to attempt a work on general geography. His treatise consists of 17 volumes, two of which are devoted to the world at large as an introduction, 10 volumes to Europe, four to Asia, and the remaining one to Africa.

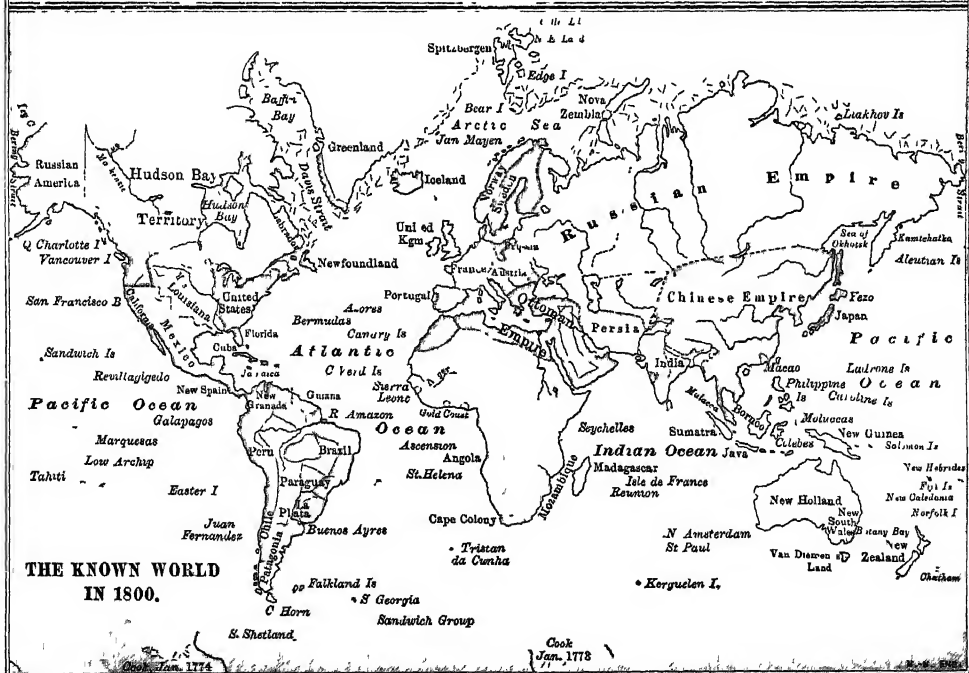

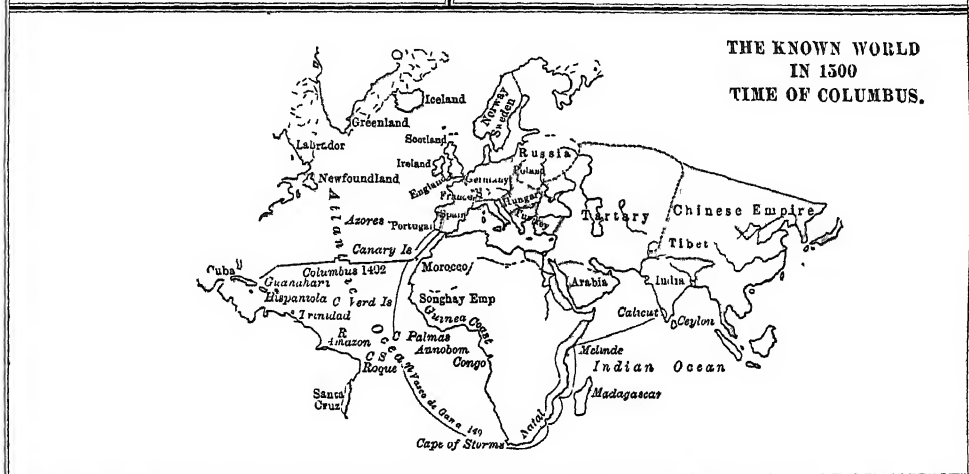

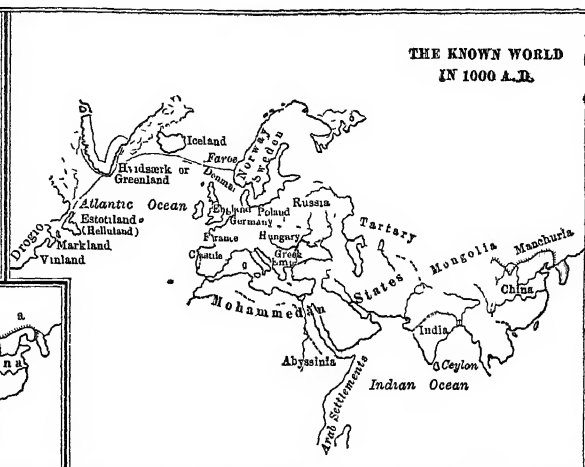

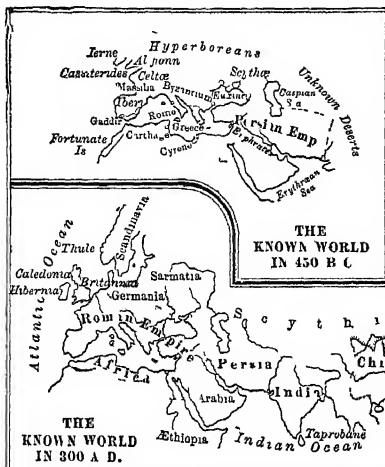

The great work of Ptolemy the Alexandrian,

who lived in the second century of our era, marked an epoch in early geographical science and was for many centuries the paramount authority on the subject of the earth, and his map was that universally used. Still, the map contained several serious errors, which had far-reaching results. He fell into the error of adopting the result given by Posidonius for the earth's circumference, and this, together with an error in the longitude of the Canaries, which marked his initial meridian, resulted in bringing the west coast of Europe and Africa within 9000 miles of the east coast of Asia. It was this which induced Columbus, 13½ centuries later, to voyage westward to reach the Indies. The map is constructed on a reticule of parallels and meridians, and though its errors of position and form in detail are many, it shows in comparison with earlier maps, especially that of Hecataeus, a vast extension of the known world. The advances in knowledge thus made were largely lost during the Middle Ages, when the scholastics developed the older plane-surface theory of a world, with Jerusalem as the centre of the universe. The most elaborate treatise embodying these ideas is that of Cosmas Indicopleustes, who lived in the sixth century (a translation has been published by the Hakluyt Society, London, 1899). Many specimens of mediæval cartographs, embodying these ideas, have survived, the most important of which have been reproduced by Prof Konrad Miller, of Stuttgart. The modern development of ideas concerning the form and magnitude of the earth is treated in the articles on **ASTRONOMY** and **NAVIGATION**.

Exploration, Ancient. The legend of the Argonauts undoubtedly grew up around the story of actual voyages made by the early Greeks to the Far East. The Phœnicians were the first nation of discoverers, and, like most of their successors, they were animated by the desire of gain. Tyre and Sidon became great commercial centres, from which ships sailed to all the Mediterranean waters, and to which traders came from India and from the lands beyond the Red Sea a thousand years before the Christian era. By the time of Herodotus (c 484-424 B.C.) Phœnician voyagers had passed through the Strait of Gibraltar, the ancient Pillars of Hercules, establishing settlements along the northwestern African coast, or coasting across the Bay of Biscay to the tin mines of Cornwall. The Phœnicians made valuable contributions to the exact knowledge of geography in their *peripls*, or itineraries. The names of two famous sea captains are associated with the furthestmost extension of Phœnician exploration—that of Hanno (about 450 B.C.), who led a party of several thousand colonists down the African coast to the neighborhood of Sierra Leone, and that of Himilco (about 500 B.C.), who sailed beyond Cornwall to Ierne or Ireland. Another famous voyage was made somewhat previous to this time by an Egyptian fleet dispatched by the Pharaoh Necho, which started from the Red Sea and, as it is reported, returned through the Strait of Gibraltar after a voyage around Africa lasting several years. About 320 B.C. Pytheas, a Carthaginian navigator, set out from Marseilles and sailed past the coast of Spain and Gaul as far as "Ultima Thule," probably the Shetland Islands. The conquests of Alexander the Great added little to the limits of exploration, but proved of inestimable service in bring-

ing Europe and Asia together and giving the West some knowledge of the countries and characteristics of the East. Rome continued the work of increasing and unifying the geographical knowledge of the world and brought Britain, Germany, and many other border regions within the circle of civilized nations. Much of this knowledge was wiped out in Europe by the irruptions of the Germanic and Tatar tribes, but much too, was fortunately saved by the Arabians, who rose to power after 630. Science and learning, driven out of Europe, flourished at Bagdad, Damascus, and Cordova, and other capitals of Islam. After 800 the study of the Ptolemaic cosmography was assiduously carried on, and important geographical treatises were composed by Abu Jaafra Mohammed, who wrote between 813 and 833, Al Masudi, who between 943 and 94 traveled extensively in southern Europe and Asia, going as far as China, and Idrisi, whose comprehensive *Geographer's Garden of Delight* appeared in 1154. The greatest of the Mohammedan travelers was Ibn Batuta (c 1304-78), a Moor of Tangiers in Morocco, who traversed northern Africa, Asia Minor, India, China, and the steppes of southern Russia and Central Asia, covering nearly 75,000 miles. When the Renaissance came in Europe, much of the older geographical learning was recovered from Arabic books and scholars. During the mediæval period the journeys of Benjamin of Tudela (1160-73), Friar John of Piano Carpini in 1245, Wilham of Ruysboeck in 1255, and the Franciscan Friar Odoric (1316-30), served to keep Europe in touch with what was happening in Asia. Much more important were the travels of Marco Polo, of Venice, because the spirited account of his adventures and observations, written after his return in 1295, acted greatly towards the revival of active exploration.

Exploration, Modern. This revival is associated with the name of Prince Henry of Portugal, known as "the Navigator." Prince Henry devoted all his time and resources, from 1418 until his death, in 1460, to fostering maritime exploration, with the results detailed in the article on **AFRICA**, under *History*. Of the Mediterranean nations, Italy especially furnished a remarkable succession of navigators, who, sailing under other flags, doubled the extent of the known world during the century following the death of Prince Henry. Columbus in 1492 proved the possibility of crossing the Atlantic and discovered the New World, which he took to be the Indies; John Cabot in 1497 landed on the coast of North America, Vespucci between 1497 and 1501 established the continental character of the southwestern Atlantic shores, and Verrazano gave France her claim to the northern continent in 1524. Before the advent of these Italians Bartholomeu Dias in 1488 rounded the southern point of Africa. In 1497-98 Vasco da Gama made the sea voyage to the real Indies by way of the Cape of Good Hope. For the next hundred years discoveries followed close upon each other, until all the main features of sea and land upon the globe had been determined. Serrão reached the Moluccas or Spice Islands by way of India in 1512, and in 1520-21 Magellan found the way to them across the Pacific. Magellan perished in the Philippines, but his ship, the *Victoria*, kept on her voyage westward to Spain, completing the first circumnavigation of the globe. Cartier in 1543 entered the St Lawrence and with the

exploration of that river basin began the work which was continued by Champlain, Joliet, and the Jesuit fathers in the seventeenth century and completed by La Salle, who reached the mouth of the Mississippi in 1682, thus establishing the general character of the interior of North America. In 1542 Antonio de Mota reached Japan, and in the same year Gaetano discovered the Sandwich, or Hawaiian, Islands. In 1553 and 1556 Sir Hugh Willoughby, Richard Chancellor, and Stephen Burrough sailed around northern Scandinavia to Archangel, sighting Nova Zembla. Chancellor and Jenkinson proceeded to Moscow, and thence the latter went on to Bokhara, bringing back to Europe much information about the interior of Russia. Frobisher began the long record of English explorations in the Northwest in 1576, and the next year Drake started on the second circumnavigation of the globe. Australia was discovered by Torres and the Dutch sailors of the *Duyfken* in 1606, although it is possible that it had been seen a few years before by the Portuguese. In 1642 Tasman completed the delineation of the main outlines of this continent and established the character of the lands beyond it to the south and east. For a century and a half the tide of discovery slackened while the nations of Europe were busy with the task of occupying and exploiting the vast areas newly brought to their knowledge. Then came the work of Bering, who in 1728 established the boundary between Asia and America at the strait which had been reached in 1648 by Deshnev (and which received the name of Bering Strait), and that of Captain Cook, who between 1768 and 1779 completed the survey of the water world, proving that there was no large habitable land mass undiscovered in the Southern Hemisphere. The work of Cook was perfected by La Pérouse, who finished the delimitation of the oceans in 1788.

Meanwhile the scientific exploration of the interior of the continents had begun. In 1740 Varonne de la Vérandrye reached the Rocky Mountains of North America, and in 1771 Hearne penetrated to the Arctic shores of the same continent by way of the Coppermine River. In 1768-72 Bruce began the century-long task of opening up the interior of Africa by his journey to the headwaters of the Blue Nile. In 1789 Mackenzie discovered the great river to which his name is given. Lewis and Clark (1803-06) and Pike (1805-07) filled in many of the important features of the western United States. From 1799 to 1804 Humboldt traveled in the West Indies, Mexico, and South America, and by the accurate and comprehensive reports of his observations set a new standard which has increased immensely the value and trustworthiness of most of the geographical work done since his time. Mungo Park had reached the Niger in 1796. Through his explorations and those of Clapperton, Denham, and Lander, the problem of the source of the Niger was solved by 1830. In the course of their journeys Clapperton and Denham reached Lake Chad in 1823. In 1828 René Caillié visited Timbuktu, where Laing had been killed in 1826. Livingstone crossed South Africa, tracing the course of the Zambezi, between 1849 and 1856, and in 1859 he discovered Lake Nyassa. While Livingstone was traveling in the region of the Zambezi, the German traveler Barth was engaged in a remarkable series of explorations in the west-

ern Sudan. Burton and Speke found the way to Tanganyika and Victoria Nyanza in 1858, and within the next six years Grant, Speke, and Baker approximately solved the problem of the real sources of the Nile. Lake Albert Nyanza was reached by Baker in 1864. Stanley in 1876-77 traced the course of the Congo, the principal affluents of which were observed by Wissmann during his two journeys across Africa between 1881 and 1887. In 1887 Stanley set out on the Emin Pasha relief expedition, in the course of which he discovered the Mountains of the Moon of Ptolemy. Asia, largely because it has been in parts longest known, remained for a time least known to Europeans. Between 1785 and 1794 Billings surveyed eastern Siberia. Somewhat earlier, in 1761-67, Niebuhr had explored parts of Arabia, a work which was supplemented by Palgrave in 1862-63. In 1856-57 the brothers Schlagintweit crossed the Himalayas and Tibet. In 1868 Richthofen entered upon his career as a Chinese explorer, and about the same time Ney Elias traversed central China. The arid wastes of Central Asia included within the boundaries of China were visited four times between 1871 and 1888 by Przhevalsky. Valikhanoff reached Yarkand in 1859, and in 1870 Fedtchenko penetrated into the country north of Pamir. The course of the Yang-tse, Mekong, and Brahmaputra rivers was traced by the Pandit Krishna between 1878 and 1882. Younghusband traveled from Peking to Kashmir in 1887. Among other recent explorers of Central Asia have been Sosnovski, Potanin, Pyevtsov, and other distinguished Russian travelers, Bell, Carey, Rockhill, Bonvalot, Henry of Orléans, Littledale, and Sven Hedin, who spent the years from 1893 to 1900 in exploring Chinese Turkestan, Tibet, and Mongolia.

Among the great Arctic explorers of the first half of the nineteenth century were Parry, the two Rosses, and Sir John Franklin. See POLAR RESEARCH.

Final proof of the fact that the oceans encircle the continents was supplied by McClure's achievement of the northwest passage (1850-54) and by Nordenskjöld's voyage from Norway along the Siberian coast and out through Bering Strait in 1878-79. In 1892 Peary established the insular character of Greenland. Nansen's voyage in the *Fram* (1893-96) determined the problem of the Arctic ice motion and proved that there can be no large land division at the North Pole. Borchgrevink visited the Antarctic regions in 1894-95, and again in 1898-1900, and the later Belgian, British, German, Swedish, and French expeditions widely extended knowledge of the South Polar regions.

The first geographical atlas was prepared by Claudius Ptolemy at Alexandria about 150 A.D. This gave the location of places on the earth's surface and continued to be the best compendium for 1400 years. It was printed many times during the fifteenth and sixteenth centuries, usually with the addition of maps embodying the results of contemporary travel and observation. It was finally superseded by the Atlas of Ortelius, published in 1570, and this in turn gave place in 1595 to that of Mercator, who had devised, about 1539, the principle of the projection known by his name. Ramusio and Hakluyt, contemporaries of Mercator, published the first two great collections of travels in the less-known parts of the world, thereby providing the data for succeeding efforts to enlarge geographical knowl-

edge Atlases making notable contributions to general knowledge were published by Blaeu in 1638, Sanson in 1645, Delisle in 1700, D'Anville in 1745-71, and Stieler in 1817.

Systematic Geography. The modern science of geography, as defined at the beginning of this article, may be said to have its origin in the work of Alexander von Humboldt and Karl Ritter. Although approaching the subject from different angles, each demonstrated its unity and showed that interaction between the physical and the organic world was its underlying principle. A generation elapsed before geography received university recognition in Germany, but now every university in that country, where the subject is more advanced than elsewhere, has its chair of geography. The foremost exponent during this period was Baron von Richthofen. Within the last 15 or 20 years the science has also made great progress in France, thanks to Vidal de la Blache, and in Great Britain through the efforts of Mackinder and Herbertson. In the United States the European conception of geography is just beginning to make itself felt. Although the Ritter school had an able exponent in this country, in the person of Guyot at Princeton University, this influence did not prevail. It was rather the geological side of the subject that received special attention in this country, mainly through the efforts of W. M. Davis, whose work in physiography has left a lasting impression on American geography. Only recently has interest arisen in other phases of the subject, mainly in human geography, more especially in response to a demand from educational circles for a more teachable presentation of the subject.

GEOGRAPHY, ECONOMIC Economic geography treats of the production, exchange, and transportation of commodities. It discusses the distribution of natural resources, plant, animal, and mineral, and the various industries connected with them. It takes up the various forms of man's economic activities. The most important of these are agriculture, mining, manufacturing, and commerce. All of these presuppose an advanced stage of civilization, while such activities as gathering, fishing, and hunting, as the sole means of subsistence, represent the lower forms of civilization. The most important mineral products are coal and iron; their association is the mainstay of modern industrial development. Manufacturing is mainly carried on with the aid of machinery. The necessary power is derived from several sources—moving water, steam, and electricity. Commerce consists essentially of the exchange

between different regions of the commodities which each most easily produces. It may be divided into two parts, trade and transportation. Trade is the arrangement of the exchanges, e.g., the buying and selling of goods, while transportation is the conveyance of the goods to their destination. That part of economic geography which deals with commerce has often been designated commercial geography, although this term is also used synonymously with what has here been defined as economic geography. The study of Commercial or Economic Geography forms an important course in the work of many leading universities. For bibliography see the article GEOGRAPHY.

GEOGRAPHY, MEDICAL See DISTRIBUTION OF DISEASES.

GEOLOGICAL SOCIETY OF AMERICA

An organization for the promotion of science and geology in North America, organized in 1888. The society holds one meeting annually, at which many technical papers are presented, and during the following year some of these papers are printed in a volume known as the *Bulletin*. The society had a membership in 1914 of about 380, comprising nearly all the working geologists of the United States.

GEOLOGICAL SURVEY, UNITED STATES

The United States Geological Survey, a bureau of the Department of the Interior, is charged with the investigation of the geological structure and mineral resources of the country. The bureau was organized in 1879 as a consolidation of the independent surveys that had been active for several years in exploring the Western States and Territories. In 1867 Clarence King organized a geological expedition for the examination of a belt of country including the fortieth parallel, and extending across the Rocky Mountains from Wyoming to California. In the same year the general government commissioned F. V. Hayden, who had previously been attached as scientist to exploring parties in the West, to make a survey of Nebraska. The exploration of territory west of the one hundredth meridian and of the Colorado basin was provided for by the government in 1871, and the expeditions were placed under the direction of George W. Wheeler and J. W. Powell. The four organizations, popularly known as the King, Hayden, Wheeler, and Powell surveys, fulfilled an important mission in the scientific investigation of a vast and little-known territory. As the scope of operations was extended, however, it became evident that the work could be conducted to better advantage under a uniform system. A plan for unifying the service was proposed by the National Academy of Sciences and finally adopted by Congress in 1879, when the independent surveys were discontinued. The control of the new organization, known as the Geological Survey, was placed in the hands of a director, who was required to submit an annual report of plans and operations of the Survey to the Secretary of the Interior.

The functions of the Geological Survey, as originally outlined by law of Congress, with subsequent modifications, include the preparation of a topographic map of the United States, the investigation and mapping of the areal geology, the examination of mineral deposits, the collection of mineral statistics, the study of hydrography with reference to water power and the irrigation of arid regions, and the classification of public lands. The preparation of the topographic map, a necessary preliminary to the

geologic and hydrographic work, is carried on by the topographic branch of the Survey. At the end of the fiscal year 1913 a total area of 1,178,974 square miles, or 38.9 per cent of the entire area, exclusive of Alaska, had been surveyed upon scales of 1, 2, and 4 miles to the inch, varying with the importance of the different regions. When completed, the topographic map will give an accurate presentation of the surface features of the country. The geologic branch of the Survey investigates and maps the geological formations. The map, as rapidly as completed, is issued in folios, it shows the areal distribution of the various rocks, their geological structure, and the location of mineral resources. The work of the geologic branch is conducted by four divisions, as follows: geology, Alaskan mineral resources, mineral resources, and chemical and physical researches. The Geological Survey has contributed much to the advancement of geological science as well as furthered the material interests of the country. The publications issued for general distribution include the director's report (annual), monographs, professional papers, bulletins, and water-supply papers. Consult Walcott, *The United States Geological Survey* (Washington, 1895). See MINES, BUREAU OF GEOLOGY (from Gk. γῆ, gē, earth + -λογία, -logia, account, from λέγειν, legein, to say). Geology is the science which investigates the history of the earth. The rocks of the earth's crust contain the records of this history. Many of the pages of the rock book are lost, others are obscured through partial destruction, and many, like the hieroglyphics on ancient monuments, require great care, patience, and intelligence to decipher, yet, in spite of these difficulties, we are already in possession of a vast fund of information concerning the history of the earth.

Geological study shows that forces similar to those of the present have been operating in the past. Therefore the proper interpretation of the past history presupposes a knowledge of the forces working at the present time to modify the earth. One class of forces, depending largely upon energy from within the earth, causes the earth's surface to rise and fall, volcanoes to erupt, and the rocks to be disturbed, another, deriving its energy from without the earth, mainly from the sun, sets in operation winds, waves, rain, rivers, glaciers, and tides, which wear away the surface of the land and distribute the waste in the oceans. The effect of life on the globe is another geological factor. Many geological changes are influenced by animals and plants. It is of importance, therefore, that in many instances the layers of rock forming the crust contain remains of animals and plants of past ages. The study of these remains has given much information concerning past life and the conditions amid which the life existed. Moreover, since life has developed in orderly succession, the study of the fossils of animals and plants has given a basis for the division of the earth's history into periods, or ages.

Although geology stands as a distinct science, with numerous subdivisions, to master it thoroughly requires a broad knowledge of several allied sciences. Botany and zoology are indispensable to the student of fossils, physics and chemistry, to the student of rocks, and astronomy and geography, to all who would broadly grasp the subject of geological history. Each of these sciences furnishes tools with which

the geologist works out the varied and complex earth history.

Fundamental Principles of Geology. Geological work is so slow, and the evidence of vast changes in the past so clear, that, so long as it was held that the age of the earth was to be reckoned in a period of a few thousand years, no other conclusion was possible than that the changes observed had been rapidly made as a result of stupendous catastrophes. Thus, the early literature of geology deals largely with imagined deluges, sudden upliftings of the crust to form mountains, destructive invasions of the land by ocean water, and similar catastrophes. When, however, it was made clear by Hutton and his successors that the recorded facts indicated slow changes, it began to appear possible that the age of the earth was great. The promulgation of the doctrine of evolution, and the increased knowledge of past life, as recorded by the fossils, brought further evidence of the great age of the earth. In consequence of these advances in science the interpretation of the former history of the earth by modern geology rests upon two principles that may be considered established: one, that *the age of the earth is very great*, the other, that *in the processes in operation at present, we may look for illustrations of most of the changes of the past*. These two principles were formulated in the doctrine of uniformitarianism (q v), which was proposed as a substitute for the older theory of catastrophism (q v). By this doctrine the past may be investigated in the light of the present. Given time enough, even the slow processes operating at present, which produce no perceptible change in one's surroundings in a lifetime, will accomplish the stupendous results so clearly proved by geological study.

Age of the Earth. The evidence from geology all points towards an age for the earth to be reckoned in millions of years. One line of evidence upon which this conclusion is based may be illustrated as follows: there are, in some places, great accumulations of rock layers which were deposited in the ocean. These layers are known to reach a depth of many thousands of feet, in some instances over 40,000 feet. A study of these beds indicates that they were accumulated slowly, as similar beds of limestone, clay, sand, and gravel are now being accumulated in the sea. If anything like the present rate prevailed, the time required for their formation is very great, probably not less than 100,000,000 years. This estimate is, of course, open to doubt because of the question whether the past and the present have been so closely alike, but even if this doubt is warranted, the deduction must still be made that the age of the earth is very great. From a study of the wearing away of the land and the planing down of mountains, a similar conclusion may be reached. A second class of evidence pointing to a great age for the earth is supplied from a study of the fossils preserved in the rocks. The evolution of plant and animal life seems, in general, to have been gradual, as it is in the present time, and this conclusion harmonizes with the evidence from the rocks themselves.

Physicists have also estimated the age of the earth in several ways. One of these estimates is based on the rate of cooling of the heated interior of the earth. Another estimate is based on the effect of the tides in retarding the rotation of the earth by the friction of the tide

wave Still a third line of argument is based upon the rate of cooling of the sun, whose light, according to Lord Kelvin, will not last more than 5,000,000 or 6,000,000 years longer. The facts concerning the earth's heat, the sun's heat, and the earth's form, together with the rate of cooling of the sun and the earth and the effect of tidal friction, have led Lord Kelvin and other physicists to the conclusion that the age of the earth is not greater than 20,000,000 years. Great though this estimate of time is, it is not great enough to satisfy geologists, for the evidence from geology seems to point to a far longer history for the earth. Moreover, physicists are now generally inclined to concede a much greater age than Kelvin estimated, the discovery of new factors, e.g., radioactivity, that enter into the calculations has necessitated a more liberal interpretation of the data.

From what has been said, it is evident that we are not in a position to state even approximately the age of the earth in years, but all lines of evidence agree in pointing to the conclusion that geological time is to be reckoned in millions of years, and geologists are practically unanimous in the belief that the time since the oldest stratified rocks were deposited cannot be much less than 100,000,000 years.

The Branches of Geology. Investigation of the earth's history may be carried on along various lines, in fact, geology is so complex a subject that it is now no longer possible for one man to claim to have a thorough knowledge of the entire subject. Consequently it has come to be the custom to subdivide geology into several branches. Some of these branches are quite universally recognized, in the case of others there is difference in usage.

1 *Cosmical Geology*.—In this branch are included investigations in the borderland between astronomy and geology. It is a consideration of the relations of the earth to the other members of the solar system and to other bodies in space. As archaeology is related to history, so is this phase of cosmical study related to geology proper.

2 *Geognosy*.—This division of geology includes a study of the materials of which the earth is formed—air, water, minerals, and rocks of the crust—and of the condition of the earth's interior. The study of minerals to determine their composition, crystal form, and other characteristics is the province of the science of mineralogy, which has chemical and physical, as well as geological, relationships. The study of rocks forms the science of petrology or lithology. Petrography, a branch of geology recently developed, is concerned with a study of rocks from the standpoint of their composition, characteristics, and geological relations.

3 *Dynamic Geology*.—Under this heading is included a study of the operation and effects of the forces that are and have been at work to modify the earth.

4 *Structural Geology*.—This division of geology is concerned with a study of the architecture of the earth. That is to say, structural geology investigates the actual arrangement of the materials that are included under geognosy as they have been placed by the forces of dynamic geology. Using the parallel of architecture, the crude materials are included under geognosy, the arrangement and position of these materials, and their relation to one another, are included under structural geology, the forces

that have formed the materials and arranged them, and the way in which they have operated to do it, form the theme of dynamic geology.

5 *Physiographic Geology*.—This division deals with the forms assumed by the surface of the land as a result of the operation of the dynamic forces upon the materials and structure of the earth. Extending the parallel of architecture to this division, it is to geology what the finished building is to architecture. This division of geology is coming to be considered a separate science of physiography, or geomorphology.

6 *Stratigraphic Geology*.—Historical geology is a term often applied to this division, because it is more intimately connected with a study of past histories than any other of the divisions. By a study of the life record inclosed as fossils in the strata, and by a study of the rocks themselves and their structural relations, stratigraphic geology tells of many of the great events in earth history. One of the most important phases of this line of study relates exclusively to the investigation of the life record. This may be called paleontological geology. But now the broader students of stratigraphic geology make use not only of paleontology, but of dynamic, structural, and physiographic geology to determine not merely the life record, but also the physiography of past ages. Thus considered, it is one of the broadest divisions of the science.

7 *Glacial Geology*.—One of the latest events of stratigraphic geology was the general glaciation of different parts of the world. The study of the events of this time, which necessarily includes a study of existing glaciers, has attracted a large number of geologists, so that glacial geology has come to be recognized as a distinct branch of the science.

8 *Economic Geology*.—The geological processes have resulted in the accumulation of many useful materials—soils, clays, building stones, and metallic minerals. The study of these from the standpoint of their occurrence and origin constitutes economic geology.

COSMICAL GEOLOGY

A full treatment of this phase of geology is out of place in a brief general article. Moreover, much of it belongs to astronomy. Studies of the shape of the earth, and the resemblances between the earth and other bodies in space, both in form and composition, are undertaken by physicists and astronomers. These studies, however, throw light upon the earliest phases of earth history, pointing to the conclusion that the earth, like other bodies in space, was once a molten sphere which has cooled on the outside, forming a solid, cold crust. Of the original crust geological investigation has as yet found no sign. It is to the continued cooling of this once molten sphere that we owe some of our most important geological events. The forces, having their seat in the heated interior, may be considered as *terrestrial*, or *hypogene*, forces. The passage of light and heat to the earth, the great movements of rotation and revolution, and the pull exerted by the sun and moon constitute the *extraterrestrial*, or *epigene*, forces, which, aided by gravity and acting through the medium of air and ocean, set in motion another series of geological agencies. Dynamic geology is concerned with a study of the operations of these two sets of forces whose origin is cosmical.

Other phenomena of the earth having an influence on geological history are the precession of the equinoxes and the variations in the eccentricity of the earth's orbit. These two astronomical changes have influenced the amount and distribution of heat on the earth's surface in past times, but to what extent is an unsolved problem. There are still other obscure questions in cosmical geology, e.g., the possible changes of the earth's axis and centre of gravity. Being on the borderland of two or three sciences and dealing with subjects on which it is difficult to gather facts, these are among the great scientific problems awaiting solution.

GEOGNOSY

The earth consists of three quite different sections—the solid earth itself, or the lithosphere, a partial water cover, or the hydrosphere, and a gaseous envelope, the atmosphere. Each of these has its geological bearings.

The Atmosphere. The atmosphere consists of a mixture of gases, of which the most important are oxygen and nitrogen in the proportion of 21 per cent of oxygen to about 79 per cent of nitrogen, argon, and other similar elements recently discovered. The nitrogen is inert, the oxygen very active, not only in its influence on life, but also in its effect on rocks. A minute percentage of carbon dioxide, about 0.03 per cent, is of basal importance to plant life. A variation in the percentages of these three constituents would produce a very great difference in the effect of the air. Water vapor is present in variable quantities in the air, and its condensation causes the rain upon which springs, rivers, and lakes depend. There are also minute solids, called dust particles, and very small quantities of a large number of other substances, as salt, nitric acid, ammonia, etc. (See *ATMOSPHERE*). By its influence on life the air is of the highest geological importance. It also affects rocks directly, causing them to oxidize and disintegrate, and the movements of the air, in the form of wind, produce direct geological results, as well as indirect ones by the agency of waves and currents which are wind-driven. A consideration of the geological effects of the air forms part of dynamic geology.

The Ocean. Filling the depressions between the continent upfolds are the oceans, reaching a depth in some places of 5 or 6 miles. Altogether, about three-fourths of the earth's surface is covered with ocean water, with an average depth of over 2 miles. This great hydrosphere is disturbed by tidal waves, ocean currents, and wind waves, which are important agents of dynamic geology. As a modifier of climate, and as the source of the water vapor in the air, it is also of geological importance. In the ocean water many substances are held in solution, the dissolved solids constituting about three and one-half parts to every one hundred parts of water. Of these dissolved substances, over three-fourths are common salt and one-tenth is chloride of magnesium. A minute proportion of carbonate of lime is the basis for the limy shells and tests which have so often accumulated to form beds of limestone. As the home of shell-building animals whose remains form rock beds, and as the seat of deposit of waste from the land, the ocean is of the very highest geological importance. See *OCEAN*.

The Crust of the Earth. The cold, outer

portion of the earth is composed of rocks—some derived from beneath the surface, whence they have risen in molten condition, others formed by the reassembly of the materials obtained from the disintegration of other rocks. These rocks have been subjected to movements, as a result of which the earth's surface has been made irregular. The cause of these movements of the crust depends upon the unstable equilibrium of the earth itself, the results have been to make great downfolds where the ocean basins are situated and upfolds where the continents are located, with numerous minor uplifts and downsinkings along narrow lines, both in the sea and on the land, forming mountain ranges. (See *CRUST OF THE EARTH*). By far the greater part of the earth's surface is fairly level. Most of the ocean bottom is a vast series of submarine plains with occasional mountain ranges and volcanic peaks rising above them. On the land much more than half the surface is also plain or plateau, some of the plateaus rising to elevations of 10,000 to 15,000 feet. See *CONTINENT*.

In the ocean the deposit of waste from the land, and the accumulation of the solid parts of animal remains, have the general tendency to level the sea floor. Agents of erosion are in general ineffective excepting at the contact between land and sea, and consequently the only forces operating to make the sea floor irregular are those of uplift or downsinking of the crust. On the land, on the other hand, the action of the forces of denudation carves the mountains, plains, and plateaus, making the surface more irregular. And along the coast line the work of the waves and tides is added to the dynamic processes by which the land is being irregularly denuded. Thus, the land portion of the earth's crust is often deeply scarred and cut, revealing the internal structure of the superficial portions of the crust.

Interior of the Lithosphere. Early geologists considered the interior of the earth to be molten, basing their conclusion upon a number of facts pointing to a high temperature for the interior. The numerous hot springs indicate heated conditions below the surface, all deep borings and mines show a rise in the temperature with increasing depth, and volcanoes actually bring melted rock to the surface. The movements of the crust also may be accounted for by assuming a heated interior, which upon cooling and shrinking allows the cold, solid crust to settle on it and wrinkle. If the observed increase in temperature in mines and borings, which averages 1° for every 50 to 60 feet of descent, is continued far into the earth, temperatures must eventually be encountered which are above the melting point of rocks at the surface.

Astronomers and terrestrial physicists have shown, however, that the earth cannot be a molten sphere with a thin crust. In its behavior towards other members of the solar system the earth acts like a solid body, and one as rigid as steel. If there is a solid crust, it must be at least 2500 miles thick. The evidences for this conclusion are obtained not only from the behavior of the earth towards other members of the solar system, but also from the absence of tides which would be present in a molten interior, and from the fact that the average density of the earth is far greater than that of the rocks at the surface, indicating a very dense, heavy interior.

Geological facts also point towards the conclu-

sion that the earth's interior is not molten. Consequently geologists have long accepted the hypothesis of a solid heated interior, so hot that it would be molten under normal conditions, but kept from melting by the enormous load of the crust, since the melting point of rocks is raised with an increase in pressure. Whether there is a zone of molten rock between the solid cold crust and the solid heated interior is not known. Many believe that the rock of the interior is molten only where the pressure is relieved by the uparching of the crust under mountain folds. The condition in which the heated rock exists in the interior is one of the fundamental problems of geology still awaiting solution.

Elements and Minerals of the Earth's Crust. Relatively few of the 80 or more elements form an important percentage of the crust. Oxygen, the most abundant element of the outer portion of the earth, constitutes 86 per cent of the ocean, 21 per cent of the air, and 47 per cent of the crust. Nitrogen, though forming about three-quarters of the air, is of little importance in the ocean or the rocks. Silicon forms 27 per cent of the crust, and aluminium 8 per cent, so that the three elements (oxygen, silicon, and aluminium) together constitute 82 per cent of the crust. Next in importance are the following: iron, 5, calcium, 4, sodium, potassium, and magnesium, each about 2.5, carbon, 0.22, hydrogen, 0.21, phosphorus, 0.1, sulphur, 0.03, and chlorine, 0.01 per cent.

These elements, combined according to definite chemical laws, form minerals. A great variety of different combinations are known, making, in all, over 2000 mineral species. Most of these are rare, and only a very few form prominent contributions to the crust. Of these common minerals, by far the most abundant is quartz, made of the two common elements silicon and oxygen. Its hardness and indestructibility make it a factor of strength in rocks. Probably next in abundance is the group of feldspars, of which a number of different kinds are recognized. Although hard minerals, the feldspars disintegrate in the weather, forming clay and certain soluble substances. Calcite is a third common mineral, composed of calcium, carbon, and oxygen. It is fairly soft and quite soluble in waters carrying carbon dioxide or mineral acids. Dolomite, the magnesium carbonate of lime, has similar characteristics to calcite. Other common rock-forming minerals are the micas, amphiboles, and pyroxenes, mainly complex silicates of aluminium with potassium, magnesium, iron, etc. Gypsum, the hydrous sulphate of lime, and the several oxides of iron—limonite, hematite, magnetite—the carbonate of iron, siderite, and the sulphide of iron, pyrite, are other common minerals. Of these or their decayed products the great part of the rocks of the crust are made. These minerals are of high geological importance; the others are of interest especially to the mineralogist and the petrographer. See MINERALOGY; QUARTZ, FELDSPAR, ETC.

Rocks of the Earth's Crust. Minerals, combined in various ways, form rocks. Sometimes the combinations are according to definite chemical laws; but rocks are usually mere aggregates of several minerals. A threefold division of the rocks may be made as follows: *igneous*, or those derived from a molten condition; *sedimentary*, mainly sediments in water; and *metamorphic*, or those due to the alteration of other rocks by heat and pressure.

The igneous rocks vary among themselves in two characteristics—one chemical composition, the other texture—and the classification now generally recognized is based upon this double variation. From different volcanic vents the lava differs chemically—in the one extreme being very acid, i.e., with much silica, in the other being very basic, i.e., with a small percentage of silica and a large percentage of the basic elements—iron, magnesium, potassium, sodium, etc. These chemical differences give rise to different classes of minerals—quartz and feldspar prevailing in the acid rocks, micas, amphiboles, pyroxenes, and iron oxides in the basic. According to the conditions of cooling, the igneous rocks vary in texture. Some are blown out by violent explosive expansion of steam and, cooling quickly, form glassy, porous pumice and volcanic ash. In other cases flowing lava cools so rapidly that it sets without the formation of individual minerals, forming natural glass, or obsidian. More commonly the lava becomes crystalline and is either fine-grained or has a fine ground mass inclosing large porphyritic crystals. Many igneous masses do not reach the surface, but cool in the vent of the volcano or, being intruded into the rocks, cool in the crust. These cool so slowly that the minerals crystallize into good-sized individuals, producing coarse-grained rocks, like granite, syenite, etc.

The term "sedimentary" for the second class of rocks is not perfectly satisfactory, since not all the rocks included are sediments. The group comprises mechanical deposits, such as conglomerate, sandstone, and clay, which are derived from preexisting rocks by the processes of disintegration and erosion, and are removed and deposited by air, water, or ice, chemical deposits, accumulated by the precipitation of materials held in solution, and including rock salt, gypsum, calcareous tufa, etc., organic deposits, such as limestone, chalk, marl, coal, and bog-iron ore, which are formed by the growth and decay of animal and plant organisms.

Either igneous or sedimentary rocks, under the action of heat and pressure, are subjected to changes which in some cases go so far as to remake the rock entirely. This alteration, or metamorphism, sometimes takes the form of crushing, accompanied by the development of new minerals, in other cases there is a development of new minerals without noticeable crushing. This formation of new minerals may go so far as to destroy entirely all evidence of the original characteristics of the rock, as in many schists and gneisses. The new minerals naturally develop with their long axes along the lines of least resistance, thus giving to the rocks a parallel structure, and it is due to this feature that slates split readily in one direction, viz., parallel to the cleavage planes of the micaceous minerals. By metamorphism, also, limestone is often changed from amorphous carbonate of lime to crystalline calcite, forming marble. Sandstone is changed to dense quartzite by the deposit of silica around the grains. Coal is changed to anthracite by the expulsion of volatile substances, causing the concentration of carbon, and in some cases this metamorphism has gone so far as to produce crystalline graphite, which is pure carbon. For details as to origin, composition, and classification of rocks, see the articles on PETROLOGY and ROCK.

DYNAMIC GEOLOGY

Dynamic geology is a conflict between the hypogene and epigene forces. The hypogene forces raise some parts of the earth's surface into the air and lower other parts beneath the ocean, the epigene forces attack the parts thus raised and tend to spread over the sea floor the materials derived. The epigene forces may be grouped under the general heading of denudation. So far the forces of uplift have been more potent than those of denudation, and the land surface is battered and scarred by the conflict, but should the forces of uplift cease, or so lose in effectiveness that denudation was more rapid than uplift, the land would slowly lose in ruggedness, and the surface would be reduced by denudation to a more and more level condition. In discussing the scope and principles of dynamic geology we will first consider the hypogene forces.

Changes in the Level of the Land Among the most far-reaching results of geological study is the proof that the earth's surface is not stable at the present time, and that a similar condition has existed in all periods of the past. Again and again stratigraphic geology tells of changes in land level of stupendous nature, and studies in dynamic geology have proved that similar changes are now in progress in many parts of the world. In some places the movement is an uprising of the land, in others a down sinking, and these movements in some cases affect broad areas of the crust in a slow uprising or down sinking, while in other cases the movement is localized and spasmodic. These latter movements are usually associated with mountain growth, earthquakes, or volcanic eruptions, and over a limited area the level of the land may change several inches, or even feet, in a few minutes. The movements affecting large areas are so slow that careful study is necessary to prove their existence.

Many instances of land movement now in progress might be given. The coast line of New Jersey is sinking at the rate of about 2 feet a century, the coast of Labrador is rising at an unknown rate, the coast of West Greenland is sinking; in Sweden records of 150 years show that the region south of Stockholm is sinking, while to the north the land is rising, in one place having risen 7 feet in that period. Local rapid movements of the land were observed in Japan during the earthquake of 1891, and in California displacements of from 10 to 20 feet were noted after the earthquake of 1906, changes of level, both uprising and down sinking, have occurred in the Bay of Naples, the coast of Chile has been uplifted during earthquakes in the last century. Evidence of changes of level in past ages is furnished by elevated beaches, raised beaches that are no longer horizontal, and submerged forests. The irregular coast line of parts of continents, as in north-eastern America, is interpreted as a drowned coast, where, by land sinking, sea water has been allowed to enter the valleys, forming fiords. In some cases the continuation of the land valleys may be traced along the sea bottom, as in the case of the Hudson River (q.v.).

The question has naturally been raised as to whether these changes are due to land movement or to changes in sea level. Some of them, as in Sweden, where the movement is differ-

ential, and the spasmodic movements in limited areas, are certainly due to land movement. With regard to others, the conclusion is not so certain, though the geological evidence all points towards a change in the land rather than of the sea.

The cause for the instability in the crust has often been referred to the heated condition of the earth's interior. Various hypotheses have been proposed to account for the exact manner in which this heated condition causes change in level. One hypothesis would explain the change by contraction, by which it is held that, through loss of heat, the interior is shrinking, and the crust, in accommodating itself to the shrinking interior, is caused to move. A different explanation, which is supported by some of the leading investigators in dynamic geology, is based upon the principle of isostasy. This explains crust movement by assuming that variations in the load on the crust cause movements. The reduction of load by denudation of the land and the increase of load in places of sedimentation necessitate an isostatic readjustment, causing sinking in one place and rising in another, as there would be in a pile of wax of irregular height. Other hypotheses have also been proposed, but space forbids their discussion here.

Mountain Formation The stresses brought about in the earth's crust through the energy which is causing change in level, whether this be due to contraction, isostasy, or other cause, throw the surface into a series of folds, the largest forming the continental uplifts and ocean depressions, the smaller forming mountain chains. According to the contractional hypothesis the general movement of the crust is a down sinking, but locally portions are uplifted because the solid crust cannot accommodate itself to the shrinking interior without wrinkling. The great pressure thus applied to the rocks, operating through long periods of time, causes them to bend or break. Where the rocks which are subjected to these stresses are deeply buried, and hence under great pressure, they bend, even though they are brittle rocks. When the strain is more quickly applied, or when the rocks are nearer the surface, faulting is common, and thick beds of brittle rocks, like sandstone or limestone, are more liable to break than thin-bedded rocks such as shales. See FAULT.

All evidence points to the conclusion that the formation of mountains in the past has been slowly accomplished. Indeed, some mountain chains, such as the Andes and those of the East Indies, the Philippines, and Japan, are now growing and apparently little if any more slowly than the mountain growth of the past. It is found by a study of the structure of mountains that in most cases their growth has been intermittent; i.e., periods of freedom from uplift have occurred. Many of the mountain chains are along lines of crust weakness established in the early periods of geological history. Along these lines the stresses have relieved themselves at various times so that these regions have remained mountainous throughout geological time. On the other hand, many parts of the crust have been marked by entire freedom from mountain folding. The zones of mountain growth extend in a general north and south direction in many parts of the earth, as in western North and South America, eastern North America, and eastern Australia. A belt of shorter ranges, with east and west axes, extends across the Old

World in the north temperate zone. Many efforts have been made to find a system in the arrangement of the mountains of the globe and to account for their distribution, but no thoroughly satisfactory theory has been evolved. See CONTINENT, MOUNTAIN, ETC.

Volcanic Action. Molten lava, rising from within the earth towards the surface, sometimes reaches the surface, but often rises into the crust and remains there. Small masses filling cracks in the rocks are called dikes, masses thrust in between the layers of the strata form sills or intruded sheets, like the Palisades of the Hudson, still larger masses, which lift the rock and form great wells of lava, are called laccoliths, or laccolites, and huge masses, with irregular boundaries, common in the cores of mountains, are known as bosses. Instances of each of these classes of igneous rock have been revealed by the denudation which has stripped off the overlying strata.

Where the molten rock reaches the surface it usually issues through a fissure, and when the volcanic energy is vigorous, as it was during the formation of the mountains of the western United States, the lava may well out through these fissures and form vast floods which inundate great areas on either side of the fissure. Hundreds of thousands of square miles in the West are covered by these ancient lava floods. In no part of the world is this form of fissure eruption well developed at the present day, though the volcanoes of Iceland approach this type.

The geological effects of volcanic eruptions are of very great importance. The heat of intruded masses causes change in the rocks with which they come in contact. By the outflowing of the lava extensive changes are made in the topography, and highly important, though usually destructive, effects are produced on life. Much rock material is added to the crust, mostly near the volcanoes, in the form of ash and lava flows, but partly as intrusions into the crust and partly as deposits, on the land and in the sea, derived from ash drifted about by the air and water currents. See VOLCANO, LACCOLITE.

Earthquakes. The eruption of volcanoes is frequently accompanied by a shaking of the earth, and the rising of lava into the crust and the movements of the lava before an eruption also cause earth jars. Likewise a breaking of the rocks, or a movement of the strata along a fault plane, causes earthquakes. Indeed, any jar

form from the centre, or focus. At the epicentrum, directly above the focus, the wave movement is upward, on all sides from the epicentrum it reaches the surface at an angle, departing more and more from the vertical as distance from the epicentrum increases. The violence and the time of appearance of the shock vary in all directions from this centre. Irregularities of rock texture and structure interfere with the regularity of these variations. The propagation of the earthquake wave under ideal conditions is shown in the accompanying diagram, where *E* represents the epicentrum and *A B* coseismic curves.

Among the geological effects of earthquakes the destruction of life is best known, but the shaking of the ground sometimes changes the topography, shaking loose earth about and opening fissures in the ground and rocks. When the earthquake originates under the sea a great water wave is raised. This, advancing on neighboring shelving coasts, so increases in height as to wash over the lower land with highly destructive effects. These earthquake water waves have an important influence on sedimentation in certain places, and the jarring of the sea floor and the ocean water sometimes causes a great destruction of life, which aids in the formation and preservation of fossils. If the jarring is too frequent, however, the tendency is towards extinction of life in the region subjected to the jarring. See EARTHQUAKE.

Hot Springs and Geysers. Water is everywhere percolating through the upper layers of the crust. Reaching fissures, it often rises to the surface, forming large and permanent springs. This water is frequently heated in its passage, sometimes through the influence of heat-producing chemical changes in the rock, sometimes deriving its heat from rocks whose temperature has been raised by the friction caused by slipping along fault planes, sometimes being warmed by the presence of intruded masses of lava. The time required for the cooling of great masses of intruded melted rock is so great that hot springs and geysers might be caused by them for many centuries.

The heated waters take many mineral substances into solution in their passage through the rocks. On reaching the surface this is often evident in the deposits made near the outlet as the water cools. For example, the geysers of the Yellowstone precipitate silica, the hot springs carbonate of lime. Many hot springs have medicinal properties because of the minerals in solution. A great variety of mineral matter is carried by the hot water, and even veins of precious metals are formed by it. See GEYSER, THERMAL SPRING.

Formation of Ore Deposits. Heated water under pressure in the rocks is a potent chemical reagent. It soon becomes alkaline or acidic from substances derived from the rocks and in this condition dissolves and changes minerals in a complex way. As it circulates through the crust, the condition of this water is constantly changing—growing warmer or cooler, receiving accessions of water from different sources, and obtaining various substances from the rocks through which it passes. Under these changing conditions mineral substances may be dissolved in one place only to be subsequently deposited elsewhere. Nor is the activity confined to highly heated water. The surface waters descending through the rocks also dissolve and deposit, as

EARTHQUAKE WAVE.

to the rocks, even the explosion of gunpowder or the falling of a cavern, will produce an earthquake shock. The jar, originating at a point or along a plane, is transmitted through the rocks as a series of waves moving outward in curved

is illustrated especially well in certain deposits of iron ores. However, the conditions most favoring the formation of mineral veins are the presence of heated water and of channels which permit its circulation. Of channels the most important are fault planes, joints, and fissures. Since these are most abundant in the mountain regions, and since mountains most commonly have associated igneous phenomena by which the water is heated, or which themselves may give off hot waters and gases, such regions are especially favorable for mineral deposit. In addition, the igneous rocks contain the greatest store of the metallic elements, and hence their presence is important as a source of supply of the metals. All these conditions prevail in the mountainous sections of the western United States, one of the great mineral regions of the world. See ORE DEPOSITS.

Metamorphism. The phenomena of mountain building and igneous activity are favorable to that alteration of rocks which is included under the term "metamorphism." Heat, hot solutions and vapors, and great pressure are effective in changing the character of rocks. This alteration may be local, through contact with intruded masses of igneous rock, when it is called contact metamorphism; or it may be widespread, through intense and extensive mountain building, when it is known as regional metamorphism. In each case the resulting changes are similar, though the alteration is usually carried to a far greater degree in regional than in contact metamorphism. Metamorphism has also been subdivided, according to the agency which has predominated, into hydrometamorphism, thermometamorphism, and dynamometamorphism.

All rocks in a region of metamorphism are involved, and the resulting changes are independent of the origin of rock, being determined by the nature of the metamorphism and the composition of the rock subjected to the change. Sometimes the alteration is so complete that no trace is left to tell the original character of the rock, not even the general class to which it belonged, and there are some geologists who believe that in some cases metamorphism has been carried to the extreme of actual melting, or, at least, to the reduction of the rock to a plastic condition. On the other extreme, some rocks are so slightly altered that their original condition is easily recognized, e.g., pebbles of conglomerate, elongated and stretched out of shape, are sometimes found, bedding planes in some slates are still observable crossing the planes of cleavage, distorted fossils may be present, and beds of marble may be traced to their origin from limestone strata, or quartzite to a previous condition of sandstone. The genesis of even the highly metamorphosed schists and gneisses may at times be traced by following along the beds to some less intensely metamorphosed section containing fossils, or other indications of their origin. Thus, it is known that some of the highly altered beds of metamorphic rocks in the Alps were deposited in the Tertiary sea and metamorphosed during the building of the Alps in late Tertiary time. See METAMORPHISM.

Weathering. Of an entirely opposite character to metamorphism is that change in rocks which results from contact with the air. In the processes of metamorphism the materials of rocks are rearranged, and in most cases bound more closely together, in the processes of weather-

ing the materials are weakened and the rock caused to disintegrate and fall apart. Weathering, like other geological processes, is a complex phenomenon resulting from a cooperation of various agencies. Most of the agencies of weathering operate both chemically and mechanically.

Air aids in the weathering of rocks by supplying oxygen, carbon dioxide, and other substances for chemical changes. Through the wind it performs mechanical work. Heat and cold, by causing contraction and expansion, aid in the breaking up of the rocks. Percolating waters cause many chemical changes, especially by the aid of oxygen from the air, carbon dioxide from air and decaying vegetation, and organic acids, derived from plant decay. Mechanically water is important when the rain drop strikes the ground, and when frost is formed in soil and rocks, the expansive force rends the materials apart with great effect. Plants are also important, both chemically and mechanically. Chemically they work by obtaining plant food from the earth, mechanically by the intrusion of their roots in soil and rock. Burrowing animals are likewise effective agents of weathering, especially the ants and earthworms, which bring fresh materials to the surface and make the soil more porous.

The effectiveness of the agencies of weathering varies with the nature and situation of the rock. All rocks are entered by water, but some are far more porous than others. Some minerals are easily soluble, some relatively insoluble, some decay with ease, others are almost indestructible. But even the densest rock, made of the most indestructible of minerals, will crumble, though slowly, in the weather. On steep slopes, as on mountain tops and cliffs, the bare rock is exposed to the weather by the aid of gravity, which removes the fragments as they fall, but on more level ground some of the weathered material remains as a blanket, protecting the rock from some of the agencies of weathering. Arid lands are unfavorable places for weathering, because of the general absence of water. A forested country is protected by the forest cover, and it is probable that this protective effect is of more importance than its destructive effect. In damp tropical regions rock decay is of most importance, in cold climates frost is one of the most important agencies.

Of the effects of weathering, by far the most important is the disintegration of the rock to form soil. Whenever the slope is not too steep,

RESIDUAL SOIL

the disintegrated fragments accumulate as soil cover. Such a soil of rock decay is called a residual soil, because it is a residuum of mineral decay after all the easily soluble portions have been removed. By far the greater part of the

land has a soil cover of this origin. A second highly important effect of weathering is the preparation of rock for transportation, and were it not for weathering geological history would have been far different. The rock waste falls or is washed into the streams which use it as tools for carving valleys, as the material for building flood plains and deltas, and as contributions to the deposits of sediment which are made in the sea.

Wind Work. As an agent of geological change, the importance of the wind is not fully recognized by dwellers in humid regions. Aside from its influence in weathering, mentioned above, the wind does effective work in two classes of regions, viz, in arid lands and on seacoasts. In both places the protective covering of vegetation is absent, and in both places fine-grained rock fragments are dried and exposed to the wind. In these positions the sand is borne about by the wind and piled into irregular hills, or dunes. The friction of the sand particles over one another grinds them down; and, when blown against rocks and cliffs, a natural sand blast is in operation, with the result that the rocks are worn away. An additional effect of wind action is the construction of land in the sea. Where sand bars are thrown up by the waves, or where coral beaches are built on coral reefs, the wind completes the construction of land by building dunes of the fragments washed ashore. The blowing of sand and dust out to sea adds to the sediments gathering there. The distribution of volcanic ash over wide areas is another important geological effect of the wind. Indirectly the wind is exceedingly potent as the transporter of vapor for rain, and as the force which causes the waves and currents in the ocean. See WIND, DUNE, LOESS; AEOLIAN ACCUMULATIONS.

Work of Underground Water. Water is ever percolating through the rocks of the crust, and this underground water is an effective agency of dynamic geology. Much of this water returns to the surface after a short journey, and it is this which with rain keeps the rivers supplied. Wells show its general presence in the surface rocks, and springs are places where favorable conditions have conspired to direct quantities of it back to the air. Among these favorable conditions are fault fissures, joint

SPRING ALONG FAULT PLANE.

planes, and relatively impervious layers. The percolation of water along such layers when they rest in unstable positions is an important cause of landslides. Where rocks, such as limestone, are made of minerals that are soluble, the passage of water usually dissolves out underground channel ways. Along the joint and bedding planes the rock is slowly dissolved away, the water entering from sink holes at the sur-

face and emerging as springs on some valley side into which the underground water is draining. These caverns are often ornamented with stalactites and stalagmites, caused by the deposit of carbonate of lime which the water must

SPRING ON HILLSIDE

P, porous rock, I, impervious strata

precipitate on emerging from the rock into the cave air. See CAVE.

River Work. In draining from the land the water carries a load of mineral matter in solution and in suspension. The former is mainly supplied from the underground water, though some is obtained from the river bed. The suspended material is in part derived from the in-wash of soil by the rains, in part from materials obtained by weathering of the valley sides, and in part by the direct work of the rivers, using the rock materials as tools of excavation. There

FORMATION OF CAVE IN LIMESTONE

is a great variation in the work which rivers are doing. Some have such a rock load, on so gentle a slope that they cannot cut, but must build up, their beds. Others are rapidly excavating their beds and have cut deep gorges and cañons, which they are still deepening. Their rate of work varies with the volume of water, the slope, the nature of the rock, and the amount and nature of the load of rock waste being transported. Since the rate of work varies with the kind of rock which is being excavated, rivers that are engaged in deepening their valleys are liable to have falls and rapids because of unequal erosion on rocks of different hardness.

One of the great geological results of this river work is the formation of valleys. Where a stream is rapidly cutting, its valley is narrow and steep-sided. Even in this case the valley is broader than the stream, partly because by its meandering course the river undercuts its bank and partly because weathering is broadening the valley. Weathering continues even after the stream has ceased its downcutting, and therefore the valley continues to grow broader and broader, the stream removing the materials which this weathering supplies. Thus, as a transporting agent, rivers, in coöperation with

weathering, which prepares and supplies the materials, are important factors long after they have ceased to cut directly into the rock.

In the transfer of the waste of the land to the sea some of the material halts on the way. Even the most rapid of streams, bearing the coarsest of fragments, furnish illustrations of this in their beds, in bars, and in narrow strips of deposit on their margins. The larger streams, especially near their mouths, are often bordered by flood plains in which sediment is laid aside in flood time and in which, as the stream slowly changes its course by meandering, portions are being taken up on the side of cutting, while other portions of the river load are being deposited on the opposite side. Such flood-plain deposits are built of fine-grained fragments, making a very fertile soil. See **EROSION, VALLEY, FLOOD PLAIN, DELTA, ETC**.

The Work of Lakes. Lakes are formed by some interference with drainage, usually a dam across some stream course, as the growth of a mountain barrier, a lava flow, or a dam of glacial deposit. The lake waves work on the coast line, cliffs are cut, beaches are formed, and on these the fragments are ground finer. The rivers which enter the lake add still more to the deposit accumulated, forming deltas where they enter, but giving the finer material to the currents for transportation off into the lake. Weathering adds to the supply of sediment, and the wind drifts more rock fragments to the water. In the quiet lake waters, even the finest of this sediment in time settles to the bottom. Given time, then, the fate of lakes is to be filled, and the truth of this has been graphically stated in the remark that "rivers are the mortal enemies of lakes." But rivers are not allowed to do the entire work of lake destruction, as has been shown. Aside from the agencies of lake-filling mentioned, the influence of organisms is effective. The shells of animals and the accumulations of plant remains are also factors of importance. In the last stages of lake destruction water-loving plants—the reeds, rushes, and sphagnum mosses—are effective, both by their own accumulation and by their interference with waves and currents, thus aiding in the deposit of rock fragments. Many filled lakes have been transformed by plant growth to bogs in the northern climates, where the sphagnum moss grows readily. By the processes of lake-filling important accumulations of sedimentary rocks are made, and in some countries, as the western United States, where large lakes were formed behind mountain dams in recent geological periods, there are extensive areas occupied by lake-formed strata. Coal beds, representing the stages of organic influence, are a part of these lake beds. In arid climates, where evaporation exceeds the rainfall, the lake waters are lowered below the outlet, then, year by year, the mineral substances brought in solution by the incoming water, and left behind in the lake as the water is evaporated, become more and more concentrated. Such lakes become salt and, if the process continues, deposit layers of salt, gypsum, and other substances. Before this stage is reached, however, the precipitation of carbonate of lime takes place because this substance is relatively less soluble than the chlorides and sulphates. Beds of these precipitated rocks are common in the West, where they have been recently formed and, in fact, are in some cases still forming; they are also found among the

strata of earlier ages when similar conditions existed. See **LAKE**.

Glacier Work. Glacier action at present is confined to high mountains or to high latitudes. There are three classes—valley, or alpine, plateau, and continental. Of the last named, Greenland and the Antarctic furnish illustrations, and during the Glacial period (q.v.) continental glaciers covered northwestern Europe and northern North America. Hence glacial action assumes wider importance than it would if considered solely from the standpoint of the work of present glaciers. The erosive action of glaciers seems to be very great where the ice movement is free along valleys. The weight of the ice, pressing its grinding tools on the under rock and slowly dragging over it, grooves and polishes the rock and deepens as well as broadens the valleys. The results of this work are readily seen in a region from which vigorous ice action has disappeared. The material dragged along by the ice is a mixture of large and small rock fragments in various stages of reduction by the grinding process. At the ice front, or when the ice melts away, this material is released and, falling to the ground, accumulates as an unsorted mixture of materials, because the ice carried large and small fragments with equal facility. This glacier deposit is known as till, or boulder clay. If the ice front stands long enough along a single line, the accumulation of ice-borne debris forms a moraine. The melting of the ice releases much water along the front, and this water assorta a portion of the till, causing clay deposits in one place, sand and gravel in other places. By the glacier-borne floods large quantities of rock fragments are carried far away from the ice front and deposited in the river valleys and even borne to sea. Where glaciers enter the sea there is a direct contribution of material to the ocean, and by means of the icebergs which break from the glaciers some of the rock fragments are carried far to sea. The deposits made directly by the ice, and by water supplied by ice melting, cover northeastern North America and northwestern Europe, forming the soil of those regions. These glacial deposits vary greatly in form and in texture according to the exact nature of the formation, and they vary also in depth. Many important effects have been produced by these deposits, especially on the drainage. The great number of lakes in Europe and America are mostly due to some form of glacial interference with drainage, and the goiges and waterfalls are due to the turning aside of streams by glacial deposits. See **GLACIER, BOULDER CLAY, ETC**.

Ocean Work. The most powerful agent of erosion in the ocean is the wind wave. By its direct blow, and by hurling and grinding rock fragments together, waves are wearing coast lines back. From the cliffs thus formed much material is supplied by weathering, which is assisted by the influence of the salt and other soluble substances with which the rock is sprinkled by the ocean spray. The waves, approaching the coast diagonally, drift the rock fragments along the coast, and this movement is further aided by the wind and wave-formed currents. These fragments often find lodgment in embayments, forming beaches. Such beaches are mills in which the rock fragments are further ground down. The finer fragments obtained by the waves, added to those brought by

the rivers, the wind, and weathering agencies, are in part drifted out to sea by the undertow, the wind-formed currents, and the tidal currents. Rarely the tides have an erosive influence, but with ocean currents and ocean drifts they are important transporting agents. The currents and drifts are also geological factors in modifying climate and in bringing food to sea animals. The materials derived from the land by the various agencies are strewn over the sea bottom near the land—the coarsest near the coast, the finest out to sea. Sometimes the sediment comes to the sea in greater quantities than the agencies of the ocean are able to remove. Then they accumulate as bars along the coast, and the waves expend their energies on the bars, leaving the protected coast behind the bars untouched. If the sea bottom is sinking, great beds of conglomerate, sand, and clay may be accumulated, if it is rising, the beds previously formed are added to the land, as along the eastern United States south of New York. More than half of the rocks of all the continents were formed on subsiding sea beds near land areas and made of the land waste. Later they were elevated to form parts of the continents, and they have often been built into great mountains, such as the Alps, Appalachian, and Rocky mountains.

In the sediments accumulating on the sea floor animal remains are always present, and as the distance from the coast increases, these become of increasing importance because of the diminution of the supply of rock waste. Far from the coasts, in the open ocean, the contributions of land waste are so slight that the sea-floor deposit is made almost exclusively of animal remains, especially of the tests of minute surface animalculæ which have dropped to the sea floor. This forms an ooze, variously named from the animal forms predominating. Of these the most numerous are usually the Globigerina, low forms of Foraminifera. Chalk beds are made of Globigerina ooze, raised to the surface and consolidated. In the very deepest oceans only the insoluble residue of these shells continues to the bottom, forming a red clay deposit. In this clay are found also volcanic dust, meteoric iron, and the ear bones of whales, indicating its extremely slow accumulation. About one-third of the sea floor is covered by red clay, and one-third by ooze, yet red clay is not found on the continents, and ooze rarely. This seems to indicate a permanency of the deep ocean basins, and that the ocean-formed rocks of the land were mostly made in those shallow parts of the ocean which bordered the continents.

Organic influences are not confined to the deposits of the deep sea. Grasslike plants and, in tropical regions, mangrove trees are effective in aiding deposit on many coasts, especially in protected spots. Shell-building animals also form deposits in addition to contributing to the elastic sediments. But far the most important of the coastal organic influences are those of the corals, which build reefs along the coasts, and islands on shoals in the sea. The coral fragments are built into islands by uplift, by waves and winds, and coral ooze is strewn over the sea floor near the reefs by the grinding of the waves and transportation by the currents. By these means beds of limestone are being accumulated. See OCEAN, DEEP-SEA EXPLORATION; CORAL ISLAND.

Work of Life. As a geological agent, life is

important in many respects, and reference to life has already been frequently made. It helps to disintegrate rocks, to transport fragments, and to make deposits of rock materials. All forms of life have geological influence, and man, the highest and most powerful of the animals, has come to be one of the most important of the geological agents. By modifying and destroying animals and plants, by removing the forests, by interfering with rivers, lakes, and oceans, by excavations in the ground, and by many other actions, man is aiding in geological change, and in a way more varied and effective than any other organic agency.

Denudation. The land uplifted by continent movements, mountain building, and volcanic activity is being attacked by the agents of denudation. The rocks are dissected, the land made irregular, and the fragments carried to the sea. Mountains are planed down, volcanoes removed to their very roots, coast lines cut back, and the structure of the upper parts of the crust revealed. Thousands of feet have been removed from all of the continents, and new land has been made of the fragments deposited in the sea and then lifted to the air by the forces from within the earth. The work of destruction by the agencies of denudation is partly repaired by uplift. A study of the form of land resulting from this interaction of uplifting and down-cutting belongs to physiography (q v).

STRUCTURAL GEOLOGY

The rocks of the crust, considered under the three headings of sedimentary, igneous, and metamorphic, present certain characteristic structural features. When in the form of flows the igneous rocks are arranged in layers, and they are often covered with beds of sedimentary

INTRUDED SHEET OF IGNEOUS ROCK

strata. Sheetlike intrusions of lava are also in beds. But dikes, bosses, and laccoliths are more irregular. These igneous rocks vary in texture, as has been already stated. Joint planes are commonly present, being due to contraction of the cooling masses which results in a breaking of the rocks. These joints at times assume al-

BOSS OF INTRUDED ROCK (B)

most mathematical regularity, as in the hexagonal columnar jointing of Fingal's Cave and the Giant's Causeway. Many of the metamorphic rocks inherit some of the characteristics of the rock from which they were derived. But, when

GEOLOGY

ANTICLINAL FOLD, CHESAPEAKE & OHIO CANAL, NEAR HANCOCK, WEST VIRGINIA (UPPER)
JOINT-PLANES IN ROCKS NEAR ITHACA, N. Y. (LOWER)

highly metamorphosed, they become massive and crystalline, resembling in this respect the igneous rocks. However, owing to the influence of pressure, the metamorphosed rocks are characterized by a parallel development of their constituents, often very marked. Veins are common in the metamorphic rocks, and the layers are often highly contorted under the strain of the tremendous pressure to which they have been subjected. Joint planes of later origin are also present. The sedimentary strata are characterized by arrangement in layers due to the assorting action of the agencies which have caused their accumulation. This assortment is found both on a very small scale, represented by laminae, and on a large scale, represented by changes in the nature of the material. For example, a series of shales, with many laminae, may grade downward to a sandstone and upward to a limestone. The minor variations represent the influence of slight variations in the force or direction of currents or in the nature of material

LACCOLITE

supplied, the larger changes indicate more extensive changes, such as uplift or depression, which completely alter the conditions under which the sedimentation is taking place. A shallowing means coarser fragments, a deepening finer fragments, because of change in the position of the coast line. The sedimentary beds have the shape of greatly flattened lenses, because they die out in all directions, but the beds of coarser fragments, having less extent, are more lens-shaped than those made of finer fragments.

The nature and structures of sedimentary rocks often reveal the manner of origin. Coarseness indicates nearness to shore, limestone indicates abundant life, and the presence of currents, varying in velocity and direction, is indicated by cross, or current, bedding, in which the layers vary greatly in coarseness and in the direction and angle of inclination. This form of bedding is caused by river, wave, and wind currents. Ripple marks, rain prints, footprints of land animals, and mud cracks, formed by the cracking open of mud exposed to the sun, are also commonly found, indicating shallow-water origin for the deposits. From such evidence a remarkably large proportion of the sedimentary beds are known to have been formed in shallow water. While most of the rocks included in the sedimentary group are deposited as fragments, and hence are at first unconsolidated, the sedimentary strata of the land are mainly consolidated. This consolidation is usually the result of the deposit of some kind of cement by percolating water. Carbonate of lime, some sort of iron, and silica are the common cements. The presence of cementing materials in the ground water is illustrated by the replacement of woody matter by silica, forming petrified wood. At times this cementing material gathers around centres, such as grains of sand or fossils, forming concretions.

Aside from the bedding planes, the sedimentary rocks, as well as the other groups, are crossed by joint planes, which, with the bedding planes, cause the rock to break naturally into

FAULT

A B, fault plane, D E, throw, U, upthrow, Dt, downthrow

rhombic or cubical blocks, greatly aiding in quarrying operations. Most of the jointing in sedimentary strata, and much of that in the igneous and metamorphic rocks, seems to be due to disturbances in the rock, which cause strains. Under violent strains the rocks are often folded and faulted, especially among mountains. This folding is sometimes very complex and amounts to real contortion. A single fold, with a dip in

OVERTHRUST FAULT

but one direction, is called a monocline, the ordinary uparching of rocks is known as an anticline, and the downfolding as a syncline. These may be symmetrical or unsymmetrical, and in cases are even overturned or recumbent. Under favorable conditions the rock under strain breaks in place of bending, forming faults. Some of the faults are dislocations of only a

UNCONFORMITY

A B, between two series of horizontal sedimentary rocks.

few inches, some of thousands of feet. Ordinarily the plane of faulting is approximately vertical, but in some cases, as when folds are overturned and the folding continues to the point of breakage, faults are developed with

nearly horizontal planes. Such faults are called overthrust faults, and the plane a thrust plane, because the rocks on the upper side are thrust over those on the lower side.

Ordinarily the sedimentary strata are horizontally deposited in the sea, and when lifted to form a part of the land they are usually still approximately horizontal. With mountain disturbance, however, the rock layers are thrown into inclined positions. In plains and plateaus, on the other hand, the rocks are prevailingly horizontal and there is little disturbance. Owing to the volcanic activity accompanying mountain formation, and to the great pressure under which the strata are placed in folding, both volcanic and metamorphic rocks are common among mountains, but are rarely found in plains. By reason of the instability of the earth's crust, land is often lowered below sea level subsequent to a period of denudation. Then sedimentary deposits are laid down on the submerged surface, after which the area may be raised once more into land. The plane between the new

UNCONFORMITY

A B, between sedimentary rocks and a series of folded rocks.

deposit and the old land marks an unconformity, and the upper rocks are said to rest unconformably upon the lower. An unconformity thus represents a gap in rock formation and in the life record and is often of great use in interpreting geological history. See JOINTS, ANTICLINE, DIKE, FAULT, ETC.

PHYSIOGRAPHIC GEOLOGY

This branch of geology is specifically treated under the heading of **PHYSIOGRAPHY**, so that only the general principles will be here stated. Physiography is concerned with a study of the forms assumed by the surface of the crust and the origin of these forms. Both on the ocean bottom and on the continents, plains, mountains, and volcanoes have been built, and each of these crust forms has a history. This history may start with the origin—the plain is an old lake bed, or a raised sea bottom, or a lava plain, etc. After its origin changes of one kind or another have occurred, giving it its present modified characteristics. For example, rivers may have developed upon it, or the agencies of the sea may be at work upon it, or glaciers may have passed over it. It is a question of physiographic geology to decide what has happened since the origin of a given land form.

In recent years, largely as a result of the work done by Professor Davis, it has been found that land forms normally pass through a life history which can be stated in terms of youth,

maturity, and old age. The characteristics of a newly formed coast line, a young stream valley, or a mature plain are readily seen. These aspects of physiography may be considered briefly by a few examples. A young stream has steep sides, because there has not been time enough for weathering to broaden them, it is certain to have falls or rapids, if the rock materials are of variable hardness, because it has not yet established a grade, and is therefore busily cutting in its bed and discovering rock irregularities, it may have lakes, because there has not been time enough for the rivers to fill them, and its tributaries are liable to be few and its divides poorly developed, for want of time. A mature stream has lost these characteristics. It has many tributaries and well-defined divides, but no waterfalls, excepting possibly in the headwater regions. Lakes are absent, and the valley is broad and its side slopes moderate. This is the normal development, but accidents may occur to interfere with this development. For example, lava floods may cross the valley or fill it, glacial deposits may be laid down to embarrass the stream, and the land may be raised or depressed. A mountain or a plain, or any other land feature, when newly formed and hence young, will have, therefore, certain characteristics, but with increasing age these will be changed. For example, drainage, at first vigorous, will dissect the land form, making it more irregular. A plain may then become a hilly region, and a mountain chain will become very rugged. Weathering and erosion will later reduce the irregularities, causing the mountain to become more level and the plain once more to approach a level condition. See **PHYSIOGRAPHY**.

STRATIGRAPHIC GEOLOGY

The fossil organisms, whose study forms the basis of paleontology or biogeology, in connection with a study of the rocks themselves, are useful in telling of past changes in climate and physical geography. But perhaps their most important service to the geologist is as factors in the determination of the geological age of the rocks. Their use in this respect depends upon two important principles—one that the strata are normally found in the order of their deposition, the oldest below, the highest above. This is known as the law of superposition of strata. The second principle is that, in the evolution of life on the globe, there has been a general upward progression. A knowledge of the nature of this progression, therefore, makes it possible, by a study of the fossils of given strata, to tell in what stage of life development they live and to assign an age to the strata in which they are found. The use of the term "age" in this connection naturally does not mean years. A term like the Devonian period might be considered to represent in geological history what the term "Bronze age" means when applied to human history. It refers to a stage of life development.

Prior to the enunciation of these principles by William Smith about a century ago, there had been various attempts to classify the strata. An early attempt employed the three terms Primary, Secondary, and Alluvial. A later attempt elaborated this time division as follows: Primitive, Transition, Secondary, Tertiary, and Alluvial. In the classification at present widely in

use, the term "Tertiary" is still employed, and "Secondary" is occasionally met in the writings of geologists of a few years ago. At one period lithological data were used in classifying the strata, on the assumption that at certain periods widespread conditions permitted the general deposit of rocks with certain lithological characteristics. Thus, there was a Carboniferous period, or age of coal, an Old and a New Red Sandstone period, a Cretaceous, or Chalk period, an Oolitic period, etc. Several of these inherited terms are still in use, even now that it is known that lithological characteristics were not universal. With the introduction of the life record it was found possible to define periods of geological history with more definiteness, often placing their boundaries at unconformities which marked a break in the preservation of the life record, thus making a good dividing line. This study has led to the necessity for the introduction of new names and the abandonment of some of the old ones. Very commonly the new names are geographic—Devonian, from Devonshire, England, and Permian, from Perm, Russia, e.g.—being adopted from the region where the study necessitating the new name was made. The use of fossils has also made it possible to subdivide the larger divisions of geologic history, and the names thus introduced are usually geographical and of local significance. Thus, those of Texas differ from those of New York, California, India, or England. But the large divisions are of world-wide application. The following table gives the names commonly in use in America for the main divisions.

DIVISIONS OF GEOLOGICAL TIME

Cenozoic	Quaternary	{ Recent Pleistocene (Glacial period)
	Tertiary	{ Pliocene Miocene Oligocene Eocene
Mesozoic	{ Cretaceous Jurassic Triassic	{ Upper Cretaceous Lower Cretaceous
	Permian Carboniferous	{ Coal Measures Subcarboniferous
Paleozoic	Devonian	{ Upper Devonian Middle Devonian Lower Devonian
	Upper Silurian or Silurian	{ Cayuga. Niagara. Oswegan.
	Lower Silurian or Ordovician	{ Lorraine Trenton Canadian
	Cambrian	{ Upper Cambrian Middle Cambrian Lower Cambrian
	{ Keweenaw Animikean Huronian	
Proterozoic		
Archeozoic	{ Archean Complex (Laurentian and Keewatin)	

In a given region a broad statement of the stratigraphic geology would start with the oldest rocks, perhaps the Archean, and continue down to the present. It would treat of the fossils, their characteristics, variations, and associations, and it would include a study of the structure, position, and relations of the rocks themselves. These studies would be applied to an interpretation of the history of the region, both in general and in detail, the evolution of

life, the climate and its variations, the relation of sea and land, and their variations in relation, the nature of sedimentation and the conditions accompanying it, the geographic conditions and the changes in past geography, with causes, periods of volcanic activity and their effects, the growth of mountains and their reduction, in a word, all the many and complex changes and interactions and interrelations of conditions which have helped to make the geological history. It is such a complicated subject that no adequate abstract is possible in an article of this scope. In fact, stratigraphic geology, being a history of the past, differs for each locality and can be properly discussed only in treatises on geology. Much on stratigraphic geology is, however, given in various articles on specific topics. See PALEONTOLOGY, PALEOBOTANY, ARCHEAN SYSTEM, CAMBRIAN SYSTEM, SILURIAN SYSTEM, ETC.

GLACIAL GEOLOGY

One of the last great episodes in geological history was the advent of great ice sheets from northern lands, invading and overwhelming northern North America and northwestern Europe. Because of its recency (in the Pleistocene period), the record of this invasion is clear. It lowered the hills, deepened the valleys, scoured, grooved, and polished the rocks, and transported soil and boulders in its onward march, leaving them in complex deposits when it melted back. These deposits clogged the valleys, turning streams aside and causing them to carve new valleys, which are now gorges with rapids and falls, and by making dams across the streams many lakes were ponded back in the stream valleys. In its advance the ice sheet drove out both animal and plant life, and many interesting effects on life were produced. A study of these records, and an interpretation of the events which they record, are the province of glacial geology.

The time of coming, the length of duration of the ice invasion, and the length of time since its withdrawal, are not known in years. From 25,000 to 50,000 years is the estimated time since the withdrawal of the ice from the northern part of the United States. The duration of the ice invasion was many times the length of the post-Glacial period and was great enough for a large amount of work to be performed. The beginning and the end of the Glacial period are included in the Pleistocene, so that even the time of coming is a recent geological event, being post-Tertiary. There is increasing evidence that the Glacial period was complex, consisting of several ice advances, with intermediate periods of deglaciation, or interglacial epochs.

Much discussion has arisen on the question of the cause of the Glacial period, without, however, arriving at definite results. That the land in the glaciated regions at the beginning of the Glacial period was higher than now is demonstrated, and it seems probable that, could the land be once more raised to that elevation, glaciation would again set in. There is reason to believe that the ice invasion such as marked the Pleistocene was not a unique event. Characteristic glacial materials have been found in the Permian system of South Africa, India, and Australia, and some geologists believe that they occur also as far back as Cambrian time. Whatever the causes may have been, there is no rea-

son to suppose they reached their single culmination during the Pleistocene period. See GLACIAL PERIOD

ECONOMIC GEOLOGY

A great number of geological products have economic value, and our industrial development of the present time is dependent upon these products. The investigation of these from the standpoint of their occurrence, origin, and uses belongs to the economic geologist. Of the topics of economic geology, undoubtedly the most important is the soil. Its origin, distribution, variations in texture and chemical composition, and the means of bettering it and of properly utilizing it, are questions of high importance. Building products—the building stones, cement materials, and clays—form a second important group, mineral fuels, including coal, natural gas, and petroleum, a third group, and metallic products, including both the precious and baser metals, form a fourth group. Besides these, there are many lesser products—the precious stones, abrasive materials, salt, gypsum, fertilizers, etc. The number of industries dependent upon this varied list of geological products and the vital relation of several of them to modern civilization show the value of a thorough and scientific knowledge of the nature and cause of their occurrence. It is the importance of this economic aspect of geology that has led governments, both state and national, to support expensive geological surveys. For a scientific study of economic geology, other aspects of geology must also be considered, consequently the whole field of geology has profited from the need of study of the economic aspect. See ORE DEPOSITS; MINING

THE HISTORY OF GEOLOGY

Geology ranks as one of the youngest of the sciences. In the latter part of the eighteenth century the discussion was being waged with warmth by Hutton and his followers on the one hand, and Werner and his followers on the other hand, as to whether any but the most recent igneous rocks were to be ascribed to other than aqueous agencies, as Werner affirmed. Catastrophism was rampant, and articles on that phase of natural philosophy which dealt with the earth history were mainly philosophical polemics defending some hypothesis. The clergy took a share in the discussions, opposing any theory of earth history which seemed at variance with the then existing dogmas of theology. It had not yet come to be the custom in the natural sciences to gather facts patiently, weigh them carefully, and endeavor to draw logical conclusions from them. Rather it seems to have been the custom to take such facts as appeared, philosophize upon them, and defend the conclusions with vigor against all comers and all fact.

James Hutton, in 1785, sounded the first note of the new geology when he said that he saw "no traces of a beginning, no prospect of an end." This generalization, now a foundation stone of the geological structure, was based upon a wide and thoughtful study and upon many carefully gathered facts. In Playfair's *Illustrations of the Huttonian Theory* are to be found many of the principles of modern geology. A second great epoch in the history of geology

was the work of William Smith at the close of the eighteenth century. As has been stated above, his work made possible the division of the geological record into ages based upon scientific principles. His work, therefore, stands as the foundation of stratigraphic geology. The work of Hutton and Smith made it possible for others to follow, and quickly facts began to accumulate and conclusions to be drawn which gave to geology the right to be considered as a separate science. Sir Charles Lyell, sometimes called the founder of modern geology, gathered these results and added to them his own, putting them together as a system in his *Principles of Geology*, still a geological classic. He vigorously promulgated his system, and was, without doubt, the greatest and most effective of geological teachers.

In these earliest days of geology as a science Americans had but little share, but before the middle of the century James Hall, James D. Dana, and others were vigorously at work on the geology of the North American continent. State geological surveys were established in many of the States, government geological expeditions and surveys were started, and, finally, the present United States Geological Survey was organized. Another event of great importance in the history of geology was the announcement of Agassiz's glacial hypothesis. Prior to his announcement floods, and then floods with icebergs, relics of the earlier days of catastrophic geology, were appealed to in explanation of the phenomena of the drift. Aside from its importance for the science of glacial geology, which it originated, Agassiz's doctrine of a glacial period was important as the destroyer of the last remnant of catastrophism from geological science. Henceforward uniformitarianism was accepted and for a while perhaps too thoroughly accepted and too blindly followed, as a result of Lyell's energetic advocacy. No longer was there any belief in the performance of geological work in a limited period of time, but moderate uniformity and great lapse of time were firmly established principles. Perhaps to Darwin's doctrine of evolution, which Agassiz did not accept, is due the final establishment of the principle of a great lapse of geological time. Be this as it may, the promulgation of the doctrine of evolution was an event of great importance to geology, which made advance in certain phases of geology possible. This theory was based in part on paleontological evidence, and geologists took a large share in its establishment. The discussion which followed its announcement resembled in some respects the discussion on geological philosophy at the end of the preceding century.

Out of the old natural philosophy have come several sciences, and out of each of these have developed several divisions, or subspecies, some of which may be classed as distinct sciences. The field of geology is so large, and its problems are so varied, that, as the body of fact gathered by the army of workers has increased, it has become necessary to subdivide, and, as in all sciences, the tendency is ever towards narrower and narrower specialization. The generation of geologists now passing away could be familiar with the whole field, as their teachers could be naturalists, and theirs natural philosophers. In one sense this is unfortunate, but in others it is for the best, because with specialization the details of knowledge are best gathered. Some

day a geological Darwin will appear with large enough grasp of the subject to arrange the facts patiently gathered in the various fields and to see their bearing on the great and still unsolved problems of geology.

In the United States this bureau, known as the United States Geological Survey, publishes reports, bulletins, and monographs of great value. There are also geological surveys in operation in the different States. Among the leading geological journals in America may be mentioned *Journal of Geology* (Chicago), *Economic Geology* (Lancaster, Pa), *American Journal of Science* (New Haven), *Bulletin of the Geological Society of America* (Washington). In England the leading journals are the *Geologist* (London) and *Quarterly Journal of the Geological Society* (ib). The leading German periodicals are *Neues Jahrbuch für Geologie, Mineralogie und Paläontologie* (Stuttgart) and *Zeitschrift für praktische Geologie* (ib).

GEOMANCY (from Gk γῆ, gē, the earth, and μαντεία, manteia, divination) Divination by means of signs from the earth. See SUPERSTITION.

GEOMETRICAL OPTICS See LIGHT.

GEOMETRIC MEAN If three quantities, a , b , c , are in geometric progression, b is called the geometric mean between a and c . e.g., 2, 4, 8 are three such numbers, 4 being the constant multiplier, and 4 is the geometric mean. From the nature of the series,

$$\frac{a}{b} = \frac{b}{c}, \text{ or } b^2 = ac, \text{ and } b = \sqrt{ac}.$$

The positive value of the square root is usually, but not necessarily, taken as the geometric mean when a and c are positive, the negative value being taken when a and c are negative, e.g., the geometric mean between 2, 8 is $\sqrt{16} = +4$, but between -2 , -8 , it is $-\sqrt{16} = -4$. The several terms of a geometric series which lie between two numbers, as a , l , are called the geometric means between a , l . The geometric mean of n positive real quantities is the positive value of the n th root of their product, e.g., the geometric mean of 8, 27, 64 is $\sqrt[3]{8 \cdot 27 \cdot 64} = 24$.

GEOMETRIC PROGRESSION See SERIES.
GEOMETRID MOTH See MEASURING WORM.

GEOMETRY (Lat *geometria*, from Gk. γεωμετρία, *geometria*, from γεωμετρής, *geometrēs*, geometer, from γῆ, gē, earth + μέτρον, *metron*, measure) The science of form. Geometric concepts arise from the consideration of forms of actual objects, just as numerical concepts arise from the consideration of collections of objects, for example, the idea of a cube results from observing that the corresponding physical object, as a die, occupies a certain part of space. This implies the first geometric assumption, viz., that space is divisible. In this case it is divided into two parts, that within the cube and that outside of it. Geometry considers only the former, the space occupied by a substance. This space is

called a geometric solid or simply a solid. The boundary between the space and that outside of it is a surface. A surface, being itself an element of space, is also divisible, and the boundary between two parts of it is called a line. A line, in turn, is divisible by a point. The number, comparative size, and position of these elements unite to make the concept cube. With accurate ideas of point, line, surface, solid, it is easy to imagine a world of geometric figures formed by their combinations. It is then only necessary to add concise definitions and axioms (qv) to found a system of geometry. But the validity of these assumed premises must determine the validity and scope of the resulting science—a fact forcibly exemplified in the case of Euclidean geometry.

Geometry was developed by the ancients, especially by the Greeks, to a high degree. But their constructions and solutions in elementary geometry were generally effected by the use only of the straight edge and compasses (instruments corresponding to the geometric elements, straight line and circle). Their achievements were therefore limited, and such problems as the trisection of an angle, the duplication of a cube, and all those which cannot be expressed by equations of the first or second degree, remained unsolved until the introduction of other instruments. The word "geometry" signifies land measure, and Herodotus attributes the origin of this science to the necessity of resurveying the Egyptian fields following each inundation of the Nile. He refers to the plan of taxation enforced by Sesostris (Rameses II), which required a survey of the land. Proclus also confirms the Egyptian origin of geometry by saying that Thales introduced this art from that country into Greece. The greatest among the disciples of Thales was Pythagoras, who formulated deductive geometry and discovered many important propositions. Among the illustrious successors of Pythagoras were Anaxagoras, (Enopides, Bryson, Antiphon, Hippocrates of Chios (who duplicated the cube, but not by elementary geometry), Zenodorus, Democritus, and Theodorus. To this list should be added the name of Plato, who introduced a new epoch in the science by formulating the method of geometric analysis and emphasizing the necessity of accurate definition. Menæchmus, a contemporary of Plato, discovered the conic sections. Among those who studied at the Academy of Plato were Eudoxus, who contributed extensively to the theory of proportion and the method of exhaustions, and to whom are due many theorems found in Euclid's *Elements*, and Aristotle, who improved many geometric definitions. The name of Euclid (qv) marks another epoch in the history of geometry. Euclid's work is remarkable, not for its originality, but for its simplicity and perfection as a logical system, based as it was on the discoveries of his predecessors. This work of 15 books, called the *Elements*, has for over 2000 years formed the basis of elementary instruction in geometry wherever the science has been taught. For the development of the geometry of conic sections we are indebted to Apollonius, of Perga, and to Archimedes. The later Greeks also cultivated geometry enthusiastically, as is attested by Nicomedes and Hipparchus, and in the Christian era by Ptolemy and Pappus.

The elementary plane geometry ordinarily studied in the American schools is based directly,

or indirectly through the work of Legendre, upon Euclid's *Elements*. Of this classic work, the first four and the sixth "books" are devoted to plane geometry, i.e., geometry in which the figures can all be imagined in one plane, even though, for purposes of superposition, they may be imagined as taken out of that plane in the course of the discussion. Euclid's treatment of solid geometry, in which the figures are imagined as occupying three dimensions, was so meagre that the elementary treatment of the subject to-day differs quite radically from that in the *Elements*. One of the principles of Euclid's work now most often violated is the attempt to avoid hypothetical constructions. For Euclid seeks to show how to construct each of the figures needed before he makes use of it. Thus, since it is impossible to trisect a general angle by the use of the compasses and the unmarked straight edge, Euclid would have been estopped from asking such a question as, Do the arms of an angle, and the two lines which trisect the angle, trisect a transversal of these lines? At present it is more common to assume that the necessary figures can be constructed and see what propositions can be proved from certain assumed postulates and axioms. Later, the question of the figures admitting of construction by the compasses and straight edge is considered by itself. Euclid's work has, until very recently, been the leading textbook on geometry in the schools of England and her colonies, but it has long since given way to a more modern treatment in most other countries and of late has been abandoned as the standard textbook in England.

The basis of ancient geometry as set forth in the *Elements* went practically unchallenged until the nineteenth century. The renewed interest in the science, growing out of the Renaissance, inspired the investigation of Euclid's assumptions and led mathematicians to seek to demonstrate the fifth postulate or twelfth axiom (given by Brill as the eleventh), viz., that two unlimited straight lines intersect on that side of a transversal on which the sum of the interior angles is less than a straight angle. Among the eminent mathematicians who sought to show the dependence of this proposition upon those preceding it were Legendre and Gauss. Lobachevsky and Bolyai were the first to construct a geometry independent of Euclid's assumption and thus to found the so-called non-Euclidean geometry. Then at once followed a great advance towards exploring the new field, and from the researches of Riemann, Helmholtz, and Beltrami, it is concluded that 10 of the Euclidean assumptions are valid for all geometry, but that the one just mentioned and "two straight lines [or, more generally, two geodesic lines] include no space," are limited to the properties of particular space. Riemann and Helmholtz formulated assumptions for a geometry in space of n -ply manifoldness and with constant curvature and observed that on the sphere, whose curvature is constant and positive, the sum of the angles of a triangle is less than a straight angle, this characterizing the space of the geometry of Bolyai and Lobachevsky. Klein has designated these three geometries respectively, the elliptic, parabolic, and hyperbolic. Starting with this broader view, many of the leading mathematicians of the last quarter of a century, including Cayley, Lie, Klein, Pasch, Killing, Fiedler, and Mansion, have given much

attention and made valuable contributions to the subject of geometry

Without questioning the validity of Euclidean geometry, there have grown out of it in modern times two great systems—an analytic, or coordinate (see ANALYTIC GEOMETRY), and a synthetic, or “modern,” geometry. The latter embraces descriptive and projective geometry, although systems of coordinates have been introduced also in the second of these subjects

Descriptive Geometry This has for its object the representation of solids upon two planes at right angles to each other, these planes then being, for convenience, flattened out into a single plane. This may be done in a variety of ways, but the original method is that of parallel rays perpendicular to the planes and known as the
